To mineral acid poisons, alkalis are A. The most suitable are lime, soap, chalk, potash, soda, or magnesia; they should be moderately diluted with water. Freshly precipitated oxide of iron, followed by a solution of potassium carbonate, is to some extent a chemical A. to prussic acid. Atropine is an A. to aconite, hellebore, veratrine, and morphine. Weak acids such as vinegar are A. to alkalis. Tannin or tea, charcoal, and morphine are A. to atropine and belladonna. Epsom salts and Glauber's

salt are A. to carbolic acid. Potash and injected atropine or strychnine are A. to chloral. Egg albumin and milk form an A. to copper salts. Ammonia is antidotal to formalin. Zinc sulphate is an A. to lead salts. Potassium permanganate is an A. to opium or morphine and to strychnine if immediately administered.

**Antietam**, a narrow but deep riv. in Maryland, U.S.A., flowing into the Potomac. A prolonged battle was fought on its banks between the Federals and the Confederates in Sept. 1862. The former were victorious, but with the loss of 13,000 men.

**Antifebrin**, *acetanilide* (chemical symbol  $C_6H_5NHCOCH_3$ ), a crystalline substance obtained by acting on aniline with glacial acetic acid. It is an analgesic and anti-pyretic, though it is undesirable to use it when the fever is prolonged, as its effects pass off so quickly. It quickly relieves the pain of migraine and neuralgia, and is the chief or only constituent of many advertised 'head-ache powders,' etc. It is liable to produce alarming symptoms, such as gasping respiration, cyanosis (darkening of the skin through deficient oxidation of the blood), and collapse, but these usually pass off if hot drinks and stimulants are administered.

**Antigo**, cap. tn. of Langlade co., Wisconsin, U.S.A., 203 m. N.W. of Milwaukee. It is a banking city, and contains locomotive works, foundries, and factories for wooden and iron goods. Pop. 8600.

**Antigone**, in Gk. mythology, a daughter of Oedipus and Jocasta. She accompanied her father into exile at Colonus. After her father's death she went to Thebes, where Hemon, son of Creon, the king, fell in love with her. Her brothers, Eteocles and Polyneices, slew each other in single combat, and A., disregarding Creon's edict, buried Polyneices. As a punishment she was shut up in an underground cave, where she afterwards hanged herself. Hemon, her lover, in despair put an end to his life.

Gk. tragic poets have used her life and character as a subject for many of their works. Sophocles immortalised her in *Antigone* and *Oedipus at Colonus*. Euripides also used the theme in his *Phaenician Women*, but the discrepancy with Sophocles' version should be noted.

**Antigonish**, cap. tn. of co. of same name, Nova Scotia. It is the seat of the Catholic bishop of Arichat, and contains St. Ninian's Cathedral and the large college of St. Francis Xavier. It is a banking tn., a port of entry into Nova Scotia, and a distributing centre for a large agric. dist. The harbour on St. George's Bay is navigable by small vessels. Pop. 2150.

**Antigonus** (382-301 B.C.), known as Cyclops (the one-eyed), one of the generals of Alexander the Great. In the div. of the kingdom after Alexander's death he received Pamphylia and Lycia. He was forced to flee into Greece, and found favour with the regent of Macedonia. On the death of Antipater the

regent, he determined to win the lordship of Asia. He became lord over Asia Minor and Syria. He assumed the title of king in 306 B.C. He failed in an attempt to invade Egypt, and fell in a decisive battle at Ipsus in his eighty-first year.

**Antigonus** of Carystus in Euboea. A Gk. writer of the third century B.C., in the age of Ptolemy II. of Egypt. He spent most of his early life in travelling. He was summoned to the court of Attala I. of Pergamum. His chief works were the *Lives of Philosophers* and *Collections of Wonderful Tales*. This collection, which on the whole is of very little value, was ed. (1799) by J. Bechmann, with a commentary; and by Keller (1877).

**Antigonus Doson**, king of Macedonia, was grandson of Demetrius Poliorcetes. He assumed gov. on the death of Demetrius II. in 229 B.C. and married Chryseis, the queen-mother. His reign was a critical period in the hist. of the interaction of the Gk. states. He co-operated with Aratus and the Achaean league against Cleomenes, king of Sparta, invaded Laconia in 221 B.C., and by the victory of Sellasia made himself master of Sparta. He repelled an invasion of the Illyrians in Macedonia. He d. a few months later in 220 B.C. The appellation, 'Doson' (Gk. *δωσω*, going to give) satirically marked his readiness to promise and slowness to perform.

**Antigonus Gonatas** (319-239 B.C.), Macedonian king, grandson of A. Cyclops and son of Demetrius Poliorcetes. He did not obtain immediate possession of the throne, but assumed the title of king, and after waiting 7 years celebrated his accession. Pyrrhus drove him from his kingdom in 273 B.C., but he recovered it in the next year and retained possession of it until his death.

**Antigua**, one of the W. Indian Is., is a Brit. possession, forming with Barbuda and Redonda one of the 5 presidencies of the Leeward Is. It was discovered by Columbus in 1493, settled by the Eng. in 1632, made a bishopric in 1842. It is the seat of gov. of the Leeward Is. It became a crown colony in 1898. Suffered severe damage from hurricane, 1929. Chief tns., St. John, Falmouth, and Parham. The Is.'s natural harbours are St. John's, English, Falmouth, Willoughby, and Parham. Sugar is cultivated, and molasses, tamarinds, and pineapples are exported. Area, 108 sq. m. Pop. with dependencies, 41,000. The Is. was named by Columbus after the church of St. Mary of A., Seville. It is an Is. of rocky caves and dense thickets of thorny underwood, and many are the legends associated with its picturesque ravines, intricate mt. paths, and dangerous shores lined with coral reefs. The settlement of A. is associated with the name of Sir Thomas Warner, whose son Edward led a party of Eng. colonists from St. Kitts (q.v.) to A. in 1652, and was made the Is.'s first governor by his father. Later the Is., together with the other Leeward Is., was included in the patent granted to Lord Carlisle, the lessee of which grant was

Francis, Lord Willoughby. Willoughby governed the Leeward Is. from Barbados, relinquished control in 1652, but returned after the Restoration and governed till 1666, when he was lost at sea. In 1666 Fr. troops, together with some Irish malcontents, landed at Five Is. Bay and took possession of A.; but in 1667 it was ceded to England by the treaty of Breda. There were soon after the cession only 500 black people on the Is., while a century later the pop. included nearly 39,000 slaves, 1230 free people of colour, and 2600 whites. In 1689 the inhab. of Anguilla (q.v.) sought refuge in A., which was defended from Fr. and Carib attacks by Sir Timothy Thornhill. The notorious Daniel Parke became governor in 1706. Violent differences occurred between him and the inhab., but he refused to resign and was at length killed by an infuriated mob on Dec. 10, 1710.

It was at Eng. Harbour that Nelson hauled down the broad pennant of Commissioner Monray, on the ground that he, Nelson, as captain of the *Boreas*, was senior officer of the station. At Indian Warner, in the hilly dist. between Willoughby Bay and Eng. Harbour, there is a vault in which Col. Thomas Warner and others of the Warner family were buried. It is situated near the ruins of the old Great House. 'Indian Warner' was the common appellation of a natural son of Gen. Sir Thomas Warner by an Indian woman, and he was so called to differentiate him from Col. Philip Warner, another and legitimate son of the general. Col. Philip Warner slew his half-brother and had to go home to stand his trial for murder, but was acquitted.

William Dampier, *Voyages and Descriptions*, 1699; Capt. Thomas Southey, *Chronological History of the West Indies*, 1827; *Antigua and the Antiguans*, 1844; V. L. Oliver, *History of the Island of Antigua*, 1895-99; C. Manington, *The West Indies*, 1925.

**Anti-Jacobin**, or **Weekly Examiner**, an Eng. paper founded by George Canning and his friends to express their opposition to the principles and policy of the Fr. revolutionaries. The chief contributors were Canning, George Ellis, and John Hookham Frere, the paper being ed. by William Gifford (q.v.). It lasted from Nov. 20, 1797, to July 9, 1798.

**Antilegomena** (Gk., contradicted), a term applied to certain books of the N.T. whose inspiration was not at first universally acknowledged by the Church. The books were the Epistles of James, Jude, 2 Peter, 3 John, Acts of Paul, and the Apocalypse. The name was given in contrast to the other books, which were called Homologoumena (agreed to).

**Antilibanus**, or **Anti-Lebanon**, a mt. range of Syria, inferior in height to Lebanon, with which it runs parallel, and from which it is separated by the valley of Cuele-Syria. Its highest peak is Mt. Hermon, which is 9050 ft. high.

**Antilles**, a name sometimes applied to the whole of the W. Indies, sometimes to the 2 large groups, the Greater A. and the Lesser A., or Caribbean Is. The

Greater A. comprise the largest is., namely Cuba, Jamaica, Haiti, and Puerto Rico, as well as the small is. near their coasts. The Lesser A. comprise the Windward and Leeward Is., with the Virgin Is. (Anegada). For further information of the A., discovered by Columbus, see under the various names above mentioned.

**Antilocapra**, or **Prongbuck**, a N. Amer. ruminant, somewhat resembling the antelope, but differing from it in having deciduous branched horns. The genus is also characterised by the absence of lateral hoofs. The animal stands about 3 ft. high.

**Antiochus**, in Gk. mythology, the son of Nestor, king of Pylos, whom he accompanied to the Trojan war. He was famous for beauty, swiftness, and skill, and was the friend of Achilles, who avenged his death when he fell in saving Nestor from Memnon. He was buried, together with Achilles and Patroclus, on the headland of Sigeum.

**Antilogarithm** is the number corresponding to a logarithm. Thus 100 is the A. of 2, because 2 is the logarithm of 100.

**Antimachus**, Gk. epic poet of the latter part of fifth century B.C., b. at Colophon, and a friend of Plato. His works, which show great erudition but little talent, include an epic *Thebais*, highly esteemed by Alexandrine critics, and an elegiac cycle, *Lyde*. The *Thebais* was ed. by Kinkel in *Epicorum Græcorum Fragmenta*, vol. 1., 1877, and *Lyde* by Bergk in *Poetæ Lyrici Græci*, 1843.

**Antimilo**, a small is. situated to the N.W. of Milo (anc. Melos) in the Grecian archipelago.

**Antimony**, a chemical metallic element (symbol Sb, atomic number 51, atomic weight 121.2) occurring in nature chiefly in combination with sulphur as stibnite, antimonite, or A. sulphide, Sb<sub>2</sub>S<sub>3</sub>. Other A. compounds found in nature are arseniferous A., AsSb, antimonial silver, AgSb, antimonial nickel, NiSb, A. oxide, Sb<sub>2</sub>O<sub>3</sub>, etc.

The metal is prepared by melting the sulphide in a reverberatory furnace so as to separate it from impurities of quartz, etc. The pure sulphide is then roasted in order to convert it into the oxide, which is afterwards reduced with carbon. Another method is the fusion of the sulphide with scrap iron, when iron sulphide and A. are formed. The A. is further purified by re-melting with potashes and on solidifying it shows fern-like markings due to crystallisation, and is known as 'star-metal.'

A. is a lustrous silver-white metal. It has a sp. gr. of about 6.7, melts at about 630° C., is hard and so brittle that it can be easily powdered. It volatilises at a white heat in air, and may be distilled in a current of hydrogen. It does not undergo alteration on exposure to the air at ordinary temps., but burns on heating to form the oxide; if burned in contact with charcoal at a high temp. the oxide is evolved in dense white fumes. The metal combines directly with chlorine with evolution of much heat.

A. forms numerous useful alloys with other metals. Eng. type-metal is an alloy of lead, A., and tin; the A. imparts hardness to the alloy and that quality of expanding at the moment of solidification which gives a clear outline to the cast. Britannia metal consists of tin, A., and zinc; pewter contains tin, A., copper, and bismuth; and anti-friction metal is usually composed of copper, A., and tin.

The chief compounds of A. are A. hydride, SbH<sub>3</sub>, a disagreeably smelling gas; A. trioxide, found in the mineral valentinite; pyroantimonic acid, formed by heating the white powder produced by the action of nitric acid on the metal; A. trichloride a crystalline solid, but if prepared by boiling the sulphide in strong hydrochloric acid, a viscous mass, called butter of A.; and A. pentachloride, a heavy, colourless, fuming liquid.

In medicine, potassium antimonyl tartrate, known as tartar emetic, is administered in small doses as a diaphoretic and expectorant, and in doses of from 1 to 2 grains as an emetic. More frequently it is injected intravenously in the treatment of kala-azar (blackwater fever) and trypanosomiasis (sleeping-sickness). A. trisulphide is given in doses from 1 to 5 grains for the same purposes. In larger doses, A. is an irritant poison, causing vomiting and purging. Chronic antimonial poisoning is characterised by nausea, progressive weakness, and may end in death by exhaustion.

**Antinomianism** (Gr. ἀντί, against, νόμος, law), the doctrine that Christians are freed from obligation to keep the law of God. Antinomian is the term applied by theologians to those who hold that faith in Jesus Christ dispenses with, and renders unnecessary, as far as a future state is concerned, the observance of morality and the performance of good works. The dispute as to whether man is 'justified' by 'faith' or by 'works' is one of the oldest in the Christian Church, and it is evident from sev. passages in the N.T. that the apostolic church was divided on the matter, but it was not until the Reformation that the term was first used. It was applied by Luther to the followers of John Agricola, his fellow townsman, who was b. at Eisleben in Saxony. At Wittenberg in 1537 Agricola maintained in a disputation the Antinomian point of view, which was controverted by Luther, Melancthon, and others. The Antinomian controversy was terminated in 1540 by a retraction by Agricola. A. found foothold in this country during the Commonwealth, but the assembly of divines in 1643 condemned sev. writings which appeared to them antinomian. Parliament in 1648 enacted that any one convicted, on the oaths of 2 witnesses, of maintaining that the moral law of the Ten Commandments is no rule for Christians, or that a believer need not repent or pray for pardon of sin, should publicly retract, or, on his refusal, be imprisoned till he found sureties that he would no more maintain these doctrines.

**Antinoüs**, a youth of extraordinary beauty of Claudiopolis in Bithynia, favourite and companion of the Emperor Hadrian. He drowned himself in the Nile A.D. 130. Hadrian paid most extravagant respect to his memory and founded Antinoöpolis in his honour. A favourite subject in art.

**Antinoüs**, see AQUILA.

**Antioch**, now **Antakieh** in Syria. Founded by Seleucus 300 B.C. after the battle of Ipsus, 301. Acquired the name of 'Queen of the East.' Here the disciples were first called Christians, A.D. 42. A. was taken by the Persians, 540, by the Saracens about 638; recovered by the E. emperor, 966; lost again, 1086; retaken by the crusaders in June 1098, and made cap. of a principality, 1099, and held by them till June 1268, when it was captured by the sultan of Egypt. It was taken from the Turks in the Syrian war, 1832, by Ibrahim Pasha, but restored at the peace. A. suffered much by earthquakes, and about 1600 persons were killed on Apr. 3, 1762. Prin. cultures: tobacco, maize, cotton, and mulberry for silk production. In 1835 it had only 5000 inhab. It has a Brit. consul. Pop. 30,000.

**Antioch College**, a non-sectarian educational institution at Yellow Springs, Ohio. It was founded by Horace Mann (q.v.) in 1853. Academic training is not regarded as sufficient of itself to equip a student for a career and therefore the college is so organised that the student may divide his time between school and practical work in the economic community. The student-roll of 1931-32 contained 586 names (371 men and 215 women). There is a library of 37,000 books.

**Antiochus**, the name of thirteen kings of Syria of the Seleucid dynasty. The lives of most of these are given below. The name was also borne by the kings of Commagene (69 B.C.-A.D. 72), whose house was affiliated to the Seleucids.

**Antiochus I. Soter**, or Preserver (280-261 B.C.), was the son of Seleucus, a general of Alexander the Great, who after the death of Alexander raised Syria into an independent kingdom. Upon the murder of Seleucus, 280 B.C., A. succeeded to the throne, and reigned 19 years. He prosecuted his father's claim to the kingdom of Macedonia against Antigonus Gonatas, son of Demetrius, who was his brother-in-law, but the dispute was accommodated by a marriage between Antigonus and Phila, daughter of Seleucus and Stratonice, in consideration of which the Macedonian prince was allowed to retain the peaceable possession of his throne. Demetrius, the son of Antigonus, also married Stratonice, the daughter of A. A. defeated the Gauls, who had crossed into Asia and settled in Galatia. He d. 261 B.C. See *Appian, Syria*; Justin, xxvii.

**Antiochus II., Theos**, or God (261-246 B.C.), son of A. Soter, succeeded his father. The Parthians, 250 B.C., under Arsaces, expelled the Macedonians from their country, and Arsaces became

the founder of the Parthian empire. Bactria and other provs. E. of the Tigris followed this example; and A., apprehensive of the final loss of those regions, concluded a treaty of peace with Ptolemæus Philadelphus, 252 B.C., by which he agreed to repudiate his wife Laodice and marry Berenice, daughter of the king of Egypt. These conditions were fulfilled; but on the death of Ptolemæus, 2 years afterwards, A. restored Laodice to her rights, and in return was poisoned by her, 247 B.C., with the view of securing the succession to her eldest son, Seleucus Callinicus.

**Antiochus III., the Great** (223-187 B.C.), was the son of Seleucus Callinicus, and succeeded his brother Seleucus Ceraunus. The young king appointed governors to preside over the sev. dists. of the Syrian empire, which, during preceding reigns, had lost much of its ter. The kingdom of Pergamus had profited by the weakness of the Seleucid dynasty, but under the able management of Achæus, the cousin-german of A., those provs. which had been wrested from the Syrians were recovered, and Attalus of Pergamus was confined within the limits of his proper kingdom.

Achæus, who had been a faithful friend of A., finding that plots were laid against his life by those who were in the king's confidence, proclaimed himself king of those provs. in Asia Minor which he had recovered, and which had been entrusted to his charge. Ptolemæus Philopator still held Cæle-Syria and Palestine, which had been conquered by his predecessor, Euergetes. A. first took arms against Egypt, and among other places he recovered Damascus. A truce was made between Ptolemæus and A., but it expired before any agreements were made, and was resumed, 218 B.C. A. penetrated into Phœnicia, and gained possession of Galilee and the tracks E. of the Jordan. But in the following year he was totally defeated at Raphia, near Gaza, and obliged to retreat to Antioch. The Syrian king, pressed by Achæus, was compelled to sue for peace with Egypt, which he obtained on condition of resigning his claim to the contested provs. A. now turned his whole attention to the destruction of Achæus, whom he overpowered and put to death; and the provs. of Asia Minor were again annexed to the Syrian empire, 213 B.C.

Arsaces, son of Arsaces I., who estab. the Parthian empire, had overrun Media while A. was engaged in the wars against Ptolemæus and Achæus. The Syrian king invaded Parthia, and after sev. campaigns Arsaces was left in possession of Hyrcania, on condition of his assisting A. to recover the rest of the revolted provs. After an unsuccessful attempt to recover Bactria from Euthydemus, with whom he concluded a treaty, he re-estab. the supremacy of Syria in the provs. between the Indus and Persia. He returned through Persia to Antioch, having been employed for 7 years in these E. campaigns, in which he earned the title of Great.

Ptolemæus Epiphanes, a child of 5 years old, succeeded to the throne of Egypt, 205 B.C., on the death of his father, Philopator. A. and Philip, king of Macedonia, united in a design to expel him and share the Egyptian dominions between themselves. A. regained possession of Palestine and Coele-Syria in 2 campaigns; and he entered Jerusalem, 198 B.C., where he was received by the Jewish people with great joy. A. then proposed a treaty of marriage between his daughter and the young king of Egypt, by which Coele-Syria and Palestine were to be given with the princess as a dowry. He now proceeded with a powerful fleet round Asia Minor, crossed the Hellespont, and took possession of the Thracian Chersonese, 196 B.C., which belonged to Philip, king of Macedonia; and here he came in contact, for the first time, with the power before which his own was compelled to retire. The Romans had already reduced Macedonia to the condition of a subject kingdom, and being jealous of this interference in European affairs, they sent ambassadors to require restitution, not only of all that A. had taken from Philip, but of all that he had taken from Ptolemæus, whose guardians, soon after his accession to the throne, had placed him under the protection of the Romans. A. replied to these requisitions in terms as haughty as those in which they were made.

In 195 B.C. Hannibal, driven from Carthage, came to Ephesus to seek the protection of the king of Syria, and his representations induced A. to match his strength against the power of Rome. In the winter of 192 B.C. A., at the invitation of the Ætolians, crossed over into Greece with an army, posted himself in the tn. of Demetrias, and was chosen by the Ætolians as their commander-in-chief. A. captured Eubœa, but he did not push on his conquests with vigour. The Rom. consul, Acilius Glabrio, defeated the Syrian king at Thermopylæ, and he was compelled to retire to Asia, 191 B.C. The next year L. Cornelius Scipio was consul, and appointed to conduct the Syrian war, and his brother, the celebrated Africanus, served under him as lieutenant. A. withdrew his forces from Europe, and the Romans crossed the Hellespont. He now offered terms of peace, but the Romans demanded more than he would concede, and he met the consul Scipio, 190 B.C., in a pitched battle near Magnesia, in which he was defeated with immense slaughter. A. retired to Syria, and yielded to the terms of the conqueror. He was to resign the provs. W. of Mt. Taurus; to pay 18,000 Euboic talents for the expenses of the war; to deliver up to the Romans his elephants and ships of war; and to place in their hands Hannibal and other foreigners who had taken refuge at his court. Hannibal, with another, preserved his safety in flight; the rest were delivered up, together with hostages for the observance of the treaty, of whom A. Epiphanes, the king's younger son, was one.

In collecting means to pay the heavy burden imposed upon him, A. plundered a wealthy temple in the prov. of Elymæis. But the people of the place rose in arms and massacred him and his attendants, 187 B.C., in the thirty-seventh year of his reign and fifty-second of his age. A. did more to restore the greatness of the Syrian kingdom as under the first Seleucus than any other of his dynasty; but he was unfortunate in meeting the first shock of that power before which all the kingdoms of the known world were destined to fall. See Polybius, v., xviii., etc.; Appian, *Syriaca*; Livy, xxxvi., xxxvii.; Sir Walter Raleigh, *Historie of the World*, 1628.

**Antiochus Epiphanes**, or **Illustrious** (175-164 B.C.), the second son of A. the Great, succeeded his elder brother, Seleucus Philopator. A. at the time of his brother's death was on his way from Rome, where he had been a hostage. Egypt now reclaimed the provinces of Palestine and Coele-Syria, wrested from her by A. the Great. In the first campaign, 171 B.C., A. routed the Egyptians between Mt. Casius and Pelusium, and fortified the frontiers of Palestine against further aggression. In the next year he overran Egypt, except the strong city of Alexandria, and gained possession of Ptolemy Philometor, the young king. In the same year in consequence of the formation by the Jews of a party favourable to the Gks. which, aided by the high priest, Jason, had succeeded in securing the supreme power in the State, he sacked Jerusalem, and profaned and plundered the temple, as related in Maccabees (i. 1. and ii. 5); after which he appointed Philip the Phrygian governor of Judæa. The Alexandrians having raised Ptolemy Euergetes, commonly called Phyxon, the brother of Philometor, to the throne, A. again invaded Egypt, 169 B.C., and laid siege to Alexandria. Being unable to reduce that city, he left Philometor as the nominal king; of the country; but the 2 brothers agreed to hold the kingdom in common, and Egypt was restored for a time to tranquillity. Thereupon, A. undertook a fourth expedition into Egypt, 168 B.C., and was laying siege to Alexandria when ambassadors from Rome ordered him to leave Egypt, and he obeyed. Returning through Palestine in the same year, he ordered that great persecution of the Jews related in the second book of Maccabees. The vigorous resistance of the Jews induced A. to send a force under Lysias into Judæa, which was totally defeated. Transported with passion he hastened towards Antioch from the N. provs., which were in a state of revolt, but he was suddenly attacked by a violent disease, and d. in agony. See Livy, xlii., etc.; Polybius, xxvi.-xxxi. ed. Bekker.

**Antiochus Eupator** (164-162 B.C.) son of A. Epiphanes, when a child 9 years old succeeded to the throne, under the guardianship of Lysias. After a nominal reign of nearly 2 years he was dethroned, and put to death by his cousin german,

Demetrius Soter, son of Seleucus Philopator, who succeeded to the crown.

**Antiochus, or Dionysus Epiphanes** (141-142 B.C.), son of Alexander Balas. Tryphon supported his claims against Demetrius Nicator, but subsequently murdered him and usurped the throne.

**Antiochus**, surnamed **Sidetes** (137-128 B.C.), was a younger son of Demetrius Soter, king of Syria. His reign was comparatively prosperous and tranquil. He reduced Jerusalem, 134 B.C. He defeated Phraates, king of Parthia, and recovered all which had been wrested from Syria, except Parthia; but he lost his life, 129 or 128 B.C., in a sudden attack which the enemy made on his winter quarters.

**Antiochus Grypus**, or Hook-nosed (125-96 B.C.). After the death of A. Sidetes, Syria was distracted by civil wars. Demetrius Nicator escaped from Parthia, and resumed the crown; but he was soon dethroned by Alexander Zebinas. Cleopatra, the wife successively of Balas, Nicator, and Sidetes, retained possession, however, of a portion of Syria, and Seleucus, her son by Nicator, regained some districts contiguous to those held by his mother, and proclaimed himself king of Syria. This raised her jealousy, and she murdered him with her own hand. She now recalled from Antioch her son A. G. (named also Philometor, and, on his medals, Epiphanes), 125 B.C. Grypus soon expelled Alexander Zebinas; but Cleopatra became jealous of him also; and she was compelled to drink a poisoned draught, which she had offered to her son. A. G. reigned in peace for 8 years; at the end of which a fresh competitor for the throne started up in the person of his half-brother.

**Antiochus**, surnamed **Cyzicenus** (112-96 B.C.), from being educated at Cyzicus, the son of Cleopatra by A. Sidetes. After a sharp contest he and his brother agreed to divide the empire in 113 or 112 B.C. Cyzicenus occupied Coele-Syria and Palestine; Grypus the rest of the empire. Grypus was assassinated, 96 B.C. Cyzicenus was defeated and slain by Seleucus, the son and successor of Grypus. Seleucus perished after a reign of 7 months.

**Antiochus Eusebes**, the Pious (95-83 B.C.), son of A. Cyzicenus, proclaimed himself king of Syria upon his father's death. While he was engaged in war with his cousin, Philip, another A., surnamed Dionysus, full brother to Philip, seized upon Coele-Syria. The latter was soon slain in a war against the Arabians. After a brief period, the Syrians, wearied by the desolating feuds of the Seleucidan princes, invited Tigranes, king of Armenia, to take possession of the country and Eusebes then fled into Cilicia.

**Antiochus**, surnamed **Asiaticus** (69-65 B.C.), was the son of A. Eusebes. Tigranes being obliged to withdraw his troops from Syria to make head against the Romans, A. gained possession of part of the kingdom, 69 B.C. He retained it for 4 years, at the end of which Syria was reduced by Cn. Pompeius to a Roman

province, 65 B.C. In A. ended the Seleucidan dynasty.

**Antipædobaptists**, name given to those who deny the validity of infant baptism. They are generally known by the shorter title of Baptists.

**Antiparallel**, a term in geometry. A. lines make with each other angles equal each to each, but contrary ways, one being external and the other internal.

**Antiparos** (ancient Olios) is an is. of the Cyclades group in the Aegean Sea, separated from Paros by a dangerous channel. It produces wine and cotton; but is chiefly celebrated for its wonderful grotto, 120 yds. long, 113 yds. wide, and 60 ft. high, from the roof of which depend large stalactites. The floor is rough and uneven, and set with various coloured crystals and stalagmites. Pop. 500.

**Antipasch**, Low Sunday, the Sunday after Easter Day.

**Antipater**, a general of Alexander the Great and regent of Macedonia during Alexander's expedition to the E. (324-323 B.C.). Suppressed Thrace and Sparta. On Alexander's death he was left in command in Macedonia, and in the Lamian war he crushed the Greeks, who had attempted to reassert their independence. He became sole regent in 321 B.C. and d. in 319 B.C.

**Antipater, Lucius Cælius** (fl. 150 B.C.), one of the most ancient of Roman historians, was also an orator and lawyer. He was a contemporary of the Gracchi, and wrote a famous list of the second Punic war. See Meltzer, *De L. Cælio Antipatro*, 1867; W. S. Teuffel, *Geschichte der römischen Literatur*, 1870.

**Antipatharia**, a sub-order of coral. The growths, usually found at great depths are slender and branched in appearance. The polypes resemble small anemones and have from 6 to 24 simple tentacles.

**Antipathy** (Gk. ἀντί, contrary, and πάθος, feeling), signifies an involuntary dislike or aversion for a certain object. Many As. are natural and do not arise from any accidental circumstance, such as the aversion to the tastes and smells of many drugs, and the dislike of certain foods. Some As. arise from fear and past unpleasant associations. Some people have As. to certain animals, because they imagine that they are very dangerous or harmful, and some faint at the sight or sound of certain things.

**Antipatris**, a city of Palestine, at edge of plain of Sharon, on main road from Jerusalem to Caesarea. Built by Herod the Great (37-34 B.C.), and named after his father Antipater. Frequently mentioned by Josephus. See also Acts xxiii. 31-32. Its ruins are the modern Ras-el-Ain, where is situated Jerusalem's water supply.

**Antipaxo**, a very small Gk. is. a little to the S. of Paxo, one of the Ionian group.

**Antiperiodics**, medicines which counteract the poisons of periodic disorders like ague. The principal A. are quinine, arsenic, and iodine.

**Antiphanes**, Athenian comic poet of

fourth century B.C. The chief representative of the Middle Attic comedy. He is supposed to have written between two and three hundred plays, the extant fragments of which were collected in *Comicorum Atticorum Fragmenta* (Koch, 1884).

**Antiphilus**, a Gk. painter of the Alexandrian age. He worked for Philip I. of Macedonia and Ptolemy I. of Egypt. He is said to have been a rival of his contemporary Apelles, and is described by Quintilian as 'excelling in light and shade and caricature' and Pliny mentions sev. of his works in various styles. He was also the inventor of a kind of caricatures called *Grylli*. They were a species of grotesque monsters, part man, part animal or bird.

**Antiphlogistics**, medicines which have the power of counteracting or allaying fever; such as mercury, aconite, antimony, etc.

**Antiphon** (480-411 B.C.), the earliest of the Attic orators, a member of the oligarchical party and was largely responsible for the establishment of the Four Hundred in 419. On the restoration of the democracy he was condemned to death. He is often regarded as the founder of political oratory. His chief work was as a professional speech-writer. Only 15 of his speeches have come down to us. They are to be found in Reiske's collection and Bekker's *Attic Orators*, 1822-23.

**Antiphon** (Gk. ἀντί, against, φωνή the voice), a species of psalmody sung alternately. Probably originated in the service of the anct. Jewish Church. Introduced into Christian worship by Ignatius (d. A.D. 115). Introduced into Lat. Church by Ambrose, Bishop of Milan, in the fourth century.

**Antiphonary**, **Antiphonarium**, in music, the book wherein the antiphones were written; a copy of which was kept in each church and monastic establishment. Such books were often very ornate and costly.

**Antipodes** (Gk. ἀντί, against, πούς, foot), a term applied to places diametrically opposed on the earth, so that if a line were drawn connecting them it would pass through the centre of the globe. Noon at one place is midnight at the other, and the longest day corresponds with the shortest. The A. of England is A. Is., near New Zealand.

**Antipope** is the name given to a pope who is not recognised by the Church, but who usurps the papal power, being chosen by some religious or political party. Authorities differ as to the number of As. Some say there have been 28, others 32, while some say 35 or 36. The first A. was Novatian, chosen in 251; and then followed Felix, chosen by Constantine in 355, during the pontificate of Liberius; Ursinus in 366, while Damasus was pope; Eulalius 418, against Boniface I.; Laurentius, 498, against Symmachus; Paschal and Theodore, 687, against Sergius I.; Theophylactus, 757, against Paul I.; Constantine, 767, and Philip, 788, against Stephen IV.; Zizimus, 824,

against Eugenius II.; Anastasius, 855, against Benedict III.; Sergius, 891, against Formosus; Christopher, 904, against Leo V.; Francon, under the name of Boniface VII., 974, against Benedict VII.; Philagathus, called John XVI., 997, against Gregory V.; Gregory, 1012, against Benedict VIII.; John, called Sylvester III., 1044, against Benedict IX.; John, called Benedict X., 1058, against Stephen IX.; Cadalos, called Honorius II., 1061, against Alexander II.; Guibert, called Clement III., 1080, against Gregory VII.; Albert, Theodoric, and Maginulf, 1101, against Paschal II.; Maurice Bourdin, called Gregory VIII., 1118, against Gelasius II.; Anacletus, 1130, and Gregory Conti, called Victor IV., 1138, against Innocent II.; Octavian, called Victor V., 1159; Guido, called Paschal III., 1164; Calixtus, 1168, and Lando Sittino, called Innocent III., 1178, against Alexander III.; Nicolas V., 1328, against John XXII.; Robert, called Clement VII., at Avignon, against Urban VI.; Pedro de Luna, called Clement VII., 1378, against Boniface IX.; Muñoz, called Clement VIII., 1424, against Martin V.; and Felix V., 1429, against Eugenius IV.

**Antipyretics**, remedies which tend to reduce the temp. in fevers. They may act (1) by the abstraction of heat, as in the use of the cold bath and ice, and by administering copious doses of diaphoretics and sudorifics; or (2) by lessening heat production by their action on the nervous system, as in the use of antipyrine, antifebrin, and quinine; or (3) by destroying the poison which causes fever; or (4) by increasing the dissipation of heat through their action on the skin or circulation, as alcohol, aconite, antimony, etc.

**Antipyrine** ( $C_{11}H_{11}ON_2$ ), or *dimethyl-phenylpyrazolone*, an organic substance used in medicine as a febrifuge.

It crystallises in white leaflets which melt at 113° C., and is soluble in water and alcohol. The aqueous solution gives a red colour with ferric chloride and bluish-green with nitrous acid.

A. has a slight effect on the temp. in health, but a marked one in fever. It has been used in almost every febrile condition, but its routine use is not now recommended. It speedily gives relief in migraine, headache, and neuralgia, and predisposes to sleep after the pain has disappeared.

**Antiquaries**, Society of, formed in the eighteenth century to promote the study of antiquities. Earlier societies had been founded in the sixteenth and seventeenth centuries, but it was not until 1717 that the society was formally reconstituted. In 1780 George III. granted the society apartments in Somerset House. It is governed by a council of 20, and a president who is also an *ex officio* trustee of the Brit. Museum. The present headquarters of the society are at Burlington House.

**Antique Crown**, a special name of an Amer. type called Egyptian by Eng. printers.

**Antiquities**, see **ARCHÆOLOGY**.

**Antirrhinum**, a genus of plants belonging to the Scrophulariaceae found in temperate climates. *A. majus* is the snapdragon, which is common in Great Britain; *A. orontium*, the lesser snapdragon, or calves' snout, is a native throughout Europe. Intermediate and dwarf varieties can be grown and of almost any colour excepting blue.

**Anti-Saloon League of America** was founded in 1893 in Ohio for the total suppression of the liquor traffic. By means of agitations, legislative measures, educational and publicity movements, it was the most important factor in the prohibition movement in U.S.A. With numerous branches throughout the states, its headquarters are at Westerville, Ohio, and Washington, D.C. This organisation was instrumental in amending the Amer. constitution and in bringing about prohibition. With the disappearance of prohibition again from the constitution, the influence of the league declined.

**Antisana**, a volcanic mt. in the Andes Mts. in Ecuador, S. America. It is about 19,260 ft. high, and was ascended by Edward Whymper in Mar. 1880. On its slope, about 12,400 ft. high, exists one of the highest inhabited places in the world.

**Antisail**, an old astronomical term (derived from the Gk. *anti*, against, and *sail*, shadow), signifying those who live on the same meridian, but on opposite sides of the equator, so that their shadows fall at noon in opposite directions. See **ANTIGOI**.

**Antiscorbutics**, remedies effective against scurvy. Under the Merchant Shipping Act, 1894, A. must be carried on Brit. ships. Lime juice is often used, hence the nickname 'limey' applied by foreigners to Eng. sailors. See **SCURVY**.

**Antisemites** was the name which was applied to those who were opposed to the Jews in the second half of the nineteenth century. The movement originated in Russia and in the Balkan peninsula and then spread into Austria, Hungary, Rumania, Germany, France, and Algeria, in which countries the Jews were to be found in large numbers. This hatred of the Jews, or Antisemitism, as it was called, was not the outcome of antipathy to their religion, but arose on account of the wealth and power which they were accumulating. In Russia and Hungary the movement assumed a terrible aspect, and riots and murder took place in 1882. In Germany and Austria Antisemitic parties arose, and a league was formed to restrict the liberties and political rights of the Jews. Thousands of Jews were compelled to flee. In 1894 the Dreyfus affair occurred in France. Capt. Dreyfus, a Jew, was falsely accused of treason and condemned, but was afterwards released.

Although Jews are now a world nation and are to be found in most countries, the intensity of Antisemitic feeling varies greatly. Russia, Hungary, Austria, and E. Europe generally, which have witnessed the most violent outbursts, were, until the late nineteenth century, the

centres where the strongest animosity was shown. In France and, before the Nazi regime, in Germany, Antisemitic actions conformed to the usages of the law, and, though exceedingly violent propaganda was common, the legal rights of Jews were upheld. In America and throughout the Brit. Empire Antisemitism is almost unknown excepting as one out of the many sentiments that sway a large number of persons. The intensity of anti-Jewish feeling is usually in inverse ratio to the ability of the people to compete with Jews in commerce and finance. In those lands where the people have little natural instinct for trade and banking, such wealth as there is flows to the Jews and the racial difficulty becomes critical; whereas in such places as the U.S.A. and Britain, where the native people develop business capacity, the Jew is accepted as a fellow-citizen. During the half century after about 1870, when France, Germany, and Italy were becoming increasingly commercial lands, the Jew found his way more generally into citizen life. In England an agrarian nation under the Edwards expelled the Jews, with whom they could not compete; but vigorous pioneers of world commerce during the seventeenth century permitted their return as having nothing to fear from them.

Antisemitic propaganda usually takes the form of rumour and exaggerated stories of secret abominable rites in illiterate countries and of book opinions or press leaders in the more educated. In France no fewer than 9 periodical papers called 'Anti-Juif' have been pub. at various times.

A terrible revival of Antisemitic feeling swept through Germany with the rise to power, in 1933, of the Nazi party under Hitler. Ger. Jews, irrespective of class or attainments, were maltreated and deprived of their livelihood, and many of world-wide celebrity sought refuge in other countries—especially England and the U.S.A. In this revival in Germany, Antisemitism took the form of a political movement owing its impulse to Hitler, who founded his 'Aryan paragraph' (see **ARYAN**) on the teaching of Gobineau, Houston Stewart Chamberlain, and others, and made it, in effect, the cardinal feature of his policy of founding a Third Reich, embracing only the pure Germanic or 'Nordic' peoples of W., Central and E. Europe. In conformity with this policy, the Jews were declared to be the enemy of the Ger. people and their persecution became a settled policy which was pursued again in 1938, when Germany annexed Austria, and in 1939 on the annexation of Czechoslovakia. In Russia the Communists would not allow Jews to continue as capitalists or 'unproductive elements,' but, for the rest, they gave them equal rights. It was in Poland and Rumania, with respectively 3,000,000 and 1,000,000 Jews, that the Jewish issue was most acute before the Second World War; and much more than in other countries, and even in Germany. Antisemitism was a popular

movement. This movement implied all manner of motives and mental attitudes: the jealousy felt by the Polish lower middle classes for their Jewish rivals and competitors; the Socialism of the ignorant, in which the Jews were blamed as a sinister capitalist power; the deeply ingrained clerical hatred of the Jew as 'Christ's enemy'; and, finally, the fear of all govts. of the spread of Communism among the great mass of impoverished Jewish artisans and outright paupers. The gentle working classes and the peasantry in those countries, however, remained, on the whole, unaffected by Antisemitic propaganda; but they also remained aloof from the Jews, and more or less indifferent to their fate. This indifference was accentuated by the separatism of the Jews, which was encouraged by the gentle ruling classes as well as by Jewish clerical obscurantism and Zionist nationalism. Their separate language, their anachronistic religious way of life, and their medieval mode of dress all helped to create virtual ghettos in Poland long before the Nazis built walls around them. The guilt of separatism was at least, in part, responsible for the passivity and apparent indifference with which the mass of Gentiles watched the wholesale slaughter of the Jews in the terrible concentration camps of Belsen, Buchenwald, Auschwitz, Dachau, and Maidanek. It is impossible to determine precisely how many Jews were slaughtered in these camps, but even the most conservative estimates put the total at not less than 4,000,000.

See A. Dushaw, *Anti-Semitism: the Voice of Folly and Fanaticism* (New York), 1943; A. Tartakower and K. R. Grossmann, *The Jewish Refugee* (New York), 1944; Max Gottschalk and Abraham G. Duker, *Jews in the Post-war World* (New York), 1945; James Parkes, *Antisemitism: an Enemy of the People*, 1945, and *The Emergence of the Jewish Problem*, 1946. See also AUSCHWITZ, BELSEN, 'MEIN KAMPF', etc.

**Antiseptics**, agents which prevent putrefaction by destroying or arresting the growth or development of the germs upon which putrefaction depends. The process must be distinguished from disinfection, which destroys the germs causing disease, though the 2 terms are often confused. The theory that putrefaction and fermentation are due to the presence of minute organisms owes much to the researches of Pasteur, and Lord Lister was the originator of the method of treating surgical wounds by substances known to destroy or arrest the growth of these organisms.

The bacteria of putrefaction are always present in ordinary air, but they require certain conditions of temp. and moisture to develop. Thus it is found that extreme heat or cold kills bacteria and prevents infection. If therefore substances like milk or meat are boiled and then kept in hermetically sealed vessels they may be kept fit for consumption for an indefinite period. On the other hand, putrescible substances kept at a low

temp. in refrigerators will remain unaffected, and advantage is taken of this fact in the transportation of meat from America, Australia, and New Zealand to this country. Absence of moisture is unfavourable to the growth of bacteria, so that the practice of drying fish, fruit, and meat is a method of preserving them. It should be observed, however, that food materials preserved in such a manner should be kept in a perfectly dry place, as they are liable to absorb moisture from the air, when putrefaction becomes possible. Jam owes its keeping qualities to the high sugar content, in which the osmotic pressure is too great to allow the activity of bacteria, though here also the entry of atmospheric water vapour should be guarded against.

Besides these methods of preventing infection, there are certain chemical substances which have the power of destroying the germs of putrefaction. Their uses include the preservation of food and the prevention of septic poisoning in wounds. It is necessary, of course, that an A. employed for preserving food should not be injurious or unpalatable to man, and that A. used for dressing wounds should not have an undue irritating effect upon the tissues. Salicylic acid is used for the preservation of food, but the use of boracic acid for this purpose is now illegal. It was, until recent years, much used to preserve milk, butter, meat, and fish. Salicylic acid is used to preserve beer, butter, fruit, and meat, but its employment is not completely innocuous, and therefore should be discouraged. The same criticism applies also to formalin, sometimes used for the preservation of cream.

Carbolic acid was for some time the chief A. used in surgery, but its place has to a great extent been taken by mercuric chloride (corrosive sublimate) and mercury binoiodide. Thymol, salicylic acid, phenyl salicylate, and boracic acid are also used as A., as well as alcohol, hydrogen peroxide, iodine, and proprietary derivatives of coal tar (e.g. dettol). For the dressing of wounds not made by the surgeon iodoform is often employed. It does not kill the bacteria directly, the action on the micro-organisms being subsequent to a decomposition resulting, under the influence of the heat of the body, from fermentation induced by matter exuded from the wound.

The influence of A. on the results of surgical practice has been enormous. Pyæmia, septicæmia, and gangrene are now much more uncommon than formerly, and it has been found possible to treat wounds without resorting to amputations where that course would be impossible without A. Compound fractures and extensive wounds of the limbs do not, therefore, commonly mean the loss of the limb affected. Operations, too, are performed which were formerly considered too dangerous, particularly in connection with abscesses and diseases of bones and joints. Owing to the damage caused by A. to the tissues, and consequent delay in healing, the A. method of

nursing has now largely given way to the aseptic technique, which aims at preventing, by strict cleanliness, the entry of germs into wounds.

**Anti-slavery.** A movement for the abolition of the slave trade was started in England by Thomas Clarkson about 1782, subsequently to Lord Mansfield's decision in the Somerset case that slaves could not exist in England. He was assisted by William Wilberforce, and in 1792 a motion in favour of gradual abolition passed the Commons. In 1805 the trade was forbidden with new colonies, and in 1807 the General Abolition Bill extended the prohibition to all Brit. possessions. The Emancipation Act of 1883 provided for the gradual abolition of slavery in the colonies.

In the U.S.A. emancipation was practically accomplished in the N. states by 1799, and there was a gradual growth everywhere of public feeling in favour of total abolition. A.-S. societies were founded in 1832 and 1833, and most Amer. writers, including Emerson, Bryant, Whittier, Lowell, Longfellow, and Mrs. Stowe, lent their influence in the same direction. The famous emancipatory edicts of Lincoln in 1862, 1863, and 1865 secured the success of the abolitionists. See further under SLAVERY AND THE SLAVE TRADE.

**Antispasmodics**, medicines intended to relieve spasms. The term is applied to (1) drugs which paralyse the motor centres or nerves, as anaesthetics, or which depress them, as bromides of potassium and ammonium; (2) drugs which produce a general depression of the vital functions, as tobacco, aconite, and sedatives generally; (3) drugs which relieve colic by stimulating the bowels, as asafoetida and castor; and (4) drugs which relieve spasm of the bronchial tubes, as stramonium and belladonna.

**Antispast**, a tetrasyllabic metrical foot, composed of an iambus and a trochee; the first and last syllables being short and the middle ones long, as in 'Clîstêm-nêstrâ'.

**Antisthenes** (444-365 B.C.), founder of the Cynic school of philosophy, b. at Athens. Studied rhetoric under Gorgias. Became a devoted pupil of Socrates, and walked daily from Piræus to Athens to hear him discourse. Founded a school of his own, where he attracted the poorer classes by the simplicity of his life and teaching. This was in the Cynosarges, a gymnasium for the use of Athenians born of foreign mothers; whence probably his followers acquired their name, Cynics. From this school subsequently sprang the Stoics.

**Antistrophe** (Gk. *ἀντί, against*, *στροφή, a turning*), part of an ode sung by the chorus on returning from left to right, having previously sung the strophe when moving from right to left. It is of Gk. origin.

**Anti-Taurus**, see TAURUS.

**Antithesis** (Gk. *ἀντί, against*, *θέσις, placing*), an opposition or contrast of ideas expressed by using words that are naturally opposed to one another.

**Antitoxin**, a term applied to substances elaborated by the body to counteract the toxins of bacteria. Their chemical composition is a matter of doubt, but they are known to be proteins. It is found that when the body is inoculated with small quantities of a toxin, increasing quantities of A. are generated to counteract the poison, so that the individual eventually acquires 'active' immunity; by chemical treatment the toxins can sometimes be converted into less harmful 'toxoids'; these are used for immunisation against diphtheria and tetanus. The serum treatment consists in inoculating an animal, such as a horse, with small quantities of toxin until it becomes immune, when the blood is withdrawn and freed from blood corpuscles; this constitutes the serum (containing A.), which may be regulated to any degree of potency and injected into the human blood system, providing 'passive' immunity. Active immunity protects an individual from a disease, whilst passive immunity is useful as a means of treatment, i.e. when the disease has already been acquired; both methods are employed in diphtheria and tetanus.

**Anti-trades.** Steady winds blowing in the upper air in a contrary direction to the trade winds blowing at the earth's surface. Thus in the N. hemisphere they blow from the S.W. and in the S. hemisphere from the N.W. Their direction has been demonstrated by the dispersion of matter ejected from volcanoes.

**Anti-Trinitarians**, see ARIUS, UNITARIANISM.

**Antitype** (Gk. *ἀντίτυπος*, of corresponding form) is the representation of that which was prophesied. Thus, in Scripture, the paschal lamb is the type, of which Christ is the A.

**Antium**, now Porto d'Anzio, was a very ant. tn. of Latium. It was founded by Tyrrhenians and Pelasgians, and was an important city of the Volsci. The people were given to piracy. It was taken by the Romans 468 B.C., revolted, and again taken by the Romans 338 B.C., who colonised it and took all its ships, the beaks of which (*rostra*) served to ornament the platform in the Rom. forum. It was the residence of many of the Rom. nobles and emperors in the latter times of the republic and under the empire. Nero, who was born there, built many fine buildings. See ANZIO, PORTO D'.

**Antivari**, a seaport on the Adriatic Sea, formerly belonging to Albania, but ceded to Montenegro by the treaty of Berlin, 1878. It is the seat of a Catholic archbishop, and contains a castle built by the Venetians, from whom it was taken in 1573. Pop. 2500.

**Anti-vivisection.** Agitation against vivisection, based on the contention that the practice is unnecessary and cruel, followed the publication of the experiments of various nineteenth-century continental investigators, particularly Majendie. It resulted in the appointment of a royal commission in England in 1876, and the practice was regulated by the Vivisection Act of that year.

Another commission sat from 1906 to 1908, and the report was pub. in 1912. Among the numerous societies founded for the total suppression of the practice are the London and Provincial A.-V. Society, which is the oldest, having been founded in 1876, and has a monthly official organ, the *Anti-Vivisection Journal*; the Brit. Union for the Abolition of Vivisection, with the largest membership in the world, under direct voluntary medical leadership, and which issues a monthly paper, the *Abolitionist*; the Animal Defence and A.-V. Society, the National A.-V. Society, and the Electoral and

Parl. A.-V. League which has been particularly active during election campaigns. A few hospitals denounce the practice, while many medical men, scientists, and clergymen of all denominations are members of the various societies and responsible for some of the propagandist literature issued by the societies. It is to be noted that at the public health exhibitions of films at Westminster, illustrating experiments in vivisection, and shown at lectures in medical schools, hospitals, and colleges, a certificate is required by statute to be given by specified scientific authorities to the effect that the 'knowledge so imparted is useful in saving human life and in alleviating human suffering.'

**Antlers**, the outgrowths of the frontal bone found in male deer. The A. is attached by a bony ring, the 'burr,' to a pedicle, which in turn is joined to the skull. During growth the antler is covered by a sensitive, hairy skin, known as 'velvet,' which dries up and is rubbed off when maturity is attained. The A. are shed annually, and the number and complexity of the branches increase year by year. They occur in various forms, in practically all kinds of deer, and are used for offensive purposes. The female reindeer is antlered as well as the male. A. with more than 12 points are seldom found in Great Britain, but heads of 60 points are in existence on the Continent. Shed A. are used commercially for handles of knives, umbrellas, etc.

**Antlia Pneumatica**, the 'Air-Pump,' a constellation in the S. hemisphere, named by Caccalle in 1752. It is bounded by Centaurus, Crater, Hydra, Pictis Nautica, and Argo. Sigma Antliae is a variable star with a period of 7 hrs. 47 min.

**Ant-lion**, the larva of the family Myrmeleonidae, of the order Neuroptera. The eggs are laid in loose sand, and when the larva has appeared it forms a conical pit, at the bottom of which it hides, and seizes upon any small insect, such as an ant, which may fall into it. By means of its legs it throws sand on its victim to hasten its fall, and by means of its mandibles, which communicate with the alimentary canal, it holds it firmly and absorbs its juices, then throws away the body. The mature insect has 4 wings. It is unknown in England, but is found in various parts of Europe and America.

**Antæci**, from the Gk., signifies 'those who live over against each other,' and is the name given to the inhab. of 2 places which have the same lat. and long., except that one place is N. of the equator and the other S. Those who live N. of the equator are A. to those who live S., and vice versa. Two antæcial places have the same hour of day or night, but opposite seasons of the year.

**Antofagasta**: 1. a tn. and port of N. Chile, cap. of Chilean prov. of the same name. Founded in 1870 as a shipping port for the silver mines in that dist. Belonged to Bolivia until 1879. Then occupied by Chilean military forces. The smelting works for silver mines are located here. Pop. 54,000. 2. A prov. between Tarapacá and Atacama. Rich in saline deposits. The silver mines of Caracoles are about 90 m. N.E. of the port of A. It produces for export silver, copper, lead, and salt. Chief tns. are Taltal, Cobija (the old cap.), and Tocopilla. The prov. belonged to Bolivia until 1879, and fell into Chilean possession in the war of 1879-82. It was ceded definitely to that republic in 1885. Area 46,621 sq. m. Pop. 145,000.

**Antoine de Bourbon**, duke of Vendôme, married, in 1548, Jeanne d'Albret, only child of Henry II., king of Navarre. Henry, prince of Béarn, afterwards Henry IV. of France, was the offspring of this marriage. A. assumed the title of king of Navarre in the right of his wife. A. de B. aspired to be at the head of the administration of France after the accession of the youthful King Francis II., but failed. When the civil and religious war broke out in 1562, the king of Navarre commanded the king's troops and received a wound at the siege of Rouen, of which he d. in November of the same year. See **BOURBON**; **HENRY IV.**

**Antokolsky, Marc** (1842-1902), Russian sculptor, b. at Vilna. In 1864 he was admitted as a special student to the Academy of Fine Arts, St. Petersburg, where he gained numerous medals. In 1871 the Emperor Alexander II. bought his statue of 'Ivan the Terrible.' A. finally settled in Paris. Among his best works are 'Peter the Great' (1872); 'Christ Bound before the People' (1874);

'The Death of Socrates' (1876); 'The Last Sign' (1878); 'Mephistopheles' (1881); 'Spinoza' (1882); 'Yermak' (1900); 'The Sleeping Beauty' (1900).

**Antommarchi, Francesco** (c. 1780-1838), Napoleon's physician at St. Helena, was a native of Corsica, and a surgeon and anatomist of considerable repute. He enjoyed the full confidence of the emperor, who left him a considerable sum of money. After serving as director of hospitals in the Polish revolution, he proceeded to the W. Indies, and d. in Cuba. He wrote *Les Derniers Moments de Napoléon* (1823).

**Anton, Robert** (fl. 1616), poetical writer. Author of a vol. of satires, *Philosophers' Satyrs*, the second ed. of which was named *Vices Anatomie Scourged and Corrected in New Satires*. Its chief interest lies in numerous references to Beaumont, Spenser, Jonson, Chapman, and Daniel.

**Antonelli, Giacomo** (1808-76), was the son of a wood-cutter of the lt. vil. of Souino. After a brilliant career in the Grand Seminary at Rome, Pope Gregory XVI. preferred him to various eccles. appointments. Pope Pius IX. made him a cardinal in 1847, and in 1848 president of the Liberal Cabinet which drew up the *Statuto* or Constitution. On the fall of the ministry he fled with the pope to Gaeta, but on their return (1850) again became the pope's chief minister. He amassed a large fortune.

**Antonello da Messina** (c. 1414-c. 1493), lt. painter, a native of Sicily, was a close follower of Flemish methods of painting, which he learnt from the Van Eycks and introduced into Italy. He acquired great renown in Venice as a portrait painter. His chief extant works are 'Salvator Mundi' and 'The Crucifixion', both in the National Gallery, London, the portrait of an unknown man (Berlin Museum), and portraits at Dresden, Rome, Venice, and in the Louvre.

**Antonia Major** was the elder daughter of M. Antonius and Octavia, according to Suetonius and Plutarch, but Tacitus (*Ann.* iv. 44; xii. 64) speaks of her as the younger daughter. She married L. Domitius Ahenobarbus, Heron, Cn. Domitius, married Agrippina, and was the father of the Emperor Nero; and her daughter, Domitia Lepida, was the mother of Messalina, afterwards married to the Emperor Claudius.

**Antonia Minor** (38 or 37 B.C.-A.D. 38) was the sister of A. Major, and the wife of Drusus Nero, the brother of the Emperor Tiberius. She had 3 children, Germanicus, Livia, and the Emperor Claudius; Germanicus had a son, Caligula, who reigned. She was noted for her beauty and her chastity.

**Antonina**, seaport of São Paulo, Brazil, on bay of Paranaguá. 13 m. N.W. of Paranaguá. Pop. 10,000.

**Antonine Column**, a lofty pillar which stands in the piazza Colonna at Rome. It was raised by the senate in commemoration of the victories of Marcus Aurelius Antoninus over the Marcomanni

and other Ger. tribes. The total height is 163½ ft., but the pedestal is disproportionate to the shaft. The capital is Doric, and the shaft is made of 28 blocks of white marble. A spiral staircase of 190 steps is cut through the interior of the marble, and leads to the gallery on the top, which is surrounded by a balustrade. The exterior of the shaft is covered with *bassi-relievi*, representing the victories of Marcus Aurelius.

W. F. Mansell

ANTONELLO DA MESSINA  
Self-portrait in the National Gallery, London.

**Antonini Itinerarium**, a register of the prin. roads and routes of the Rom. empire, probably the records of the survey of Julius Caesar. The book is divided into 2 parts, one of which deals with the road routes of Europe, Asia, and Africa, the other with the prin. sea routes. The distances are all given from Rome. The author is not known definitely, but if it was a Rom. emperor it was probably Antoninus Caracalla.

**Antoninus Liberalis** probably lived under the Antonines. He is the author of a work in Gk., entitled a *Collection of Metamorphoses*. This collection is borrowed from a variety of authors, and is valuable as containing many passages of poets who are now lost. The best ed is that of H. Verheyk, Leyden, 1774.

**Antoninus Pius** (A.D. 86-161), son of a Rom. of consular rank. Adopted by the Emperor Hadrian in 138, he succeeded him in the same year. His elevation to the imperial purple was very popular, and he almost immediately adopted a policy of reform and retrenchment. He was a patron of science, a protector of the Christians, and a sincere worker for the good of his people. He

was responsible for the building of the wall of A. from the Clyde to the Forth.

**Antoninus, The Wall of.** This was an earthen rampart and ditch, built to strengthen the line of fortifications already laid down by Agricola. The mound (*vallum*) ran from Bridgess on the Forth to W. Kilpatrick on the Clyde, a distance of about 37 Eng. m. The width of the mound and ditch seems to have been about 25 yds.; its depth from the top of the mound to the bottom of the ditch has been variously estimated at between 40 ft. and 20 ft. It had in it at least 19 well-appointed stations, with small watch-towers in between. A military road ran at the back of the *vallum*. The object of the wall was to keep back the inroads of the barbarians, but the Rom. power was not so strong between the S. and N. walls as it was in the ter. to the S. The great disadvantage of such a wall seems to have been that it required almost one-fifth of the whole of the garrison of Rom. Britain to guard it.

**Antonio de Lebrija (1444-1522),** Sp. writer, b. in Lebrija, Andalusia. For 20 years he taught belles-letters at the univ. of Salamanca and then at Alcalá, to which latter place Cardinal Ximenes had appointed him. He is especially remembered as one of the most valued collaborators on the Complutensian polyglot Bible, an enterprise under the auspices of the above-named cardinal. He wrote numerous works on languages, mathematics, theology, etc. When he d. he was engaged on a hist. of Spain which has never been completed.

**Antonio, Nicolás or Nicolao (1617-84),** a Sp. writer, b. at Seville. His most important work is *Bibliotheca Hispana*, an account of Sp. writers from 1500 to 1664 (Rome, 1672, 2 vols. folio, and Madrid, 1783, 2 vols. folio). For Sp. literature there is certainly neither a better nor a safer guide.

**Antonio of Padua (1195-1231),** a devoted follower of St. Francis of Assisi, was b. at Lisbon. In 1220 he entered the order of the Franciscans. He desired to devote himself to missionary labours, but being wrecked on the coast of Sicily he wandered through Italy, gaining a great reputation as a preacher. To him are attributed many miracles and works of wonder. He d. in 1231, and in the following year was canonised by Gregory IX. Festival, June 13.

**Antonio, Prior of Carto (1531-95),** was the natural son of Louis, younger son of Emmanuel, king of Portugal. On his return from captivity in Morocco he claimed the throne of Portugal on the death of Cardinal Henry. He was opposed by Philip II. of Spain, who had a much better claim, as had also the Duchess of Braganza. Being supported only by the peasantry, he was easily defeated, and fled to France and later to England, by both of which countries he was supported out of hostility to Spain. Expeditions fitted out by Fr. and Eng. alike failed, and he d. a disappointed claimant.

**Antonius, Gaius (d. 44 B.C.),** surnamed

**Hybrida**, son of the Orator, was the colleague of Cicero in his consulship (63 B.C.). Under the orders of the Senate he had to conduct the war against Catiline, but on the day of the battle he was prevented by illness, real or feigned, from appearing on the field, and the command devolved upon his lieutenant, Petreius. In 61 B.C. he had, as proconsul, the prov. of Macedonia. A. gave out that Cicero had stipulated for the payment of a large sum of money, in return for Cicero's aid in getting him the prov., a charge which Cicero's ambiguous language and conduct seem not to discountenance. A. was guilty of great extortion, and at the end of the first year Pompeius threatened a motion in the senate for his recall. Cicero, who avows in his private letters that he could not defend A. without injury to his own character, nevertheless exerted his eloquence most powerfully and successfully in his defence. Accordingly A. held the prov. for a second year; but on his return (59 B.C.) he was brought to trial on a charge of extortion and of carrying on war out of his prov. without the authority of the state. Though again defended by Cicero, he was found guilty, and condemned to perpetual exile. He returned to Rome 47 B.C., and probably d. 44 B.C.

**Antonius, Marcus, the Orator (142-87 B.C.),** the son of C. A. In 99 B.C. he was the colleague of A. Postumius Albinus in the consulship; and in the following year he defended M. Aquilius on a charge of extortion during the Servile war in Sicily. In 97 he was censor. He fell a victim to the fury of Marius and Cinna, when they took forcible possession of Rome (Plutarch, *Marius*, xlv.). His eloquence is celebrated by Cicero in his *Brutus*, xxxvii., xxxviii.

**Antonius, Marcus (d. 69 B.C.),** eldest son of the Orator, and father of the triumvir. He was entrusted with the duty of protecting all the coasts of the Mediterranean against the pirates. Crete was the chief scene of his operations, and though his partial successes gained him the honorary title of Creticus, the outrages and extortion of which he was guilty led at last to an insurrection in which he lost his life.

**Antonius, Marcus (Mark Antony) (83-30 B.C.),** the Triumvir, grandson of A. the Orator, and son of A. Creticus, was b. of a patrician family, and was related to Julius Caesar on his mother's side. His youth was spent in profligacy. In 58 B.C. he fled to Greece in order to escape his creditors, and in Athens he spent some time in listening to the teachings of the Gk. philosophers. Summoned to the campaign against Aristobulus in Palestine, and taking part later in a campaign in Egypt, he distinguished himself by his bravery and activity. In 54 he was with Caesar in Gaul, and through his influence he became quaestor, augur, and tribune of the plebs. When the civil war broke out he was one of the warmest supporters of Caesar, and was expelled the senate house. He was deputy governor of Italy during Caesar's absence in

Spain, and later also during his absence in Africa, whilst he was second in command at the famous battle of Pharsalia. During his period of office A. seems to have conducted himself with little tact or morality. He divorced his wife, being enamoured of the actress Cytheris, and drank to excess. He quarrelled with Cæsar when he returned, but a speedy reconciliation followed. In 44 B.C. he was consul with Cæsar and supported the offer of the crown to Cæsar. After the assassination of Cæsar he so played on the passions of the Rom. mob by publishing Cæsar's will and by his eloquent oration, that the conspirators were forced to flee from Rome, and A. was left to attempt to carry out his ambition of becoming dictator himself. In Oct. 44 he set out to attack D. Junius Brutus, who had refused to surrender the prov. of Cisalpine Gaul, which he had received from the senate, to him.

By this time, however, Octavian, Cæsar's heir, had returned, and to him flocked the soldiers of the dead Cæsar. A. was declared a public enemy and Octavian commanded the operations against him. He was defeated at Mutina. Octavian now forced the senate to give him the consulship, but meanwhile A. had escaped and had joined Lepidus. He marched towards Rome with large forces, but terms were arranged between himself, Octavian, and Lepidus wherein it was agreed that they should declare themselves triumvirs and share the whole Rom. world. Gaul was to go to A., Spain to Lepidus, and Africa, Sardinia, and Sicily to Octavian. A huge proscription followed, in which Cicero perished a victim of the revenge of A. In 42, by the 2 battles of Philippi, the republican parties were annihilated. In the following year A. was captivated by the charms of Cleopatra and remained in her company during the winter at Alexandria. A short outbreak of war between his wife Fulvia and Octavian recalled him, but on the death of Fulvia a reconciliation of the triumvirs took place, and he married his colleague's sister, Octavia. A fresh div. of the empire was made, Lepidus getting Africa, Octavian the W., and A. the E. In 39 he visited Athens; in 37 he renewed the agreement with Octavian, and then returned to Syria, where he was still under the spell of Cleopatra. In 32 he was deprived of his power, and war was declared against Cleopatra. In 31 he suffered defeat at Actium and fled to Egypt, where, deserted by his troops and pursued by the enemy, he committed suicide.

**Antonius Musa**, *see* MUSA.

**Antonomasia**, in rhetoric, the substitute of a descriptive epithet for a proper name, or *vice versa*, as when Shakespeare is called 'the swan of Avon,' or an orator 'a Cicero.'

**Antony, Saint** (A.D. 251-356), called the Great, was b. at Koma in Upper Egypt, and was the first institutor of monastic life. He distributed his property amongst his neighbours and the poor, and retired to a wilderness near his native vil. He

afterwards went further into the desert, where he lived in solitude until 305, when he founded his first monastery in the Fayum, near Aphroditopolis. Seven of his letters, written originally in Coptic, but trans. into Lat., are extant in the *Bibliotheca Patrum*. In 1089, cures of the distemper called the 'sacred fire' were believed to have been wrought by his intercession. From that time it was called St. A.'s fire, and in modern days erysipelas.

**Antony of Padua**, *see* ANTONIO OF PADUA.

**Antrim**, maritime co. of N. Ireland. The formation in the N. and E. is hilly, the interior sloping in the direction of Lough Neagh. The prin. elevations are Trostan, 1810 ft., and Slemish, 1782 ft. The prin. streams are the Bann, the Main, and the Bush. The coastline is distinguished by its basaltic rock formation, the Giant's Causeway being one of the finest specimens of columnar basaltic rock. Peat bogs are frequent in the interior. Salt, iron, and limestone are extensively worked, and there are coal-fields near Ballycastle. A. is the centre of the Irish linen manuf. The other staple industries are agriculture (hax, oats, and cereals), and the manuf. of cotton and wool. It has important coast fisheries. The co. returns 7 members to the Parliament of N. Ireland and 2 to that of Great Britain and Ireland. The predominant form of religion is Presbyterianism, an effect of the Scottish colonisation. Catholics are also numerous. Pop. (1937) exclusive of co. bor. of Belfast, 197,000. Pop. of tn. 5000. Area 1090 sq. m., of which about one-third is under cultivation. The co. tn. of A., 14 m. N.W. of Belfast, has linen and paper industries.

**Antrim, Randal Macdonnell**, first Marquess of, and Earl of Dunluce (1609-83), Catholic nobleman. Introduced to court, 1634; created a marquess, 1643, on account of his promise to raise an army of 10,000 in Ireland for the service of Charles I. In this he was unsuccessful, but in 1644 sent 1600 men to the aid of Montrose in Scotland.

**Antrum of Highmore**, in anatomy, a term applied to the maxillary sinuses; a cavity in the body of the upper jaw-bone, forming an accessory air cavity to the cavities of the nose (*q.v.*). The roof forms the floor of the orbital cavity.

**Antseranana**, or **Antsirano**, seaport on N. coast of Madagascar, on Diego-Suarez Bay. Founded in 1855. The chief Fr. naval centre in the Indian Ocean and of great military importance. Pop. 18,000.

**Antung**, one of the chief ports of Manchuria, near the mouth of the Yalu R. It is a junction of the railway from Mukden and the Korean railway. Pop. 165,000.

**Antunnacum**, *see* ANDERNACH.

**Antwerp**: 1. prov. of Belgium, 1104 sq. m., pop. 1,267,000 at the end of 1946. 2. cap. of this prov. on the Scheldt R., 55 m. from the sea and 27 m. N. of Brussels. Chief seaport and commercial centre of Belgium. Excluding the suburbs, the area is 33.4 sq. m. and the pop.

260,000; including the suburbs (Berchem, Borgerhout, Durne, Ekeren, Hoboken, Merksem, Mortsel, and Wilryk) the area is 64.4 sq. m. and the pop. 550,000. The completion of the new docks has brought up the total quayside length to about 150,000 ft., making A. one of the largest ports in the world. In 1938 about 12,000 vessels of a combined tonnage of 24 million (quarter Brit.) entered the port. In 1946 the number of vessels was 5300 and the tonnage 11½ million; in the first half of 1947, 3600 vessels with a tonnage of 8.8 million. The chief of its many manufs. are sugar, beer, spirits, soap, candles, tobacco, cigars, chocolate, biscuits, sewing-silk, chemicals, furniture, and textiles. It is also extensively engaged in the industries of shipbuilding, diamond-cutting, petroleum-refining, tanning, etc. Surrounded by two circles of fortifications, A. was considered before the First World War to be one of the most strongly fortified places in Europe. The city is exceptionally rich in treasures of architecture and painting. Amongst the most notable of these are the superb Gothic cathedral (1352-1543) with its 6 aisles, its famous chimes, and Rubens's masterpieces 'The Descent from the Cross' and 'The Elevation of the Cross'; the church of St. James (1491-1624) containing the tomb of Rubens and a beautiful altar-piece by the master; the Museum Plantin-Moretus, residence and workshop of this famous printer's family since 1520; Rubens House (reconstructed recently); the old castle Steen (tenth century) and the Butchers' Hall (sixteenth century), now historical museums; the hôtel de ville (1565) and the Exchange. The Royal Gallery of Fine Arts contains a fine collection of masterpieces of all ages and schools, comprising numerous pictures by Van Eyck, Memlinc, Maessys, Rubens, Van Dyck, Jordaens, and many other Flemish painters. A. has had a varied and eventful hist. It appears to have been founded by a Frankish tribe some time before the eighth century. In the beginning of the ninth century A. was destroyed by the Northmen. The foundations of the Steen castle date from the period A. was rebuilt in the tenth century. From the eleventh century its importance increased steadily, but its commercial traffic was confined to local needs until the fifteenth century, when, with the decline of Bruges, began the modern prosperity of A. In the sixteenth century it was the most prosperous city of N. Europe. It lost this position in 1576 when 8000 of its inhab. are said to have been butchered during the Sp. invasion. The city was captured in 1585 by Alexandro Farnese, duke of Parma. In 1648 the Scheldt was closed by the treaty of Westphalia. The city fell into the hands of the Fr. in 1794. Napoleon visited it in 1803 and took a great interest in its potentialities. He wished to make it a strong commercial and military centre, with special reference to its possible use against England. He ordered the construction of the 2 first docks and of new shipbuilding yards.

From 1815 to 1830 as part of the kingdom of the Netherlands, A. received a new impetus from the trade with the Dutch colonies. During the 1830 revolution A. was stoutly defended by the Dutch general Chassé, but surrendered to the Fr. in 1832, and was finally ceded to the Belgians, whose possession was confirmed by the treaty of 1839. In 1863 Belgium paid 36 million francs to obtain from the Netherlands the freedom of traffic on the Scheldt. From that time it steadily advanced in prosperity to its flourishing condition prior to the Second World War.

*Siege of Antwerp (1914).*—The siege and defence of A. in the First World War occupied the period Sept. 28–Oct. 9. While Liège was still holding out, King Albert on Aug. 12 decided to retire on A., so as to be in a position to attack the flank of the enemy advancing through the S. of Belgium into the N. of Fr. Two sorties from A. were made on Aug. 25–26 and Sept. 9–13, delaying successfully the Ger. reinforcements for the battle on the Marne. On Sept. 28 the Gers. launched their attack against the A. stronghold by a direct advance on the Scheldt from the S. and S.E., the quarter in which the outer defence works of A. extended 9 m. along the crescent formed by the riv. and its tribs. In a few days, one by one, the main forts were put out of action. The fort of Walem fell after being heavily shelled on Oct. 2. The garrison took up a new position behind the Nethe R. Next day (Oct. 3) a Brit. marine brigade 2200 strong and 2 Brit. naval brigades with 6 heavy guns arrived, and the hopes of the garrison ran high. Whether the Brit. force was sent in the hope of relieving the tn. or merely as an isolated incident, or to co-operate in saving the situation in S. Flanders by holding the enemy on the Scheldt, is doubtful, but relief was probably the true if vain purpose. Repeated enemy attempts to cross the riv. were repulsed between Oct. 3 and 5 with heavy loss, but on Oct. 6 the Belgian line was pierced. The whole Belgian force and the Brit. marines then fell back within the inner forts to make a final stand. The successful withdrawal of the army began in the same night, the great oil-tanks of the port having previously been destroyed to prevent capture. About 200,000 inhab. crossed the Dutch frontier. Three battalions of the 1st Brit. Naval Brigade were also compelled, though not having received the order to retire, to enter Holland and so were interned. The tn. was formally surrendered on Oct. 10. The ensuing retreat was a repetition on a minor scale of the epic retreat from Mons. As a result of the fall of A. Ostend and Zeebrugge were evacuated and the Belgians took up fresh positions on the Yser. *Consult* Field-Marshal Earl Ypres, 1914; *The British Official History of the War*. A. in the Second World War.—On May 17, 1940, the last of the Belgian troops left the city, making the Scheldt tunnels useless for the enemy, who entered A. on the following day. The Gers. remained in occupation until 1944, when it was liberated by the Brit. advance. The

11th Brit. Armoured Div. entered the city after a daring drive northwards of 110 m. in 8 days. Helped by the underground army's action in saving a bridge over the Ruppel at Boom (10 m. S. of A.), the first tanks arrived at A. unexpectedly on Sept. 4. There was no Ger. resistance in the city of any account, nor were the port installations blown up. The undamaged, well-equipped port was a valuable weapon in the hands of the Allies. The Gers. offered some resistance just N. of A. on the Albert Canal until Oct. 4. From Oct. 13 until the end of March 1945 the city was subjected to incessant flying-bomb and rocket attacks, causing much loss of life and damage; but this did not interfere with the working of the port and the moving of military supplies, which began to reach A. on Nov. 28 after the complete liberation of Walcheren at the mouth of the Scheldt.

The Albert Canal, linking Liège with A., was completed in 1939. It figured prominently in the fighting for the relief of the Low Countries in 1944.

**Anu**, chief of the Babylonian gods, head of the great divine triad, the other two being Enlil and Ea: the father of the gods and the ruler of destiny. The name is found on the earliest known inscriptions in Babylonian remains. His priu. temple was at Uruk. Later he gave place to the Assyrian god, Ashur.

**Anubis**, in Egyptian mythology the son of Osiris and Isis, a subordinate deity of the third order, represented as having the head of a dog or jackal. On Rom. monuments he is identified with Hermes, and he was worshipped by the Roms. as Mercury.

**Anupshahr**, tn., United Provs., India, on the Ganges, 73 m. S.E. of Delhi. Pop. 9000.

**Anura**, an order of tailless amphibia, including frogs and toads. They have been subdivided by Cope into 3 classes: 1. *Aglossa*, i.e. the African and tropical Amer. toads and fossil forms; 2. *Firmisternia*, i.e. frogs; 3. *Arctifera*, i.e. toads.

**Anuradhapura**, or **Anuradha**, tn., Ceylon, 80 m. N. of Kandy. From the fifth century B.C. to the eighth century A.D. it was the cap. of the is. It possesses the famous bo-tree, which is supposed to have sprung from the tree under which Gautama was transformed into Buddha. Pop. 7500.

**Anus**, the external termination of the rectum, or opening of the lower end of the alimentary tract. The aperture is closed, except during the act of defecation, by the external and internal sphincter muscles. A congenital closure of the rectum by an imperforate A. is sometimes met with in infants, but can usually be remedied by a simple surgical operation. Other affections of the part are spasm of the sphincter muscle, ulceration or fissure of the A., a pruritus ani, characterised by intense irritation. The usual treatment consists of strict attention to cleanliness and the use of suitable ointments.

**Anville**, Jean Baptiste Bourguignon d' (1697-1782), Fr. map-maker and geographer, was b. in Paris and became

geographer to the king. His maps and studies in anct. geography are still used. His chief publications are the *Atlas général*, 1737-80, and the *Atlas Antiquus Major*, with its 3 vols. of *Geographie ancienne*, 1769.

**Anwari** (fl. twelfth century A.D.), Persian poet, author of lyrical and satirical pieces collected under the title of the *Diwan*. He was a favourite of the sultan Sandjar, whom he followed in his expeditions. He was also an astrologer of some repute.

**Anweiler**, or **Annweiler**, a canton and tn. in the Bavarian Palatinate, Germany. The tn. is situated on the Queich near Landau, has a pop. of 4500, and before 1939 had manufs. of paper and leather. In the neighbourhood are the ruins of the castle of Trifels, where Richard Cœur-de-Lion was imprisoned in 1193.

**Anxur**, a thriving tn. of the Volsci, long before the Rom. Conquest, situated in Latium. It was taken by the Roms. 403 B.C. (Livy, iv. 59), retaken by the Volscians, 399 B.C. (Livy, v. 8), and again taken by the Roms. 396 B.C. (Livy, v. 13). It afterwards became a Rom. colony (Livy, viii. 21), under the name of Tarracina, or Terracina (q.v.).

**Anytus**, a wealthy leader of the Athenian democrats, and son of Anthemion. With Thrasylbulus he helped to overthrow the Thirty Tyrants. He was the most powerful of the accusers of Socrates (399 B.C.), and the Athenians, on repenting of the latter's death, sent A. into exile.

**Anzac**, the Australian and New Zealand Army Corps which served in the First World War, the word being formed of the initial letters of the corps. The 'Anzacs' most conspicuous service was rendered in the ill-fated Gallipoli campaign of 1915. The Corps effected a heroic landing under intense difficulties, at Gaba Tepe, later named Anzac Cove in memory of the exploit (Apr. 25, 1915, 'Anzac Day'). (See also GALLIPOLI CAMPAIGN.) After the evacuation they fought in Macedonia, on the Salonika front, in Egypt, and in France. In Egypt, a number of A. formed the force which, under Sir Charles Dobell, attacked the Turks at Gaza (1917). In France they fought with characteristic dash in the Somme battle, 1916, notably at Pozieres.

**Anzengruber**, Ludwig (1839-89), Austrian dramatist and novelist. B. in Vienna and became an actor at 19. His best work, mainly dealing with peasant life, was produced after 1867, after he had returned to clerical work in Vienna. *Pfarrer von Hirschfeld*, an anti-clerical play, made him famous in 1870, and was followed by *Meineidbauer*, 1871; *Kreuzschreiber*, 1872; *Die Tochter des Wuchers*, 1874; *Gewissenswurm*, 1874; *Hand und Herz*, 1875; *Der Schandfleck*, 1876; *Das vierle Gibot*, 1878; *Ein Faustschlag*, 1878; *Aus'm gewohnten Gleis*, 1880; *Der Sternsteinhof*, 1880; *Mahl und Stein*, 1889. He collected works were first pub. in 1880, and a biography by Bettelheim in the same year.

**Anzin**, tn., France, on the Scheldt, 1 m. from Valenciennes, in the dept. of Nord. It is the largest coal-mining centre in the country, and has extensive manufs. of machinery and metal industries. Pop. 14,800.

**Anzio**, Porto d' (anc. Antium, q.v.), seaport of Italy, 30 m. S.E. of Rome. It was a fishing tn. and a bathing resort of the Romans. Nero and Caligula were b. here. The modern tn. dates from the restoration of the harbour in 1698. Pop. 7700. The A. and Nettuno beachhead formed an important subsidiary front in the Allies' campaign against the Gers. in Italy in the Second World War. An apparent deadlock on the Ger. defensive line between the Apennines and the sea was resolved by the surprise landing of a strong detachment of the Fifth Army behind the Gers.' flank at A. and Nettuno (Jan. 22, 1944). The bridgehead thus estab., at the extreme range of allied support by fighter aircraft was heavily counter-attacked and the defenders passed through a precarious phase, but held out until, on May 18, other allied troops stormed Monte Cassino (see CASSINO, BATTLE OF), and burst through the Gustav line to effect a junction with them.

**Aomori**, see AWOMORI.

**Aonia**, tn. of United Provs., India, 21 m. S.W. of Bareilly. It contains the tomb of the Rohilla chief, Ali Mohammed, who d. in 1751. Pop. 14,000.

**Aorist** (Gk. *ἀόριστος*, indefinite), the Gk. tense used to express indefinite past time. It corresponds to the Eng. past tense, 'died,' 'went,' 'did,' and is specially suitable for the narrative style. The distinction between first and second A. was not observed in practice.

**Aorta**, the large blood-vessel leading from the left ventricle of the heart and sending arterial blood to all parts of the body. It ends by bifurcating into the common iliacs at the fourth lumbar vertebra.

**Aosta**, cathedral tn., N. Italy, in the prov. of Turin, 50 m. N. of Turin. Its anc. name Augusta Prætoria was derived from the colony founded there by Augustus in 25 B.C. The tn. possesses many relics of the Rom. settlement, amongst them the triumphal arch of Augustus, the prætorian gate, and the remains of an amphitheatre, while the present walls are very largely those built by the Romans. The cathedral dates from very early times. It was reconstructed in the 11th and much altered in later centuries. A. is notable as the bp. of Anselm, archbishop of Canterbury, and the scene of some of the labours of St. Bernard, who was archdeacon. The tn., though beautifully situated in a rich fruit-growing dist., is not altogether prepossessing in appearance, being cheerless and of irregular formation. The Val d'A., the delightful valley between the Pennine and Graian Alps, produces abundance of fruit and cattle, and has extensive mineral deposits.

**Aoudad**, a species of sheep with certain affinities to the goat. Red-brown in colour, with long hair hanging down from

the front of the neck and the base of the fore-legs. Has powerful horns and is fierce in character. Found in Abyssinia and the Barbary states.

**Apaches**, formerly a fierce and predatory tribe of N. Amer. Indians, inhabiting parts of N. Mexico, Arizona, and Texas. At one time very numerous, they have been largely exterminated, the survivors, numbering a few thousand, now being confined in the reservations set aside for them by the U.S. Gov. The name *apache* has more recently been applied to that peculiar criminal type, the Paris hoodigan.

**Apafi**: 1. Michael I., prince of Transylvania (1632-90). Chosen prince in 1661 and remained faithful to the Porte, under whose protection he reigned till after the siege of Vienna in 1683. In 1687 he obtained a declaration of Transylvanian independence under Austrian protection by a treaty with the Emperor Leopold I. 2. Michael II., son of the above (1677-1713). Succeeded to a war with the Turks, who were supporting Count Tököly's claim to the Transylvanian throne. A., with the aid of Austria, was victorious. In 1699 Transylvania was incorporated with Hungary.

**Apalachicola**: 1. A riv. of Georgia, U.S.A. The A. has 2 main branches, the Chatahoochee and the Flint, which rise in Georgia and meet at the extreme S.W. of the state, and that part which then flows through Florida into the gulf of Mexico is called the A.: length 70 m. 2. A city and port of Franklin co., Florida, U.S.A., on riv. and bay of same name. Noted for oyster, tarpon, and other fisheries. There is a monument to Gorrle, the physician, who discovered the cold-air process of refrigeration. Pop. (1925) 3000.

**Apanage**, see APPANAGE.

**Aparri**, port of Cagayan prov., Luzon, Philippines, on estuary of Cagayan R. The only serviceable harbour on the N. coast of the is. Pop. 21,000.

**Apathy**. The Gk. doctrine of A.—unruffled tranquillity of mind as a virtue—is generally associated with the Stoic school of philosophy. Yet it is really much earlier and there are clear indications of it in the Cynic school. Democritus describes human happiness in the same way as A. is described by later philosophers. This idea is in accordance with the general feeling of the Hellenistic period, which was always ready to recognize the happiness of the individual as existing in a kind of quietism. But this extreme view found opponents in Plato and others. Plato always deliberately opposed A. and later philosophers are strongly influenced by the more moderate attitude. In the eyes of the Neo-Platonists—especially Philo—A. appears as the highest stage of virtue. Modern psychologists describe A. as visceral anaesthesia. James argues that emotional A. keeps pace with sensory anaesthesia, assuming that a subject absolutely anaesthetic could experience no emotion. This—the James-Lange theory of emotion—is, however, opposed

by others. See e.g. Jas. Ward, *Psychological Principles*, 1920.

**Apatin**, a tn., Hungary, on the Danube, 49 m. S.W. of Szabadka and 125 m. S. of Budapest. Has a considerable trade in silk, hemp, and madder, and manufs. woollen cloth. Pop. 14,000.

**Apatite**, a mineral, very widely distributed, which consists mainly of phosphates of calcium. Most varieties correspond to the formula  $3\text{Ca}_3(\text{PO}_4)_2 + \text{CaF}_2$  or  $\text{Ca}_3(\text{PO}_4)_2 + \text{Ca}_3(\text{PO}_4)_2\text{F}$ , but sometimes the fluorine is replaced by chlorine. It crystallises in a hexagonal form, and crystals are sometimes found over a foot in length. When found in large masses, as in Norway and Canada, it is mined for the extraction of phosphates. It is always a constituent of gneiss, granite, and diabase, usually in minute crystals, and probably the phosphates in the soil are due to A. from the disintegration of such rocks.

**Ape**, a term used to denote (1) the anthropoid Aas. (*q.v.*), the short-tailed or tailless Aas. and monkeys (*q.v.*) and baboons generally; (2) more specifically, the most man-like forms, such as the chimpanzee, the orang, the gorilla, and the gibbons.

**Apeldoorn**, tn., Netherlands, prov. of Gelderland, 17 m. N. of Arnhem. Manufs. paper extensively, also blankets and woollen cloth. In the neighbourhood is Castle Loo, the royal hunting-lodge. Pop. (1939) 70,000.

**Apella**, the Spartan assembly of free-men. It was composed of all citizens of 30 years of age and over. It was convened once a month between the bridge of Babyca and the Cnacion, the ravine of the Cenus. As the anct. Homeric Agora had only been able to shout its assent or dissent, so the A., though assigned a real part in the constitution, could only vote by acclamation. Before the A. were laid the subjects approved by the Gerousia (the council of elders). Declarations of war, treaties of alliance, depositions of kings, etc., were within its cognisance. No one could speak in it without the invitation of the president—a feature also to be found in the Rom. Comitia. In historic times the ephors presided, but in Lyscurgus's day the kings and elders convened the meeting.

**Apelles**, a Gk. painter of the fourth century B.C. He was b. at Colophon in Ionia, and studied at Sicyon, near Corinth. Becoming a favourite at the court of Philip of Macedon, he was appointed by Alexander to be his portrait painter. As none of his works now remains, it is impossible to judge them other than by reputation, but A. seems to have been particularly skilful in drawing, composition, and simple but graceful colouring. Among his greatest pictures were 'Alexander wielding a Thunderbolt,' the 'High Priest's Procession at Ephesus,' and 'Aphrodite Anadyomene.' His idealism must have been remarkable, and he was renowned for his skill in technique.

**Apellicon** lived in the first century B.C., and was, according to Strabo, a

native of Teos, but he was admitted as a citizen of Athens. He was a Peripatetic philosopher, and a great collector of books. He purchased the library of Aristotle containing the MSS. of that philosopher and of his pupil Theophrastus; but his library was taken to Rome by Sulla when Athens was conquered 86 B.C.

**Apennines** (Lat. *Apenninus*), a long mt. range, often called the 'backbone of Italy.' Starting from the Maritime Alps, the A. run down the whole length of the peninsula, and are continued through Sicily, beyond which a line of submarine elevations connects them with the mts. of N. Africa. Their name is probably derived from the same root *pen* which is found so frequently in Celtic lands (as in Penmaenmawr). Though spoken of by early writers as a single range, the A. are now generally classed as N., Central, and S. The N. div. includes the Ligurian, Tuscan, and Umbrian ranges, of which the first runs round the gulf of Genoa, from the Maritime Alps to the valley of the Magra, near Spezia. Its highest point is Monte Bue, 5915 ft. Between the Maritime and Ligurian mts., and the sea lies the narrow strip of coast known as the Riviera, while on the N. they sent off many tribs. to the Po. The Tuscan A., reaching across the peninsula to the sources of the Tiber, are slightly higher than the Ligurian, Monte Cimone rising 7103 ft. A spur on the W., called the Alpi Apuane, supplies very fine marble, at Carrara. The chief rvs. of the Tuscan range are the Arno on the S., and the Panaro, Secchio, and Reno on the N. The N. end of the Umbrian range gives rise to 2 rvs. famous in hist., the Tiber and the Metaurus, which rise within a few m. of each other, but flow into different seas. The S. extremity of the range is not easy to define, as it becomes complicated with the great mass of the Central A. These, the loftiest in the peninsula, are broken up into sev. chains, of which the Gran Sasso has Monte Corno, 9580 ft., and Monte Amaro, 9170 ft., while the Sibillini and others have sev. peaks of 7000 and 8000 ft. The S. A. are very irregular, their chief ranges being the Matese (with Monte Miletto, 6725 ft.), the Lucanian (Monte Pollino, 7325 ft.), and the Calabrian. In these last, as in the Apuan dist., granite, gneiss, and other anct. rocks are predominant; elsewhere the whole system is mainly of Triassic and later formations, a great part being limestone. The A. are not metalliferous, but furnish valuable stone. On the W. there are many traces of volcanic agency, but the only craters now active are those of Vesuvius, Etna, and Stromboli. The highest peaks of the A. are covered with snow during great part of the year, but there are no glaciers. In former times there were large forests of pine, oak, chestnut, and beech, containing many wild animals, but much of the timber has been felled, and only wolves are now troublesome, though a few bears still remain. Much more dangerous were the brigands who flourished,

especially in S. Italy, down to very recent times.

**Apennines** (Lunar), an extensive mt. range similar in some respects to terrestrial features and visible to the naked eye when projecting into the dark part of the disk. It is 460 m. long and the highest summit, Huykhens, is 18,000 ft. high.

**Apennade**, a Dan. seaport and watering-place in Slesvig, on an inlet of the Little Belt; has a good harbour and considerable transport trade, beside fishing, shipbuilding, and other industries.

**Aperients**, medicines which stimulate the natural action of the bowels. Sometimes the term is applied only to those milder purgatives which only slightly quicken the movement of the bowels. In the wider sense they may be divided as follows: (1) laxatives, which have a gentle stimulating influence on the bowel muscles, as figs, prunes, olive oil, etc.; (2) purgatives, which increase the movements of the intestines, and mildly stimulate the glands, as castor oil, aloes, etc.; (3) drastics, which act more intensely, increase the intestinal fluid, and cause painful fluid motions, as jalap, podophyllin, and large doses of purgatives; (4) hydragogues, which cause free secretion from the intestinal glands, remove much serum from the blood-vessels, and cause watery motions, as croton oil and large doses of cream of tartar, Epsom salts, Glauber's salt, etc.; (5) cholagogue purgatives, which stimulate the liver and increase the bile, producing greenish liquid motions, as aloes, rhubarb, iridine, etc.

**Apetalous Plants** are those in which the corolla is suppressed.

**Apex Beat**, the stroke of the A., or point, of the heart against the pericardium, through which it can be heard and felt externally on the wall of the chest just below the breast. Deviations in the position or force of this beat afford important indications of pathological changes in the heart.

**Aphasia**, the partial or complete loss of the power of speech or of expression by writing, or of understanding spoken or written words. The term is not applied when the power is lost through lesions of the peripheral nerves or organs, but only when the central nervous system is affected. The memory-stores which enable us to use and understand the language we have so gradually acquired correspond with certain portions of the brain, and a consideration of the process of acquiring the power of speech will go far to explain why A. is so often restricted to certain functions connected therewith, while others remain intact. The child understands words before he can speak; these percepts are stored away in the brain in the first temporal convolution of the left-hand side in right-handed persons, and vice versa in left-handed persons. Later, the child learns to make the co-ordinated movements of the tongue, larynx, etc., necessary to pronounce a word. The memories of these movements are stored away in the foot

of the third left frontal convolution. When he learns to read, the visual memories of the words are stored in the cerebral cortex, and so on. In health, there is constant communication between these portions of the brain, so that the image of a written word calls up the memory of the spoken word and of the movements necessary to give it utterance. If a lesion in any one of these areas occurs there is a corresponding loss of power of expression or understanding. Thus the patient may recognise a word when seen, but be unable to pronounce it; or may be able to pronounce it, but not recognise the sound when uttered, and so on. The condition sometimes improves of itself as the lesion heals, but it often happens that the patient has to learn all over again, as a child does, the art of speaking, reading, or writing, whichever has been lost.

**Aphelion**, the position in the earth's orbit when the earth is furthest away from the sun. The orbit of the earth's revolution is an ellipse, with the sun in one of the foci. Thus the earth is at varying distances from the sun as it moves round in its orbit. It is nearest in Jan., when the earth is moving its fastest; and furthest in July, when the earth's motion in its orbit is the lowest. The first position is called *perihelion* and the latter *aphelion*.

**Aphemia**, or **Motor Aphasia**, inability to articulate words from disease of the cortical centre and not of the peripheral nerves or organs. See **APHASIA**.

**Aphides** (plural of *aphis*), a family of plant-lice belonging to the order Hemiptera, very common in Britain. They are characterised by their soft and oval bodies, small heads, jointed beaks, antennae of 7 joints, wings (when present) transparent and 4 in number. They feed on plants and from their food form an excretion, known as *honey-dew*, of which ants are very fond; in warm weather it may be seen like a coating of varnish on leaves, where it is injurious to the plant.

The aphides reproduce parthenogenetically and viviparously. In the early summer the unfertilised females may produce as many as 25 females alive in one day, and as these can also produce in a few days, their numbers increase enormously. In the autumn males begin to appear as well as females, and after mating the female produces a *winter-egg*, which in the spring develops into a female aphid—and again the cycle of generations begins. If it were not for birds, spiders, parasites, and ladybirds which prey on the aphides, probably all vegetation would be destroyed.

*Aphis* is the commonest type in Britain, but other well-known genera include *Phylloxera*, or vine-louse; *Nectarophora*, green pea-plant louse; *Phorodon*, or hop-plant louse; and *Chermes*, which produces galls on spruce fir. See G. B. Buckton, *Monograph of the British Aphides*, 1876-83; J. Davidson, *List of British Aphides*, 1925.

**Aphis-lion**, or lace-wing fly, is a member

of the Chrysopidae, order Neuroptera, which feeds on the aphides. The genus *Chrysopa* is common in Britain.

**Aphonia** (Gk. *ἀ-,* without, *φωνή,* voice), a medical term to denote loss of voice; it differs from mutism in which sufferers frequently utter inarticulate sounds. Growths in the larynx, paralysis of the respiratory muscles, disease of the vocal cords, hysteria, and nervous disorders may all cause this malady.

**Aphorism**, a general truth conveyed by means of a few telling words. The name was first used of the *Aphorisms* of Hippocrates, the opening sentence of which is 'Life is short, art is long.'

Anderson

#### APHRODITE: CNIDIAN VENUS

The statue by Praxiteles in the Vatican.

**Aphrodite**, the Grecian goddess of love and beauty, the Venus of Rom. mythology. Her name signifies 'sprung from the foam,' and her origin is thus described by Hesiod. A. was not only herself endowed with unsurpassed beauty and grace, but had the power to bestow beauty of form upon her favoured ones, a beauty which she bestowed upon Paris, with disastrous results to the Gk. Helen. She was the goddess of fruitfulness, and as such the patroness of marriage. At first she was regarded by the Gks. as the goddess of married life, but later simply as the goddess of sensual passion. These 2 ideas are represented in the Platonic idea of A. Urania and A. Pandemos. In Grecian mythology she is represented

as the daughter of Zeus and Dione, and as the wife of Hephaestus and the lover of Ares. There seems to be no doubt but that the goddess was originally of oriental origin. In the E. she was known by the names of Ishtar, Ashtoreth, Astarte, and practically all the attributes of Gk. mythology are ascribed to her in her earlier forms; her attributes of fruitfulness, her connection with the sea and moon all being emphasised in the E. ideas. The chief places of her worship were Cyprus and Cytherea. The sparrow and the swan, the rose, the poppy, and the lime-tree, were all sacred to her. Her most famous statue was that of Praxiteles at Cnidus, others being that of Melos (Milo) at Paris, the Capitoline Venus at Rome, and the Medicean Venus at Florence.

**Aphroditopolis**, see **ATFIEH**.

**Aphthæ** (Gk. *ἀφθαί,* eruption) is a disease occurring chiefly in infants, and is commonly called *thrush*. It is not usually serious, and cleanliness is the primary cure, with attention to diet and local application of glycerine and borax. See **THRUSH**.

**Aphthonius**, who lived at the end of the third and beginning of the fourth centuries, was a Gk. rhetorician of Antioch. He was the author of 40 Gk. fables and of *Progymnasmata*, an introduction to the study of rhetoric. It was first printed by the elder Aldus with the other rhetoricians, *Rhetores Græci*, Venice, 1508, and was in common use until late in the seventeenth century.

**Apia**, a seaport on the N. coast of Upolu, W. Samoa, cap. until 1914 of Ger. portion, but assigned to New Zealand under mandate by the treaty of Versailles. It is built on a curving bay, backed by a conical hill. Vaea, the burial place of Robert Louis Stevenson, beyond which rise the slopes of the high mt. range. Copra and cocoa beans are exported. Under the mandatory administration the sanitation of A. has been greatly improved. There is a water-supply, sewerage system, hydro-electric plant with electric lighting, and other modern conveniences. The tn. has 2 motion-picture theatres, sev. transport companies, engineering works, and other business enterprises. There is a high-power wireless station. Foreign consulates were set up in A. in the eighties of last century, a step which so exacerbated the traditional rivalry among the native clans as to lead to a dangerous crisis, and Britain, America, and Germany sent warships to A. (1899). In Mar. of that year 4 Ger. and Amer. warships were sunk by a hurricane, and only U.M.S. *Calhoun* escaped destruction. In 1899 there was a recurrence of the frequent trouble over the kingship question, when Mataafa, a Catholic exile, opposed Malietova, youthful son of the late king. Britain and America favoured Malietova, and when this led to a crisis Brit. and Amer. warships bombarded A. Pop. 2000. See Felix M. Keesing, *Modern Samoa*, 1934; R. Gibbings, *Over the Reefs*, 1948.

**Apian**, Peter (1495-1552), an astronomer, and, we may add, astrologer, b. at Leipzig. His real name was Hienewitz. *Biene* in Ger. signifies a bee, whence the Lat. *apianus*, the full form of his name. He is principally remarkable for his observations of comets, and is said to have been the first who observed that their tails are generally turned from the sun; but this had been previously noticed by Fracas-toro. He also attempted the solution of astronomical problems by mechanism as described in his *Opus Cæsareum*, and pointed out, in his *Cosmographia*, the use which might be made of lunar observations in finding long.; he d. at Ingoldstadt, where he was prof. of mathematics.

**Apiary** (Lat. *apis*, bee), a place for keeping beehives. The name is derived in the same way that an aviary is taken from *avis*, a bird. Bee-keepers disagree as to the best position of the A., but all maintain it should be impervious to winds.

**Apiaster**, an old name for the bee-cater in general: now confined to *Merops apiaster*.

**Apicius**, the name of 3 Roms. celebrated for their gluttony. The first lived c. 92 B.C. The second c. A.D. 14, and the third about the middle of the first century.

The second is the most famous, M. Gabius A., who, after squandering his fortune in gluttony, committed suicide because he would not be able to satisfy his appetite on the pittance left. His name has become proverbial for gluttony. (Tac. *Ann.* iv. 1; Dio Cass. lvi. 19; Athen. p. 7; Pliny, viii. 209, ix. 66, xix. 137; Juv. iv. 23.)

**Apiin** (Lat. *apium*, parsley), the peculiar principle of parsley, obtained from it by solution in water. It crystallises in colourless needles, without taste or smell. It is soluble in boiling water or alcohol, insoluble in ether.

**Apocrinidae** (Gk. *amion*, pear, *apivon*, lily), a family of crinoid fossils of the order Articulata. The stem is long and rounded, the calyx unsymmetrical and composed of heavy plates. They occur chiefly in the Jurassic and Cretaceous systems.

**Apion**, a Gk. grammarian who studied at Alexandria and who lived during the reigns of Tiberius and Caligula. He was a determined opponent of the Jews, and was sent on one occasion to Rome at the head of an embassy to complain to the Rom. emperor (Caligula) of the Jews, and was the author of a number of works, only fragments of which remain, the story of *Androclus* and the *Lion* (Gellius, v. 14), and the *Dolphin* at *Dicæarchia* (Gellius, vii. 8); with fragments from the work against the Jews preserved by Josephus in his reply.

**Apis**, the sacred bull of Memphis. The origin of the worship of the bull *Hap*, called by the Gks. A., is unfortunately hidden in obscurity. He is said to have been held in honour by Mena, the first historical king of Egypt, and to have been raised to godship by Kaiekbos, a king of the second dynasty. Herodotus says A. is 'the calf of a cow incapable of conceiving another offspring'; the Egyptians

say that 'lightning descends upon the cow from heaven and from thence it brings forth A.' Living and dead A. was closely associated with Osiris. A. became known by the Gk. name of Serapis, and was accounted the husband of the goddess Isis. Special marks were found on the sacred bull A., e.g. it was black, had a white square on its forehead, on its back the figure of an eagle, and on its tongue a beetle. It was cared for with all honour; from its manner of approach, from its movement in its stall, from the manner in which it received food from visitors, the auguries were taken. Its birthday was celebrated by a 7 days' feast. Its death plunged the whole kingdom in mourning. It was the re-incarnation of the god Osiris, and was therefore worshipped as such. From modern researches we find that the bodies of the sacred bulls were mummified with all care, and at the Serapeum 2 galleries measuring together 1200 ft. were found in which the bodies of the sacred bulls had been placed.

**Apium**, a genus of plants belonging to the Umbelliferae, found in ditches in Britain, and nearly every part of Europe. *A. graveolens*, the only important species, is the celery; in its wild state it is poisonous, but when cultivated it becomes harmless.

**Aplanatic Lens**, a lens which is free from spherical aberration.

**Aplerbeck**, a suburb of Dortmund in Westphalia, Germany, with coal mines and iron works.

**Apneumatosis**, see COLLAPSE, PULMONARY.

**Apnoea**, a technical term for the suspension of breathing. It denotes the prevention of breathing owing to the presence of too much oxygen in the blood.

**Apocalypse**, lit. trans. a revelation, i.e., something revealed only to a chosen person. The term is usually applied to the last book of the N.T., which is often referred to as the A. of St. John. In the Eng. Bible, however, the name the Revelation of St. John the Divine is given to this book. The term, however, was used at a much earlier period by the Jews to indicate a number of writings which, in the form of parables and prophecy, were supposed to reveal the end or the future state of the world. This apocalyptic literature is found in both the O.T. and the N.T., and was originally the outcome of the Hellenistic Jews. It differed very essentially from the prophetic writings, since the prophets emphasised the need for repentance, and the utter wickedness of the times; while the apocalyptic writers despaired of the present, but put their whole trust in the deliverance and reward which was to be the gerdon of the sufferings and sorrow of the present. Among the canonical books of the O.T. we may mention as apocalyptic writings parts of Isaiah and of Ezekiel and the book of Daniel; amongst the uncanonical, the book of Enoch and the Psalms of Solomon. We find also in Christian times a number of writings which are classed as apocalyptic writings, and which

are outside the canon. Amongst those in the canon are parts of St. Mark and of Thessalonians and the Revelation; outside the canon we find a number of books, altogether about a dozen, which are also called apocalyptic writings, and amongst which are found the Shepherd of Hermas, and the Revelations of Bartholomew.

**Apocalyptic Number**, or 'the Number of the Beast', is the mystical number 666 (see Rev. xiii. 18). There have been various interpretations of this mystery. In Gk. and Heb. the letters of the alphabet were used for numbers, and so 'the number of the beast': for it is the number of a man' was the value of the letters composing the name. The most generally accepted solution is 'Neron Kesar,' the Heb. for the Lat. 'Nero Caesar.' In anct. Heb. the vowels 'e' and 'a' are not represented, but 'o,' being a long vowel, is. The value of the letters N R O N K K S R is therefore  $50 + 200 + 6 + 50 + 100 + 60 + 200 = 666$ . Another interpretation has been made from the Gk. word 'Lateinos,' meaning the Rom. empire.

**Apocatastasis**, in the theological sense the extension of the kingdom of God over all the earth at the appointed time, i.e. the ultimate conversion of the whole world to the Christian faith.

**Apocrypha**, a word of its wider application used to denote spurious Heb. literature, but technically restricted to mean books which were included in the Septuagint (Gk. O.T.) and the Vulgate (Lat. O.T.), but were not included in the Heb. canon. A general reference to the word A. means usually the A. of the O.T., but there is also much apocryphal literature in connection with the N.T.

The A. of the O.T. as used by Protestants includes the following books: 1 Esdras, 2 Esdras, Tobit, Judith, additions to Esther, Wisdom of Solomon, Ecclesiasticus, Baruch, the Song of the Three Holy Children, the History of Susannah, Bel and the Dragon, the Prayer of Manasses, 1 Maccabees, 2 Maccabees. The sources of these books are various, some showing Persian and Grecian influences, whilst others remain entirely Hebraic. Most of the books date from the first or second century B.C., and fall practically into 3 divs.: (a) Historical, (b) Legendary, (c) Didactic or Philosophical.

The books of the A., whilst not of the same value as the canonical books, nevertheless give us a glimpse into the religious life and ideas of the Jewish race. They show us a race rising from misfortune with unshaken faith and relying always on the promise given them that they were still the chosen race and must ultimately triumph. They give us also the beginning of the change from the law of the old dispensation to the law of the new. A transition from the old Jewish standpoint to the new.

The early Gk. fathers gave as much attention to the books of the A. as they did to the canonical books until the council of Laodicea. After this council the books of the A. were treated as being strictly uncanonical. But in the W.

Church Jerome declared that all books outside the Heb. canon were apocryphal, whereas Augustine declared that the apocryphal books simply implied those books whose origin was unknown or obscure. Another view declared that the books of the A. were valuable for their moral teachings, but were not to be regarded as a part of the canon. Diverse opinions were held right down until the period of the Reformation. At the Council of Trent the opinion of Augustine was strongly upheld and the books of the anct. Lat. Vulgate were declared canonical and sacred. That is, the whole of the books of the A., with the exception of 1 and 2 Esdras and the Prayer of Manasses, were declared of equal value with the canonical books.

The Protestants, however, remained firm in the belief that only the books of the Heb. canon were sacred and scriptural. Wycliffe declared that all books save those of the Heb. canon should be set among the A., that is, books 'without authority or belief.' Luther denied them to be as sacred as the Scriptures, but deemed them valuable because of their good moral teaching. This later attitude seems to be the one more closely adopted by the Protestants, since in the early Protestant eds. of the Bible the A. is given, but given apart from the canonical writings. Further, the sixth article of the Church of England states that other books of the church may be read for the sake of example and teaching, but not for the establishment of doctrine. The A. is regarded by a large number of orthodox people, however, not merely as uncanonical, but as inimical to the inspired word of God.

In addition to the A. included in the Septuagint there are also a number of books included in apocryphal literature. Amongst these may be mentioned History of Joannes Hyrcanus, Book of Jubilees, Books of Adam, Jannes, and Jambres, Joseph and Asenath, Perse Alseth.

**Apocrypha of the New Testament.** The numerous unauthenticated Christian writings, among which is the Epistle of Clement. This is founded largely upon the Epistle to the Hebrews, and written in imitation of the Pauline epistles. It throws an interesting light upon the doctrines of the early Christian Church. The second epistle is the first example of an early Christian homily. It differentiates between the books of the O.T. ('Biblia') and the books of the N.T. ('Apostles'). The Epistle of Barnabas is supposed to have come from the pen of Paul's companion, but this authorship has been shown to be spurious. It attempts to prove the complete overthrow of Judaism. The Shepherd of Hermas is supposed to have been written by that Hermas who is mentioned by Paul in the Rom. epistle. It consists of a series of orisons, but its chief interest lies in the fact that it gives us some insight into the working and doctrine of the early Rom. Church. The Gospel of Peter and the Revelation of Peter: both these books are uncanonical. The Protevangelium of James is an

account of the wonders dating from the birth of Mary to the birth of our Lord. The Gospel of St. Thomas deals with the infancy of Christ, and gives accounts of the miracles of that period. The Gospel of Nicodemus is divided into 2 parts. The first contains an account of the trial of Christ before Pilate. This part is called also *Acta Pilati*. The second part is supposed to be the narrative of Simeon and his 2 sons, who rose from the dead after the resurrection of Christ and who relate the happenings in Hades on the descent of the Christ.

**Apocynaceæ**, a natural order of monocotyledonous plants which are chiefly tropical and usually form shrubs. All species contain latex, generally of a poisonous nature, in 2 cases being nuxvomica and the tanguin poison. The characteristics of the flowers of this order are that they are symmetrical, monoclinous, in whorls of 4 or 5; the fruit consists of 2 follicles or a berry. The formula is  $K(5)C(5)A5G(2)$ .

**Apodes**, an order of fishes. According to the Linnean system it includes all those without the ventral fins. Cuvier restricts the order to those which, besides this character, are likewise malacopterygious, and according to this classification the eel, muraena, and gymnotus are examples.

**Apodictic**, a logical term applied to a conclusion which is necessarily true, i.e. the opposite of which is impossible.

**Apogamy** is the curious condition met with in some ferns, e.g. in *Nephrodium Filix-mas*, the shield fern. In this case the new fern-plant arises directly as a bud from the prothallus without aid of sexual organs. In other cases A. is effected parthenogenetically, the new plant arising from an unfertilised oosphere. See also APOSPORY.

**Apogee** (from Gk. *apo*, from, and *gē*, the earth), another term for *aphelion* (q.v.) and used more particularly in speaking of the moon.

**Apolda**, a Ger. tn. and political dist. in Thuringia. About 9 m. N.E. of Weimar. Manufs. cloth and hosiery. Had also dye-works, bell foundries, and manufs. of steam engines and bicycles. Pop. about 25,700.

**Apollinaire**, Guillaume (1880-1918), Fr. writer. His real name was Wilhelm Apollinaris de Kostrowitzky, he being the natural child of a Polish woman and a priest of Monaco. He was b. in Rome. He wrote legends on his early years and all that is certainly known of him is that he had travelled much before he came to Paris in 1902 and allied himself with some of the younger and more advanced writers and artists. He was either the inventor or the chief protagonist of Cubism. He conducted a regular dept. in the famous Fr. magazine *Mercur de France*. When the First World War broke out he served at the front, and was so badly wounded in the head that his skull had to be trepanned twice. He wrote fantastic prose and verse with equal facility. Prin. works: *Alcools* (poems), 1913; *Calligrammes* (poems), 1918; *Contes choisis*, 1923.

**Apollinaris, the Younger**, bishop of Laodicea in Syria. A bitter opponent of Arianism. This controversy took him so far that he even opposed the orthodox position of the Catholic Church. His denial of the existence of the human element in Christ's nature led to his condemnation by Catholic synods. He d. about 390.

**Apollinaris Sidonius** (d. c. 488), a Christian author and bishop of the fifth century. B. in Lyons about the year 431, of noble family, he was connected by marriage with the Emperor Avitus. His learning, however, saved him when Lyons was captured by Majorian, as it did later when Rome fell into the hands of the Goths. He became bishop of Clermont. A number of his works are still extant.

**Apollinaris Water**, an alkaline mineral water from the A. spring in the valley of the Ahr, Rhine Prov., Germany.

**Apollo**, the god of the ideal arts and activities in classical mythology. A Gk. legend describes him as the son of Zeus and Leto. Leto, wearied by her flight from the jealous anger of Hera, sank exhausted on the isle of Delos and gave birth to A. The is., heretofore a barren rock, sprang to life and covered itself with golden flowers in honour of the birth. A. is represented as being many-sided. Homer describes him as a sender of plagues; he is also described as the god of prophecy, the god of shepherds, the god of music, and the god of medicine. He was held in honour as a great athlete, the winner of the first Olympic race, and the founder and builder of cities. Troy was supposed to have been built by his aid. As A. Delphinus he was held in reverence by sailors as the god of light who helped them over the dark and dangerous sea. As the god of light he was also the god of purity, and demanded purity of worship from his followers. He was also the god through whom the taint of crime could be removed. In later Gk. mythology he is the sun god, but earlier mythology has a distinct sun god, Helios. The bow and the lyre are the usual attributes of A.; the bay, the palm, the roe, the swan, the snake, the mouse are all sacred to him.

The most famous representation of A. is the A. Belvedere, an imitation of an early bronze statue, which shows him, bow in hand, diving back the Gauls from his temple at Delphi. In the A. Citharæus, A. is represented in flowing robes and almost feminine in form. The usual statue of A. represents him as the type of the ideal Gk., handsome, tall, and perfectly proportioned.

**Apollo of Rhodes**, a colossal bronze figure of the sun god, reckoned among the 7 wonders of the ant. world. It is said to have been the work of Charos of Lindus and to have been set up by the Rhodians about 280 B.C. in gratitude for the successful defence of the city against Demetrius. The height was probably about 90 ft., and the work is stated to have occupied the sculptor 12 years. In 226 B.C. it was overthrown by an earthquake, and the metal was sold by Arabs when they captured Rhodes in A.D. 653.

**Apollodorus**, an Athenian painter of the end of the fifth century B.C. He introduced some innovations in perspective and light and shade. His works include an *Odysseus*, and an *Ajax* struck by lightning.

**Apollodorus**, a grammarian of Athens who fl. c. 140 B.C. He wrote a book on the mythology of the *Gks.*, in addition to a number of grammatical treatises and a book on geography. His extant *Bibliotheca* is regarded by authorities as only part of a larger book which has been lost.

**Apollodorus**, a famous architect of the second century. He was b. at Damascus. He became a favourite of the Emperor Trajan, for whom he constructed a bridge over the Danube. He also designed a number of buildings and triumphal arches. He offended the Emperor Hadrian by his outspoken denunciations, and on Hadrian's accession he was put to death on trivial charges.

**Apollonia**: 1. Anct. city of Illyria, near mouth of R. Aous. Colonised by Corinthians and Corcyreans, and famous as a Rom. place of learning. 2. Anct. city of Thrace, on the Euxine. Colonised by emigrants from Milesia. The famous statue of Apollo was removed from here to Rome by Lucullus, 72 B.C. The site is now occupied by *Sandoli*. 3. Anct. port of Cyrene, now *Marsa Suza*.

**Apollonicon** (from *Apollo*), a powerful chamber organ with both keys and barrels, manuf. by Messrs. F. Light & Robson in London, and first exhibited by them in 1817. It could be played by an organist, and was also a self-playing instrument, being provided with 2 revolving cylinders studded like those of a barrel-organ. It had 45 stops and 1900 pipes. Taken down about 1840.

**Apollonius Dyscolos**, or the *Sturdy*, famous grammarian of Alexandria, second century A.D. He lived during the reigns of Hadrian and Antoninus Pius. He was the first grammarian who introduced system into grammatical treatment. He is called *grammaticorum princeps* by Priscian, by whom he is followed somewhat closely. His works have been ed. by Bekker and Schneider.

**Apollonius of Perga**, a celebrated geometer of the Alexandrian school. He was b. some 25 years later than Archimedes, i.e. c. the year 262 B.C. He is classed with Euclid and Archimedes as one of the founders of mathematical science. His chief work is a book on conics which gained for him at the time the title of the 'great geometer,' and which has preserved his fame. His book on conics is the only one of his works which has come down to us, although the names of others have been preserved by later writers.

**Apollonius of Rhodes**, a Gk. poet and grammarian, b. in Alexandria, who fl. between the years 222 and 181 B.C. His most famous work was a poem on the legend of the Argonauts called the *Argonautica*. He received his title of Rhodius from the people of Rhodes, amongst whom he lived for some considerable time after

having left Alexandria in disgust at its unfavourable reception of his *Argonautica*. He left Rhodes in order to become librarian at the museum at Alexandria, whither he was recalled. His poem the *Argonautica* was a favourite with Rom. writers, and although in later days it has received somewhat harsh criticism, such criticism is not altogether deserved.

**Apollonius of Tyana**, a Gk. philosopher. He was b. a few years before the Christian era. He studied at Tarsus, and became a follower of the doctrines of Pythagoras. He claimed for himself a divine mission, and gathering around him a number of disciples, he travelled widely in the east, visiting Nineveh, Babylon, and India, where he came under the influence of oriental teaching. When he returned he was received with great honour, and many miracles were ascribed to him. He himself assumed only prophetic vision. He was patronised by Rom. emperors, and during the height of his fame traversed W. Europe. Later, after being accused of conspiring against Nero, he retired to Ephesus, where he opened a school, and where he d. at the age of nearly 100 years. By Blount and Voltaire he was held to be the superior of Christ. His biographer Philostratus gives an account of his life, which must, however, be stripped of its exaggeration and fiction before we can see a glimpse of the earnest striver after a higher life. See C. Bigg, *The Origin of Christianity*, xxii., 1909.

**Apollonius of Tyre**, the name of a medieval tale which is supposed to have a Gk. origin. The first mention of the tale seems to be about the latter end of the sixth century. The story relates how A. of T., having solved the riddle set him by King Antiochus, has to flee in order to escape the wrath of the king. In Cyrene he marries, and on the death of King Antiochus, he goes to claim Antioch, to which kingdom he is heir. On the voyage his wife apparently dies in giving birth to his daughter. The corpse is thrown overboard and the daughter left at Tyre. After 14 years of vicissitudes the three, husband, wife, and daughter, are miraculously restored to each other. The story had great popularity during the Middle Ages in almost every country. Shakespeare used it in his drama called *Pericles*.

**Apollon**, an Alexandrian Jew described in the Acts of the Apostles (xviii. 24-28). He is said to have been an eloquent speaker and a man mighty in the Scriptures. Until his 'conversion' by Priscilla and Aquila he appears to have preached only the baptism of John. There remains still some doubt as to exactly what form this 'conversion' took, since he appears always to have been a Christian. He became a follower and fellow teacher with Paul, and a great deal of his work was done in Corinth, where he gained great influence (1 Cor. iii. 4). It is held by some that previous to his conversion he wrote the Wisdom of Solomon, while Martin Luther believed him to be the author of the Epistle to the

Hebrews, a view which has received much support.

**Apollyon** (Gk. Ἀπολλύων, meaning destroyer). This name is given in Rev. ix. 11 as a translation of the Heb. 'Abaddon,' 'the angel of the bottomless pit.' A. forms a striking figure in Bunyan's *Pilgrim's Progress*. His identification with the Asmodeus of Tobit seems doubtful.

**Apologetics**. From the earliest ages the Christian faith has been subject to attacks, varying in character with the changes of thought produced by centuries of national, eccles., and philosophical strife. These attacks have in turn called forth defensive works, written from many different points of view, and often disagreeing with each other in important respects, but still having one common aim, that of upholding the main doctrines of Christianity. Such defences have received the general name of A., from the Gk. ἀπολογία, a defendant's personal reply to his accuser, e.g. Plato's *Apology of Socrates*. Of course, defence has often taken the form of a counter-attack, as when we find Paul denouncing the grossness of paganism. A full hist. of Christian A. would trace the moral and intellectual development of Europe, Asia Minor, and N. Africa during 2000 years, with its continuous effect upon religious thought. Arguments accepted as profound by one age often appear trivial to another, having been founded on premises which fuller knowledge has disproved.

In early ages we naturally find the Christians defending themselves against 2 main lines of attack, those of Jewish and pagan opponents. By the former they are looked upon as renegades and blasphemers, the latter accuse them of law-breaking, sedition, impiety, atheism, secret immorality, and 'foolishness' (1 Cor. i. 18). In reply to the former, O.T. hist. and prophecy were largely employed by Paul and his colleagues, while the Gks. were referred to the highest philosophy of their own writers, which inculcated pure morality, an exalted idea of the deity, and a belief in the immortality of the soul. This was pointed out not only as an acceptable form of natural theology, but as being supported by divine revelation. Some of Paul's chapters (e.g. Rom. xiii.) seem intended as specific answers to some of the pagan accusations. Among the most famous apologists of the early Church were Justin Martyr, Origen, and St. Augustine. The latter's work, *De Civitate Dei*, did much to establish the W. Church on a permanent footing.

During the Middle Ages, while pagan enemies had become extinct, Jewish and Moslem authors well instructed in Gk. philosophy took up new lines of attack. Christian writers had maintained that faith and reason must necessarily be in harmony, but now began the controversies concerning 'natural' and 'revealed' religion which have lasted to the present day. Among the great Moslem and Jewish names are those of Avicenna,

Averroes, Maimonides, and Jehuda Halevi; on the Christian side Anselm, Abelard, Albertus Magnus, and Thomas Aquinas. The main result to Christendom of these controversies was what is known as the 'Thomist compromise,' which declares that certain doctrines are beyond the sphere of reason. The 'nominalists,' William of Occam, Buridan, and others, going further still, asserted *all* matters of faith to be above argument. The Church of Rome, on the whole, sided with the Thomists. Since the revival of learning, the growth of modern philosophy and science has had immense effect on religious thought. The rise of deism, a new presentation of 'natural theology,' was contemporaneous with that of Jansenism, which sought to put new wine into old bottles by accommodating the ideas of Augustine with the modern claims and teaching of the Vatican, and also to some extent with certain tenets of Protestantism. The greatest of the Jansenists was Blaise Pascal, a staunch Christian and Rom. Catholic, yet his colleagues of Port Royal were subsequently persecuted as heretics at the instigation of Rome. Deism may be looked on as a natural reaction among those who had imbibed Protestant ideas of freedom against the extreme views held by some of the 'supernaturalists,' and this, with pantheism and other allied forms of teaching, had many advocates, some of them men of high abilities—Lord Herbert of Cherbury, Spinoza, Thomas Hobbes. These were succeeded by others who went further and preached downright atheism. John Locke, while a sincere believer in Christianity, argued in its favour on the ground of reason, and objected to miracles being urged in support of doctrine.

The deists were answered by many writers, both Eng. and foreign; of the former William Law, Butler, and Paley were the most renowned, Paley's *Evidences* becoming a standard text-book. In Germany Lessing and others sought to 'rationalise' Bible interpretation. Kant (followed by Coleridge) tried to give this movement a new and more spiritual form. Some Ger. critics have thrown over 'natural theology' altogether in favour of revelation.

But agnosticism and the new criticism, the most recent forms of objection to 'orthodox' Christianity, are based on the modern discoveries of science and of historical research. The conflict between science and theology is no new one—Galileo was not the first to suffer in it—and though Huxley invented the word agnosticism in 1896, the *idea* is to be found in anct. Gk. literature, though the sophists argued on other lines and against other ideals.

The view taken by Spencer and Huxley is that concerning the deity, and also concerning many things of which we can have no *sensible* perception, we can have no actual proof of certainty. But the theologian replies that physical and spiritual knowledge are so entirely different that we cannot argue from one to the other.

The new criticism (founded on close study of the N.T., assisted by discoveries of ant. MSS., and a minute collation of those already known) began in Germany, and has extended to France, England, and America. Among well-known writings on the subject are the *Lives of Christ* by Strauss and Renan, Seeley's *Ecce Homo*, Garvie's *Ritschlian Theology*, R. Mackintosh's *Primer of Apologetics*, and Bruce's *Miraculous Elements in the Gospels*.

**Apologia pro Vita sua** (apology for his life), the autobiographical sketch of his position in the Oxford Movement, issued by Cardinal Newman in 1864. It contains his reasons for joining the Rom. Catholic Church, and characteristically refutes Charles Kingsley's accusations, which were the immediate cause of the *Apologia*. See Everyman's Library ed. and recent biographies by Robert Sencourt and Maisie Ward, 1948.

**Apologies of the Fathers** are writings in defence of Christianity from the beginning of the second to the sixth century. They had as their objects to uphold Christianity against heathenism, to refute the false accusations made against Christians, and to show emperors the injustice of persecution. Among the Gk. apologists of the second century were Justin Martyr, who wrote *Apologia Prima pro Christianis* and *Apologia Secunda*. The two, usually referred to as one *Apologia*, were written c. 150. Athenagoras, who defended the Christians against the charges of atheism, incest, and infanticide; Tatianus; Theophilus of Antioch; and Ilermas. Amongst the Lat. apologists of the second century were Tertullian, the author of *Apologeticus*; Minucius Felix, who wrote the dialogue entitled *Octavius*; and Cyprian, the author of *On the Absurdity of Idolatry*. In the fifth century Origen, a Gk., and Ambrosius, a Lat., wrote against the attacks of Celsus, Porphyrius, Hierocles, and Julian, who attacked the hist. and doctrines as well as the morals of the Christians. The greatest of these fathers was Eusebius, whose *Evangelical Preparation* contains, in 15 books, the introduction to his *Evangelical Demonstration*, in 20 books. He explains the harmony between the O.T. and N.T., and upholds the teachings of Christ and of His disciples; and he examines the *Life of Apollonius of Tyana* by Philostratus. Other apologists were Athanasius, Chrysostomus, Cyrillus of Alexandria, and Theodoret, who argues for Christianity from the writings of the heathens. Lactantius wrote *Divine Institutions* in 7 books; St. Augustine *On the City of God* in 22 books; and St. Jerome refutes the objection that no distinguished individuals embraced the Gospel. The work entitled *The History of Orosius* contends that plague, famine, and earthquakes were not the outcome of the Gospel.

**Apologue**, a fabulous story, in which a worldly-wise or moral lesson is conveyed in a lively, dramatic, and often satiric manner, the characters employed

being generally of a lower order than man. See Jotham's so-called parable (Judges ix.), also the fables of Aesop and others, and the Ger. *Reineke Fuchs*. A true 'parable' is more spiritual in its teaching than an A.

**Apology** (*ἀπολογία*), a Gk. word originally signifying a defence made in a court of justice by or for a person accused, e.g. Plato's *Apology of Socrates*. The word was also used for a work in defence or justification of what might be considered wrong, or be disapproved, e.g. Tertullian's *Apology for Christianity*, Bishop Watson's *Apology for the Bible*, and Barclay's *Apology for the Quakers*. In ordinary language it is used in the sense of asking pardon for an offence.

**Apomorphine** ( $C_{17}H_{17}O_3N$ ), an artificial alkaloid, derived from morphine by the abstraction of a molecule of water. It is administered hypodermically or by the mouth to produce vomiting, and is therefore an emetic. It is also used as an expectorant, and is of great value in acute catarrhs attended with very viscid secretion, and particularly in cases of bronchitis and croup in children.

**Aponogeton**, a species of pondweed (*Najas*) found at the Cape, where it occurs in sev. varieties. The *A. distachyon* is a favourite aquarium plant, having sweet-smelling white flowers and bright green floating leaves.

**Aponus, Petrus**, see ABANO, PIETRO DI.

**Apophthegm**, or **Apothegm** (*ἀποφθέγμα*), a Gk. word signifying 'a thing spoken out.' It is a short, pithy, and instructive saying, intended to convey an important truth to the hearers. Plutarch made a collection entitled *The Apophthegms of Kings and Generals*, and also of the Aes. of the Lacedaemonians entitled *Laconica*. Cicero called them *salutae*, salt pits. The following are examples: 'Bigotry murders religion, to frighten fools with her ghost.' (Colton's *Lacon*). 'We ask advice, but we mean approbation' (*Lacon*). Bacon made a collection entitled *Apophthegms New and Old*.

**Apophyge** (from the Gk. *ἀποφύγειν*, to flee away), a term applied by architects generally to a concave surface lying between or connecting 2 flat surfaces not in the same plane, and particularly to a slight concavity which is almost invariably found to terminate the shaft of an Ionic or a Corinthian column both above the base and under the necking. The more familiar Eng. term is *escape*, and the Fr. term is *congé*.

**Apophyllite**, a mineral consisting chiefly of calcium silicates, and corresponding to the formula  $4H_2CaSi_2O_7 + KF + 4H_2O$ . It occurs generally in association with the zeolites, and large crystals have been found in India, Mexico, and the Harz Mts.

**Apophysis**, in physiology a protuberance or process on a bone, having no independent centre of ossification, and so forming a continuous part of the bone. Especially applied to the spinal vertebrae. In botany, a swelling of the seta below the theca or spore case in certain mosses,

or on the scales on the cones of certain pines.

**Apoplexy**, 'a clinical term used to indicate a condition characterised by sudden paralysis, usually attended with loss of consciousness, and due either to the breaking of blocking up of a blood-vessel in the brain.' This definition, suggested by Dana, divides A. into cerebral hæmorrhage and brain softening caused by the blocking up of a blood-vessel.

The predisposing causes of cerebral hæmorrhage are alcoholism, syphilis, and gout, and the immediate cause is general physical strain or mental excitement. It occurs usually after the age of 40, although it is commonly met with at birth and during early childhood. Generally, the patient is seized without any warning, and consciousness is usually lost at once. The patient falls, the face is often congested, one side of the body is paralysed, according to the position of the hæmorrhage, and the breathing becomes stertorous. The condition may last without much alteration for a day or two, after which there are signs of inflammation in the affected area, fever and delirium may set in, and occasional spasmodic movements may be made. Death may occur at any stage, but the structural damage may be slowly repaired, though the paralysis seldom disappears altogether.

The treatment consists in placing the patient in the position where there is least constriction. The clothing should be loosened, the head somewhat elevated, and care should be taken that the paralysed tongue does not fall back into the throat. Ice bags may be placed round the head, and hot-water bottles at the feet. The bowels should be made to move freely, calcium salts may be given to promote coagulation of the blood, and nitroglycerin to reduce the blood pressure.

Acute cerebral softening may be brought about by a blood-vessel being plugged up with material brought to the brain by the blood current, or by obstruction caused by clotting in the arteries or veins. The blood is unable to nourish properly a portion of the brain, and varying degrees of softening take place. If the condition is due to the sudden plugging of an artery, the onset is sudden and there may be loss of consciousness, or vertigo. Where clotting takes place the onset is more gradual; there may be headaches, great depression, and confusion of mind. The outlook is more promising than in hæmorrhage, death not being so likely to occur and the resultant disability being less.

**Aposiopesis**, in rhetoric, the abrupt ending of a sentence, which is left unfinished, for the sake of greater effect.

**Apostasias** are herbaceous plants belonging to the family of the Apocynaceæ; they originally came from the mountainous forests of Java and the Penang Islands.

**Apostasy**, among the Gks. this word originally meant a defection from the military standard, but later and more

generally a lapse from Christianity, especially if from unworthy motives. In the Rom. Church it was specially used for the renouncing of monastic or clerical vows. Julian the Apostate (331-63) attempted to displace Christianity for paganism; whence his surname.

**A posteriori**, *see* **A PRIORI**.

**Apostle** (Gk. ἀπόστολος), a messenger or envoy. A title now specially applied to teachers sent out by Jesus Christ (Luke vi. 13). But the name seems not to have been confined to the twelve, for in 1 Cor. xv. Paul says of our Lord, 'He was seen of Cephas, then of the twelve, after that he was seen of James, then of all the apostles.' Evidently while the twelve were pre-eminent, others also were recognised as As., and even among the twelve there was a differentiation. 'The Pillars' stood out above the rest, and 'the Lord's brethren' were specially honoured. In Acts xiv. Paul and Barnabas are both spoken of as As., though neither of them belonged to the twelve. The title thus bestowed on many leading ambassadors of Christ was claimed by some who were not entitled to it (Itev. ii. 2). During the second century A.D. a traditional restriction grew up; after this we seldom find any but the original twelve, Matthias, and Paul entitled As., their chief followers being spoken of as 'evangelists' and 'apostolic missionaries.'

**Apostle Jug**, a form of stoneware vessel much used in the sixteenth and seventeenth centuries. It was made both with and without a lid, and was so called on account of its ornamentation with the figures of the 12 apostles in relief.

**Apostle Spoons**, frequent as christening presents during the fifteenth and sixteenth centuries. Each handle bears the figure of an apostle. A complete set of 12 spoons is now rare and commands a high price.

**Apostles**, Acts of the, *see* **ACTS**.

**Apostles' Creed**, *see* **CREED**.

**Apostles' Days**, the feasts of commemoration of the 12 apostles. In the Rom. Church these are: Matthew, Sept. 21; John, Dec. 27; Peter and Paul, June 29; Thomas, Dec. 21; Philip and James, May 1; Simon the Canaanite and Jude, Oct. 28; Bartholomew, Aug. 24; Andrew, Nov. 30; Matthias, Feb. 24; James the son of Zebedee, July 25. In the Gk. Church the following dates are different: Matthew, Nov. 16; John, Sept. 26; Thomas, Oct. 6; Philip and James, Oct. 9; Bartholomew, Aug. 25; Matthias, Aug. 9; James the son of Zebedee, Apr. 30.

**Apostles' Islands**, a group of 27 is. on Lake Superior, forming part of Wisconsin, U.S.A. Total area about 200 sq. m. The chief industries are lumbering and the quarrying of brown sandstone. Lapointe, on Madeline Is., is the chief tn., near which is an Indian reservation.

**Apostles, Teaching of the**, often called the Didaché (Gk. διδάχη, teaching), is the title of a Christian work of the apostolic age, discovered and pub. by Bryennios in 1833. It contains 16 chapters, and is divided into 2 parts,

the first of which gives an account of the 2 ways of life and death, and the second gives the rules governing the service, the sacraments, and the ministry in the church. It is believed that this work formed the basis of the *Apostolic Constitutions* dating from the third and fourth centuries. Certain passages in the *Didaché* and in the *Epistle of Barnabas* resemble each other, and it has been a point of contention as to which preceded the other; but some think that they are independent. Harnack, Taylor, and others believe that the first part of the *Didaché* was originally a Jewish work entitled *The Two Ways*. The exact date of the work is not known, as the dates assigned to it vary from the latter part of the first century A.D. to the middle of the second century.

**Apostolic Constitutions and Canons.** The A. C., in 8 books, is a collection of notes on the eccl'es, customs of the first 4 centuries. The work purports to be written by the apostles, but it is a composite work which has gradually crystallised, its composition extending over a long period of time. To the last book are appended the *Canons of the Holy Apostles*, said to have been given to the Church by Clement of Rome. Opinions as to their value have varied considerably, but out of the 85 canons, only 50 (trans. into Lat. by Dionysius the younger) have ever been commonly known in the W.

**Apostolic Fathers.** These hold an intermediate place between the apostles themselves and the apologists of a later period. The name should, strictly speaking, be given only to those believed to have been in actual touch with the original apostles, as Clement, Ignatius, and Polycarp, but by common usage it has come to include others who, during the second century, carried on the traditional teaching of the primitive Church, among whom were Irenæus and Hermas. Their writings are valuable for their differences as well as their essential likeness in spirit, for they show how the growing Church was influenced by both the personality and nationality of its great missionaries.

**Apostolic Majesty,** a title of the kings of Hungary conferred by Pope Sylvester II. upon St. Stephen, king of Hungary, in 1000. It was renewed by Pope Clement XIII. in 1758 in favour of Queen Maria Theresa, and was used by the late emperor of Austria.

**Apostolic Succession,** the doctrine that the power of ministering in the Christian and Catholic Church can be derived only from a validly consecrated bishop, i.e. one who had himself been validly consecrated, and so on back to the time of the apostles. Or, to look at the question from the other end, that the apostles received powers of ordination which they handed on to others, and which has so been handed on down to the present bishops of the Church. It is insisted on as of the case of the Church by the Rom. Catholic, Gk. Orthodox and Anglican Churches, but its necessity is denied by the various Protestant sects.

**Apostolici** were imitators of the apostolic life mentioned by Epiphanius (*Hæres.*, 67). In the middle of the twelfth century there existed a sect called Apostolic Brothers on the banks of the Lower Rhine, who rejected oaths, infant baptism, fasts, ceremonies, worship of saints, purgatory, masses, second marriages, and the power of the pope. Some of them were brought before the eccles. court of the archbishop of Cologne, and were afterwards burned to death. About 1260 Gerhard Segarelli of Parma founded another apostolic brotherhood who rejected the authority of the pope, oaths, and capital punishments.

**Apostolius, Michael** (d. c. 1480), a Gk. theologian and native of Constantinople. When the Turks conquered the city he fled to Italy, and so zealously upheld Plato's teaching as against that of Aristotle that he lost the protection of his patron Cardinal Bessarion, and retired to Crete. Among his numerous works were *Paramira*, a collection of proverbs in Gk., first printed in 1538; a fuller ed. was pub. in 1619, ed. by Heinsius. Another work was *Oratio Panegyrica ad Fredericum IV.*

**Apostrophe:** 1. A rhetorical figure of speech; literally a turning away (*ἀποστροφή*), when a speaker breaking off his discourse addresses himself directly to some person or object. 2. A comma (') denoting elision, as in c'er. In the genitive singular it represents the A.-S. ending *es*, as man's for *mannes*. The incorrect use of the (') is a very common error.

**Apothecary,** originally the keeper of a drug store (Lat. *apothecarius*), later a rival of the physician. Now called in England a pharmaceutical chemist.

**Apothecaries' Fluid Measure and Weight, see under WEIGHTS AND MEASURES.**

**Apothecia** (Gk. *ἀποθήκη*, storehouse) are open, shield-like fruits of certain fungi of the group *Discomycetes*, e.g. *Phyiscia parietina*. Here they may be seen attached to the surface of the leaf-shaped thallus, of a darker orange colour than the rest of the plant.

**Apotheosis,** deification, the recognising of a mortal as a god—this is very frequent in polytheistic religions. (See Proude's *Short Studies*, vol. III.) Julius Cæsar was deified by Augustus, and this precedent was followed by other Cæsars. Even their relatives and favourites were often thus honoured. Constantine was deified by the pagans, and canonised by the Christians. A modified form of A. exists in the Gk. and Lat. churches, but the worship accorded to saints (*ἅγιοι*) is formally distinguished from that offered to God (*θεοὶ*).

**Apotome:** 1. In anct. Gk. music, the remainder of a whole tone when diminished by a limma or smaller semitone, the ratios being 2187 and 2048. 2. In mathematics, the difference between 2 incommensurable numbers, or the difference between the diagonal and side of a square.

**Appalachian Mountains.** These mts. form an important feature in the physical

geography of the U.S.A., separating the plain of the Mississippi-Missouri from the Atlantic slope. Their total length, about 1500 m., extends from the St. Lawrence to Alabama, and their width in some parts reaches 300 m. They are longitudinally divided into a number of ranges and valleys, the latter forming a chain known as the Great Appalachian Valley. The chief ranges in the N. are the White Mts. and the Green Mts. (Vermont), with some smaller hills N. of the St. Lawrence; in the centre, the Blue Ridges of Pennsylvania and Virginia; in the S., the Black and the Smoky Mts. The highest of the N. peaks rise to 5000 or 6000 ft., many in the S. reach nearly 7000 ft. On the W. the Alleghany plateau slopes to the Central Plain. The E. ranges are pierced laterally by the Hudson, Delaware, and other valleys, but the W. plateau is almost unbroken. This had a notable effect on early colonisation; Eng. settlers, with great labour and hardship, worked their way along the rivers to the A. Valley, but there they were stayed for many years by the difficult country, and also by the enmity of the red men, encouraged by the Fr. from Canada and the Spaniards from Louisiana. This check helped to fill up and solidify the Atlantic states, and hardened them for their later contests with France and England.

The chief rivers of the A. system are the St. John (N. Brunswick), Hudson, Delaware, Susquehanna, Potomac, and James, on the E.; the Alabama flowing S., and the Tennessee, Cumberland, and Kenhawa into the Ohio. The ranges are largely covered with forests, and wild animals are numerous, including the bear, lynx, and deer.

**Appalachicola**, see APALACHICOLA.

**Appanage**, or **Apanage**, in Fr. law, was the provision of lands or feudal superiorities assigned by the kings of France for the maintenance of their younger sons, and was in practice from the time of the Capets until 1832. Towards the close of the thirteenth century the rights of the *apanagiste* were further circumscribed, and in 1790 it was enacted that the younger branches of the royal family of France should be provided for out of the civil list until they married or attained the age of 25, and that then a certain income called *rentes apanagées* was to be granted them. In 1832 the word A. was substituted for that of *dotation*. The term A. is now given to the allowance made to the princes of a reigning house out of the public funds. In Scotland A. is the patrimony of the prince and steward, and in England the duchy of Cornwall is the A. of the Prince of Wales.

**Apparatus Sculptoris**, or the **Sculptor's Workshop**, a constellation distinguished by Lacaille. It is situated in the reign of the heavens immediately to the eastward of the large star Fomalhaut or a Piscis Australis, and hardly rises above the horizon in our hemisphere. It is bounded by Cetus, Aquarius, Fornax Chemica, Piscis Australis, and Phoenix.

**Apparent** (in astronomy). An A. phenomenon is one which is actually seen in the opposition to that which results from correction or reduction.

**Apparent Magnitude**, in optics, the angle which any object subtends at the eye of an observer. If OB be the object, and E the situation of the observer's eye, then the A. M. of the former is the angle E—i.e. OEB, formed by two visual rays drawn from the centre of the pupil to the extremities of the object.

**Apparent Motion**, the velocity and direction in which a body appears to move, when the spectator himself is in motion, without being conscious of it.

**Apparition**, an immaterial appearance as of a real being; a spectre or ghost. From the earliest ages amongst all peoples a belief in As. was prevalent, and it only ceases to exist with a more enlightened knowledge of the circumstances which affect the minds of men. Amongst savages there is a belief that when a man is asleep his soul leaves his body and wanders in the night, and that the adventures which happen to the soul in its wanderings are real circumstances. The soul is supposed to visit friends, relations, or enemies, and these visitations are called dreams by the person visited. There is another belief among many people that when a man dies his spirit still lives and is seen by other people as a dream or a phantasm. In the early religions the worship of the dead played a great part, for sacrifices were made to members of the family who had died. The heathen had great fear of the spirits of the dead, which were regarded by him as demons. Against these demons he believed he had to struggle, and in order to succeed he embraced witchcraft. Closely allied to this belief in As. is the belief in ghosts, who were supposed to be the souls of deceased persons, appearing in a visible form, or otherwise manifesting their presence, to the living. The spirit of a murdered man is said to visit the murderer in the night. Ghosts have been alleged to appear in the same dress they wore when living; they are often pale and cloudy in appearance, and the ghosts seen in churchyards are often clothed in white. This belief in As. has had a very powerful influence on the mind of mankind. It has caused suffering and pain, and has often been the cause of the loss of the reasoning faculties; it preoccupied the mind; and the priest and the tyrant were powerful to delude the weak. There is no doubt that these delusions and superstitions were the outcome of ignorance, as may be proved by the investigations as to the causes of these physical and mental phenomena. It is well known that there are physical conditions which are necessary to sound thought, and a mind which is deranged by fear, by disease, or even by excitement, has a tendency to form images of those objects which have caused the derangement. Fear of a certain object has often caused that object to appear to the mind. As. have in all ages formed the subjects of pictures and of writings. The Society

for Psychical Research conducts investigations in this field. Amongst the works written on As. and kindred phenomena may be mentioned: R. Baxter, *Certainty of the World of Spirits*, 1691; S. Hibbert, *Sketches of the Philosophy of Apparitions*, 1824; C. Crowe, *Night Side of Nature*, 1852; Andrew Lang, *The Book of Dreams and Ghosts*, 1897; C. Richet, *Thirty Years of Psychical Research*, 1923; E. Bennett, *Apparitions and Haunted Houses: A Survey of Evidence*, 1939; H. Price, *The Most Haunted House in England*, 1940, and *The End of Borley Rectory*, 1946; and the publications of the Society for Psychical Research. See also HALLUCINATION; PSYCHICS.

**Apparitor**, in Rom. times, was a person who was in attendance on public functionaries to execute their orders (Livy, iii. 38). The term therefore included a great variety of officers (Justinian Code, 12, tit. 52, etc.). In later times an A. was a messenger in eccles. courts, whose duty it was to call defendants into court, and to execute the orders of the judge.

**Appeal**. In law, to remove a cause from an inferior to a superior court for the purpose of re-examination or for decision. In it the party appealing, called the appellant, tries to show that the decision of the lower court on a matter of fact or of law was erroneous, that the verdict was against the weight of evidence or the sentence excessive. By this means judicial abuses are reduced to a minimum and something approaching uniformity in judgment is secured by the fact that the judges or magistrates in the lower courts have the precedents and dicta of the higher courts to guide them. The party appealed against is called the respondent or appellee. The idea underlying the system of A. would appear to be that a principal does not divest himself of responsibility when delegating his authority to an agent. Judges being but the agents of the king, and through the king of the community, the responsibility for their decisions should, in grave cases at any rate, be brought home to its source. It is this idea which enabled St. Paul, brought before Festus, to say, 'I appeal to Cæsar' (Acts xxv.), and to have his A. allowed, and it is this idea which gives to every Brit. citizen the right of appealing in the last resource to the 'King in Parliament,' in other words, to the House of Lords. As. can be made from Dominion (excepting Eire), Indian, and colonial courts to the 'King in Council,' i.e., the Privy Council functioning through its judicial committee. In theory the entire House of Lords, or entire Privy Council, hears the A. In practice the House of Lords in its legal capacity consists of certain Law Lords whose functions are regulated by the Appellate Jurisdiction Acts, 1876 and 1887. The law lords consist of the lord chancellor, 4 lords of appeal in ordinary, and other peers of Parliament who hold or have held important judicial office, 3 forming a quorum. No peer is excluded, but by custom peers other than those mentioned neither attend nor vote. In the

case of *Bradlaugh v. Clarke*, in 1882, an eccentric and non-legal peer successfully asserted his right to sit and did so, voting with the minority. As. lie from the courts of A. in England, and from the court of session in Scotland, but there is no A. from the Scottish high court of judicatory. As. from the Eng. courts must be brought within 12 months. As. from the court of session must be brought within 2 years. Each of the lords may make a speech in the form of a judgment giving his views, and the decision is by majority. If their lordships should be equally divided in opinion the decision of the lower court stands and each side must pay its own costs. The law lords may sit independent of the fact that Parliament is prorogued or dissolved. The Privy Council's jurisdiction as an appellate court has been subjected to many modifying statutes, the Act which constituted its judicial committee being passed in 1833. This committee consists of the president of the council and the lord keeper and other councillors who hold or have held high judicial rank in the colonies or at home. Two other privy councillors may be added by the king and assessors in the persons of colonial judges, and in eccles. cases, of which the Privy Council is the final arbiter, bishops are sometimes added. The court of A. in England as constituted by the Judicature Acts, 1873-75, consists of the lord chancellor, ex-lord chancellor, the lord chief justice, the master of the rolls, the president of the Probate Div., and 5 lord justices. The quorum is 3, unless both parties agree to have the case tried by 2, and no judge may hear in the A. court an A. against his decision in the lower court. The court of A. has 2 divs.: the master of the rolls presides in one, and a senior lord justice in the second. If possible, King's Bench cases are heard by 2 common law and one equity (Chancery) justice, and in Chancery cases the proportions are reversed. The court must hear motions for a new trial or to set aside verdicts given by a jury. As. are heard from both divs. of the high court, from the palatine courts of Lancaster and Durham, the Liverpool court of passage, bankruptcy, etc., and the question of registration and parl. election petitions under the Corrupt Practices Act. Appeals from recorders' and magistrates' courts are heard in the first instance by the high court, and any further A. from that court would go to the Court of A. and from there to the House of Lords. The A. court may, but in practice seldom does, hear fresh evidence on A. and it may reverse the findings of the lower court, but may content itself with ordering a new trial. In interlocutory matters appeal must be made within 14 days, in final cases within 6 weeks, of judgment. As. in eccles. cases are heard by the Judicial Committee of the Privy Council. Until the Criminal Appeal Act, 1907, the practice of the criminal law in this country was almost unique in the fact that no A. was

allowed from the assizes (other than on a question of law reserved by the trial judge for the opinion of the old court for crown cases reserved (*q.v.*)), though clemency might be exercised by the sovereign on the advice of the home secretary. While, of course, the royal prerogative of mercy remains, the court of criminal A. (England), with carefully defined and somewhat restricted jurisdiction, offers to the convicted criminal another chance. The court consists of the lord chief justice and 8 judges of the King's Bench Div. appointed by him in consultation with the lord chancellor. They do not, of course, all sit at the same time, but there must be not less than 3 and always an uneven number of judges. An A. lies to the court on any ground which involves a question of law alone, but it is only by leave of the court or upon the certificate of the trial judge that an A. lies on any ground involving a question of fact alone, or mixed law and fact. There is also a right of A., by leave of the court, against sentence. In a few specified cases there is a further A. to the House of Lords. What are known as divisional courts, that is, courts consisting of 2 high court judges, hear nearly all the As. from quarter sessions and country courts, but the consent of the inferior court must in some cases first be obtained. Similarly, the consent of the divisional court is necessary before an A. from it to the A. court can be heard. The quarter sessions hear As. from courts of summary jurisdiction (police courts) when sentences of imprisonment have been imposed 'without the option.' In the Scottish courts there is an A. from the outer to the inner house of the court of session; from the sheriff court to the court of session, when more than £50 is involved; from the sheriff-substitute to the sheriff-principal; to the high court of judicatory, on points of law; from inferior courts in criminal cases; and to the quarter sessions from the petty sessions. For A. in the old criminal law of England involving trial by combat, see article under that head.

**Appeals in U.S.A.** Appellate jurisdiction in the U.S.A. may be considered under (1) A. from state courts to federal courts; (2) A. to the circuit courts of appeal; (3) A. to the Federal Supreme Court, and (4) injury cases. (1) *A. from State to Federal Courts.*—Such A. are authorised by statute where the construction of the Constitution, laws or treaties of the U.S.A. is involved, or some right, privilege, or immunity is claimed thereunder. Such an appeal can only be taken after the unsuccessful party has carried the case through the state courts to the court of last resort and is still unsuccessful. (2) *A. to the Circuit Courts of Appeal.*—The dist. courts and circuit courts exercise only original and not appellate jurisdiction. The courts of these 2 classes, together with the Supreme Court, formed the judicial dept. of the Federal Gov. until the year 1891. In that year a new court was created, called the circuit court of appeal, to be held at one or more places in each circuit, presided over by the 3 judges

authorised to hold the circuit courts throughout the circuit, or, in other words, the justice of the Supreme Court assigned to the circuit and the 2 circuit judges appointed for the circuit. By Acts in Congress the number of circuit judges of many cases has been increased to 3. In practice, however, the justices of the Supreme Court only in rare instances serve in this capacity. When the circuit courts of appeal were estab., the appellate jurisdiction of the circuit courts was transferred to them, and they were given also a considerable part of the appellate jurisdiction previously exercised by the Supreme Court, the object of establishing the circuit courts of appeal being to relieve the Supreme Court of too great a burden. The circuit courts of appeal in the exercise of their general jurisdiction hear appeal cases from the dist. and circuit courts in suits between citizens of different states or between citizens of a state and aliens; also in Admiralty cases and cases under the patent copyright revenue or postal laws, and in criminal cases where the crime is not capital or otherwise infamous, in which event the appeals lie to the Supreme Court. With but few exceptions the decision of a circuit court of appeal is final and conclusive, and no further appeal to the Supreme Court is allowed. These courts do not hear A. from state courts. (3) *A. to the Federal Supreme Court.*—The appellate jurisdiction of the Supreme Court embraces (i) A. from the dist. or circuit courts in convictions for a capital or otherwise infamous crime; in prize cases; in cases involving the construction or application of the Amer. Constitution and cases in which the constitutionality of any law of the U.S.A. or the validity or construction of a treaty made under its authority is in question; and in cases in which the constitution or a law of a state is claimed to be in contravention of the Amer. Constitution; (ii) A. from the circuit courts of appeal in any case certified by that court to the Supreme Court or removed from it to the Supreme Court by direction of the latter, and in some other cases in which A. to the circuit courts of appeal are not final; (iii) A. from state courts of last resort, but only in cases involving a federal question. Such is the case when there is involved (a) the validity of a treaty or statute of the U.S.A., (b) the repugnancy of a state statute to the Federal Constitution, or (c) where the decision is against any title, right, privilege or immunity claimed to be under the Constitution, statutes, treaties, or authority of the U.S.A.; (iv) A. from the Supreme Court of the Dist. of Columbia or the Supreme Courts of the ters.; (v) A. from the court of claims or from dist. or circuit courts in cases against the U.S.A. (4) *A. in Jury Cases.*—The Constitution provides that 'no fact tried by jury be otherwise re-examined in any court of the U.S.A. than according to the rules of the common law.' But this article merely prohibits a review by a court sitting without a jury of the conclusions of fact reached by a jury and there is an appellate

jurisdiction in jury cases which allows the court to review the rulings of the trial judge and to reverse the decision of the judge entered on the verdict for errors of law.

Congress passed an Act in 1916 to give finally to the decisions of state courts and circuit courts of appeal in certain types of litigation, leaving to a discretionary review by the Supreme Court the question whether a national interest might be involved. This Act has diminished the number of cases of writs of error to state courts, but appears to have had very little effect on A. from the courts of error to the circuit courts of appeal. After the Act had begun to make itself felt in reducing the cases on error to the state courts, the most prolific source of the courts' business was the direct review of dist. court decisions. An Act was passed in 1925 by which it was hoped to assemble in a single statute the whole law defining the appeal power of the U.S. courts and to gather up the scattered provisions defining the jurisdiction of the circuit courts of appeal. The aim of the Supreme Court is to be allowed to confine its adjudications to issues of constitutionality and other matters of essentially national importance. It is open to doubt whether the Act has achieved this purpose to any appreciable extent, but in theory cases now come to Washington only from 3 sources: the dist. court, the circuit court of appeal, and the state court. A decision adverse to the constitutionality of Federal legislation cannot be taken from the circuit court of appeal except on *certiorari* (q.v.); but a declaration by the circuit court of appeal of the unconstitutionality of state legislation is subject to review as of right by the Supreme Court. See Felix Frankfurter and James M. Landis, *The Business of the Supreme Court: a Study in the Federal Judicial System*, 1928.

**Appearance.** In law, within 8 days from the service of a writ or summons, the defendant must 'enter an A.' by delivering to the proper officer of the court a memorandum stating his intention either to defend the case himself or to employ a solicitor on his behalf. Notice of this is given to the plaintiff. This procedure obviates the need of a personal A. In civil cases special provision is made for the representation of infants, lunatics, companies, etc., by responsible persons.

**Appellants, or Lords Appellant,** the title given to Thomas, duke of Gloucester, and the earls of Derby, Arundel, Nottingham, and Warwick, who in 1387-1388 'appealed,' i.e. accused of treason, De Vere and De la Pole, the advisers of Richard II. during his minority. The L. A. were responsible for the actions of the 'Merciless Parliament' of 1388. In 1397 Richard imprisoned Warwick and Gloucester, and caused Arundel to be executed.

**Appendant,** a legal term applied to incorporeal hereditaments. Thus advowsons may be A. to a manor; lands to an office; and various rights, as of

fishing, to a freehold. As., as being originally annexed to the prin., are distinguished from appurtenances, which may be created by grant or prescription at any time.

**Appendicitis,** see APPENDIX.

**Appendiculariidae** (Lat. *appendix*, from *appendere*, to hang from), family of Ascidians belonging to the phylum Tunicata, including sev. genera, notably the Appendicularia, Oikopleura, Fritillaria, and Kowalevskia. They have an oar-shaped tail which contains a persistent notochord, and they have 2 gill-apertures. Huxley destroyed the fallacy that they were larvæ.

APPENDIX

A, large intestine; B, entry of small intestine (showing valve) into D, caecum; C, appendix.

**Appendix,** in anatomy, an appendage; the term is applied particularly to the A. vermiformis, the small blind gut projecting from the caecum. The average length of the A. is  $4\frac{1}{2}$  in., and the diameter about a quarter of an inch. The size, however, varies greatly, and cases have been recorded of the congenital absence of the A. It has no known function in the human body, and probably represents an organ which is gradually being evolved out of existence. Hence its vitality is low, and it is peculiarly susceptible to the inflammation known as appendicitis.

**Appendicitis** is favoured by any structural defects of the organ, such as unnatural length, location, and arrangement. The presence of faecal concretions and foreign bodies, such as seeds, gall-stones, bristles, worms, etc., acts as a predisposing cause; and intestinal disturbances, caused by indiscretions in the diet, may bring about

an attack. Females are less often attacked than men, because there is often a lymphatic connection between the A. and the right ovary, so that it is not so completely shut off. The onset may be gradual, but frequently is quite sudden. There are abdominal pain, fever, and constant tenderness on pressure over a limited area midway in a line between the anterior superior iliac spine and the umbilicus.

Surgical treatment is of great importance. Although all cases do not demand operation, a surgeon should always be at hand to help to settle the important question of when the operation should be performed. At the beginning of an attack is the safest time, but if abscesses are being formed before the condition is recognised, it is wiser to wait until adhesions have been formed. The death-rate from appendicitis has of late been enormously reduced by prompt surgical interference. The period of convalescence demands great care in the management of diet and bowel action, and no exercise of any kind should be undertaken for some time.

**Appenzell**, a canton of N.E. Switzerland, enclosed within the canton of St. Gall. It is divided into Ausser Rhoden, mainly Protestant and industrial, and Inner Rhoden, Rom. Catholic and pastoral. A remarkable feature of A. is the yearly *Landesgemeinde*, or general assembly, held in each Rhoden, at which every adult male citizen *must* appear, girt with a sword. Here the local gov. and the representatives to the Swiss Federal Assembly are elected. From the eleventh to the fourteenth century A. was under the abbots of St. Gall, but after a hard struggle for independence it became a member of the Swiss confederation in 1522. Its old code of laws (the Silver Book) is still used in swearing in the executive at the *Landesgemeinde* in Inner Rhoden. Ausser Rhoden (pop. 55,000, chief tn. Herisau (13,000) manufs. cotton, muslin, and embroidery. Inner Rhoden (pop. 14,500, cap. A. pop. 3000) is especially conservative in the retention of old-world dress and traditions.

**Apperception**, a metaphysical term first introduced by Leibnitz (1646-1716), to denote the spontaneous transformation by the mind of the 'perceptions' of sense into the elements of conscious knowledge. This idea was taken up by Kant (1724-1804), who laid special stress upon the spontaneity of the mental action involved, and introduced the theory of the 'synthetic unity of A.', i.e., the principle that all incomplete knowledge must be capable of falling into place in one complete system. The psychological side of A. has been worked out by Herbart (1776-1841), Lazarus (1824-1903), and Steinthal (1823-99), who emphasise the practical significance of the process, and make the realisation of this the basis of educational theory. The subject has received still further attention from Wundt and Stout. See G. W. von Leibnitz, *Nouveaux*

*Essais*, 1765; J. F. Herbart, *Psychologie als Wissenschaft*, 1824-25; G. F. Stout, *Analytical Psychology*, 1896; W. Wundt, *Principles of Physiological Psychology*, trans. 1904.

**Apperley**, Charles James, better known as 'Nimrod,' under which pseudonym he wrote many articles for the *Sporting Magazine* and the *Quarterly Review*, besides sev. books on sporting matters, including the famous *Life of John Mytton*, 1837. He was an enthusiastic fox-hunter, and his books take high rank in the literature of sport. He d. in London, 1843.

**Appiani, Andrea, the Elder** (1754-1817), a famous fresco painter of Milan. He modelled himself on Correggio, and is thought in his frescoes 'Amor and Psyche' at Monza, and others in the royal palace at Milan, to have almost equalled his master. His prosperity ended with that of his great patron, Napoleon I.

**Appiani, Francesco** (1702-92), a distinguished fresco painter of the eighteenth century, was b. at Ancona. He was employed by Benedict XIII. at Rome, but he lived chiefly at Perugia, where he continued to paint until his death. He shows a degree of vigour, except in the cases of Spinello Aretino and Titian, perhaps without a parallel. He painted, according to Lanzi, many pictures for Eng. commissions.

**Appiano** was the name of an It. family in the Middle Ages. Jacopo d'A. was secretary to Pietro Gambacorta, who made him chancellor of Pisa. He killed Gambacorta and his 2 sons 1392, and acquired Pisa, which was retained until his son sold it to the Duke Visconti of Milan about 1400. Piombino, however, was retained by the family until 1589, when Alessandro, the last possessor, was killed, and it fell into the hands of Spain.

**Appianus** (c. A.D. 90-140), an important Rom. historian, b. in the first century A.D. A native of Alexandria, he there attained high office, but about A.D. 100 removed to Rome. Here he practised as a lawyer, and also occupied himself in composing a series of chronicles of the growth of the Rom. empire, taking the chief dists. and periods separately. His 24 vols., 11 of which are extant, were merely compilations, and are not made attractive by eloquence or any great power of thought. Yet writing as he does on the hist. of those periods, especially of the civil wars, of which there are few memorials remaining, his records are of great value. His works have been ed. by sev. modern authorities, notably in Ger. by Schweighäuser, Bekker, and Mendelssohn, and an Eng. translation is pub. in Bohn's Classical Library.

**Appia Via**, a Rom. military road, begun about 312 B.C. by Appius Claudius, to consolidate the conquest of Samnium. Appianus illegally prolonged his censorship that he might complete this work and his famous aqueduct. He carried the former from Rome to Capua, and the skill with which it is taken through difficult country, over

hills, ravines, and marshes, is remarkable. It was continued later to Beneventum and Brundisium, and so solidly was it constructed that much of the old work remains to this day. Statius calls it 'longarum regina viarum.' For miles out of Rome it is bordered by pagan and early Christian ruins. Horace, in his first satire, describes a journey along it, and St. Paul came this way into Rome (Acts xxviii. 15). Trajan varied its final stage by a new route, the Via Traiana, from Beneventum by Canusium, and Pius VI. in 1789 constructed the New Appian Way from Rome to Albano.

**Appin**, a dist. of Argyllshire, in 'the Stuart country' between Loch Linnhe and Loch Creran, with rugged but beautiful scenery. Slate, granite, and lead are worked. Principal vills., Ballachulish, Duror, and A. This dist. plays an important part in Stevenson's *Klannapped*.

**Appius Claudius**, see **CLAUDIUS**.

**Apple**, a spurious fruit, or pseudocarp, of the species *Pyrus malus* of the Rosaceæ. It has been cultivated for many ages and in many lands; Homer speaks of its presence in the gardens of Alcinous and Laertes, while, according to the phrase of Horace, a Roman banquet lasted 'ab ovis usque ad mala,' from the egg to the A. It is a spurious fruit because the calyx-tube swells up to form the fleshy part. The *pips* are the seeds, and the pseudocarp is called a *pome*.

**Apple, Love**, see **TOMATO**.

**Apple of Sodom, or Dead Sea Apple**, the fruit of a tree said to grow on the shores of the Dead Sea. The legend avers that it looks like a tempting fruit, but when plucked is found full of ashes. Thus 'like an apple of Sodom' has come to signify disillusion.

**Appleberry**, see **BILLARDIERA**.

**Appleby**, a bor. and mkt. tn., cap. of Westmorland, on the R. Eden. It was an important stronghold in the Norman period, and suffered so much from attacks by the Scots in 1176 and 1388 that it never regained its former status. During the great rebellion it was held for the king by Anne, countess of Pembroke. It returned 2 members to Parliament until 1832, when it was disfranchised. Pop. 1600.

**Appleton**, co. seat of Outagamie co., Wisconsin, U.S.A., on the Fox Riv., about 90 m. N. of Milwaukee. First settled in 1833. Has a famous univ. founded by Amos Laurence in 1847, also large manufs. of paper, machinery, woollen goods, etc. It became a city in 1857. Pop. 28,000.

**Appleton, Sir Edward V.** (b. 1892), Brit. physicist, b. at Bradford, Yorkshire, educated at the Cavendish Laboratory, Cambridge. Devoted himself to research on radio-waves, and has become the world's leading authority on them. Secretary of the Dept. of Scientific and Industrial Research, thus occupying the senior Brit. Gov. post concerned with physical science. In 1924, to-

gether with S. J. Barnett, A. devised and made the experiment which proved the existence of the Kennelly-Heaviside reflecting layer in the upper atmosphere. They located the position of this layer in the upper atmosphere by radio-waves. The experiment was, therefore, the first example of the location of an object by radio waves—or, in other words, by radio-location. The technique was subsequently used for the location of aircraft. In further experiments A. in 1926 showed that there was an additional reflecting layer at a height of 150 m. above the ground, which was electrically stronger than the Kennelly-Heaviside layer, and was the reflecting agent which enabled short radio waves to pass round the world. Hence, the fact that we can broadcast round the world is due to this experiment. Has pub. various original papers on electricity and the scientific problems of wireless telegraphy.

**Appoggiatura** (It. *appoggiare*, to lean on), a short musical note used as an embellishment, and having no time-value. The time of the long A. is taken from the note which follows it; it is given its marked value, and the succeeding note takes what remains of its face value. It originated in the desire of classical composers, such as Beethoven, to hide a suspended note, and is now obsolete. The short A. is known also as an *acciacatura* (q.v.) or grace-note, and is written with an oblique stroke through the stem.

**Appointment, Power of**, see **POWER**.

**Appomattox Courthouse**, a vil. in A. co., Virginia, where the Confederate army under Lee surrendered to the Federals under Grant on Sunday, Apr. 9, 1865, and ended the Civil war.

**Apponyi, Count Albert** (1848–1933), Hungarian statesman and the 'Grand Old Man of Hungary.' Originally leader of the Nationalist party (Conservative), but in 1899 went over to Liberals. Leader of the Independent Kossuth party, which opposed the Hapsburg dynasty. In 1901 became president of the chamber of deputies, but resigned from the Liberals in 1903 and again led the National party. In 1906 as minister of education his work had a profound effect on Hungarian culture. After the Communist revolution he was commissioned by the Entente to form a gov. in Hungary, but failed to secure agreement between the different parties. Was chairman of the Hungarian peace delegation. Was awarded Grotius prize of The Hague Univ. together with Earl Balfour. See *The Memoirs of Count Apponyi*, 1935.

**Apportionment**, signifies generally a sharing in due proportion, as in the allocation of benefits, damages, liabilities, etc. In law the regulations concerning A. are so numerous and complicated that special Acts to systematise them have repeatedly been passed in Great Britain, the colonies, and the U.S.A. They fall under 2 main heads: (1) A. in respect to estate; (2) A. in respect to time. Property bequeathed on trust

under certain conditions is governed by what is called *equilable A.*

A. Bills are passed in the U.S.A., one after every census, to determine the ratio of representation for each state in the coming decade; the states themselves also make similar regulations for their own legislatures. This system has often been greatly abused for party purposes.

**Apposition.** In grammar, when a noun or noun-clause is used to explain a noun or pronoun in the same case, they are said to be in A.; thus 'John the Baptist was beheaded,' 'He, the chief culprit, escaped.' Here 'the Baptist' and 'the chief culprit' are nominatives in A. to 'John' and 'he' respectively. Again, 'Alexander killed Clitus, his friend'; here 'friend' is objective in A. to 'Clitus.' In the possessive case the apostrophe is added to the second noun, as 'William the Conqueror's army.'

**Appraisement,** a legal term meaning valuation, such as may be required for purposes of sale, distress, mortgage, assessment, compensation, or probate. Any person undertaking the work, unless he is a licensed auctioneer or house agent, must take out an appraiser's licence, the penalty for default being £50. He is liable to the person employing him for any loss arising through negligence or want of skill on his part.

**Apprehension,** in psychology, a term which serves to point the distinction between the act of thinking and the object of the thought. A complete object can only be adequately described in language, and not by isolated words, or, in other words, only by propositions capable of being asserted, denied, or assumed. If, for instance, the thought takes the form of believing, it is clear that we cannot 'believe' the object as such, but we must believe some proposition concerning that object. Again, when we are said to 'perceive' or 'know' something, this expresses the fact that we perceive or know that something is or is not the case. From this it is evident that the object of thought holds an identity in our consciousness which is independent of both time and change. It retains its identity of meaning. Events begin and cease; but what the mind *apprehends* is not the mere event as it occurs, but the 'fact' that it does occur. Thus, the Great Fire of London began and ended in 1666, but the fact of its occurrence in that year is not limited by temporal conditions; that it happened in that year is a *fact at the present moment*. In the language of psychology, the distinction is between the act of thinking, which is an event in our own mental hist., and the object which has the same meaning whenever it is apprehended. The acts of thinking and apprehending are distinct occurrences in the time-order of our conscious life. I can apprehend the Great Fire repeatedly on different occasions; but on each separate occasion my perception is a separate one. As a corollary of this position,

it is evident that the object itself can never be identified with the present modifications of the individual consciousness by which it is 'cognised.' Again, there is said to be 'implicit A.' when anything is apprehended in the act of apprehending a whole of which it forms a part, without being separately distinguished as a constituent of this whole. Thus, in glancing at a clock, I am distinctly conscious of the clock face as a whole, but not separately of the shape of each individual numeral which it contains; or again, in listening to a band, I may clearly apprehend the combined sound as a confused mass without differentiating the several tones produced by the various instruments. Such implicit awareness is called by psychologists subconsciously as distinguished from clear consciousness. Psychology also deals with this distinction in the consideration of the organism and forms of 'attention' or the range and scope of attention or of momentary consciousness. Consult James Rowland Angell, *Psychology*, 1905; G. F. Stout, *A Manual of Psychology*, 4th edition, 1929.

**Apprentice,** one who is contracted to a master for a certain period to be taught a trade or profession; in return he gives his services, and usually a premium is paid. The system can be traced back to the thirteenth century, when it applied to all trades and professions, even students being indentured to study for their degrees. Barristers were technically As. for 16 years, but for most arts and crafts the term was 7 years, which period was made universal and compulsory early in the reign of Elizabeth. Difficulties and anomalies arising later led many persons to question the value of this arrangement, and after much argument, in which Adam Smith in his *Wealth of Nations* took a leading part, Parliament decreed in 1814 that trades and handicrafts should be thrown open to non-As. also. Of late years, owing to many causes, such as parents' difficulties in paying premiums, the increased subdivision of labour, trade union restrictions, etc., the number of apprenticeships has so decreased as seriously to affect the supply of thoroughly trained workmen. Efforts have been made by various public bodies to remedy this, with only partial success.

An A. being generally a minor, the contract is signed on his behalf by a parent or guardian. It must always be stamped, except in the cases of parish and ships' As. A master has considerable authority over a lad during his period of service, but the tyranny and ill-treatment which were common in olden times are now unknown. The A. must work on any day his master requires, except Sunday, and must not enter upon any engagement which might interfere with his duties, without the employer's consent. Obedience and good conduct are imperative, but corporal punishment for

misbehaviour has become obsolete. The master must supply proper training and indoor As. must be provided with food and medical attendance. He cannot discharge an A. without grave cause, such as serious misconduct or permanent disablement. The agreement is at an end if the master dies or becomes bankrupt, and it may be concluded by mutual consent.

**Approaches**, in warfare, trenches dug by besiegers to protect them in gradually working their way nearer to the line of fortification. Introduced into Europe by the Turks in the fifteenth century.

**Approbate and reprobate**, a Scottish theological term corresponding to the Eng. 'doctrine of election.'

**Appropriation** (from Lat. *appropriare*) means the setting aside of money or other property to be applied exclusively for one particular use. In Eng. eccles. law, the existing system of impropriation is the result of the changes made during the reign of Henry VIII., when at the dissolution of the monasteries many of the lands which had belonged to the Church were granted by the king to his courtiers and others. These estates often included rich benefices, whose principal tithes had been appropriated to the use of a monastery or bishopric, while a vicar or curate had been appointed to take charge of the par. duties. The new owners continued the custom, and those of them who were laymen came to be called lay impropriators, or lay rectors.

In civil law, a debtor who owes separate amounts to the same creditor is entitled when making a payment on account to allocate the money as he likes in respect of the different debts. If he pays it in without making any such stipulation the creditor can appropriate it as he chooses, even to the payment of a debt which has been allowed to lapse. If there has been no selection by either, the law generally gives the preference to earlier rather than later debts.

In constitutional finance, both in Parliament and, in the U.S.A., Congress, special Appropriation Acts are passed every session to authorise payments by the Treasury of various sums required for the public service, as set forth in estimates presented to and passed by the House.

**Approved School**. Before the passing of the Children and Young Persons Act, 1933, A. Ss., or 'Home Office schools,' as they are sometimes called, were known as industrial schools and reformatories. The expression 'Home Office school' is misleading, because it suggests that they are entirely run by the Home Office, whereas, in fact, out of a total of 95 such schools which were certified in 1939, 72 were under voluntary management, and the remaining 23 were provided by local authorities. But none of them may operate except subject to Home Office inspection and approval, though the Home Office has no control over the appointment of the staff apart from the headmaster or headmistress. The cost of maintaining a

child in an A. S. is borne equally by the Exchequer and by the local authority within whose dist. the child was resident when his (or her) offence was committed, or the circumstances arose which led to his committal. But the child's parents or guardian may be required to contribute according to their means. The schools are classified according to age-groups: Boys' schools: junior (for boys under 13 on admission); intermediate (boys of 13 and under 15 on admission); and senior (boys of 15 and under 17). Girls' schools: junior (girls under 15 on admission), and senior (for girls of 15 and under 17 on admission). Each of the classes contains Rom. Catholic schools, and there is a subsidiary classification of the senior schools according to the specialised forms of technical training they provide. Thus among the boys' schools there were, in 1939, 4 nautical schools, besides schools equipped for instruction in engineering, agriculture, gardening, and other trades. Most of the girls' schools teach domestic subjects, but a few specialise also in gardening too. In the junior schools the education provided is on the same lines as in the public elementary schools. A child or young person may be committed by the court to an A. S. in any of the following circumstances: (i) on a finding of guilt for any offence punishable in the case of an adult with imprisonment; (ii) on the application, and subject to the consent of, his parent or guardian, and of the local authority, if he is found by the court to be 'beyond control'; (iii) on the application of a public assistance authority, if he is maintained in, or boarded out from, an institution belonging to the authority and he is found to be refractory; (iv) on the application of the local education authority if the court finds that a school attendance order has not been complied with; and (v) if a child or young person is found by the court to be 'in need of care or protection.' Once the court has decided to commit a child or young person to an A. S., it is the duty of the local authority to make inquiry and to supply the court with information as to a suitable school in which there is a vacancy. But the selection of the school rests with the court, limited of course by the age of the child and his religious persuasion. Under present conditions the schools are so full that a local authority is fortunate if it succeeds in finding a vacancy in any school of the right age-group within a month or two of committal. At the end of 1941 there were no fewer than 1300 children, all committed to A. Ss., waiting their turn in remand homes in different parts of the country. Sometimes several months elapse between the date of committal and the child's arrival in the school, during which time he has to be detained in a type of institution which was never designed for long-term treatment. At the moment (1942) the Home Office is planning to relieve the congestion in the remand homes by the opening of sev. new A. Ss., and, in particular, by the erection of 4 new institutions, designed on the lines of permanent camps, each with a capacity

of 250 children. In recent years the experiment has been tried of providing a few short-term A. Ss. to which the court may send cases which do not appear to require the full training which the ordinary school provides.

Consult *The Child and the Magistrate*, by John A. F. Watson (chairman of the Southwark Juvenile Court), 1942.

**Approved Society.** 1. A friendly society approved by law for the purposes of the National Health Insurance Acts prior to that of 1946. See NATIONAL INSURANCE.

2. A society registered under the Industrial and Provident Societies Acts (1893-1923), or the Friendly Societies Acts (1896-1924), one of whose chief

APRICOT

objects is the provision of allotments, and which is restricted by its constitution as to the rate of interest on its share and loan capital and the distribution of profits among its members.

3. A registered company the constitution of which prohibits the issue of any share or loan capital with interest or dividend exceeding the rate laid down by Treasury regulations.

**Approver.** By the old Eng. law, when a person who had been arrested, imprisoned, and indicted for treason or felony confessed the crime charged in the indictment, and was admitted by the court to reveal on oath the accomplices of his guilt, he was called an A.

**Approximation,** a term used in mathematics to denote a result which is not exact, but sufficiently accurate for the purpose for which it is required. Where calculations depend on measures of length, weight, etc., the measurements themselves, even with the best of instruments, are only approximate, so that it is useless to elaborate the calculations to a degree of refinement exceeding the efficiency of the instruments. Where money calculations are involved, it is usually unnecessary to carry them further than the limits of the coinage; for instance, interest calcula-

tions do not generally include fractions of a penny.

A. may be procured by limiting the number of places of decimals, or the number of significant figures, or by expressing the result as correct within a certain fraction of error of the whole. In pure mathematics, logarithms and trigonometrical constants are usually only correct to a certain number of places of decimals.

**Apraxin, Feodor** (1671-1728), a distinguished Russian soldier and admiral under Peter the Great, whom he greatly assisted in founding the Russian navy. He took a leading part in the wars against Sweden and Turkey, and was made senator and admiral-general. Brave, genial, capable, and energetic, he was yet greedy and dishonest, and incurred Peter's wrath to such an extent that he would have been beheaded but for the intervention of the Empress Catherine, whom later he helped to place on the throne at Peter's death.

**Apricot,** a well-known fruit, a drupe, of the *Prunus Armeniaca*, a species of Rosaceae. It is related to the cherry, almond, peach, and plum, and is largely cultivated in Europe.

**Apries,** an Egyptian king, the son of Psammis (Psamthek), and eighth king of the twenty-sixth dynasty (Eusebius), or the seventh, according to Africanus. In Heb. hist. he is known as Pharaoh Hophra (Jer. xlv. 30). He succeeded his father in 589 B.C. and reigned 25 years. He made an expedition against Cyprus, and fought a naval battle with the king of Tyre. His army sent against the Gks. of Cyrene was defeated, and this circumstance caused a revolt of the people under Amasis, whom they asked to be king. A. was defeated and executed 568 B.C. and was buried in his ancestral tomb at Sais. See Herodotus, II. 161-163 and 169; iv. 159.

**April,** the fourth month of the year, consists of 30 days, which was the number said to be assigned to it by Romulus. Numa Pompilius gave it 29; but Julius Caesar gave it 30, which number it has since retained. In the original Alban or Lat. calendar A. consisted of 36 days and was the first month. The Rom. name was Aprilis, from *aperire*, to open; either from the opening of the buds, or of the bosom of the earth in producing vegetation. The A.-S. name was *Eostre-* or *Eastre-monath*.

**A priori** and **A posteriori.** The contrast between these 2 methods of reasoning does not now imply exactly what it did in anct. times. By an *a priori* argument was originally meant one from law or cause to effect, by a *posteriori* one from effect to cause. Kant, the great Ger. philosopher, introduced a new distinction. Reasoning on the fundamental laws of the mind, he asserts that there are certain 'transcendental ideas' (called by him *categories*), which exist independently of experience, and arguments from these are *a priori*. Such ideas are those of space, time, reality, negation, and

others, which, he says, we do not derive from experience, but through the application of which we acquire experience. In morality also he declares that the ideas implied in the words good and bad are innate and imperative in every mind, independently of actual observation. *A posteriori* arguments, on the other hand, are deduced from experience founded on observation. That school of philosophy which sets the highest value on the Kantian *a priori* reasoning is called Institutionalism or Transcendental; the opposing section are called Empiricists.

**Apron.** The original meaning of a protective outer garment has been extended to cover various engineering devices used to shelter certain parts of a mechanism. Thus it is used of a rectangular piece of lead which covered the vents of cannon; of a piece of curved timber above the forward end of the keel of a ship; of a protective platform at the base of machines, etc.

**Apsaras** in Hindu mythology, a race of female water-sprites, somewhat resembling the Germanic swan-maidens, who appear in the Gandharvas legends.

**Apsæ**, a semicircular or polygonal termination to or prolongation of a church or other building, more common on the Continent than in England. Besides the A. at the E. (or W.) end, others have sometimes been added, for example, at the ends of transepts. As. are frequent in Byzantine and Coptic churches, and in anc. Rom. buildings.

**Apscheron** is a peninsula in the Caspian Sea at the end of the Caucasus Mts. The seaport of Baku (*q.v.*) is situated here, and the dist. has a very large petroleum industry.

**Apsides.** All heavenly bodies, except free-wandering comets, move round their primaries in an elliptical orbit, and the 2 points in that orbit which are at the greatest and least distance from the central body are known as A. The point most distant is called the higher apsis or aphelion, that least distant the lower apsis or perihelion (the corresponding terms in relation to the moon are apogee and perigee). The line of A.'s is the major axis of the ellipse. This line, which, owing to the attraction of other bodies, is always shifting forward (in the case of the earth and all the planets except Venus, where the motion is retrograde), gives rise to what is known as the anomalistic year, i.e. it takes the earth 4 min. 39 sec. longer than the sidereal year to return to its perihelion.

**Apsley House**, a mansion standing by Hyde Park, London. It was built by Baron A. Lord Bathurst, in 1785, and in 1820 Wellington bought the lease from his brother, after living in it from 1816, and in 1830 he bought the Crown interest. It is now the property of the nation.

**Apsyrtus**, see ABSYRTUS.

**Apt** (anc. *Apta Julia*), a Fr. tn. in the dept. of Vaucluse, 30 m. S. of Avignon. The cathedral was built about the tenth century. Pop. 6000.

**Apertal** (Gk. a privative, and *πτερόν*

wing), an architectural term applied to a temple which has prostyle, but whose columns do not extend laterally and run along the flanks from one end to the other. Few Gk. temples followed this fashion but most of the Rom. parallelogrammic temples were apertal prostyle.

**Apterygota**, or **Aptera**, are insects which are themselves wingless, and are thought to have descended from wingless ancestors. They thus differ from such insects as wingless ants, which have winged relations and ancestors. In this group there are only 2 orders, the Collembola and Thysanura. The best-known species in Britain belongs to the latter order, and is the *Lepisma saccharina*, the silver-fish, found in kitchens.

**Apteryx** (Gk. a privative, and *πτερόν*, wing), or **Kiwi**, a bird found only in New Zealand, is a ratite bird of the family Apterygidae. The tail and wings are minute and useless, the feathers are hair-like, the beak is long and weak. It is about the size of a hen, is nocturnal, insectivorous, and lays a single large-sized egg.

**Apuan Alps**, a branch of the Etruscan Apennines, 30 m. long, lying parallel to the Ligurian Alps and falling very steeply to the Mediterranean. The greatest altitude is reached in Mt. Pisanino (6382 ft.). They are noted for beautiful white marbles (Carrara, Massa, etc.).

**Apuleius**, **Lucius** (b. A.D. 130), a Rom. satirist and rhetorician, b. at Madaura, N. Africa, was the son of a wealthy magistrate. He studied at Carthage and Athens, and showed a preference for the philosophy of Plato. After the death of his father he used the great riches left him to travel, and went to Italy and Asia. The outcome of this was his great satire *The Golden Ass*, a prose romance purporting

APSIDES

to narrate the experiences of one Lucius, whom an enchantress had changed into an ass. Justly described as the 'parent of modern romantic literature,' it is veritably 'a gallimaufry of intrigue, sorceries, bickerings, and ravishments, savoured with gaiety and humour, told at the topmost pitch of skyscraping spirits.' The finest part is the graceful tale of Cupid and Psyche, which has been pub. separately more than once. Adlington was the first Eng. translator of the whole of the work (1566). (See also ADLINGTON, WILLIAM.) It was also trans. by Sir George Henry in 1831 in Bohn's Classical Library. A. married a wealthy

widow, and was accused by some of having gained her by witchcraft. His defence was pub., and is a very fine piece of work (*Apologia sive Oratio de Magia*). He spent the latter part of his life at Carthage, and the exact date of his death is uncertain.

**Apulia** (It. *Puglia*), a region of Italy comprising the 3 provs. of Bari, Foggia, and Lecce, with an area of 7400 sq. m. The Apulian Plain forms the N. part, which is rather barren, although sheep are bred there and cultivation of the land is practised in certain spots. The S. part is more hilly, and in the N.W. of this part is the isolated mt. of Gargano, which reaches to the height of 5000 ft. in one place. The R. Ofanto (Aufidus) is the chief waterway of the dist., and there are 4 fairly large lakes. The chief exports of the place are wine, fruit, cereals, and silk. The prin. ports are Gallipoli, Taranto, and Brindisi, while the chief tns. are Foggia, Barletta, Andria, Lecce, and Bari. In anct. times A. was inhabited by sev. peoples, as the Apuli, the Messapii, and the Daunil. It was conquered by the Romans in 317 B.C. The second Punic war was partly fought here, and the battle of Cannæ took place within its borders in 216 B.C. It came under the power of the E. empire, and afterwards became part of the Lombard duchy of Benevento. The Byzantines recovered part of it subsequently, only to lose it again to the Normans, and afterwards Robert II. seized it and merged it under the crown of the Two Sicilies. Pop. 3,027,000.

**Apulum**, see ALBA-IULIA.

**Apuré**, a riv. in Venezuela which rises in the Cordillera Mts. and flows into the Orinoco. The chief tns. on its banks are San Fernando and Nutrias. Its course is about 1000 m., and it is navigable for just over half that distance.

**Apurimac**, a riv. in Peru which rises in the Andes in the prov. of Arequipa. After a course of about 600 m. it joins the R. Ucayali, and finally the Amazon. It also lends its name to the dept., which has an area of nearly 8200 sq. m. The cap. is Abancay, and it yields rubber, rice, and cotton, having also excellent grazing land for cattle-breeding.

**Aquæ Calidæ**, see VICHY-LES-BAINS.

**Aquæ Perennes**, see EPERNAY.

**Aqua fortis**, the old name for nitric acid.

**Aquamarine** (Lat. *aqua*, water, *marinus*, pertaining to the sea), a sea-green or bluish-green variety of beryl which is used as a precious stone. It is found in N. and S. America and in Australia.

**Aqua regia**, a mixture of nitric acid with 4 times its vol. of hydrochloric acid. It derives its name from its capacity for dissolving the so-called 'noble' metals, such as gold and platinum, which are unaffected by most solvents.

**Aquarium** (Lat. *aqua*, water), a small reservoir of fresh or salt water in which aquatic animals and plants are kept for scientific purposes, or for amusement.

Large aquaria are to be found in places such as zoological or botanical gardens and laboratories in which biology is studied.

Owing to the placidity of the water and air, an A. is difficult of aeration; artificial fountains, the presence of green plants, and the action of pouring water from a height are all beneficial. In a salt-water A. the green alga of the genus *Ulva* grows readily, while duckweed will flourish in fresh water. The amateur natural historian will find sticklebacks, minnows, newts, tadpoles, axolotls, and water-snails thrive under his care, but generally fish are difficult to preserve alive. Gold-fish, sun-fish, thunder-fish, and cat-fish frequently are denizens of aquaria, but they are liable to be attacked by a fungus disease which usually proves fatal. Insufficient aeration and decaying food will cause a white, film-like substance to cover their bodies, hamper their movements, infect their neighbours, and work speedy havoc among them. It may sometimes be removed by placing them in water in which salt has been dissolved, or by gentle application of a soft paint-brush when the patient is under running water. The *Triton cristatus*, a large newt, is a hardy, carnivorous amphibian which requires a large receptacle, and at certain periods of the year prefers to live on land. See E. G. Boulenger, *The Aquarium Book*, 1925; G. C. Bateman, *Fresh Water Aquaria*, 1936.

**Aquarius**, a group of stars forming the eleventh sign of the zodiac. This constellation is supposed to bear a resemblance to a water-bearer, hence its name and its hieroglyph . The sun enters this constellation on Jan. 21. The origin of the name has been traced by some to the fact that the Nile rises during the month of A., whilst others attribute it to the rainy season in India. No star in A. is brighter than the fourth magnitude, but it includes some interesting double stars, a fine star-cluster, and the 'Saturn' nebula.

**Aquatic Animals** is a vague and wide term applied to animals which cannot exist without water, to amphibians which take to it on occasions, and to animals which are also perfectly at home on land; it includes those which respire air by means of lungs, or water by means of gills, vibratile cilia, or any other apparatus. They are distributed over the whole world.

Most of the lower invertebrates are truly A.: sea anemones, jelly-fish, many of the annelids, even earthworms, and crustacea, such as crabs and lobsters, cuttle-fish, molluscs, such as mussels and cockles, with the exception of some gasteropods, would perish if exposed to the sun and deprived of water. Among vertebrates fish are exclusively formed for inhabiting a fluid medium; they breathe by gills, are covered with scales, their form is elongated and compressed, the eye is suited to the dense medium of the water, they balance themselves on fins, and the

laterally compressed tail serves as a paddle. Among reptiles, crocodiles and turtles may be regarded as truly A.; they breathe air, however, and come on land to lay their eggs. Nearly all A. birds (except, e.g., the water-ouzel) have webbed, oared, or lobated feet, as grebes, auks, puffins, razorbills, geese, ducks, pelicans, gannets, and gulls; the penguin is as awkward on land as a seal, and as much at home in the sea. Among mammals the whales and porpoises are most truly A., having a smooth and oily skin, a layer of blubber covering the internal viscera, and they are constructed to permit a long cessation of respiration while submerged; walrus and seals obtain their food in the sea, but breed and repose on rocks; their fore-limbs are formed into paddles, the hind limbs are placed far back and are also paddles or oars, and every part of their internal structure is saturated with oil. Other A. mammalia are usually only web-footed and visit the water for prey (e.g. the otter).

**Aquatic Plants** are known in botany as Hydrophytes (Gk. *ὕδωρ*, water, *φύον*, plant), and the term of Hydrophyta has sometimes been applied to the algæ, rather illogically, since all water-plants do not belong to that div. The Hydrophytes form a large group of flowering plants, and differ from Geophytes, which are rooted in the soil, and Epiphytes, which use other plants for support, chiefly because they dwell in the water. Plants are also grouped according to their habitat into Hydrophytes living in water, Xerophytes, those found in very dry conditions, e.g. the *Cacti*, and Mesophytes, the vast majority of plants, growing in medium conditions of humidity, i.e. in ordinary damp soil. There are, however, many incidental peculiarities of structure and pollination in Hydrophytes which are not present in their geophyte relations, and when transplanted to soil become extinct. They are not influenced by changes of temp. to such a degree as their earth-grown neighbours, hence many of them are perennial. They frequently form winter-buds, which hibernate at the bottom of the water and develop in the early spring (e.g. *Utricularia*, or bladder-wort, and *Potamogeton*, or pond-weed). Besides this asexual reproduction there is the ordinary sexual reproduction common to flowering plants, many of the flowers being above the water and pollinated by insects or the wind; several, e.g. *Zostera*, or eel-grass, have submerged flowers, of which the pollen grains are thread-like and float at any depth of water until finally they reach a large stigma and so come to rest.

An interesting feature of these plants is their heterophyllous condition, for there are no fewer than 4 types of leaves observable in them. Those which live beneath the surface are not cuticularised, and are devoid of stomata, the latter confined to the upper surface, whereas in mesophytes they are usually more numerous on the lower surface, while

those which float on the surface have both cuticle (generally of a waxy nature) and stomata. The 4 types are: (a) ribbon leaves, (b) much-divided leaves; (c) awl-shaped leaves; and (d) entire, rounded or lobed surface leaves. The ribbon leaves are found in plants which grow in running water, e.g. *Zostera*; the much-divided leaves occur in still-water plants, e.g. *Ranunculus aquatilis* or water crowfoot; the awl-shaped leaves are also submerged, and are found on plants which usually can also grow on land, e.g. *Subularia*, or awl-wort; the floating leaves have large and conspicuous air-spaces, as exemplified in such plants as *Nymphaea*, or white water-lily, *Nuphar*, or yellow water-lily, and also *Ranunculus aquatilis*. Air spaces are also common in the stem. The slimy nature of the hydrophytes is caused by a mucilaginous secretion from surface glands or hairs; the fibrous and vascular tissues are developed to a very slight extent.

Among other interesting A. P. may be mentioned *Elodea*, or Canadian water-weed, *Typha*, or bulrush (also known as cat-tail), *Nelumbium*, or sacred lotus, *Ceratophyllum*, or hornwort, *Sagittaria*, or arrow-head, *Nasturtium officinale*, or water-cress, *Iris pseudacorus*, or yellow flag, *Lemna*, or duckweed, *Stratiotes*, or water soldier. Among these are included a few plants which have their roots in water and the shoots in the air, e.g. the bulrush, and these are often classified as marsh plants. The algæ are treated of in a separate article. See J. C. Willis's *Flowering Plants*, 1908; Agnes Arber's *Water Plants*, 1920.

**Aquaint**, a means of etching on copper or steel to produce pictures in imitation of sepia and Indian ink drawings. The effects are obtained by the action of acid through a porous ground of sand or some thin resinous solutions, on copper sheets. It was invented in the eighteenth century, but is very little used to-day.

**Aqua Tofana**, a liquid poison invented by a woman named Tofana in the seventeenth century. It was tasteless, colourless, and very deadly, even in small quantities. It was sold in Rome and Naples by her daughter. The ingredients have never really been discovered, but it is supposed to have been composed largely of arsenic and lead.

**Aqua-vitis** (Lat., water of life), a term commonly applied to distilled spirits, having the same sense as the Fr. *eau de vie* and the Gaelic *uisge beatha* or water of life—whence whiskey. At one time largely used medicinally, and thought to have the power of prolonging life.

**Aqueduct** is an artificial conduit or channel for the conveyance of water, the term being usually applied to an open channel rather than pipes. As were made on a large scale by the Egyptians and Babylonians, while some of the ant. Gk. and Rom. As. are used to this day. Most of the former are

subterranean, and wonders of engineering skill, but perhaps this mode of getting water from the hills to the tns. was most extensively employed by the Romans. Rome itself was supplied by nine Aa., which brought the water over 60 m., and in some places were built nearly 200 ft. in height. These were formed either by erecting one or more rows of arcades across a valley and making them support 1 or 2 more level canals, or by boring through mt. sides which would have interrupted the water-course.

AQUEDUCT AT SEGOVIA

Ruins of Aa. can be found in many parts of Europe, among which may be mentioned the famous one at Pont du Gard at Nîmes. At Metz in France, and at Mainz in Germany, there are also ruins of the same sort. Spain has one at Segovia, and Portugal at Evora, while in Italy these ruins are very numerous.

The famous Spoleto A., 60 m. N. of Rome, erected in the seventh century, is a wonderful piece of work; and of a later date the Maintenon A., which was begun in 1684 but never finished, is one of the finest structures of this nature in the world, despite its incomplete state. Other Aa. of modern times and still in use are the Bridgewater Canal over the R. Irwell (the first in England), the Croton A., which supplies New York, the Marseilles A., over 60 m. in length, and also those at Manchester, Glasgow, Birmingham, Bombay, and Vienna. In certain parts of the U.S.A., especially California, there are timber Aa. termed flumes, which are frequently carried along steep mountain slopes and across valleys, supported on trestles. They are used to convey water for hydraulic mining,

for irrigation, and timber transportation. The 3 largest Aa. in the U.S.A. are (1) the Catskill, supplying New York, (2) the Owens R., supplying Los Angeles, and (3) the 'Hetch Hetchy' A., completed in 1932, which serves San Francisco. The Catskill has a length of 92 m. (of which 14 m. are tunnel and 23 m. pressure pipes) and a capacity of 500 million gals. per day. The Los Angeles A., which cost about 23 million dol., to construct, has a capacity of 280 million gals. per day and a length of 223 m. The San Francisco A. is 156 m. long, with a capacity of 400 million gals. per day.

**Aqueous Humour** is a watery fluid between the cornea and crystalline lens of the eye.

**Aqueous Rocks**, a term applied to rocks which have been formed by the chemical and mechanical action of the water or by organic depositions. They may be made respectively of chemical precipitates, of former rocks crumbled by the sea and cemented by softer material, or of decayed vegetable and animal life, sometimes called also *sedimentary rocks*.

**Aquiba (Aqiba)**, or **Akibah, Ben Joseph**, called Barakiba by Epiphanius and Hieronymus, lived during the end of the first century and the early part of the second (c. A.D. 50-132). He was a disciple and successor of the Rabbi Gamaliel. He joined the standard of the pseudo-Messias Bar-cochba (*q.v.*) in Judæa, and when the Emperor Hadrian took Bethara, he ordered that A. should have his skin taken off by an iron comb. He was buried in Tiberias. The authorship of the *Jezirah*, the chief book on cabalistic doctrines, has by some been ascribed to A.

**Aquifoliaceæ** (*Inf<sup>ra</sup> aqua*, water, *folium*, leaf), a natural order of dicotyledonous trees and shrubs with leathery leaves. The order has been named after the *Ilex aquifolium*, the holly, and has been characterised by Brongniart as *Illicineæ*.

**Aquila** (Lat., an eagle), a constellation situated above and resting on the zodiacal constellations of Capricornus and Aquarius, and to be found duo S. at 8 p.m. in the middle of Sept., at about 40° of elevation. In the Gk. mythology this constellation represented the eagle of Jupiter, and according to some the bird which was the tormentor of Prometheus. It is conjectured that the name was given when A. was near the summer solstice, and that the bird of highest flight was chosen to express the greatest elevation of the sun. A group of stars, now treated as part of A., were named Antinous by order of the Rom. Emperor Hadrian.

**Aquila and Priscilla**, a Jew of Pontus and his wife, who had settled in Rome, but left when the Jews were driven out by Claudius (*see* Acts xviii. 2). They were dwelling in Corinth when Paul arrived and made their acquaintance, and, as they were of the same trade as Paul, he lived with them. A. and P. left Corinth with Paul, accompanying him

as far as Ephesus, where they took up their abode. Apollos (or Apollonius) was instructed by A. and P. In Rom. xvi. we read that Paul sends his greetings to them, whence it is deduced that they had returned to Rome; but it is probable that they never left Ephesus. What befell them afterwards is not recorded.

**Aquila Ponticus**, a relative of Emperor Hadrian, lived in the second century, and translated the O.T. into Gk. Part of this version is found in Origen's *Hexapla*.

**Aquila degli Abruzzi**: 1. Prov. of Italy, between the Apennines and the prov. of Rome. Produces cereals, flax, hemp, and fruits. Area 2500 sq. m. Pop. 339,000. 2. Cap. tn. of above, on R. Aterno, 58 m. N.E. of Rome. Founded by Emperor Frederick II. on the ruins of Amiternum. Almost destroyed by an earthquake in 1703, but is now a well-built and populous city; a bishop's see; and has a large trade in saffron, and paper, linen, and lace manu. Pop. 55,000.

**Aquilegia**, a genus of Ranunculaceae, literally the water-gatherer, because the leaves collect water in their hollow. *A. vulgaris* is the columbine. The plants are found in temperate lands.

**Aquileia**, anct. tn. of Italy, at the head of the Adriatic. It was built by the Romans in 182 B.C., and strongly fortified, and at one time contained over 100,000 inhab. It was the key of Italy on the N., and in A.D. 238 it was besieged by Maximin, and in 452 destroyed by Attila. Many of the people fled to the lagoons, where Venice now stands. A new tn. was built, but it never regained its former glory. A cathedral was built in the eleventh century. It is now a poor tn. of 2900 inhabitants.

**Aquin**, a tn. on S. coast of Hayti, W. Indies, 72 m. S.W. of Port-au-Prince. Pop. of com., 20,000.

**Aquinas, Thomas** (c. 1226-74) (Thomas of Aquino), one of the most famous of scholastic theologians. He was of noble descent, and was b. at the castle of Roccasecca, the property of his father, the count of Aquino, in the ter. of Naples. He began his education at the monastery of Monte Cassino, after which he studied in the univ. of Naples. Whilst there he came under the influence of the Dominicans, and in spite of violent family opposition was at last permitted to enter their ranks. At the Dominican school of Cologne, whither he was sent, he came under the influence of the greatest teacher in Europe, Albertus Magnus. Later he followed his master to Paris, and was there granted the degree of bachelor of theology. About the year 1248 he returned to Cologne, still with the great Albertus Magnus, in the official position of second lecturer. Already the controversy between the univ. of Paris and the teaching friars had broken out, and Thomas had thrown himself with great zeal into the defence of his own order. So great was his zeal that later he was chosen to defend the

attitude of the Dominicans before the pope himself. The hostility of the univ. to the mendicant orders prevented his taking his doctor's degree until 1257, when, together with the Franciscan Bonaventura, he received that degree. Ecclesiastical honours were his practically for the asking, but he refused them all. The popes themselves were beholden to him for advice, and he was held in high regard by Urban IV. and Clement III.; so great was his love of his own order that he refused the archbishopric of Naples. In 1263 he visited London to take part in the chapter of the Dominican order. The greater part of his later life was taken up in visits to various potentates and in the active service of his order. He was summoned again in 1272 to his professional chair at Naples, and 2 years later he was summoned by Pope Gregory X. to the great council at Lyons. Ill though he was, he set out, but d. at the Cistercian monastery of Fossanova on Mar. 7, 1274. He was canonised by Pope John XXII. in 1323, and later took rank with the great fathers of the Church at the decree of Pope Pius V. in 1567. He is regarded as the patron saint of all Catholic educational establishments, and is still upheld as the teacher of the orthodox Catholic faith.

His teachings are equally important from the point of view of the theologian and that of the philosopher, and substantially his writings are regarded to the present time as the authorities by the Rom. Catholic Church. His style was definite, clear, and concise, and the basis of his system seems to have been mainly that the 2 sources of knowledge were the mysteries of Christian faith and the truths of human reason. The mysteries of Christian faith are to be believed because they help even when they cannot be understood. His greatest books are the *Summa Catholicæ Fidei contra Gentiles* and *Summa Theologiae*.

**Bibliography.**—WORKS: *Opera Omnia*, 25 vols. (Parma), 1862-75; 34 vols., ed. Vivès (Paris), 1871-80. TRANSLATIONS: *Summa Theologiae*, 1912-23, and *Summa contra Gentiles*, 1924-29, trans. by members of the Dominican Order; the latter also trans. by J. Rickaby, 1905, under the title of *God and His Creatures*; M. C. D'Arcy (ed.), *Thomas Aquinas; Selected Writings* (Everyman's Library), 1939. LIVES: R. B. Vaughan, *Life and Labours of St. Thomas of Aquino*, 1871-72; A. E. Taylor, *St. Thomas Aquinas as a Philosopher*, 1924; G. K. Chesterton, *St. Thomas Aquinas*, 1933; W. R. O'Connor, *The Eternal Quest* (New York), 1947.

**Aquincum**, an anct. Rom. citadel, situated near Budapest. The name is supposed to be a corruption of 'Aquæ-quincæ' (=5 springs), and to refer to the springs issuing from the foot of the Blocksberg.

**Aquino**, an anct. but decayed tn. in the prov. of Campania or Terra di Lavoro, in the kingdom of Naples, stands 6 m. W. of San Germano, the anct. Casinum. It was a Rom. colony

and a large and populous city in the time of Strabo: the Via Latina passed through it. Juvenal, the Rom. satirist, was b. at or in the neighbourhood of Aquinum. Pescennius Niger, one of the competitors for the empire after the death of Pertinax, was also, a native of this place. The church of Santa Maria della Libera suffered greatly in the Second World War, the nave, roof, and the roof of one aisle being destroyed, and the church of San Tommaso was ruined beyond repair. Pop. 2833.

**Aquisgranum**, anct. Rom. name for Aachen, or Aix-la-Chapelle (*q.v.*).

**Aquitania**, a Rom. prov. of Gaul, including the ter. between the Pyrenees and the Garonne. The inhab. were of the Iberian tribes and Celtic families who had settled there. A. was conquered by the Goths in the early part of the fifth century, a century later by the Franks. After being a duchy for some time, it was united to the Fr. crown in 1137. Gascony became a part of A. in 1054. In 1152 it passed under the Eng. crown through the marriage of Henry II. with Eleanor, the divorced wife of the Fr. king, but it was lost to England again in 1452.

**Aquitanus Sinus**, anct. Rom. name for the bay of Biscay (*q.v.*).

**Ara** (Lat., an altar), a constellation situated to the S. of the zodiacal sign Scorpio, and so low in the heavens as not to be visible in Great Britain. In it are 1 or 2 variable stars, one, Rho Ara, being eclipsed once in every 58 hrs.

**Ara** (dimin. of *aracae*, native name), a genus of tropical birds, the macaws, of the family Psittacidae, or parrots, and tribe Cuculiformes. It has a curved and powerful beak, a long tail, and vivid plumage, and can live in captivity. *A. macao* is found in Brazil, *A. militaris* in Mexico.

**Arab (Horse)**. The original home of the A. is unknown. Some think that, like the Barb (*q.v.*), the A. breed are descended from the 'Libyan' horse; but they were certainly to be found ultimately in the Nejd, Central Arabia, and in the fifth century A.D. were a special breed belonging to the Bedouins. By the sixth century the A. tribes were carefully breeding (or in-breeding) from them, and the purest breeds are still to be found in the Nejd. They were a decisive factor in the conquests of the Mohammedan Saracens, and, in the course of centuries these A. horses developed into the superb strains which were eventually to improve the standard of horses throughout Europe. Only a small proportion of horses bred in Arabia are pure As., and these are known as the Kohl (antimony) on account of their bluish-black tint. Legend has it that the 5 chief families ('El Khamseh') of the A. are descended from a mare known as Kehalet Ajuz (the mare of the old woman); but, however that may be, the Bedouins recognise 5 Kohl-ant strains, the first and most numerous strain being the Kehallan, which are largely bays, with a white 'star' and

1 or 2 white feet, and are reputed the fastest though not the hardiest of the 5. These are the most like the Eng. thoroughbreds, being more nearly related to them than the others. The Darley Arabian—the most famous of all E. horses ever brought to England—bought in Aleppo by Mr. Darley, H.M. consul, in 1704—was a pure bred Kehallan. The Abeyan strain, a smaller if handsomer horse, does not so strongly resemble the Eng. thoroughbred. A characteristic of the A. is the peculiar way he carries his well-elevated tail—very still and without the usual sideways swing—while at the gallop his dock is carried almost vertically. The A.'s weak points are a tendency to 'owe-neck' and excessive thickness of shoulder, the latter being one of the reasons why the A. is not a fast horse judged by modern standards. A height of 14.2 hands is the proper height for the A., so that As. are really little more than ponies. The fact that cross-breeds are sometimes taller than pure breeds does not necessarily indicate an inferior stock, for cross-breeds are frequently taller than their dams or sires; whence we may infer that the size and strength of our modern Eng. horses are not solely due to A. blood. Pure-bred As. are of most colours, but the bay and grey predominate; there are also many chestnuts, and sometimes browns and blacks. A feature of the A. is his endurance; but, as regards speed, the A., owing to careful crossing, is quite outmatched by modern Eng. racehorses. Nor, again, do As. make good jumpers, steeplechasers, or hunters. The A., however, makes an excellent light cavalry horse, though, owing to mechanisation of cavalry, this is a factor of no great importance in warfare to-day. Consult Prof. J. C. Ewart, *The Multiple Origin of Horses and Ponies*, 1908; W. Ridgeway, *The Origin and Influence of the Thoroughbred Horse*, 1905; A. J. R. Lamb, *The Story of the Horse*, 1938; Lady Wentworth, *The Authentic Arabian Horse*, 1941.

**Arabah** (arid, desert region), the geographical name of that great depression of the land in which are found the sea of Galilee, the Jordan, and the Dead Sea (Joshua xi., xii.). In the A.V. of the Bible the word is trans., being generally rendered by plain, but also by wilderness or desert. The hollow known to-day as El-'Arabah stretches southwards from the line of cliffs (the Ghor) which cross the Jordan Valley from N.W. to S.E. In its S. reaches it forms 'the wilderness of Zin' (Num. xxxiv.). It well justifies its name, Arabah, desert steppe. Its undulating surface is formed of loose gravel, stones, sand, and stretches of mud. It is torn by water-courses from either side, converging on Wadi et Jaib. It is bounded on the W. by the limestone uplands of Et-Tib, the wilderness of Paran, and on the E. by the fantastically shaped and naked crags of Edom.

**Arabesque, or Moresque**, is a term in painting or sculpture applied to a special kind of ornamental frieze or

border supposed to have been introduced into Europe by the Moors at the conquest of Spain, although traces have been found at Rome and Pompeii which prove it must have been known in Europe in some form previously. It is fantastic in design, and in many cases introduces griffins, dragons, and other fabulous monsters.

Arabgir, or Arabkir, a tn. in the prov. of Sivas in Asiatic Turkey. Manufs. silk and cotton goods. Pop. about 20,000.

Arabia (Arabic *Jesirat-al-Arab*, 'The Tall or Peninsula of the Arabs'; Persian

Musa, or the Mt. of Moses, has been identified as the Mt. Sinai (Horeb) of the O.T. The atmosphere is particularly hot and dry, and there is an almost total absence of clouds. Owing to the climatic conditions and the insufficient extent and height of the mts., little rain is attracted, with the natural consequence that there are few rivs., and those rarely permanent; the beds being dry except after a heavy rains. To these conditions the unusual degree of cold sometimes felt may be ascribed, as snow and ice are frequently found on mts. of 6000 ft.,

E.N.A.

ARABIA: THE HADHRAMAUT  
Houses on the ramparts of the old town at Seyun.

and Turkish, Arabistan), a peninsula forming the S.W. extreme of Asia. Bounded on the N. by Asiatic Turkey, on the E. by the Persian Gulf and gulf of Oman, on the S. by the gulf of Aden (Indian Ocean), and separated from Africa on the W. by the Red Sea and by the gulf of Suez at the N.W. extreme. Lies between 12° 45' and 34° 30' N. and 32° 15' to 60° E. The area is computed to exceed 1,200,000 sq. m., the length from N. to S. about 1500 m., and the greatest width about 1250 m. About one-third of the whole area is desert land, and much of the whole country is still unexplored, although it is known to be arid and practically uncultivated. The centre of A. forms a vast plateau or table-land falling from the mt. ranges on the W. coast to the R. Euphrates at the N.E. and the Persian Gulf on the E.; the height attaining to 8000 ft., while in some cases the summits even approximate 13,000 ft. Of the mts. Jebel

although in Africa, across the Red Sea, they are only to be found at about twice this height. On the W. coast there is a summer rainy season of 2 or 3 months, but in the S. little rain falls and then in the winter. Among the hottest inhabited places in the world are Muscat and Mocha, where the temp. has been known to exceed 115° F. in the shade.

A. has been divided into three parts: (1) A. Felix, or Fruitful; (2) A. Petraea, or Stony; (3) A. Deserta, or Desert. These dists. are not known as such to the Arabs, but may be described to include generally, (1) Hasa, Hadhramaut, Oman, and Yemen; (2) Hejaz; and (3) Nejd.

Owing to the small and irregular rainfall, little of the country is cultivated except in the wadis or valleys which receive the water from the mts. In the desert, however, occasional oases or fertile spots are found, and on the mts. large quantities of juniper and often pomegranates, with sometimes

many of the fruits grown in European countries, such as plums and grapes. In the wadis and cultivated tracts of land along the coasts, coffee, cotton, figs, dates, almonds, cane-sugar, tamarinds, citrons, wheat, barley, rice, and the trees which yield gum-arabic and frankincense are produced.

The mineral resources are little known, but include copper, iron, lead, and many kinds of precious stones, such as emeralds, carnelians, onyx, agate, and also marble and alabaster. In the is. of the Persian Gulf there are also extensive pearl fisheries.

Among the animal life are to be found the lion, tiger, jackal, antelope, lynx, hyena, jerboa, monkey, gazelle, wild boar, and wild ass, while ostriches, donkeys, goats, sheep, and oxen are reared. Perhaps the most outstanding of all is the camel, which is largely used for domestic purposes and transport. By nature stupid and bad-tempered, the camel has never been thoroughly domesticated, although we have record in the Bible of Job being the owner of a large number. The average life of a camel is 45 years. The milk, being nutritious, is largely used, and the Arabs cut the hair, from which a coarse cloth is made. In crossing the desert, camels, which have been aptly termed 'ships of the desert,' frequently go for 5 days without drink, and are capable of carrying a load of 600 to 900 lbs. Well known, too, is the beautiful breed of Arabian horses, whose great qualities are speed and endurance.

It is probable that the various Semitic peoples migrated from A.; the Jews and Arabians being the prin. branches of that race. Arabian historians trace the people back to 2 sources, Ishmael and Kahtan (sometimes called Joktan), distinguishing the branches by the names of Ishmaelites and Kahtanites. The former, living in the N., are considered as naturalised Arabs by the S. or pure Kahtanites. This distinction is traditional only, as a number of the Ishmaelites have settled down to an agric. life among the Kahtanites, forsaking the wandering tribes of Bedouins, while others of the Kahtanites have taken to a nomadic life in the deserts. So far back as we can trace, A. has had a great influence in the spread and cultivation of literature, and for a long time was much in advance of the rest of the world in literature, science, and art. At the present day illiteracy even among the Bedouins is unknown; reading, writing, and some mathematics being taught to every child. Invariably the people live in tribes whose chieftains, usually hereditary, but sometimes elected by the men, have little actual authority other than they secure by their own merit in counsel. Tribal wars, which were at one time intermittent, have practically ceased, but politically each tribe is still really independent of the others. Mohammed, preaching the religion of Islam (which imposed on its followers the pilgrimage

to the Kaaba at Mecca) and a united A., did indeed for a time bind the tribes together throughout the whole peninsula, but this state did not long survive his death. The effect, however, on the language was to make that of the Koran, Arabic, universal throughout the land. While the laws of property are but poorly defined, good faith is universal and disputes are settled by meetings of the tribe. Courage, lack of imagination, passion, love of poetry, and hospitality are characteristics, while usually the Arab is proud and quick-witted. Generally he has but 1 wife, although the more well-to-do have frequently several, divorce being secured at will by pronouncement by the husband.

In view of the isolated situations of the cultivated plots of land and the consequent nomadic tendencies of the inhab., the early hist. of A. is the hist. of numerous small tribes and, as is usual in such cases, little record of the doings of the people is left. We have, however, some knowledge of wars made upon the Arabians by neighbouring countries from the writings of their historians, and from inscriptions which have been found it is thought possible that, by exploration, further writings may be discovered which will throw light on the earlier political life of the country. So that, if and when found, the script may be important in its relation to our knowledge of the migrations of the Semitic races. From these writings we have information of a people known as Sabæans or Himyarites, and it was over this people that the Queen of Sheba, who is mentioned in the Bible as having journeyed to see Solomon, reigned. No record of this queen can be found, however, in the Sabæan writings. These records date to c. 1500 B.C., and at this period we find record of another people, the Minæans, who dwell in Yemen and were at war with the Sabæans leagueed with the Assyrians. It had been the intention of Alexander the Great to conquer the land, but he d. before the attempt was made. Time and again through the centuries the Abyssinians had invaded the country of the Sabæans, frequently obtaining control for a time, but only to be thrown out by the inhab. Augustus Octavianus sent an army into Yemen under Aelius Gallus to obtain command of the route to India, but was defeated. From this time until Mohammed came into power the country was sometimes independent and sometimes under foreign control, and internally the N. was almost consistently antagonistic to the S.

The power of the prophet will be better realised when it is considered that the whole pop. was divided into small and more or less independent tribes, whose relations to each other were generally unfriendly. With the growth of Mohammed's power these tribes laid aside their feuds, and, joining under his command, drove out or slew the Jewish inhab. It was not,

however, until after the prophet's death that the gospel of Islam spread actively beyond A., as his own time had been occupied in subjugating the tribes, one by one, and bringing them all into his camp. Egypt, the N. of Africa, Palestine, and the Sp. Peninsula were all welded into 1 vast empire with A. In the sixteenth century, however, A., which had again become disunited, was attacked by, and portions came into the hands of, sev. foreign powers, notably the Turks and Portuguese. By degrees the tribes resumed their authority, driving out the invaders. In the middle of the eighteenth century Mohammed ibn-Abd-il-Wahab came forward to restore the pure faith of Islam, and founded a dynasty which expanded and ultimately, after his death, included Medina and Mecca. In 1811 a war took place between this dynasty and the viceroy of Egypt, Mehemet Ali, which terminated in the conquest by Ibrahim Pasha of the Wahabi monarchy in 1818. Twenty years or so later, however, the Wahabites regained their freedom, but were separated from the dist. of Oman, which declared its independence.

The Arabic language is one of the old Semitic tongues and is known where the faith of Islam is received. The classical Arabic of the Koran is recognised as the standard of purity; in this form it is spoken in central A., with differences of dialect in the rest of the country. That used in Assyria and Egypt is less pure.

In appearance the Arab is sinewy, of medium height, with sharply cut features and a brown complexion. His actions are athletic and energetic, if a little restrained.

The pop. is variously estimated from 3,000,000 to 5,000,000. The prin. tns. are Mecca, Medina, Aden, Mocha, and Muscat.

The most profound change wrought in A. by the operation of the First World War was the hastening of the evolution of the anct. tribal organisation of the Bedouins into the communal and civic life of the State. This transition is, of course, very far from complete. The patriarchal system is still to be found and the civic life of the Arab of Medina or even of Bagdad is as yet far removed from that of a European nation. Arab prejudices and traditional die hard and it is only during the last half century that the old pursuit of agriculture has been recognised as a fit occupation for other than the descendants of slaves. Immobile as the oriental generally is, the Arab, in particular, has leanings towards W. ideas, though in so barren a country the march of progress is slow. The nomad life still has innumerable followers, while among the powerful Wahabi tribes, the most masterful in A., a reaction to orthodox Islamism, with its abhorrence of occidental customs, is a possible menace to Brit. interests in India, Egypt, and the Middle E. But the growth in the past 30 years of a strong Arab nationalist

sentiment among the tribes E. of Syria and in the borderland of Iraq has taken deep root. The patriarchal organisation had received its death-blow, and, with its decay, revolt against the Turkish hegemony grew. In the First World War the Turks suffered incalculably in prestige through their resounding defeats. Always chafing against Turkish domination, the Arabs were not loath to avail themselves of the opportunity of throwing off the yoke. It required no little experience in Arab psychology to win their alliance; but eventually the prin. Arab chieftains threw in their lot with the Allies and co-operated effectively in the ultimate overthrow of the Turk.

The chief figure in this anti-Turkish revolt was Ibn Sa'ud, sultan of Nejd and successor to Hussein as king of the Hejaz. It was his work, before the First World War, in welding the agglomeration of Wahabi tribes into communal organisations of some political significance which set the seal on what was to follow. Having wrested the Haasa region from the Turks in 1913-14, he had paved the way for the eviction of the Turk, during the First World War, from Yemen, the Hejaz, and other regions.

In the First World War Ibn Sa'ud and the shereef of Mecca (Hussein or Husein, king of the Hejaz) allied themselves with Great Britain, while Ibn Rashid, whose dynasty had been wrested from the Nejd cap. Riejadh in 1901 by Ibn Sa'ud, was in alliance with the Turks. Ibn Sa'ud was defeated in 1915 at the battle of Jurrab, and took no further part in hostilities till the last year of the war. Meanwhile, in the Hejaz the Brit. forces were engaged in successful operations for the Hejaz railway (1916-18) and in the Akaba, Tafil, and Ma'an regions (1917-18); while in S. Arabia, successful operations were carried out in the Babel-Mandeb (1914-15). Arab forces in revolt against the Turks attacked Medina in June 1916 and in the same year captured Jeddah, Mecca, and Taif; and other Arab forces, under Sheikh Feisal (later king of Iraq), co-operated with the Brit. Army under Gen. Allenby in their operations beyond Jordan and in the final offensive in Syria. In 1918 Ibn Sa'ud, encouraged by the defeat of the Turks, renewed his campaign against Ibn Rashid, but with only indifferent success. In this renewal of hostilities he was primarily anxious to secure the oasis of Khurma on the W. frontier of the Nejd, which ter., however, Hussein claimed as part of the Hejaz. This dispute precipitated the Arabian war of 1919, when Ibn Sa'ud routed Hussein's forces at Turaba and in due course annexed Khurma and, later, Abhah and other ters. In Asia. In the following 2 years his victorious Wahabites seized Hail, the cap. of the Jubal Shammar provs. in Central A., the Janf region of the Shalan dynasty (1922), and the Kharbar and Thura provs. on the frontiers of the Hejaz (1922), until, by 1926, his possessions and influence extended throughout desert A.

In this conflict the Brit. Gov., from a desire to act with the utmost impartiality, was faced with a situation of extreme delicacy. It had at one time or another during and after the First World War negotiated successfully with most of the Arabian shereefs. In 1915 it had induced Hussein, in consideration of a guarantee of independence to all the Arab states, to head the revolt against the Turks. Hussein was at that time only grand shereef of Mecca, but in 1916-17 he had seized Mecca and Jeddah and proclaimed himself king of the Arabs, but this grandiose title was not recognised by any other nation, for even Great Britain recognised him only as the king of the Hejaz. In Apr. 1921 the Brit. Gov. announced its recognition of his son, the Amir Abdullah, as ruler of Transjordan, subject to constitutional guarantees, and in Aug. of the same year proclaimed a younger son, the Amir Feisal, as king of Iraq. This astute compromise had the effect of checking the inordinate aspiration of Hussein to the overlordship of all A., a position which would only have provoked the most active hostility of the equally ambitious Ibn Sa'ud. Not content, however, with this partial concession to his pride, Hussein, in 1924, accepted the caliphate, rendered vacant by the deposition of Caliph Abdul Mejid by the National Assembly under Kemal. This was by no means an unnatural step in view of his previous title of grand shereef of Mecca. It provoked, however, such bitter dissension with other shereefian rulers and with Ibn Sa'ud that the Brit. Gov. convened a conference at Koweit in the hope of getting them to reach a settlement. The attempt was not successful, and a few months later Wahabi troops invaded Hejaz, seized Taif, and defeated the forces of the shereefs at Haddah. Hussein, then in feeble health, abdicated and was taken to Cyprus under the care of the Brit. Gov., his third son Ali assuming the vacant and tottering throne, but moving his gov. to Jeddah. But 2 months later, the Wahabis having taken Mecca and Medina without serious opposition, Ali too abdicated, and by 1926 Ibn Sa'ud had become king of the Hejaz as well as sultan of Nejd. Thus early fell the artificially created Hashimite dynasty of the Hejaz. Great Britain had 'backed the wrong horse.' It now remained to treat with Sa'ud, who was now in a position to control almost the entire Arabian peninsula. Brit. pre-occupations were mainly concerned with the frontiers of Iraq and the integrity of Transjordan, and in 1925 Sir Gilbert Clayton, the Brit. plenipotentiary, signed an agreement with Ibn Sa'ud under which, in consideration of a subsidy of £70,000, these and other objects were secured. The success of the Wahabis in this vindication of their predilection for simple modes and the patriarchal form of gov. with local administration through cadis and sheikhs, thus again emphasised the extreme conservatism of the Arab; and un-

doubtedly the creation of the second Wahabi Empire, under Ibn Sa'ud, who had previously been the Wahabi sultan of Nejd and its dependencies, was the outstanding event in modern Arabian hist. In the days of the peace conference (1919) he was almost unknown to Europeans. Hussein, after the Iraq settlement, was thoroughly disaffected with all that had resulted from his wartime negotiations, and so began to be obstructive in the direction of Central A.; but Ibn Sa'ud was ready to try conclusions with him. Matters, as shown above, came to a head in 1919. The Brit. Gov. were wrongly advised that Ibn Sa'ud was a negligible factor, while Hussein had trained armies and masses of arms. But though by 1924 he had routed Hussein, seized Taif and Mecca, and made himself king of the Hejaz, he never challenged the position of Great Britain and France in the mandated ters. In the reorganisation of gov. in the Hejaz, Ibn Sa'ud compromised between the old or traditional methods which had suited the needs of administration in the Nejd, and the modern democratic ministries and councils, which had been in process of evolution among the rulers of the sharifian dynasty; making his 2 sons viceroys in the Nejd and the Hejaz subject to his control. Political difficulties arose, in the meantime, in the Yemen, owing to Britain's position as a mandatory in Iraq and Palestine and to the conflict of interests on the Red Sea between Great Britain and Italy. Italy recognised the independence of the Imam Yahya of Yemen, but she was alone in so doing, and subsequently the Asir region of the Yemen became embodied in a Wahabi protectorate, and later, after a brief war with Saudi A., fell to that kingdom. Relations between Great Britain and the Yemen have, however, markedly improved since that time; a treaty of *bon accord* was concluded in 1934, though, in 1939, the Imam began to reiterate his claims to Shabwa, which Great Britain claims to be within the Aden Protectorate and values for its strategic position. In 1927 a gathering of the tribes of Nejd begged Ibn Sa'ud to take the title of king of Nejd and its dependencies by way of counterpoise to his regal style in the Hejaz, and a decree was accordingly issued changing his title; 5 years later this kingdom was re-named Saudia, and eventually Saudi A. In 1927 Sir Gilbert Clayton made a treaty of *bon accord* with Ibn Sa'ud, under which Great Britain formally recognised the absolute independence of Ibn Sa'ud, while Ibn Sa'ud agreed to respect the treaties made between Great Britain and the Arab chiefs on the Persian Gulf. Two years later the Brit. Gov. manifested its confidence in the Wahabi kingdom by raising the status of its agency and consulate at Jeddah into a legation.

The former distinctive features of Middle E. civilisation are perceptibly

disappearing under the pressure of W. ideas. The caliphate system of gov., which, indeed, was an anachronism early in the twentieth century, has for some years been superseded by constitutional or nationalist forms of gov. on W. models. Industrialisation, fostered by European capital, is changing the livelihood of the Arabs of Syria, Palestine, and Iraq—the ters freed from the Turkish overlordship. Education, the film, and the press are shaping the minds of the young Arabs towards new ideals. How long it will take for all these new influences to be felt in the Arabian peninsula itself is conjectural; but that the kingdom of Saudi A. can remain spiritually and materially isolated for a great length of time would seem improbable. While, politically, the different Arab states still pursue their separate destinies, most educated Arabs cherish the hope of an eventual Arab federation which shall restore to them something of the imperial power which in former ages dominated a civilised world. Inherent cultural and economic conditions, however, are incompatible with an early realisation of this dream. Moreover, the peninsular Arabs still preserve an inter-tribal form of gov., and are intensely jealous of their individual liberties. In 1934 war broke out between the Yemen and Saudi A., in which the Imam's forces were defeated and, as the result, the Asir region and the inland region of Najran were ceded to Ibn Sa'ud. In the following Mar. (1935) an attempt to murder Ibn Sa'ud was made while he was engaged at his devotions in the mosque at Mecca. The would-be assassins had come from the Yemen, and the attempt occurred at a time when the Wahabi king was receiving a Syrian delegation which was urging him to take the leadership in a movement for an Arab federal union. Ibn Sa'ud, however, gave no encouragement to the scheme. Disorderly tribes are a constant menace to caravans, especially on the borders of the Aden protectorate, and in recent years the sultans of Lahaj and of Shehr and Mukalla have asked the Brit. Gov. at Aden to send punitive flights of the R.A.F. to bomb villages by way of repression. This, coupled with the addition to the Aden protectorate of a substantial piece of ter., has provoked hostile criticism from those who are unacquainted with the difficulties of keeping order among these turbulent tribesmen.

In mandated Palestine unconditional political sovereignty, whether Arab or otherwise, was remote, as might be realised from the White Paper on Brit. policy issued in May 1939, which envisaged the ultimate creation of a Palestinian State in treaty relationship with the Brit. Gov., together with safeguards for the Jewish minority. The Palestinian Arabs, however, did not favour this scheme, it being their view, and indeed that of the surrounding Arab states, that they were explicitly promised their sovereignty in the famous

MacMahon-Hussein correspondence during the 1914-18 war. (See PALESTINE.) None the less Britain so far implemented war-time promises as to promote the independence of no fewer than 5 Arab states—Iraq, Egypt (Arab in the wider sense), the Yemen, Transjordan, and Saudi A. To that very considerable extent has Arab nationalist sentiment been gratified. But mutual jealousies still prevail. Iraq, Syria, and Saudi A. are jealous of each other's political influence, and none of them would tolerate the hegemony of any one of them. Even before the Arabs came, Syria and Mesopotamia (Iraq) were rivals, Syria being regarded, in Turkish days, as the more advanced. To-day, however, the Iraqis have the greater economic stability, owing to their wealth in oil and in cotton potentialities. Intense individualism still characterises these states to-day in Arab leadership, as was shown in the *coup d'état* of 1936 in Iraq, when Ja'far Pasha-el-Askeri, the popular minister of defence, and one-time Prime Minister, of Iraq was assassinated, the elected constitutional Gov. overthrown by the army, and Yassin Pasha, the Prime Minister, driven out of the country. Only a strong educated public opinion can further the ideal of Arab federation—an ideal to which the Syrian Arabs will most probably lead the way, inasmuch as their nationalism is untrammelled by religious differences between Muslim and Christian. More immediately significant, however, than this dream of federation or any political reforms is the revolutionary change brought about by the industrialisation of the Arab countries—a change which may well pave the way for political reforms. Iraq secures enough revenue from her oil royalties to be able to maintain a large army equipped with tanks and aeroplanes, and this enables her to enforce the obedience of the lawless tribal communities on her borders. The effect of industrialisation is to europeanise the Arab, and most marked are the sociological readjustments. Ancient modes of attire and primitive agricultural implements are wont to give place in many parts of A. to methods and habits more adapted to modern requirements. Even the religious outlook of the Middle E. is by no means untouched by modernism, though, as is well said by the competent authority, Mr. Bertram Thomas, 'modernism in Islam has its genuinely religious side and in intellectual circles a phase of agnosticism has been followed by one of religious revival.' But in the E., as in the W., a wider, more secular education is of a certainty prejudicial to the old Oriental fatalism and immobility.

*Exploration.*—Joseph Pitts, of Exeter, (b. 1663) was the first known Englishman to visit the Haramain, the holy ter. of A. forbidden to Christians, and the first to describe the holy cities of Mecca and Medina in his little book, *A Faithful Account of the Religion and Manners of the Mahometans*, pub. early in the eighteenth century (1704). In all he spent some 15 years of adventure

and slavery, and his story, not much known at the time, was recalled, 150 years later, in Burton's *Pilgrimage to Al Madinah and Meccah*. A Danish expedition, under the auspices of King Frederick V., set out in 1761, but of the half-dozen variously qualified men chosen only one, Karsten Niebuhr, a farmer's son, skilled in surveying, survived, for sickness accounted for all the others in A. or on the way to India afterwards. Niebuhr recounts their discoveries in his *Travels through Arabia* (trans. by R. Heron, Edinburgh, 1792). The expedition reached Jiddah and Sana (the cap. of the Yemen). They appear to have been well treated throughout by the Arabs. Niebuhr's book is the first introduction to the whole country of the Yemen, and for more than a generation it remained the only sound authority, not only on the Yemen, but on A. For a generation after his time little was added to knowledge of A. except the coast, which was next visited by James Bruce in 1769 and by Eyles Irwin, an Eng. agent at Mocha, in 1777. But the rise of Wahabism, the capture of Mecca, Napoleon's Egyptian campaign, and the defeat of the Mamelukes by Mohammed Ali all served to stimulate European curiosity in A. and the E. During these years travellers visited the Hejaz, and among the most remembered was a Spaniard, Domingo Badia y Leblich, who travelled under the name of Ali Bey el Abbasi, as a wealthy pedant, equipped with scientific instruments and a retinue of servants. He penetrated Mecca, took ship from Jiddah to Yenbo, and tried to reach Medina, but was driven back by the Wahabis. During his time in Mecca he came into close contact with the court of the sherif, and saw everything in the city, and in his *Travels* (pub. in London in 1816) he gives a very exact picture of the temple. The next great European traveller to come to A. was Johann Ludwig Burckhardt (b. 1784), who, travelling as Sheikh Ibrahim, crossed from Suakin to Jiddah, and visited Mecca, Taif, Medina, and Yenbo. He produced the most detailed account ever written of the Kaaba, the religious ceremonies, the trade, and the inhab. He travelled mostly at night, with the aid of a ship's compass, and gives us only slight topographical information, his chief pre-occupation being the commerce, social life, characteristics, and religion of the Arabs, all of which he closely studied during his 9 months' sojourn. His *Travels in Arabia* appeared in London in 1829, and his *Notes on the Bedouins* (whose benevolence, good faith, and charity he extols) and *Wahabys*, in 1830. After Burckhardt came Richard Francis Burton, who survives in popular imagination almost solely by his famous pilgrimage to Mecca and his equally famous translation of the *Arabian Nights*. This latter is a manifestation of really amazing learning, of a complete acquaintance with Moslem qualities, customs, and habits, besides a

universal knowledge of E. life. He was the first European to travel the Darb el Sharki, the E. road between Mecca and Medina, where water was scarce, despite the wells sunk at the order of Zobeide, wife of Harun al Rashid. Twenty years later he led an expedition to Midjan and during that journey thoroughly explored the coastal area, the wadis of the coastal range, including the Wadi Hamdh, and various areas of mts. Among the earlier explorers in Oman and the Hadhramaut were Lt. James Wellsted, who was sent on a reconnaissance to Oman by the E. India Company in 1835; Col. S. B. Miles, who continued Wellsted's explorations in 1876, crossing the mts. from Sohar into Dahira, and being the first to visit Bireima. Wellsted's map and notes of Oman have not been greatly modified by subsequent travellers, and his general description remains authoritative. Capt. S. B. Haines, of the Indian Navy (and the conqueror of Aden), carried out a thorough survey of the S. Arabian shore in 1834-36. This is the first modern account of the dist. where the Wadi Hadhramaut, the main wadi of the whole vast dist., reaches the sea. He found that the ruins in the Hadhramaut (the Adramytta of the Gks. and the Hazarmaveth of Genesis) pointed to an anct., rich, and advanced civilisation. In 1843 Adolf von Wrede, a Bavarian soldier who had lived in Egypt, carried out a courageous exploration, penetrating from the sea to the edge of the S. Desert. In 1892 James Theodore Bent entered the interior of the Hadhramaut from Mokalla. He produced the first information of the S. interior which was interesting for its general descriptive matter as opposed to the anct. hist. or geography which figures so much in less popular narratives. But up to this time European geographers knew little of the N. inland of A., the cradle of Wahabism. Among the earliest of the trans-Arabian explorers was the comparatively little-known George Augustus Wallin (d. 1854), the fruits of whose highly creditable journey in N. Central Arabia were given but cursorily in the *Journal of the Royal Geographical Society*, 1854. It was the Nejd (or Negd, as he spelt it) that engaged much of his researches, and he threw considerable light on the Arab tribes of the Howelait, and Sherarat, and on the land of the Shammar. Wallin was a Finn, and there are biographies by Elmgren (1865) and Tallqvist (1905). Charles Montagu Doughty's *Arabia Deserta* is a classic of Arabian exploration. With a pilgrims' caravan from Damascus, he reached Medain Saleh, making a record of inscriptions there, and then wandered in the desert, visiting Teima, Jebel Shammar, and Hall, and going openly as a Christian. In his journey towards Mecca he experienced much suffering and was all but murdered; but at Taif his troubles ended, for the grand sherif appreciated the value of Eng. friendships. The geographical results

of Doughty's explorations establish the nature and courses of the main channels of drainage in N. A., especially of the Wadis Handh and Rumma; and they give us the scenery, geology, and orography of Kheibar, besides the nature of the *harra* tracts and the extent of the volcanic areas of that region. Lady Anne Blunt's *A Pilgrimage to Nejd* is a sample record of scenes and events, and, like other travellers, she, and Wilfrid Scawen Blunt, were attracted to the Nejd country. They were the first Europeans to travel by the Persian pilgrims' route to Kerbela and Bagdad, and, among the results of their travels was further information on rock formations and a revision of the map of N. A. from the *harra* to Hail. Capt. W. H. Shakespeare's exploration across A. from sea to sea, begun in Feb. 1914, was a notable feat, for which he had prepared himself in his capacity of political agent at Kuwait in 1909. He discovered the first Sabæan inscriptions in N. A., traversed the Nejd and crossed the N. end of the Tuwaik escarpment to Zilfi, spending nearly 4 months in A. In 1913 Capt. W. H. Lee-Warner explored the Hadhramaut going to Wadi Duwan by the Wadi Himun, visited Shibam, Katan, Seyun, Shabwa, and Terim, during which time he obtained much information on the social organisation and conditions generally of the Hadhramaut. Freya Stark, an experienced traveller in Persia, also visited the Hadhramaut, starting from Mokalla, across the Jol or stony plateau, Sif, Meshed, Katan, Seyun, and Terim, recounting her experiences in *The Southern Gates of Arabia* (1936). The 'Empty Quarter'—the Rub' al Khali, the Great S. Desert of A.—was the objective of both H. St. John Philby and Bertram Thomas, who crossed it within a few months of each other. Until these 2 important journeys, the Rub' al Khali was almost wholly unexplored, and indeed only the fringes of the desert had been touched by their predecessors, though the journeys of G. M. Lees in 1925-26 in Oman and along the S. coast, and of Maj. R. E. Cheesman in E. A. and along the N. borders of the desert, should be mentioned. Maj. Cheesman obtained much useful information in the drainage of the Nejd uplands and on the birds, but his most interesting visit was to the country of dunes and Jabrin, where he learned something of the Murra tribesmen. Bertram Thomas had, previously, travelled along the S.E. desert border lands from Sur to Dhofar—a little-known dist.; but he was fired with the project of crossing from Muscat to Aden, for though Palgrave and Burton had some vague notion of the characteristics of the 'Empty Quarter,' no European explorers had any definite knowledge of it. In 1930 Bertram Thomas made a preliminary survey, in which he estab. that, beyond the coastal ranges of tropical vegetation, there was a single dry wadi system in a huge sandstone steppe, which declined

from S. to N. from W. to E.; and that the whole region was arid and desolate, the resort of Bedouins who led a life threatened with death from hunger and thirst, the sole vegetation consisting of acacias, bushes, and scrub, though in the middle and lower courses of the wadis gazelle, hare, and antelopes were to be found. In short, the very name Rub' al Khali meant, to the Arab, merely the sand and steppe which would not support life. His great journey, in 1932, was concerned with the main features of the region to the N. of the Qara range. Throughout this historic journey he wore Bedouin dress, spoke the local dialects, and abstained from tobacco—an orthodoxy generally calculated to win Arab confidence. His resultant book, *Arabia Felix: Across the Empty Quarter of Arabia*, throws a vivid light on the whole of life in S.-E. A., and is valuable alike to scientist and geographer. The moral and social outlook, the legends, the code of desert manners, the psychological traits of the Bedouin—all are here set forth so that the world may know the soul of a fascinating race. Philby, who was most disappointed at being forestalled by Thomas, could also rely upon a most exceptional knowledge of A., going back for 15 years to the days when he was seconded by the Gov. of India, as a military political officer, to the Brit. Expeditionary Force in Mesopotamia to assist in organising the regions wrested from the Turks. In his journey across the desert from Hofuf he received valuable assistance and encouragement from Ibn Sa'ud. Eastward from Mazainama, across alternating sandy downs and stretches of gravel, he reached the wells of Bir Fadhil, whence he sought the fabled Wabar. This was, as he described it to the Royal Geographical Society, a veritable anticlimax, for many had hoped he would discover traces of some lost city of anct. story. 'I fathomed the legend of Wabar,' he writes, 'I looked down not upon the ruins of an anct. city, but into the mouth of a volcano, whose twin craters, half filled with drifted sand, lay side by side, surrounded by slag and lava. . . . I knew not whether to laugh or cry, but I was strangely fascinated by a scene that had shattered the dreams of years. So that was Wabar!' (*The Empty Quarter*, 1933). Philby and Thomas differ in the spelling, location, and nature of Wabar, especially on the position; but this is to be explained on the assumption that the name Wabar or Ubar is applied by Islamic writers to a dist. and tribe of the earliest period in the S. half of A., and that it was given not only to a particular dist., but to all the central tract between Jabrin and the Hadhramaut. The legendary city of Sheba was discovered by 2 Fr. explorers in Mar. 1934, one being M. Malrause (winner of the Goncourt prize, 1933), after a flight over the Rub' al Khali. Many towers or temples are still standing

on the traditional site. The results of the modern exploration have, geographically, historically, and epigraphically, thrown new light on the various ant. S. Arabian dialects, such as Minean, Sabæan or Himyarite, and Hadhramaut, and they have also yielded further information on the hist. of the old S. Arabian kingdoms and dynasties, besides supplementing our knowledge of O.T. hist. and of Heb. and comparative Semitic philology.

For discoveries in Palestine and Iraq see under those heads.

**Arabian Architecture**, see ARCHITECTURE, MOHAMMEDAN.

**Arabian Gulf**, see RED SEA.

**Arabian Nights**, or **The Thousand and One Nights**, is the name of a very well-known collection of tales, long current in the E. They are supposed to have been derived by the Arabians from India through the medium of Persia. The tales themselves are connected with all subjects, but the connecting link, the thread on which they were strung, is as follows: The Sultan Shahriyar, enraged by the discovery that his bride was unfaithful, made a law that in future all his wives should be executed on the morning after the marriage. This law was duly carried out, until the sultan wedded Shahrazad, the daughter of his grand vizier. This lady was a matchless raconteuse, and by the expedient of leaving off every night in the midst of a fresh tale of surpassing interest, she induced the sultan to defer her execution until the day after, for a thousand and one nights, when her doom was postponed *sine die*. The tales were first introduced into Europe at the beginning of the eighteenth century, by means of the Fr. translation of Antoine Galland. Of some of them no manuscript is known, and Galland took them down from the mouth of a Syrian friend. Lane was the first Englishman to translate them worthily, and his opinion is that in their present form they date back to about 1500.

**Arabic**, **The**. A White Star liner sunk without warning by Ger. submarine on Aug. 19, 1915, off Queens-town. The ship was carrying at the time sev. Amer. subjects, some of whom perished. As a result of Amer. protests the Ger. Gov. offered full satisfaction to America and undertook not to sink liners without warning and without providing for the safety of the lives of non-combatants, on condition that the ship made no attempt to escape or resist. The worthlessness of this pledge was soon exposed.

**Arabic Numerals** are the numerals 1 to 9 with the character zero (0). They came originally from India.

**Arabic**, **Arabi**, or **Arabians**, a small sect of Christians which existed in the third century, chiefly in Arabia. They held that the soul would perish with the body, but that both would be restored at the Resurrection. At the council of Arabia, c. 247, Origen confuted this opinion. See Eusebius, *Historia Ecclesiastica*, vi. 37; St. Augustine, *De Haeresibus* liber, c. 83; J. F. Buddeus, *De Arabicorum Haeresi*, 1713.

**Arabin**, **Arabic Acid**, or **Gummic Acid**, a constituent of gum arabic. Gum arabic consists of the potassium and calcium salts of A. A. The A. A. may be set free by adding hydrochloric acid to the muclage, and may be separated by dialysis, or passing through parchment paper, as the gum passes through with great difficulty. Alcohol added to the solution precipitates the acid as a white amorphous mass.

**Arabi Pasha** (1840-1911), leader of the insurrectionary party in Egypt, 1882, b. of fellah parents in Lower Egypt; began life as a labourer, and served in the Egyptian Army as a private soldier for 12 years. He organised a national party in opposition to the Anglo-Fr. control, obtained the deposition of the ministry, 1881, and became minister of war in the new Cabinet, 1882. He set up as an autocrat, withdrawing the budgets from the Eng. and Fr. controllers. This act resulted in war with England, whose fleet bombarded Alexandria, July 11-12. On Sept. 13, 1882, A. P. was defeated at Tel-el-Kebir, taken prisoner at Cairo, and expelled to Ceylon. The result of his revolt was the establishment of Brit. oversight in Egypt. Pardoned by the Brit. Gov. in 1900, he returned in 1901.

**Arabis** is the typical plant of the Arabide, a tribe of Cruciferae. The species which grow in Britain are known as rock-cress, and to the same tribe belong the watercress, stock, and wallflower.

**Arabistan**: 1. A general oriental name for Arabia and other dists. inhabited by Arabs. 2. A prov. of Persia, known also as Khuzistan.

**Arabkir**, see ARABQIR.

**Aracaju**, city and port of Brazil, and cap. of Sergipe. Pop. 6000.

**Aracari**, the native name of the *Pteroglossus aracari*, one of the toucans. It belongs to the Rhampastidae, is allied to the woodpeckers, and is found in tropical America.

**Aracaty**, tn. and port of Ceara, Brazil. Important commercial centre. Pop. 30,000.

**Araceae**, a natural order of monocotyledonous, chiefly tropical, plants. The flowers are monocious or mono-clinous, the perianth is absent or has from 4 to 6 leaves, there are 1 to 8 stamens, often united into a *synandrium*, the ovary often consists of 1 carpel; the fruit is a berry, and the seeds are sometimes exalbuminous. It contains about 1000 species, of which typical flowers are the *Arum maculatum*, or cuckoo-pint, and *Zantedeschia aethiopica*, or trumpet-lily.

**Arachis**, a plant of the order Leguminosae which grows in tropical parts of Asia, America, and Africa. It yields a sweetish oil used to adulterate olive oil. It has pale yellow flowers, and the pod is forced into sandy soil by the elongation of its stalk, and there it ripens. *A. hypogaea* is the earth-nut or pea-nut.

**Arachne** in Gk. mythology, daughter of Idmon of Colophon, a dyer in purple. She excelled in weaving, and ventured to challenge Athena in the art. She produced a piece of cloth in which the amours of the gods were woven, and as Athena could find no fault with it she tore the work to pieces. A., in despair, hanged herself; Athena loosened the rope and saved her life, but the rope was changed into a cobweb and A. herself into a spider.

**Arachnida** (Gk. *aráχνη*, spider), a class of arthropods, including spiders, scorpions, and mites, differing from insects in having 4 pairs of legs, no antennae,

a fused head and thorax, and simple eyes varying in number from 2 to 12. They are mostly carnivorous; the scorpion has poison-glands leading to the sting. There are 9 orders: the *Scorpionidae* or scorpions; *Pedipalpi*, or whip-scorpions; *Araneida*, or spiders; *Palpigradi*; *Solifuge*, or wind-scorpions; *Pseudoscorpionidae*, or book-scorpions; *Podogona*;

*Phalangidae*, or harvestmen; *Acarina*, or mites. Two doubtful orders also exist: the *Xiphosura*, or king-crabs, and the *Eurypterida*. For further information see under individual heads.

**Arachnoid Membrane**, the thin, web-like membrane of the brain which lies between the pia mater and the duramater. It surrounds the nerve centres, and contains no blood-vessels; it can be separated from the dura mater, to which it adheres by its parietal layer, only by dissection.

**Arachnoides** (Gk. *aráχνη*, spider, *ἴδωρ*, resemblance), an Echinodermatous fossil of the family Scutellidae and order Clypeastroida. It receives its name from the resemblance of the markings to a spider's web.

**Arachosia**, a prov. of the anct. Persian empire, lying in the basin of the Helmand R., and corresponding to the S.E. part of modern Afghanistan. Kandahar occupies the site of its anct. cap., Arachton, founded by Alexander the Great.

**Arad**, a tn. in Rumania; on the bank of the R. Maros. It is an important railway centre, and has a large trade in spirits, wine, corn, and tobacco. It was the scene of much fighting in the seventeenth century in the wars between the Turks and the Hungarians, and in the revolutionary war of 1849 was once captured by the Austrians. Pop. 77,000. New A. is on the opposite bank of the riv. The prov. of A. is 490 sq. m. in extent.

**Aradus**, see ARVAD.

**Araf**, the Islamic half-way region or purgatory between hell and heaven.

**Arafat**, Mt., or *Jebel-en-rahm* (Hill of Mercy), is a granite hill 15 m. S. of

**Mecca.** It is much visited by Mohammedan pilgrims, and is supposed to have been the meeting-place of Adam and Eve after their expulsion from Paradise.

**Arafura, or Alfura Sea,** a div. of the Pacific Ocean, lying between the N. coast of Australia and the W. part of New Guinea, partly enclosed by Papua, the Aru Is., Timor, etc.

**Arago, Dominique François** (1786-1853), b. at Estagel and d. at Paris, was a Fr. physicist and astronomer. He was appointed secretary to the Bureau des Longitudes, and in 1806 helped Biot to measure an arc of the meridian. At the age of 23 he became a member of the Academy of Sciences, and afterwards director of the Observatory. In 1830 he was appointed perpetual secretary to the Academy of Sciences, Paris, and in 1848 was a member of the provisional Gov. He pub. works on astronomy, magnetism, the polarisation of light, and electricity, the titles of some of which are: *Recueil d'observations géodésiques, astronomiques, et physiques*, 1818; *Astronomie populaire*, 1834; and *Notices biographiques*. His complete works were pub. in 1854-62. He was held in great esteem and reputation in all Europe; and opposed Louis Napoleon, and refused to take the oath of allegiance, 1852. See Audiganne's *Arago*, 2nd ed. 1869.

**Aragon**, formerly a kingdom of Spain, but divided since 1833 into the 3 provs. of Huesca, Teruel, and Saragossa. Bounded on the N. by the Pyrenees, on the E. by Catalonia and Valencia, and on the W. by Castile and Navarre. The prov. falls naturally into 2 divs., the level plain of the valley of the Ebro, and the highlands of Upper A. The Ebro is the prin. riv., and receives numerous tribs. from the Pyrenees to the N. and the mts. of the S. The central plain is sterile and is shut off from the sea breezes; it has practically no vegetation save grasses. The highlands, however, are noted for magnificence of their forests and scenery, as also for their fertility. Wheat, maize, rice, and oil are produced in considerable quantities. One of its chief exports is merino wool. Bitter fighting for possession of Teruel occurred during the Sp. Civil war, 1936-39; the Gov. forces captured it in Dec. 1937 and the Nationalist forces recaptured it in Feb. 1938, after which the Nationalist advance gradually lost A. to the Gov. and foreshadowed the close of the war.

The people are of pure race and are probably more closely allied to the Castilians than to the Catalans. Historically it has been a Rom. prov., and after the expulsion of the Moors in 1131 became, under James I., an important kingdom. The union of A. and Castile, under Ferdinand and Isabella, formed the nucleus for the united Sp. kingdom.

**Aragon Canal**, constructed from Saragossa to Tudela by Pignatelli, the It. engineer, during the reign of Charles III. of Spain (1760-88). It had been previously begun in 1529 by the Emperor Charles V. It is 80 m. long, and has an average depth of 9 ft., and a breadth of

69 ft., and is navigable by vessels of 80 tons.

**Aragon, Louis** (b. 1895), Fr. poet; one of the school of Montherlant and Malraux and others who write in a shouting heroic mood. Author of *Le Paysan de Paris*, 1925, very different in mood from his 1942 patriotic fervour. Like others, from Verlaine to the present day, he tried to dispense with rhyme or so to change its role as to renew poetic form; but his *Crève-Cœur* (1943) adds a note of rhyme.

**Aragon River**, riv. of Spain, rising in the Pyrenees in Aragon, and flowing about 80 m. in a S.W. direction through Navarre to join the Ebro at Alfaro.

**Aragon, Tullia** (1510-65), It. poetess of sixteenth century. A natural daughter of Peter Tagliavia d'A., archbishop of Palermo, famous for beauty and learning. Her works, which had a considerable contemporary reputation, include *Rime*, 1547; *Dialogo dell'infinità d'Amore*, 1547; *Il Meschino o il Guerino*, 1560.

**Aragona**, a tn. of Sicily, situated 6 m. N.N.E. of Girgenti. It possesses the old castles of the Aragonese princes. Sulphur is successfully mined near the town. Its pop. is 15,530.

**Aragonite**, a mineral consisting of calcium carbonate, CaCO<sub>3</sub>. It has a sp. gr. of from 2.92 to 3.28 and a hardness of from 3½ to 4. It crystallises in rhombic prisms, and twinning on the prism planes is a frequent phenomenon.

A. is found in Aragon, Hungary, Sicily, Cumberland, and in the neighbourhood of hot springs, as at Carlsbad. It is distinguished from the other variety of calcium carbonate, calcite, by its greater sp. gr. and its different form of crystallisation.

**Aragua**, a state of Venezuela, constituted under the re-division of 1904, and lying mainly within the parallel ranges of the Venezuelan Cordillera. Products: coffee, cacao, sugar. Chief tns.: Maracay, the cap. (pop. 7800), and Barbacoas (pop. 13,090). Pop. of A. about 130,000.

**Aragua, or Rio Grande**, a riv. in Brazil, which has a length of about 1250 m. and flows into the Tocantins, close to São João.

**Arakan**, a div. of Lower Burma, on the Bay of Bengal between Pegu and Chittagong, having an area of about 14,500 sq. m. The old cap. bears the same name, but is generally called Myohoung to-day; formerly a large tn., but now dwindled to little over 2000 people. The dist. exports rice, timber, tobacco, and cotton. The majority of the natives are Buddhists. For the military operations in A. in the Second World War see BURMA, SECOND WORLD WAR, CAMPAIGNS IN.

**Aral, Sea of**, a salt-water lake in Asia, and, after the Caspian Sea, the largest inland sheet of water in this continent. It is in Russian ter., and is about 270 m. long by 165 broad. It is shallow, and nowhere has a greater depth than 220 ft. Two great rvs. drain themselves into this lake, the Syr Daria (the Jaxartes of old) and the Amu Daria (Oxus). At one

time it is thought to have formed part of the Caspian Sea, as only 80 m. of low, sandy, and marshy lands now separate them. It has no outlet, but much water is drawn off by evaporation. A number of small is. are dotted about over it, mainly towards the E. shore. By references of anct. writers it is probable that its shape has altered considerably, and part of its area was once dry land.

**Aralia**, a genus of the order *Araliaceæ*; belongs to India, China, and other tropical countries. *A. (or Fatsia) papyrifera* is a Jap. tree, from the pith of which rice-paper is made. *A. ginseng* has a root which is used as a tonic by the Chinese.

**Aram**, or **Aramæa**, meaning highlands, a term including all the country N.E. of Palestine. Comprised within its limits are Syria, Babylonla, Mesopotamia. The language spoken is Aramaic. This tongue is a branch of the Semitic, which is divided into 2 parts, the W. Aramaic or Syriac, and the E. Aramaic, or, as it is erroneously termed, Chaldee. In Palestine itself Syriac was the language in vogue during the time of Christ. The pure Heb., the language in which the whole of the O.T. was written, was changed after a period of Babylonian captivity to Aramaic. In quoting from the O.T. Jesus Himself uses Aramaic, and in the Talmud, especially that part appertaining to Aramæa, many traces of Aramaic influence are found. In the Targums also, the whole work is composed in Aramaic.

At the present day Aramaic is archaic, though while it was in use it happened to be the poorest in quality of all the Semitic group. Arabic and Persian succeeded it. The inhab. of A. are called Aramæans, and the name itself is strictly biblical. In early times the prin. riv. was the Orontes, and to-day this riv. is the chief water-way of Syria, so it can be said that the present site of Syria coincides with that of A. As far back as Judges mention is made of an Aramæan king extending his ters. as far as Palestine.

**Aram** was a conqueror who went from the W., or Aramæan, or Syrian Cappadocia, into the highlands of Armenia, and from whom the present name of Armenia is derived. (See Moses of Chorene, i. 13, p. 83, ed. Whiston.) This circumstance explains the fact that the Aramæans and Armenians are sometimes confounded (as in Strabo, pp. 41, 42, ed. Casaub.), and that the Armenians themselves do not use the name of Armenia, which first occurs in Herodotus and other Gk. authors.

**Aram, Eugene** (1704-59), an erudite Eng. schoolmaster who gained notoriety by the murder attributed to him. The story of the crime is the theme of Hood's poem, *Dream of Eugene Aram*; and of Lytton's romance, *Eugene Aram*, 1832. B. at Ramsgill, Yorkshire, A. came of humble parentage, but he manifested at an early age a desire for learning. He married early and settled as a school-

master or usher at King's Lynn. The murder was committed at Knaresborough in 1745, the victim being a certain Daniel Clark, a man who had swindled tradesmen and disappeared. A. hid the body in a cave on the banks of the Nidd. The crime remained undiscovered for 13 years, and it was not until 1759 that he was brought to trial at York and, after he had defended himself with great eloquence, sentenced to death. He was a scholar and philologist of some eminence—one of the first to recognise the affinity of the Celtic to the other European languages. He had travelled, and gained much learning, which he embodied in a *Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic Languages*.

**Aramæan**, see ARAM.

**Aran, Islands of**, or **South Aran**, are a group of is. situated in Galway Bay, on W. coast of Ireland. They form a natural breakwater. In order from the N. their names are Inishmore (Great Is.), Inishmaan (Middle Is.), Inisheer (Eastern Is.). They contain architectural remains of early origin, among which are the ruins of the abbey of Killenda. For a time A. was a famous seat of religion and learning. Its chief industry is fishing. The total pop. 1600. Another is. of the same name is situated off the co. of Donegal.

**Aranda, Pedro Pablo Abaroa de Boles, Count** (1719-98), a Sp. minister and general, b. at Siétamo in Aragón. In 1740 he entered the army as captain in a regiment of the Castiles. On the death of his father, who was the colonel, he succeeded him, and took part in the war of the Austrian succession. He copied Frederick the Great in his methods of military discipline. In 1766 he was the most important minister in Spain. He d. at Epila, after his fall, due largely to his attitude of sympathy with the Fr. Revolution.

**Aranjuez**, a tn. of Central Spain in the prov. of Madrid and situated on the l. b. of the Tagus. It is a junction of the main S. railways to Madrid, with a pop. of 12,000. The arid plain around it gives the profuse vegetation the appearance of an oasis, which fertility it owes to the presence of a rapid of the Tagus. The prin. industry is farming and the rearing of horses and mules. It was once the seat of the Sp. court.

**Arany, János** (1817-32), after Petöfi the greatest Hungarian poet. He was b. at Nagy-Szalontá, of a Calvinist family. In spite of the hampering influence of his home he very early manifested promise of extraordinary talents. Intended by his father for the Church, he disappointed him and joined a company of strolling players. Vicissitudes fell upon his parents, and he returned, having secured a post at home as corrector. In 1840 he was appointed as notary, and married. His first work is a satire called the *Lost Constitution*, and was of a political kind. He became famous by winning 2 prizes from the Kisfaludy Society for which he ed. a translation of Shakespeare. During his residence at

Nagy-Körös, where he was prof. of Hungarian literature and language, he produced a quantity of poems in Magyar. His works include *Something about Association* and *On Hungarian National Versification* (both being dissertations on the technique of the Magyar ballad); *Death of Buda*, a prize poem; *Toldi*; *The Love of Toldi*; and *Toldi's Evening*, an epic trilogy.

**Arapahoes**, an Algonquin tribe of N. Amer. Indians, who formerly lived in the dist. between the S. Fork of Platte R. and the head-waters of the Arkansas. Later they withdrew into Colorado. They now number about 2000, and have split up into 3 divs.: the Hitunena, in a reservation in Montana; the N. A., in a reservation in Wyoming; and the S. A., in Oklahoma, who sold their reservation in 1892, and are now citizens. See Kroeber's *The Arapahoe*, 1904.

**Arapaima** (native Brazilian name), a genus of malacopterygious fishes of the family of Osteoglossidae, related to the salmon and herring. *A. gigas* is the largest fresh-water fish in the world, attaining 15 ft. in length. It is captured by spearing in S. America for exportation.

**Arapiles**, a Sp. vil. near Salamanca, celebrated as the site of the battle of Salamanca, in which Wellington defeated the Fr., 1812.

**Ararat**, a municipal tn. of Victoria, Australia. Its pop. is about 5000, and it is situated towards the W. extremity of the Great Dividing Range. It is the centre of the trade in grain and wool of the N.W.

**Ararat**, the highest point of Armenia. It rises to a level of 17,000 ft. It is situated in the plain of Aras. The mt. mass of A., rising from the Armenian plateau, consists of 2 portions, the Great and Little Ararat. Tradition makes it the resting-place of Noah's ark. The mt. is of volcanic composition, though no recent outbreak has occurred. The name also applies to the country of Urardhas, the country where the ark rested after the flood. The name is unknown to Armenians of the present day.

**Aras**, the Araxes of Xenophon, a riv. rising S. of Erzerum and flowing through the Erzerum prov. into the Pisan plateau. It has a length of 600 m. Its trib. is the Zanga. From 180 B.C. to A.D. 50 Aratanata was the cap. of Armenia and stood on an is. in the A.

**Arasur Hills**, Bombay, famous for the shrine of Amba Bhavani. Mother Amba was apparently one of the gods of the pre-Hindu race taken over by the Hindus.

**Aratus** (271-215 B.C.), a Gk. statesman, b. at Sicyon. He was educated at A. Abantidas the tyrant put his father to death while A. was yet young. In 251 B.C. he overthrew Abantidas and commenced a very successful career. By joining the Achaean League he made it a great power against all tyrants. He eventually lost favour and was poisoned.

**Aratus** (315-245 B.C.), a Gk. poet contemporary with Theocritus. While residing at the court of Antigonus Gonatas

he wrote his celebrated astronomical poem *Phaenomena*, which was very popular in ant. times and was trans. into Lat. by Cicero. He d. in Macedonia. St. Paul's quotation in his speech to the Athenians (Acts xvii. 28) was from the *Phaenomena*.

**Araucanians**, or **Ancas**, the Indian natives of Arauco in Chile. The prov. lies between the Andes and the Pacific Ocean. They are unique as the only Indian people with a system of democratic gov. No actual laws are formulated, but discipline quite as rigorous is exercised by means of the influence upon their primitive, and therefore conservative minds, of custom and tradition. Formerly gov. rested in 4 *toquis* or princes, the chief of whom was the Great Tarqui. They hold a belief in an all-powerful being, but acknowledge the existence also of many spirits, both good and bad. They number about 102,000 (1933). The A. vigorously resisted the Sp. occupation, and made desperate but futile opposition to it.

ARAUCARIA

**Araucaria**, a genus of gigantic firs (Coniferae) found scattered over the S. hemisphere. Its leaves are stiff and broad; the scales of the cones bear a leafy appendage and the anthers are many-celled. *A. excelsa*, the Norfolk Is. pine, abounds in turpentine, and provides a heavy timber; *A. bidwilli*, the bunya-bunya pine, grows in Australia; *A. imbricata*, the monkey-puzzle, yields much resin.

**Arauco**, a maritime prov. of N. Chile. Its area is 2458 sq. m. and its pop. 56,000. Its nature is agric. and its cap. Lebu.

**Araunah**, the Jebusite owner of a threshing floor on Mt. Moriah, which David purchased as the site of an altar to Jehovah that the plague then raging might be stayed (2 Sam. xxiv.; 1 Chron. xxi.). The place afterwards became the site of Solomon's Temple. In Chron. A. is called Ornan.

**Araurá**, a tn. of Venezuela, S. America, situated in a fertile dist. producing cattle, cotton, and coffee. Pop. about 4000.

**Aravalli Hills**, a range of mts. in India running through Rajputana and Ajmere-Merwara. Its highest point is Mt. Abu (5653 ft.). The white appearance of the range is due to large quantities of quartz and not to snow.

**Araxas**, tn. of Minas-Geraes, Brazil, on the Ilho das Velhas, W. of the Matto Gordo Mountains.

**Araxes**, the name of sev. rivs.: 1. In Armenia, the modern Aras (q.v.). 2. In Persia, which flowed into a salt lake not far below Persepolis, which tn. stood on its banks. 3. The A. or Chaboras in Mesopotamia, which flowed into the Euphrates. 4. The A. of Herodotus. See Herodotus, i. 20.

**Arbaces**, a general of Sardanapalus, and king of Assyria. He founded the Median empire about 830 B.C. This is according to the very doubtful hist. by Ctesias. However, there are inscriptions of Sargon of Assyria, where mention is made of one Arbaku, a chief.

**Arbalest**, or **Arblast** (Lat. *arcuballista*, from *arcus*, a bow, and *βάλλειν*, to cast or shoot), a cross-bow. It was no doubt derived from the larger *ballistæ*, and was introduced into England by the Normans. See further under *Cross-bow*.

**Arbe** (*Rab*), an is. in the Adriatic. It forms the most northerly point of Dalmatia, Yugoslavia. It is 13 m. long and 5 broad, and has A. for its cap. The ruins of the bp. of Marco Antonio de Dominis, the celebrated philosopher (q.v.), are there. The prin. industries are fishing and silk. Pop. of is., 6000.

**Arbela**, an anct. tn. of Adiabene. During Assyrian times it was the cap. of the country between the greater and lesser Zaab. The modern tn. is populated mainly by Kurds.

**Arber**, Edward (1836-1921), Eng. scholar, D.Litt. (Oxon.), F.S.A., fellow of King's College, London, formerly Eng. examiner at London and Victoria (Manchester) univs., prof. of Eng. at Birmingham Univ. from 1894. He issued and ed. many valuable series of reprints, including *English Reprints*, 1868-1871; *English Scholar's Library*, 1878-84; *First Printed English New Testament*, 1871; *The First Three English Books on America*, 1885; *English Garner*, 1880-83; *British Anthologies*, 1899-1901; *The Term Catalogues*, 1903; *A Christian Library*, 1907. He was knocked down and killed by a taxicab in Kensington.

**Arbitrage**, a commercial term applied to the process of the equalisation of prices in different business centres by buying in the cheaper market and selling out in the dearer. It is mainly carried on between London, other European caps., and New York, and deals for the most part with stocks and shares, foreign exchange, and bullion. The profits of A. are small except in stocks, in which case the operation is attended with considerable risk.

**Arbitration** (in civil law) (Lat. *arbitrari*, to judge), a term which has come to us from Rom. law, and which is applied to a judgment given by a selected person or persons in some disputed affair. In

Rom. law we find in existence 2 forms of A., one compulsory and the other purely voluntary. As is the case in Eng. law, the arbitrators must come to a decision on all points submitted to them. A. as a method of judgment may be said to apply roughly to 3 different sets of circumstances: in civil law, in international law, and in the settlement of labour disputes.

The mode of proceeding to A. is by 'a submission' or 'reference' to 'arbitrators' or 'referees,' who then proceed with due consideration of 'equity' to give their 'award.' This manner of the settlements of disputes has been supported and encouraged in England for some very considerable time, and many Acts of the last century provided for the use of A. in many cases of dispute which would otherwise have come under the jurisdiction of the civil courts. Almost all civil cases can be submitted to A., and seldom when an award has been given by A. has it on some technical point been set aside. Breach of contract, breach of promise cases, property disputes, slander actions, trespass actions can all be submitted to A. In 1889 the A. laws of England, so far as procedure is concerned, can be said to have been practically codified. A matter which is clearly illegal and contrary to the public weal cannot be referred to A., since it is obvious that from motives of public policy and safety such matters must be punished for the public good. Any one who is capable of making a contract may be said roughly to be capable of making a reference to A., and, on the other hand, persons incapable of making a contract cannot make reference to A. It has also been held that reference to A. made by a lawyer for his client must stand good. In the choice of an arbitrator the parties at difference are absolutely free, they may choose practically whomsoever they will, and provided that the person chosen is not incapable of making sane judgments, the choice will be upheld by law. It is customary, however, to choose as an arbitrator a person capable by training of examining evidence, or a person who is familiar with the subject under A., e.g. in naval matters a seafaring arbitrator would usually be chosen. In most ordinary cases of A., however, a lawyer is usually chosen. All these rules apply to voluntary A. A court or judge, however, may put any point arising in any case to compulsory A., when the award of the arbitrators may be enforced as the judgment of the court.

**Arbitration Act of 1930.**—This Act is a corollary to the Arbitration Act of 1889, in that it carries further the constantly increasing desire of Parliament to aid and encourage private A. Its enactment resulted from the requirements of international trade and it was passed in consequence of resolutions discussed under the auspices of the League of Nations. It was in 1923 that the League Assembly promulgated a Protocol on Arbitration Clauses, recognising submissions to A., and effect was given to that protocol

by the Brit. Gov. in the Arbitration Clauses (Protocol) Act, 1924. The next step in the raising of the status of private A.s. was the Geneva Convention on the Execution of Foreign Arbitral Awards which the Brit. Gov. accepted in 1927. The Act of 1930 was passed to give effect to that convention. The vital provision of the Act is the second section, which declares that a foreign award may be enforced in England either by an ordinary action at law, or, as a judgment or order, under the Act of 1889, thus placing foreign awards on as sure a foundation as Eng. awards, so far as recognition and enforcement by Eng. courts are concerned. But the aid of our courts can be invoked only if one at least of the parties concerned is a subject of a power which has made reciprocal provisions to enforce foreign awards, as declared by Order in Council, or if the award was given in a ter., e.g. a colony or protectorate, which has received similar recognition by Order in Council.

**Arbitration, Industrial, or A. in labour disputes.** This A. usually takes place between representatives of the employers and of the employed, although frequently an independent arbitrator is appointed. The whole position of A. in its labour sense was a purely voluntary one until the year 1896, when legislation was passed placing it on a legal footing. Previous to this, however, A. and A. boards had been estab. in almost every trade in the country.

The Conciliation Act of 1896 repealed all previous legislation, and, supported by the fact that a coal dispute had been settled by Lord Rosebery in 1893 and a cab drivers' dispute by the home secretary in 1895, stated that in cases of dispute between employer and employed meetings might be held with an independent chairman, or a chairman appointed, on application, by the Board of Trade. By the formation of conciliation boards by the president of the Board of Trade (Mr. Lloyd George), a railway strike which broke out in 1910 was temporarily averted. In 1912 compulsory conciliation boards were set up by the Conciliation Bill which helped to end the coal strike of that year. These boards were to have independent chairmen elected by a given date, failing which they were to be appointed by the Gov., or they could, on application, be appointed straight away by the Board of Trade. These conciliation boards were to fix the wages which had been in dispute during the coal strike. In the U.S.A. about 30 states have made constitutional or statutory provision for mediation in trade disputes. Federal legislation may not touch the question of A. and conciliation save as regards disputes affecting inter-state commerce.

**The Industrial Courts Act, 1919.**—The Conciliation Act of 1896 combined with the Industrial Courts Act, 1919, represents the characteristic Brit. form of the system of settlement of industrial disputes by conciliation and A., with its emphasis on voluntary or optional

resort to investigation, conciliation, and A. by competent tribunals. Voluntary recourse to these methods, with or without encouragement or assistance from the Gov., has now been a long-established practice in all the well-organised Brit. industries; while trade boards supply the need in the less well-organised and unorganised industries. In some Brit. dominions, however, the principle of Compulsory A. has been adopted, and the legislation of most of the Australian states has been modelled upon it. Italy, too, under the Fascist gov. of Mussolini, adopted a compulsory A. law which absolutely forbade stoppages of work. The tendency towards compulsion is not otherwise very pronounced. In the First World War compulsory A. was adopted by the Munitions of War Acts, 1915-17, which provided for settlement of wage disputes by a committee of production, a court of A., or a single arbitrator. This system was continued for a time after the war by the Interim Wages Act, but in 1919 compulsion in the United Kingdom was abolished by the Industrial Courts Act, which estab. a standing industrial court of independent persons and representatives of employers and workpeople, to deal with such disputes as might be referred to it, with the consent of both parties, or to investigate the circumstances surrounding a dispute if the minister of labour, with or without the consent of the parties, deemed inquiry to be desirable. In its original form this measure contemplated compulsory A., and went so far as to make trade union funds liable for strikes against the decisions of the arbitrators, but in its accepted form neither the awards of the court nor the findings of an inquiry are made binding upon the parties. Thus the tradition of voluntary resort to A. is perpetuated, the only significant departure being the extension of the power to order an inquiry into the circumstances of a dispute at the minister's discretion. The act lies on the border line between A. and conciliation in that it partakes of the nature of both. But the statutory power given to the minister of labour with respect to investigation is not adequate, in that it is left entirely to his discretion to order an inquiry, and gives the court no power to compel production of documents and witnesses. Elsewhere, important changes in the machinery of conciliation and A. have been introduced by all the larger countries of the world since 1920.

In some countries the arbitral body itself exercises the initiative, e.g. in Canada, under the Industrial Conditions Act, 1919, of Manitoba, a joint council of industry was set up of 5 persons, 2 each representing employers and employees, with an impartial chairman, with the assistance of technical advisers appointed by the lieutenant-governor. This body can take the initiative in investigation of conditions affecting wages, including cases of alleged unfair profits through low wages, cost-of-living inquiries, and so forth.

While experience on the whole seems to strengthen the traditional Brit. method of voluntary conciliation and A., it also tends to confirm the view that in some authority should be vested the power ultimately to compel inquiry, and that the investigating tribunal should be of such a character as would guarantee its permanence and the continuity of its operations. These at all events are inferences which suggest themselves by the light of the settlements of trade disputes in Australia. But, in the United Kingdom, progress was prejudiced by the general strike of 1926, the rancour of which led to a reform in another direction altogether, there being ground for supposing that the free will of the work-people was not consulted before their leaders provoked the strike. (See TRADES DISPUTES ACT.)

**Arbitration, International.**—An act by which 2 nations agree to submit their differences to 1 or more persons, and to agree to their award after both the parties at difference have had an opportunity of being heard. If the arbitrator is an emperor, a king, or president of a republic he is not expected to act in person, but to delegate his authority to a chosen board of arbitrators. Further, the award of a board of arbitrators is not enforceable, as is the award of an enforced A. of civil law, but rests entirely upon the faith and honour of the parties submitting their case to A. It is usual also to appoint an odd number of arbitrators, and to abide by the decision of the majority in case a unanimous agreement is not arrived at.

International A. has to deal not only with questions of law, but also with questions of fact. Usually, however, when a point of law has to be decided, the case is referred to a court of A., which gives an 'award' as in the case of civil law. But frequently cases of frontier questions and pecuniary liability have to be decided, and in that case a 'mixed commission' usually hears the case, i.e. a commission composed of representatives from both or all sides. In the 2 decades immediately preceding the First World War international A. was used frequently by many nations. Great Britain figured in the greatest number of cases, being followed by the U.S.A. and France. The subjects in dispute may be roughly described as differences over the ownership of land or of fishing rights, and pecuniary losses caused by the wrong action of another State. Among the most important cases submitted to A. in the earlier years were the Alabama case, the Bering Sea controversy, and the long-drawn-out case of the fishing rights of the Fr. off the coast of Newfoundland, which was settled in 1904, and which had dragged its slow length along since 1711. A permanent court was estab. at The Hague in 1900 to which many important cases have been referred. The Hague Court of A. was the realisation of an old ideal dating back to the eighteenth century, and was the immediate outcome of a peace confer-

ence called by the tsar of Russia in 1899. Sixteen of the powers agreed to the appointment of a court which should be open for the settlement of all disputes amongst nations. The court was to be composed of men learned in international law and appointed by the signatory powers. The aim of the court was obviously the furtherance of the peace movement by the submission to this permanent court of all disputes from which war might arise. Probably its most important decision was given in the case of Great Britain, Germany, and Italy versus Venezuela. On that occasion it may have prevented war, and certainly allayed the spirit of hostility which had arisen from the Venezuelan question.

**A. between Great Britain and the U.S.A.**—It is to be observed that long before there was any world court of justice or a Hague court, Great Britain and the U.S.A. were distinguished among all the nations for their readiness to submit differences to A. rather than resort to arms. One of the most famous cases between the 2 nations was that known as the Alabama case. (See under ALABAMA, THE.) The most serious difference between America and Great Britain in modern times occurred during the second administration of President Cleveland. There was a dispute between Venezuela and Great Britain over the boundary between Venezuela and Brit. Guiana. Secretary of State Richard Olney of the U.S.A. intervened in a dispatch to the Brit. Gov. which brought relations between the 2 countries almost to the breaking point. The crisis was allayed by the judicious policy of Lord Salisbury, then Brit. Prime Minister, and the matter was submitted to A. and settled some years later. Other prominent cases in which the U.S.A. and Great Britain were involved and which were settled by A. were the boundary dispute between Alaska and Canada in 1903; and the N. Atlantic coast fisheries dispute which was settled in 1910 after causing difficulty for over 60 years. Not only did the 2 countries thus set an example to the world, but they emphasised it by signing a treaty of A., Aug. 3, 1911, and again on Sept. 15, 1914, when they signed an Anglo-Amer. Peace Commission treaty. In so far as human promises can avail, the 2 great Eng.-speaking nations have thus abjured all thought of war between them and have solemnly decided that any and all disputes between them shall be settled by peaceful A.

**A. and the First World War.**—It affords food for melancholy reflection that A., the solvent of international differences of no insignificant character, such as the Venezuelan boundary question, should have played next to no part in the First World War. Its voice was not, however, altogether silent, though sometimes the voice was hypocritical. Three successive Ger. chancellors, Bismarck, Holweg, and Hertling, were constantly advertising their desire for a peace by negotiation and bemoaning the Allies'

lust of conquest. The year 1917 was favourable to such 'defeatist' policy. Terrible battles—Arras, Verdun, and Ypres—had yielded nothing definite to the Allies in exchange for the great carnage. The moment was propitious, from the Ger. point of view, for encouraging a movement in the allied countries for a 'negotiated peace' as opposed to a 'peace through victory.' Behind this movement were many and diverse elements of no negligible character—the international financiers, who, rightly or wrongly, feared that credit all round would founder in the chaos of Socialism, the Socialist groups, the pacifists, certain ecclesiastics, and some of the old diplomats. The movement took shape in a proposal for a conference at Stockholm; but the conference proved a complete failure (see STOCKHOLM CONFERENCE). In the same year, too, the Catholic Church put forward a special plea for peace in which Pope Benedict XV., in outlining in his note (Aug. 1, 1917) his ideas of the bases calculated to ensure an enduring peace, proposed *inter alia* the 'settlement of all international disputes by A.' (see BENEDICT XV., POPE). The central empires loudly supported this substitution of the 'moral power of right' for material force, but said nothing of the restoration of conquered ter. The Allies left President Wilson to reply, in characteristic vein, that the action of the existing Ger. Gov. rendered nugatory any negotiations with them.

The moral to be drawn from this and similar failures is not that A. is necessarily a hopeless expedient, but merely that its voice is unlikely to be of any avail after hostilities have begun. The foundations of international relationships must be reconstructed if A. is to prove a more effective preventive of war than hitherto. In the Covenant (q.v.) of the League of Nations, a laudable if ill-fated effort, largely inspired by President Wilson, was made to strengthen A. as a means of composing international differences. The members of the League agreed that 'if there should arise between them any dispute likely to lead to a rupture' they would submit the matter either to A. or to inquiry by the council of the League, and that they would in no case resort to war until 3 months after the award of the arbitrators on the Council's report. An award had to be made within a reasonable time and a report by the Council within 6 months of submission. The League members also agreed that whenever any dispute arose between them 'which they recognised to be suitable to A. and which could not be satisfactorily settled by diplomacy,' they would submit the whole subject-matter to A. Disputes as to treaty interpretation, any questions of international law or as to the existence of any fact which if proved would constitute a breach of international obligation or as to the reparation for any such breach, were declared to be matters generally suitable for submission to A. The court of A. to which a case would be referred would be the court agreed

on by the disputants or stipulated in any convention existing between them. Finally, the members agreed that they would carry out in good faith any award made, and would not resort to war against a member which complied with the award; and in the event of any failure to carry out an award, the Council would propose what steps should be taken to give effect to it. Experience was to show, however, that in any really serious contingency the covenant was nugatory. See further under COVENANT OF THE LEAGUE OF NATIONS; LEAGUE OF NATIONS.

A. since 1922.—After the establishment of the Court of International Justice in 1922 the advance which took place in regard to A. in the ensuing 5 years was in 3 directions: in the actual work of the Permanent Court; in the number of special A. treaties concluded by individual Govs.; and, finally, in the general trend of the debates in the plenary sessions of the eighth assembly of the League of Nations. The court's intervention in a dispute between 2 or more govts. might be secured either for the interpretation of treaties, where specific provision for such reference to the court had been made in advance by the parties; or for the settlement of all justiciable disputes referred to it by both parties; or by one party only if both had accepted the optional clause of the Statute of the court (see OPTIONAL CLAUSE); or for an 'advisory opinion' upon any dispute referred to it by the council or assembly. 'Opinions' have been given on a dispute between France and Great Britain as to the nationality (and consequently liability to military service) of Brit. subjects in the Fr. protectorate of Tunis; in disputes between Poland and Germany in 1923, as to the nationality and the rights of Ger. residents in dists. ceded to Poland under the treaty of Versailles; and in the interpretation of the treaty of Lausanne (q.v.) regarding the sovereignty of the dist. of Mosul—a most important question (see IRAQ). The court's jurisdiction has (theoretically) the court still, no doubt, continued to exist throughout the Second World War) also been invoked in other ways, e.g. in the case of the *Wimbledon*, which raised certain questions of interpretation of the transport clauses of the treaty of Versailles arising out of the closure by Germany of the Kiel Canal to a Brit. vessel chartered by a Fr. firm to carry munitions to help Poland against Russia. An instance of a case of reference by the consent of both parties or by one party relying on the optional clause is afforded by the agreement in 1924 by Greece and Bulgaria to invite the court's interpretation of the treaty of Neuilly relative to a frontier dispute; and in the same year Belgium invited the 'compulsory' jurisdiction of the court against China in the matter of the denunciation of the Sino-Belgian treaty of 1865, relying on the optional clause, which both had accepted; and also by the *Lotus* case, submitted by France and

Turkey in 1926, an important case raising a pure question of customary international law arising out of a collision between a Fr. and a Turkish vessel with resultant loss of life. The readiness of both France and Turkey to submit so important a decision to the court was some indication of increasing confidence in that tribunal, and the great increase in the number of A. treaties—at least 90 were negotiated between the end of the First World War and 1926, a number much larger than all the treaties concluded during the nineteenth century—was another tribute. Thus far the progress of A. was good, but when the sessions of the eighth assembly of the League began, it was appreciated that the leading Govs. of Europe were not prepared to pledge themselves further in regard to A. until more substantial advances had been made in the sphere of security, while the Brit. Gov. showed so little sign of changing its attitude towards the optional clause that the Imperial Conference of that year declared the time premature to accept the obligations of that famous clause. In the Brit. case against Albania on the mining of the Corfu Channel, the majority of the United Nations Security Council upheld (March 1947) the Brit. charges against Albania of laying mines in the channel, but the Russian delegate used the veto and there was no decision. Britain therefore applied to the International Court of Justice, which tribunal (March 1948) rejected by 15 to 1 Albania's preliminary objection that in view of Britain's application being unilateral the court had no competence in the matter. (See further ARMAMENTS, LIMITATION OF.)

Consult *From Paris to Locarno and After*, by Fred Alexander, 1928.

**Arblast**, see ARBALEST.

**Arboga**, an anct. tn. of Sweden, in the former *tan* of Vestefås, situated on the R. A. and canal which connect Lakes Hjelmar and Mälär. Formerly a place of considerable trade, especially in woollen and iron wares, its prosperity has greatly declined. Once important, too, as the seat of many councils and diets, particularly the parliaments of 1434, 1440, 1471, and 1501. The tn. gives its name to the coinage of 1625 and 1627, which consisted of *klippingar*, or square copper pieces, and *fyrkar*, or farthings. Pop. 3000.

**Arbogast**, a barbarian officer of the Rom. army at the end of the fourth century. His nationality is obscure, but the authorities, among them being Zosimus and Sulpicius Alexander, give it as Frank. He served with distinction against the Goths, and was sent against Maximus, whom he totally defeated in A.D. 388. He then became the chief minister to Valentinian II. The death of Valentinian, who had opposed barbarian progress, led A. to select as a successor one Eugenius, a rhetorician. A battle against Theodosius saw A.'s defeat. He escaped, only to kill himself 3 days later, while Eugenius was executed.

**Arbois**, a tn. of K. France in the dept. of

Jura on the Cuisance. Produces good red and white wine and possesses a tannery, saw-mills, and paper and oil industries. Pop. 3000.

**Arbon**, a Swiss tn. in the canton of Thurgau, situated on Lake Constance, Pop. about 3000.

**Arbor Day** is a day set apart for the public planting of trees in America. The custom originated in Nebraska in 1872 and gradually spread throughout the continent. With few exceptions it is regarded as a legal and public holiday. The date is movable and fixed by proclamation. The same custom is observed in New Zealand.

**Arboriculture** (Lat. *arbor*, tree, *cultura*, cultivation), the scientific cultivation of trees, whether ornamental or useful. In the cultivation of fruit trees such processes as grafting, pruning, and binding are employed; viticulture, or vine-growing, is common to France and S. Europe. For sylviculture, or the growing of forest trees for timber, see FORESTRY.

**Arbor Low**, megalithic structure near Bakewell, Derbyshire. A circle of 30 stones, now overturned, enclosing a megalithic ruin, is surrounded by a fosse and rampart 250 ft. across. It is of late Neolithic age.

**Arbor Vitæ** (Lat., tree of life), a Chinese and an Amer. species of *Thuja* of the order Coniferae. *T. orientalis* is the name of the former, *T. occidentalis* of the latter. The leaves are small and wrap round the stem closely.

**Arbroath**, or **Aberbrothock**, a seaport of co. of Angus, Scotland. It is situated upon the mouth of Brothock Water. It is under the administration of a provost, assisted by bailies and a council. Its chief industries are the manuf. of sail-cloths, canvas, the tanning of leather, boots, bleaching, engineering, chemicals, and extensive fisheries. Pop. 20,000.

**Arbroath Flags** are grey flagstones and grey and olive shales found almost exclusively in Angus, Scotland.

**Arbuthnot, Alexander** (1538-93), a Scottish ecclesiastic and poet. He was educated at St. Andrews and later at Bourges. In 1569 he was installed principal of King's College, Aberdeen. This post he filled till his death. His existing works are: *Praises of Women*; *On Love*; *Miseries of a Poor Scholar*.

**Arbuthnot, John** (1667-1735), physician and satirist, b. at Kincardineshire, studied at Aberdeen, Oxford, and St. Andrews. Appointed regular physician to Prince George and, in 1705, to Queen Anne. Became the cherished friend of Swift and Pope and himself gained a reputation as a wit. A. was the chief contributor to *Memoirs of Martin Scriblerus*, 1741, part of which was by Pope. His other prin. works are (1712) *The History of John Bull*, mainly against the duke of Marlborough; *A Treatise concerning the Altercation or Scolding of the Ancients*; and the *Art of Political Lying*, the style of which is modelled on Swift, but without the latter's ferocity. A. was an honourable

and amiable man, one of the few who retained the sincere regard of Swift.

**Arbutus**, a genus of evergreen shrubs of the order Ericaceae, occurring in Europe, the E. and N. America. *A. unedo*, the strawberry-tree, mentioned by Virgil, bears a berry which resembles the strawberry. *A. andrachne* is the oriental A.

**Arc** (from Lat. *arcus*, a bow), a portion of a curved line. The straight line joining its extremities is called the chord. The length of an A. of a circle can be determined if the angle subtending the A. at the centre and the radius or circumference are known. If  $r$  is the radius, the circumference =  $2\pi r$ , where  $\pi = 3.1416$ . Then if  $a$  be the angle subtending the A., the length of the A. is  $\frac{a}{360}$  of the circumference.

The electric A. is the electric discharge between 2 carbon terminals at different potentials. It is utilised for lighting purposes in A. lamps, and for soldering and fusing purposes where an extremely high temp. is required.

**Arc**, Joan of, see JOAN OF ARC.

**Aroa**, an anct. tn. of Phœnicia which contained the temple of Aphrodite Astarte. It was the bp. of Alexander Severus, from whom it took the name of Cæsarea Libani.

**Arcachon**, a coastal tn. of S.W. France in the dept. of Gironde; is celebrated for the magnificent pine woods in the vicinity. There are 2 divs. of the tn., the summer part on the beach, and the winter portion inland. The climate is very mild, and many consumptives use it as a winter resort. The chief industries are oyster-breeding and fishing. Pop. 10,000.

**Arcade**, a range of arches supported either by piers or columns. The earliest known examples are those of Tabularium, the theatre of Marcellus, and the Colosseum at Rome. In some a gallery runs behind the supporting pillars, in others they are part of the wall. The latter are called blind or wall As. and are common in Eng. churches.

**Arcadia**, the central plateau of Peloponnesus, Greece. It is surrounded by mt. barriers, and suffered stagnation on account of the difficulty of establishing communication with surrounding countries. The anct. inhab. were shepherds and hunters whose gods were Pan, Hermes, and Artemis. It played a fairly important part in Gk. hist., as it is placed between Sparta and the Isthmus. A popular idea of the mode of Arcadian life attributes to them perfect happiness evinced by the absence of all that is called mundane in modern cities. Simple diet and an absolute ignorance of immorality aid this idyllic conception of the Arcadians.

**Arcadius** (A.D. 378-408), Rom. emperor and son of Theodosius the Great. He succeeded his father at the same time as his brother Honorius, and the kingdom was divided between them. Both displayed small governing ability, and it speedily passed to other hands.

**Arcadius**, a Gk. grammarian of the second century, a native of Antioch. An epitome of the works of Herodian has been attributed to him, but without authentic proof.

**Arcagnolo, L'**, or Clone, see ORCAGNA. **Arcani Disiplina**, a theological term applied to the custom, which prevailed in the early Christian Church, of regarding certain rites as intimate mysteries, to be carefully kept from the heathen and even from those who were receiving instruction in the faith. The term was not in use till the seventeenth century, in which much was written *de disciplina arcani* on both the Catholic and the Protestant side.

This practice was based on Matt. vii. 6, 'Give not that which is holy unto the dogs, neither cast ye your pearls before swine,' and on 1 Cor. xiii. 1, 2. 'The doctrines of the Holy Trinity, baptism, and the eucharist were especially withheld from the knowledge of the uninitiated. This practice of reserve prevailed about the third century, and was well estab. in the fourth and fifth. The writers who set forth the idea are Origen, Basil, Athanasius, Chrysostom, Theodoret, Ambrose, Augustine, and others. Many early writers refer to it, and veil their meaning so that only the initiated may understand. The creed was only formally delivered to the catechumen at his baptism, and was, therefore, regarded as a mystery. The Lord's Prayer, likewise, was jealously kept from the heathen, because of its prominence in the communion office. The reason given for this secrecy was that all converts were not sincere, and that the early Church was obliged to be jealous of her doctrines for fear of the misinterpretation and persecution to which she was subjected.

**Arcanum** is the neuter of the Lat. adjective *arcanus*, used as a substantive. It had the significance of a profound mystery, or, in a more particular sense, one of the alchemist's secrets of nature, such as the elixir of life, the philosophers' stone, etc. The plural form *arcana* is also used, sometimes as though it were a singular noun.

**Arcè**, an It. com. in the prov. of Caserta; pop. 7500. The tn. of A. is near Arpino, and has a pop. of 2000.

**Arcesilaus** (316-241 B.C.), Gk. philosopher, and founder of the Middle Academy. He was b. at Pitane in Æolis, and was educated by Autolycus, and later at Athens by Theophrastus and Crantor. He left no writings.

**Arcèvia**, a tn. of Ancona, Italy, on the Marches, 29 m. S.W. of Ancona; pop. 15,000 (1931).

**Arch**, a structure of stones or other hard blocks arranged in curves over an open space, so that the individual blocks may be supported by their mutual pressure and thus be enabled to sustain a superincumbent load.

The sides of an A. are termed *haunches* or *flanks*, the blocks of which it is composed are called *voussures* (B). The lowest voussours are called *springers* (C),

and the highest is called the *keystone* (A). The inner curve is termed the *intrados*, and the outer curve the *extrados*.

In building an A. it is necessary that a temporary structure should be erected in the open space to serve as a support to the vousoirs until the keystone is put in place. Semicircular frames of timbering are generally used in modern building for this purpose.

The A. was utilised by the ancients, Assyrians and Egyptians, but was not generally employed by the Greeks, who

contra-flexed. The Tudor A. is a 4-centre pointed A., and is the leading characteristic of the architecture of Tudor mansions and churches in this country. Foliated As. imitated in their form the shapes of leaves, and are classified according to the number of folis, as trefoil, cinquefoil, and polyfoil.

Arch, Joseph (1828-1919), an Eng. politician and founder of the National Agric. Labourers' Union. He was b. at Barford, Warwickshire. Justin McCarthy calls him the 'emancipator of the agric. labourer.' He represented

ARCH: VOUSOIR, SPRINGERS, AND KEYSTONE

SEGMENTAL

EQUILATERAL

LANCET

TUDOR

POINTED TREFOIL

maintained the tradition of the straight line in their architecture. Rom. As. were usually semicircular, though segmental As., that is, where the centre of the curve is below the springers, were not uncommon. The pointed A. appears to have been adopted by the Muslims as an emblem of their faith, and it made its way into Europe through the example of their own building and the ideas brought westward by the returning crusaders. It was used in Gothic architecture in various forms, the simplest of which are the equilateral pointed A., where the centres are at the foot of the springers; the drop A., where the centres are within the archway; and the lancet A., where the centres are outside the archway. In the Fr. Flamboyant period the elliptical A. with 3 centres became common, as also did the ogce A. with 4 centres, the upper curves being

the N.W. div. of Norfolk in the Parliaments of 1885 and 1886; and he was returned again in 1892 and 1895. He retired to Barford in 1900.

Arch, Triumphal. In order fittingly to celebrate the victorious return of Rom. generals, an A. was erected either across roads or at the entrance to cities. The first known T. As. were those erected by L. Stertinius in 196 B.C. He erected 2 in the Circus Maximus and the Forum Boarium respectively. During the reigns of the Rom. emperors they received much attention, and lavish expenditure of money and every device of art was brought into play to add to their splendour. Frequently they were decorated with bas-relief designs and adorned with laudatory inscriptions. The total number of T. As. that were built by the emperors is about 40, of which number 3 remain standing.

These were built respectively by Titus in A.D. 82, Septimius Severus in A.D. 203, and Constantine between the years A.D. 306 and 337. Variations of these forms of masonry exist in other parts of the old Rom. empire. They are found at such places as Rimini, Susa, Verona, Ancona, and Orange (France).

Inspired by a similar motive, Napoleon resolved to adorn Paris with 4 of these structures. In 1806 he caused to be erected the Arc de Triomphe du Carrousel. It is situated between the Louvre and the Tuileries, and has been constructed after the pattern of the A. erected by Septimius Severus. In the same year another A. was commenced beyond the Champs Elysées. This is the Arc de Triomphe de l'Etoile. Its erection, however, suffered some hindrance, and was not completed till 30 years after. In 1871 the Ger. army marched under it on their entrance into Paris. Modelled upon the style of the A. erected in Rome by Constantine was the Marble A. of London. Originally it was situated at Buckingham Palace, but in 1851 it was transferred to Hyde Park. George III. was responsible for the idea of its construction. The expense involved amounted to over £30,000.

**Archæan System** (Gk. ἀρχαῖος, ancient), in geology, the lowest system of stratified rocks, below the Cambrian system. Other terms proposed are *Pre-Cambrian*; *Azoic* (without life), because it is believed that no fossils occur in it; and *Eozoic*, on the assumption that a structure called *Eozoon* is really a fossil. The A. S. is one of great complexity; it consists of a mixture of igneous rocks with stratified rocks, many of which have been metamorphosed. The most important constituents are gneisses and schists, whilst the presence of animal or vegetable life is indicated by masses of carbonaceous shales. The A. S. is understood to underlie the younger formations in every part of the globe, and it is estimated that in places it attains a thickness of from 80,000 to 100,000 ft. There are outcrops in the N.W. of Scotland; the Wrekin in Shropshire; over a great part of Canada; in Michigan and Minnesota in the U.S.A.; in Scandinavia, Brittany, Bavaria, and the Pyrenees in Europe; in Tasmania and New Zealand; in N. China and Japan; and probably over a great part of Canada. The rocks often yield minerals of great value, including iron, gold, silver, copper, nickel, and sometimes precious stones. See Sir A. Geikie, *Text-book of Geology*, 1882.

**Archæology**, the study of antiquities. The progress of knowledge has varied the nature of the application of the word to all anc. branches of study, as it was once used only to signify the study of the art of Greece and Rome. The range is extremely wide and covers vast ground, for it embraces practically the whole of the hist. of races and things from the beginning of hist. to the Middle Ages. So many fields of study are closely associated with A., e.g. geology, palæ-

ontology, palæobotany, that it is necessary to establish a dividing line between encroaching subjects and to confine the term A. to the artistic element found in remains anc. and mediæval.

A. may be said to have commenced with the end of the Quaternary period of geology. Controversy has been waged upon the question whether distinct evidences in flint and stone implements place the source further back, into the Tertiary period. The main difficulty which seems to arise is that of discrimination between chips of rocks formed by nature in the crumbling processes of earthquakes, denudation, etc., and actually artificially formed weapons. It is certain, however, that in order for man to possess the necessary skill exhibited in the Quaternary flint implements, he must have passed through a previous and necessarily less skilful stage. Evidences of this period have been claimed to exist in the Plateau-gravels of Kent, Belgium, and Egypt, and the term *colithic*, meaning 'dawn-stone,' has been applied to them.

With the Palæolithic period evidence of a more dependable character is found. Corresponding characteristics in the flint remain, and the beds in which they are found point to the similarity of age of both the bed and the deposit, hence this evidence is almost purely geological. During the Tertiary period the contour of Europe was very different from that of the later Quaternary period. Practically all the area N. of a line drawn from S. England to Leningrad was sea, and the climate existing over the area was of a mild character. The great change came, with its enormous upheavals resulting in the appearance of the Alps, Carpathians, and Caucasus. The whole level was raised and the great mt. systems, with their capacity for condensing, caused the Pluvial period. Moreover, further phenomena which resulted were the appearance of glaciers, powerful agents of denudation and defacement, and increasing cold towards the N. Acting with these gigantic forces were the great riv. systems of Europe, and thus it is that we find such a depth of bed, worn to its extent by the erosive nature of its progress.

The earliest recorded Palæolithic implement was probably found towards the end of the seventeenth century, and it supports the incontrovertible fact that the Thames has changed its bed for one now much narrower than the old.

The study of cave remains is comparatively new. It dates from the beginning of the eighteenth century. In the now-famous cave at Gailenruth in Franconia many remains were found by the archæologist of mammoths and like extinct animals, but it was not until 1842 that the search for evidences of man's contemporaneity with them was begun. The proof was found in Kent's Cavern, Torquay, by the Rev. J. McKnery. The peculiarity of the strata in this cave led experts to find that, fortunately enough, traces existed of man's occupation of the cave through all the varying periods as

far even as the medieval stages. Endeavours to fix the enormous intervals of time that must have lapsed between the different occupiers have varied in hundreds of thousands of years, sufficient evidence of the futility of the attempt. From the caves of France important discoveries have yielded specimens of primitive portrayal of animals upon stone and clay vessels that stand far above all contemporary evidence for remarkable skill in their intelligent execution. To gauge the quality of the intellect of the human mind at this period, it would assist to compare it with the Australian black or Fuegian. The best known of these engravings, that of a mammoth on ivory, is in the Jardin des Plantes, Paris. The attempt is extraordinarily rich in cleverness of perception. The presence of prehistoric man in the Arabian desert was, in Dec. 1932, quite definitely established by the finding round Kilwa in Transjordan of rock drawings which go back to the Palæolithic or Neolithic periods. These drawings evince artistic skill, and must have been known to the Christian inhab. of Kilwa, for they had built 2 lime kilns on the hillside below some of the pictures. In the Middle E., Palestine has also been a fruitful source of valuable finds, the work of Prof. Flinders Petrie and Prof. Garstang in the vicinity of the site of Jericho and Mount Carmel being especially notable. A series of caves was discovered in 1934 on Mount Carmel by Brit. and Amer. excavators which show continuous human occupation from 100,000 years ago, up till biblical times, and so through the Arab period to the date of discovery. While the line delineations of these cave-men possess such striking accuracy of touch, scarcely less true and faithful are their sculptured objects. How such a standard of art could exist within minds of such poor development comparatively, is a question which remains unsolved. Among the difficulties which beset the students of A. are the numerous attempts at fraud which have been made from time to time. Many of the perpetrators have not only had the audacity to spend considerable care and time in the manufacture of false evidences, but have produced works on their 'discoveries' supporting their claims to scientific recognition.

At the end of the Palæolithic period a break in the hist. of man in Europe occurs, and the next traces are those of the Stone Age. The structure and form of the country he inhabits are those familiar to us at the present day. New accomplishments appear, among which are the use of animals for domestic purposes, agriculture, and pottery, besides the significant mastery of weaving. More questions arise here as to the disappearance of the Palæolithic man before the advent of the Neolithic, but the questions remain unsolved.

Traces of Neolithic man are found mostly in the barrows of Wiltshire, Gloucester, and Dorset. They are called long barrows for they were succeeded

by round barrows. Some of the long barrows contain a stone chamber within which interments of the dead took place, and it is here that evidence of the burial of the dead is found. In some cases the burial process has been preceded by cremation, in others no cremation has taken place, and in fact, from sufficient evidence, it has been proved that decay has often set in before the burial took place, a practice which is prevalent among many present-day savages. The use of flint for implements of cutting was still appreciated, and mining of the stone took place very largely. Flint shafts have been found at Grime's Graves in Norfolk and Cissbury in Sussex. Two shafts were sunk and connected afterwards at the bottom by a gallery. Sites of the factories for the making of flint tools are found also in Kent, in Antrim, Ireland, and in Spiennes in Belgium.

It may be assumed that at this stage of human hist. man occupied most of the temperate parts of the world, an area covering the greater part of the earth's surface between the poles, and from the deductions made from discoveries in many places the theory of stone preceding the use of iron for tools is supported by them. In Japan extensive 'kitchen middens' have been found to contain numbers of chert implements, together with types of primitive pottery; the use of metal has been found to follow in order. The same system has been found in the Far E. In China fewer opportunities of exploration have been available, owing to hostile superstition damaging the monuments that mark their progress. Evidences, however, have recently been discovered of a prehistoric Neolithic culture in China. It has also been proved beyond a doubt that the same development from stone to iron marked the hist. of the Negro and Bantu races of Africa. In S. Africa, Egypt, and Somaliland large numbers of stone implements have been found.

In isolated countries like those of Scandinavia and Switzerland the hist. is clear; the former was free from interruption because of its isolated position, while the latter, protected by its mts. from disturbing peoples, enjoyed a similar peace. There are many mighty relics of the Stone Age which are still in a good state of preservation, and among them the most notable are huge circles of stone. To these monuments countless superstitions have lent themselves. In England Avebury and Stonehenge are 2 of the most remarkable survivals to be seen in W. Europe (see also ARBOR LOW). At the latter the conclusion has been drawn that the stones were raised for the purpose of religious celebrations in the times of the Druids, and many stone implements in the form of hammers have been found buried on the site. Astronomical reasons have been assigned for the erection of the Stonehenge monoliths, notably by Sir Norman Lockyer. Stonehenge is now

assigned by archaeologists to the early Bronze Age.

The appearance of the Bronze Age may be said to date from 3000 B.C. in Crete, 2000 B.C. in France, 1800 B.C. in Britain. The first metallic products took the form of axes, elementary knives, and small tools and ornaments. With metal adoption may be placed the coming of the Celt, traced by evidences in the round barrows. Pottery takes a prominent place in the implements used by the peoples of the time. As the Neolithic Age was incalculably shorter than the Palæolithic, so the Bronze Age was of less duration than the preceding period. It is certain that bronze tools preceded iron. The metal is a mixture of copper and tin, and here exists a proof of the apophthegm that the march of knowledge renders the next step less laborious, for iron can be procured direct from the ore. The casting of the bronze from the necessary copper and tin was, of course, of the most elementary character, a simple furnace in the ground dependent on wind for its draught, and rough moulds of thick clay with a lip at the rim. Large numbers of bronze implements are constantly being found in Britain, and the fact of their repeated discovery destroys the contention that the tools were imported. The weapons of the Bronze Age were spears, swords, and axes or 'celts,' the edges being sharpened by stone hammers.

The introduction of iron began about 1000 B.C., the earliest evidence of which was found in S. Europe. From here it spread over all Europe. From this point advance was as rapid as it was previously slow, and once again the relative length of the period is shortened by the same tremendous rush of time. Contemporary with the advent of iron was the existence and use of gold. In Ireland the prehistoric use of metal presents many interesting data of study, and it is certain that the early wealth of that country must have been enormous. Curiously enough, silver was almost unknown yet in Europe, its only place of existence being the Mediterranean coast of Spain.

In the nineteenth century archaeological excavation was concerned mostly with Europe and the Mediterranean civilisation. The most notable achievement was Schliemann's discovery of anct. Troy and his excavations at Mycenæ. He also pointed to Cnossos as the centre of anct. Mediterranean culture, and subsequent excavations in Crete have revealed, details of the Minoan civilisation. (See also CRETE.) Meanwhile an impetus had been given to archaeological research by the decipherment of the Rosetta stone by Champollion about 1830, and by the end of the century the hist. of anct. Egypt, through the genius of Prof. Flinders Petrie and others, was fairly completely unravelled. The crowning achievement of Egyptian A. was the discovery of Tutankhamen's (q.v.) tomb

by Lord Carnarvon (q.v.) and Howard Carter (q.v.) in 1922. In this year also a joint expedition authorised by the Brit. Museum and the Museum of Pennsylvania set out under Leonard Woolley (q.v.) for Mesopotamia, which had for long been the centre of tentative research. The expedition was so far successful as to gather sufficient material to reconstruct the anct. Sumerian civilisation of Ur (q.v.), together with indisputable evidences of the Flood and of a civilisation before the Flood.

From 1881 to 1894 A. P. Maudsley, together with the artist Catherwood, surveyed the monuments and ruins belonging to the pre-Sp. civilisation of Central America. Much still remains to be done, but research has enabled evidence to be put together of the old empire of the Mayas (q.v.), situated in Chiapas, Guatemala, and Honduras. For reasons not yet incontestably explained there was an exodus of the Mayas in about 400 A.D. both to Yucatan and to Oaxaca. The Mayas were thus brought into contact with the early Toltec culture of Mexico which preceded the Aztec, and their influences upon Mexican life and art can be traced. Mayan art has some affinities with anct. Egyptian art, and there is also a similarity between the designs, games, and recreations of anct. Mexico and those of China, and India, but beyond that no connection has been estab.

Penetrating deeper into S. America, archaeologists have been able to discover details of the barbaric empire of the Incas, which at the time of the Sp. conquest included the states now known as Ecuador, Peru, Bolivia, and part of Chile and Argentina. Some of the most valuable finds both from an archaeological and artistic point of view have been those of hand-modelled pottery. From this pottery Prof. Uhle deduced 4 successive periods of culture once existent in Peru. The possibility of Mayan influence at one period may be admitted in so far as it may help to prove the whole of Amer. culture to be indigenous in its origin, and the improbable theory of an immigration of peoples from China and Polynesia would then be discounted.

The modern progress of A. has made rapid strides. New and powerful aids in photography, in cheap and at the same time reliable illustration, in the recognition by young people of the ethnological value of all fossils and archaeological remains, tend to assist its march, and with little doubt the available facts of to-day will be a shadow in comparison with the accumulated data of to-morrow.

The important aid that the invention of the aeroplane has rendered A. deserves special treatment. It has long been known that a vertical view, or photograph, would reveal anct. disturbances of the soil that could not be perceived on the ground. Chalk, for instance, once dug can never be restored to its former state. Earlier attempts at vertical

photography, by free balloons and box-kites, were not very successful. The First World War led to great activity in vertical photography for military purposes, and this led subsequently to members of the R.A.F. noticing on their photographs the signs of soil disturbances in past centuries. Col. Beazeley, in Iraq during the war, in 1917, noted the traces of buried cities; while in England, in 1922, 2 air officers, Clark Hall and Haslam, first drew attention to the traces, visible to the observer aloft, of disturbed land. In 1933, an aviator flying over the Dead Sea detected traces of an ancient. The interest of the public in this form of exploration was first roused by the discovery by Mr. O. G. S. Crawford (archæological officer to the Ordnance Survey), of the complete course of an avenue at Stonehenge. This was in 1923, and in the following year Mr. Crawford published a volume containing about 300 aerial photographs.

*Recent discoveries in Britain.*—The discovery of pre-Crag man in Darnsden, Suffolk, is considered by archæologists to be the most impressive advance in Eng. prehistoric studies or studies of pre-Paleolithic man in recent years. For pre-Crag man inhabits a land which was previously supposed to be untenanted by the human race. The discovery of his flint instruments has 'increased in length the long dim vistas of prehistory, and now that we have seen him in the far-off distance we may the more boldly scan the mists beyond him that still hide the uttermost beginnings of man's story in this country' (T. D. Kendrick). The discovery by Mr. Reid Moir in 1920 of the 'great flint implements' of Cromer—a workshop floor of early Chellean times on a flint-strewn patch of foreshore 150 yds. long—is important as proving that the Wash-Bristol Channel line is no longer to be regarded as the N. limit to the field of study of Lower and Middle Paleolithic man. Study since 1914 of the so-called 'New Stone' Age would seem to show that we have only recently begun to understand the Neolithic period. 'Not so very long ago,' says Mr. Kendrick, 'the neolithic period emerged out of a cloudy and uncertain mesolithic period as a vast "polished axe" period lasting many thousands of years, during which agriculture and the art of potting were introduced, and the inhab. of Britain buried their dead in long barrows. We see now that these changes in manner of life and in custom took place in a period which, though of astonishing vigour, was in reality short. . . . As the result of new discoveries the polished axe has ceased to be the touchstone of the neolithic period [and] . . . to understand the neolithic period itself we turn away from the axes to field-monuments and to pottery.' The discovery of 'Woodhenge,' 2 m. N.E. of Stonehenge, was the result of an air photograph taken in 1925, and is one of the most remarkable triumphs of what is not unnaturally called 'archæology from the air.' The name 'Woodhenge' was invented during the subse-

quent excavations (see Mrs. Cunningham's *Woodhenge*, 1929). Excavation of spear-heads, winged axes, sword-types (especially Hallstatt), bronze 'maple-leaf' razors, gold bracelets, bronze cauldrons, sepulchral pottery, and so on, confirms the position that the late Bronze Age in England and Wales is, taken as a whole, a period of continental influence and immigration (e.g. the Hallstatt sword implies a Lower Rhenish culture, while winged axes seem to be of Alpine origin) acting upon native traditions. Like the Achæans, the Celts seem to have assimilated the culture of the Ægean area and that of the Ægean colony at Halstatt (Austria) and it was they who were the 'carriers' of the La Tène Iron Age (i.e. the continental period which ensued on the initial Iron Age culture into Britain and Ireland). The potter's wheel was introduced by them into Britain during the archæological early Iron Age; and it is conceivable that the crematory people of the Bronze Age were a Celtic race; for during that age Celtic peoples were filtering into Britain from Gaul, having apparently come originally from the Danube region. Excavation of the hill-forts or 'camps' of the early Iron Age in England and Wales has rendered classification and grouping possible, and the copious material was collated in 1913 by Mr. C. F. C. Hawkes, who shows that the idea and practice of the building of the forts was introduced by the Iron Age invaders; that the forts were the citadels of tribal groups; and that their numerical increase in the centuries after the immigration estab. tribal consolidation and development. A number of Iron Age forts have been excavated since 1914—mostly a single rampart and ditch (e.g. Liddbury and Liddington Castle, Wilts., Thundersbarrow Hill, Sussex; the Chastleton, Oxon.). More evidence of burial customs has been found by recent excavation, e.g. of a cemetery at Harlyn Bay in N. Cornwall in 1921, and at Barnwood, Gloucestershire, in 1930. These discoveries have also thrown light on the range of types of our Iron Age pop., types tending to medium- or long-headedness, the outcome of the fusion and supervening of invading Celts on earlier indigenous strains, and they also increase our knowledge of the influence in England of the culture of the La Tène period as exemplified, e.g., in pottery, brooches, bead-rim urns, medallions, etc.

More recent archæological study of Rom. Britain has intensified the distinction between Romanisation before the conquest and of native traditions continuing after it, it being recognised that in studying a Rom. prov. the character and abundance of the material demand a different approach. Our progress in the direction of the study is due to the work of Francis John Haverfield (d. 1919) (see his *Romanisation of Roman Britain* (Oxford) (1906), ed. by Sir George Macdonald in 1923; *The Roman Occupation of Britain* (Ford Lectures, ed. by Sir George Macdonald); R. G. Collingwood's introduction *Roman Britain* (Oxford,

1932); and *The Archaeology of Roman Britain* (1930) which gives systematic accounts of every class of Rom. antiquities—roads and military works, ins., vils., villas, inscriptions, pottery, tools and weapons, and coins. See also Prof. J. G. C. Anderson's ed. of Tacitus's *Agricola* (Oxford, 1922), which contains much material by Haverfield. For an admirable summary of all recent study and discoveries on this period in England and Wales see Chapter XI of Kendrick and Hawkes, *Archæology in England and Wales, 1914-31* (1932).

See also the accounts of discoveries by archaeologists referred to in the present article; and D. A. Mackenzie, *Ancient Man in Britain*, 1922; M. C. Burkitt, *Our Early Ancestors* (for Neolithic Britain), 1926; V. G. Childe, *The Dawn of European Civilisation* (for Britain in Mesolithic and Neolithic periods and Early Bronze Age), 1925; Brit. Museum's *Guide to the Antiquities of the Bronze Age*, 1920, and *Guide to the Antiquities of the Stone Age* (3rd ed.), 1926; and the general topographical studies and period studies listed in the above work by Kendrick and Hawkes.

ARCHÆOPTERYX

**Archæopteryx** (Gk. ἀρχαῖος, ancient, πτερυγ, wing), a fossil bird found in Bavaria which presents characteristics of birds and reptiles. It is the sole genus of the order Saurura, and is the oldest known bird. Its size was that of a crow, it had teeth in both jaws, a lizard-like tail of 20 vertebrae, each giving rise to a quill feather, and 3 claw-like digits at the end of each wing. Two specimens are extant. *A. macrura* in Berlin, *A. lithographica* in the Brit. Museum.

**Archaism**, the retention, or imitation, of what is old or obsolete, especially in language and art. Archaic means primitive, antiquated, no longer in common use. Both words are modifications of Gk. words derived from ἀρχαῖος, old.

**Archangel**, a region of the R.S.F.S.R. It is bounded on the N. by the White Sea and Arctic Ocean, on the W. by the Karelian S.S. Republic, on the S. by Vologda and the N. Dvina, and on

the E. by the autonomous Komi area. The old E. boundary extended to the Urals and the W. to the Finnish border. Included in its area are the dists. Archangel, Orega, Petchora, Mezensk, and the is. off the coast. A portion of the dist. lies within the Arctic circle and is extremely desolate and barren. In the height of summer the soil is frozen. All the rivs. are frozen from Sept. till July. They are Tuloma, Orega, Dvina, Mezen, and Petchora. The climatic conditions of the peninsula of Kola are more temperate. Its surface is interrupted by hills and large lakes, e.g. Imandra. To the S. of the Arctic region the soil is covered with forests, with here and there lakes and morasses, and at intervals good pasture. Here the rivs. are closed from Oct. to Apr. In the N. dists. the inhab., necessarily nomadic, include Samoyedes, Zyryans, Lapps, and Finnish tribes. They support life by fishing and hunting. In the 'wood combines' of the A. region there are factories for wood processes and chemical industries, and paper manufs. are also carried on within the combines. Its area is 331,505 sq. m., and its pop. 1,199,000 (urb. 435,000, rural 764,000).

The administrative centre of the prov. is A. at the head of the delta of the Dvina. Its hist. has been traced back to the Norsemen of the tenth century. In 1553 Richard Chancellor (q.v.) got as far as A. and journeyed thence overland to Moscow to open negotiations for trade with England. In the time of Peter the Great A. was Russia's only port, for the Swedes controlled the lands around the gulf of Finland and the Turks the shores of the Black Sea. During the First World War it was in much the same condition, for with the closing of the Baltic and Black Sea ports, it was the only one left that was served by a railway. This led to its rapid development. It was the scene in 1918 of a serious attempt to combat Bolshevism. Allied forces, under Brit. leadership, were landed there, being joined by Russian imperialists. The attempt proved abortive, since the Russians, converted by Bolshevik propaganda, turned on their allies, and forced them to evacuate the dist. The evacuation of the Brit. forces both in A. and in Murmansk was carried out by Gen. Lord Rawlinson's N. Russian Relief Force, which landed at A. in the spring of 1919. Its manufs. (1930) are linen, leather, canvas, cord, mats, tallow, potash, and beer. Saw-milling is an important industry, and timber is floated down the N. Dvina to the saw-mills at A. Wheat and flour are shipped from S. Russia to supply the flour mills and linen factories of A. The tanning and dressing of hides and skins is carried on, and there is also a small metallurgical and shipping industry. By 1937 well-equipped shipbuilding and repairing yards had been estab. or reconstructed at A. Its harbour is open from May to Oct. The shortest day has only 3 hrs. 12 min., while the longest is 21 hrs. 48 min. Pop. of the city is about 280,000.

**Archangel**, a chief angel or a leading angel. According to Jewish writers, an angel of the eighth rank of the celestial hierarchy. *See under* ANGEL.

**Archangel**, a name of sev. species of dead-nettle (*Labiatae*) and allied plants (*Lamium*, *Galeopsis*, *Galeobdolon*, *Stachys*).

**Archbald**, a bor. in Lackawanna co., Pennsylvania, U.S.A., 10 m. N.E. of Scranton. Coal is worked and the chief industry is weaving. Pop. 10,000.

**Archbishop**, the title of a bishop of superior rank who has jurisdiction over other bishops. The title when it first came into existence did not imply that the holder had metropolitan power. In the Rom. Church at the present time, however, the title of A. can usually be said to imply metropolitan power. In other churches the terms, however, are not interchangeable. The title seems to have been first used in the early Church, being used by Athanasius and by Gregory to imply respect to their predecessors. In the E. Church the title was much more common than in the W., but gradually, with the right to summon provincial councils, the metropolitans began to assume the title of A. The As., however, were not allowed to assume authority independently of the papacy, since they were compelled to receive the pall at the hands of the Bishop of Rome. In the Rom. Church the power of the modern A. is hardly comparable with the power of the mediæval bishop. The right to wear the pall is only granted to such As. as have metropolitan jurisdiction, since there are a number who have merely titular archbishoprics. Until the pall is received and the oaths of fidelity and obedience are taken to the papacy the A. is only recognised as the A. elect, and cannot use his full powers. In England the Church is governed by 2 As., the A. of Canterbury, who is also 'Primate of all England,' and the A. of York, who is 'Primate of England.' At the time of the foundation of the Church by St. Augustine the original plan was to divide England into the 2 provs. with 2 As., 1 at London and 1 at York, who were to take precedence according to seniority, but during the pre-Reformation period the metropolitan of Canterbury exercised the functions of papal legate throughout all England. At the present day he possesses powers over both provs., he can grant licences for marriage which are valid in both provs., and can appoint votaries who can practise in both provs. Amongst his other powers he numbers an ability to grant Lambeth degrees in music, law, and theology. As the metropolitan of the S. prov. he is the guardian of all vacant sees, and appoints to benefices during such vacancy. He has also jurisdiction over all bishops within his prov., and has the privilege of visitation and deprivation which is not exercised by the A. of York. It is also his privilege to crown the kings and queens of England,

and to consecrate all bishops within his prov. He is also an eccles. commissioner for England. He takes precedence immediately after the princes of royal blood. The powers of the A. of York are very similar to those of the A. of Canterbury, with the exceptions which have been pointed out. The As. of York have the privilege of crowning the queen consort, and of being her perpetual chaplain. The A. is one of the eccles. commissioners of England, takes precedence after princes of the royal blood, and the lord chancellor. As. have the title of His Grace, and Reverend Father in God.

**Archdeacon**, a high office of the Christian Church whose rank is directly subordinate to that of bishop. He is the bishop's vicar or viceregent, the representative of the bishop, attached to the cathedral, and having jurisdiction over the clergy and authority to manage the affairs of the diocese. He presides over a court where certain eccles. causes are heard. Originally he was the chief of the deacons who assisted the bishop in eccles. affairs. The distribution of the dioceses into archdeacons cannot be assigned to any certain time. In the fifth century As. rose from mere bishops' assistants, and took upon themselves some of a bishop's powers and privileges. Gradually they acquired a position which was recognised apart from the bishop, and claimed a jurisdiction to themselves. In the thirteenth century protests from sev. synods were successful in securing a curtailment of their powers by episcopal courts. It is their special duty to inspect the buildings within their range of supervision, and to undertake the repair of eccles. property. As. are obsolete in the Rom. Catholic Church in England.

**Archduke**, a title borne by members of the former Austrian royal family. It denoted a rank above all other dukes, bearing superior powers and rights.

**Archegoniata** is a botanical term applied to the div. of the vegetable kingdom which contains plants having an archegonium (q.v.). It includes the Bryophyta (liverworts and mosses), and the Vascular Cryptogams (ferns and sclaginellas).

**Archegonium** (Gk. ἀρχή, first, γόνος, offspring) is a term applied to the female sexual organ of the prothallus of such plants as the mosses and ferns. It is flask-shaped with a slender neck and a swollen venter, in which is the ovum (oosphere or egg-cell). Fertilisation takes place by means of spermatozoids which pass down the neck.

**Archelon**, a Gk. word meaning public place belonging to magistrates. It was used in Greece to denote gov. buildings, but was especially the name of the building where the archives were kept. In Athens this was the temple of the mother of the gods.

**Archelaus**, king of Macedonia (413-399 B.C.), obtained the throne by the murder of his uncle, cousin, and half-brother. He ruled wisely, and attempted

to inculcate the refinements of Gk. civilisation among his subjects.

**Archelaus** of Cappadocia (first century B.C.), a general of Mithradates the Great. In 87 B.C. he was sent to Greece with a large army, and was besieged by Sulla and defeated. Later he deserted to the Romans.

**Archelaus**, his son, king of Egypt. In 56 B.C. he married Berenice. He reigned only 6 months, being defeated and slain by Anulus Gabinus in 55 B.C.

ARCHER-FISH

**Archelaus** (d. A.D. 16), son of A. and Glaphyra, received the kingdom of Cappadocia, 36 B.C. He fought on the side of Antonius at the battle of Actium, yet he retained his kingdom under Augustus. Incurring the displeasure of Tiberius, as it is said, because he neglected the future emperor during his exile at Rhodes, he was summoned to Rome, where he d., apparently a natural death brought on by old age and infirmity. (Tacitus, *Ann.* II. 42; Dion. lvi.)

**Archelaus** of Miletus, Gk. philosopher of Athens. He lived during the fifth century, and was a pupil of Anaxagoras. Ion of Chios says he was a teacher of Socrates. The only traces of his work are to be found in quotations from Diogenes Laertius, Simplicius, Plutarch, and Hippolytus.

**Archelaus**, bishop of Carrhae in Mesopotamia, had a controversy with the heretic Manes c. A.D. 278. He pub. the controversy in 2 books, entitled *Acta Disputationis*, etc., in Syriac, which were trans. into Gk. by Hegemonius. A fragment of this work is extant, ed. by Valesius, in the notes of his *Socrates*, pp. 197, 203, lib. I., c. 22; and again in a more complete form by Zaccagnius in his *Collectanea Monumentorum veterum Ecclesiae Graecae*, Rom. 1698 (Fabricius, *Bibliotheca Graeca*).

**Archelaus** (fl. A.D. 10), king of Judaea, son of Herod the Great. He refused to accept the throne before obtaining the consent of Augustus. His journey in quest of Augustus's agreement was

successful. A violation of the Mosaic law caused his deposition and banishment.

**Archenholz**, Johann Wilhelm von (1743-1812), a Ger. historian. He was b. at Langfuhr, Danzig. At the age of 16 he entered the Prussian army, taking part in the concluding stages of the Seven Years War. His hist. of the war is the work by which he is best known, and by which he became recognised as an historian of brilliant power. His other works include *England und Italien*, *Annalen der britischen Geschichte*, and various periodicals of a literary and political colour. He d. at Oyendorf, near Hamburg.

**Archer-fish**, the *Toxotes*, an Acanthopterygious fish of the family Toxotidae, found off the Australian and E. Indian coasts. It casts a drop of water from its mouth on to an insect playing near the surface of the sea, causing it to fall in, when it is devoured.

**Archer**, Frederick (1857-86), jockey; b. at Cheltenham. Rode his first race, 1870. Won the Derby 5 times, Oaks 4. St. Leger 6, Two Thousand Guineas 5.

**Archer**, Frederick Scott (1813-57), b. at Bishop Stortford. Inventor of the collodion process in photography and sev. improvements to the camera.

**Archer**, The, see SAGITTARIUS.

**Archer**, Thomas, architect, d. 1743. Pupil of Sir John Vanbrugh. Architect of Heythorpe Hall, Oxfordshire; St. Philip's, Birmingham; St. John's, Westminster, etc.

**Archer**, William (1856-1921), dramatic critic, b. at Perth, Sept. 23; son of Thomas A., C.M.G., of Queensland. Received degree of M.A. at Edinburgh, 1876. Travelled in Australia, 1876-77; and, after returning to Edinburgh, went to London, where he soon took a prominent position in the literary world. He became dramatic critic on the *World*, 1884, and, later, went to the *Nation*. He did much to popularise Ibsen in England. He trans. (either alone or in collaboration with his brother, Charles A.) a number of Ibsen's plays, as well as editing Ibsen's prose dramas in 5 vols., 1890-91. His works include: *English Dramatists of To-day*, 1882; *Masks or Faces*, 1888; *The Theatrical World*, 1893-97; *Study and Stage*, 1899; *Poets of the Younger Generation*, 1901; *Real Conversations*, 1904; *A National Theatre: Schemes and Estimates*, with H. Granville-Barker, 1907; *The Thirteen Days*, 1915; *India and the Future*, 1917; *War is War* (drama), 1919; *The Green Goddess* (popular drama), 1921; *The Old Drama and the New*, 1923; He also wrote 3 plays pub. posthumously: *Martha Washington*, *Beatrice Juana*, and *Lidia*. He d. in London.

**Archery**, the use of the bow and arrow, both for hunting and warfare, is widespread and dates from very early times. The foremost archers of antiquity were the Egyptians, who used bows a little shorter than a man, and arrows, headed with bronze or flint, 2 to 3 ft. long. On the authority of the Bible and other writers, the Jews were deadly with the

bow, which seems with them to have been made of reed, wood, or horn. All Asiatic nations were bowmen, notably the Babylonians, Persians, and Scythians. In medieval times the Arabs and Turks were famous archers, as were the Jap. till recent times. Exploration has revealed the use of the bow among the natives of the E. and W. Indies, S. America, the Arctic circle, and Central Africa. The Germanic nations and the Welsh appear to have been most proficient in A. in

ARROW

early European hist. The Gks. and Romans. in anct. times, despite the legends of Teucer, Ulysses, etc., seem to have been indifferent archers, and recruited their bowmen from Crete and Asia Minor. After the fourth century A.D., however, the Rom. army consisted largely of mounted archers. Scandinavian legend has many references to famous bowmen, and by the tenth century the short bow was the chief weapon of the poorest military classes in England, France, and Germany. Both the Eng. and Normans employed mounted archers at Hastings in 1066. The cross-bow, or arbalest, for the shooting of bolts, which was mounted on a stock and discharged by a catch or

ARCHERS AT AGINCOURT

trigger, was also much in use, especially in sieges and naval battles, though it was condemned by the Lateran Council of 1139. It made its reputation in the crusades, proving much superior to the bow used by the mounted Asiatic archers. In Europe the best exponents of its use were the Genoese, Pisans, and Venetians. Its use in England was forbidden by Henry VII. The famous English long-bow, 5 ft. long with a shaft a cloth-yard long, seems to have been introduced from Wales. Its long range and speed were proved at Falkirk in 1298, and the Eng. archers played an important part at Crécy, Poitiers, and Agincourt. A. was supported by all the kings, who encouraged its practice for sport, as is witnessed by the many

ballads on the skill of Eng. marksmen. The introduction of gunpowder, which began early in the fifteenth century, naturally meant the gradual decay of A., but its disappearance in England was slow. In the reign of Elizabeth treatises on the art were still being written; notably the *Toxophilus* of Roger Ascham, 1545, a detailed and practical work. The long-bow died out at the end of the sixteenth century and the cross-bow early in the seventeenth. In 1807 horse archers were used in Poland against Napoleon, and in 1860 the Chinese used bows at Taku. In the mid-eighteenth century there was a great revival of A. for purposes of health and exercise, which resulted in 1781 in the formation of the Royal Toxophilite Society. Other societies for the practice and encouragement of the art are the Woodmen of Arden, 1785, having headquarters at Meriden in Warwickshire; John o' Gaunt's Bowmen, 1785, and the Royal Company of Archers (Scotland), dating from 1676. The main legislative and managing body of Eng. A. at the present day is the Grand National A. Society, founded 1861, which holds meetings for the sport, the most important being the championship, the Leamington and Midland Co., the Grand W., and the Grand N. Modern bows are usually made of yew, either 'self,' or backed with other woods. The former, though the truer and more sensitive, are more expensive, and liable to crack and lose shape. The length of the bow varies from 5 to 6 ft., according to that of the arrows used (25-30 in.). The string is made of 3 strands of hemp, dressed with glue, and has a drawing power of 40-60 lb. for men, and 24-32 for ladies. The arrow has a shaft, which may be of various shapes, made of red deal, a 'pile,' or point, and 'nock,' cut square, and 3 turkey or peacock feathers, all curving one way.

Arches, Court of, an eccles. court of appeal of the archbishop of Canterbury, so called because it was anciently held at the church of St. Mary of the Arches, now St. Mary-le-Bow. It has power to deal with suits sent up from the consistorial courts of the prov. of Canterbury. The presiding judge was originally known as the official prin., but his duties and title have now become merged with those of his subordinate, the dean of the arches. Since 1874 he has also been chief judge of the chancery court of York.

Archias, A. Licinius, a Gk. poet, who was b. at Antioch in Syria c. 120 B.C. He gave lessons to Cicero in philosophy and rhetoric (*Pro Archia*, i.), and practically all the information we have of him comes from Cicero's speech; he came to Rome in 102, where he gained the friendship of the Luculli. He became a citizen at Heraclea in Lucania; and when this tn. was united to Rome he became a Rom. citizen. When he was accused in 61 of usurping the citizenship of Rome, he was defended by Cicero in the speech

**Pro Archia.** A. commemorated the victories of Marius and Lucius Catulus over the Cimbri in a poem, and some of his epigrams are in the *Gk. Anthology*.

**Archibald, Raymond Clare** (b. 1875), Amer. mathematician, b. in Colchester co., Nova Scotia, and educated at Mount Allison Univ., Sackville, New Brunswick, Harvard, Berlin, etc. Gained some distinction in violin-playing. But it is as a student of mathematics that he has won most distinction, and has held numerous posts on that account. After occupying a mathematical professorship at Acadia Univ., Nova Scotia, and an instructorship at Brown Univ., he became associate prof. at Brown Univ. 1917-23. Elected fellow of the Amer. Academy of Arts and Sciences, 1918; editor-in-chief of *American Mathematical Monthly*, 1922; librarian of the American Mathematical Society in 1921; member of the National Research Council, 1928-31; Publications: *Euclid's Book on Divisions of Figures with a Restoration*, 1915; *The Training of Teachers of Mathematics for the Secondary Schools of the Countries represented by the International Commission on the Teaching of Mathematics* (of which he was a member), 1918; *Bibliography of Egyptian and Babylonian Mathematics*, 1927-29; and numerous contributions to European and Amer. journals and reviews.

**Archidamus.** There were 5 kings of Sparta of this name. They were of the royal line of the Proclidae. The first is only mentioned by Herodotus (viii. 131).

**Archidamus II.**, son of Zeuxidamus, became king when his grandfather, Leotychides, was banished from Sparta. A. reigned from 469 to 427 B.C. Prudence and foresight, steadiness of purpose and gravity of deportment were his prominent qualities. In the fourth year of his reign Sparta was nearly annihilated by an earthquake, an opportunity of which the Messenians took advantage to attempt the recovery of their independence. A., by his presence of mind, saved what remained of the city from the hands of an exasperated foe; but it was not till the end of 10 years that this third Messenian war was brought to a close, when the Messenians evacuated their citadel, Ithome. (Diod. Sic., xl. 64; Thucyd., i. 103.) A. is not mentioned again till we find him speaking on the peace side in the council held by the Lacedaemonians before they resolved on the Peloponnesian war. Though a declaration of war was the result of their deliberation (431 B.C.), the Lacedaemonians gave him the command of the troops against the Athenians. He was their general also in their second expedition (428 B.C.) and third expedition (428 B.C.). He was succeeded by his son, Agis II., probably in 427 B.C. (Thucydides, i. 79; ii. 10-20, 71; iii. 1.)

**Archidamus III.** (d. 338 B.C.), the son of Agis II., succeeded his father 361 B.C. He commanded the Spartan troops during his father's lifetime, 36

B.C. and gained the 'tearless battle' against the Arcadians and Argelians: not one of the Spartans fell, but a great many of the enemy were slaughtered. He was sent (338 B.C.) to Italy to assist the inhab. of Tarentum, who were at war with the Lucanians. He fell bravely at the head of his troops, and a statue was erected to his honour at Olympia by his countrymen. He was succeeded by his son, Agis III. (Diodorus Sic., xvi. 24, 63; Pausanias, iii. 10.)

**Archidamus IV.**, grandson of A. III., king of Sparta in 294 B.C.

**Archidamus V.**, grandson of A. IV., king of Sparta in 240 B.C.

**Archidona**, tn. of Andalusia, Spain, 34 m. W. of Málaga. Pop. 8880.

**Archidoris**, see DORIS.

**Archigenes of Apamea** lived during the reign of the Emperor Trajan, and was a medical author and practitioner at Rome (see Juvenal, *Satires*, vi. 236; xiii. 98; xiv. 252). He followed the principles of the Pneumatic sect, founded by Athenæus of Attalia, and wrote treatises on pathology and the practice of medicine and surgery. His fragments are in the works of Galen, Aetius, and Oribasius.

**Archil**, or **Orchil**, a violet dye which is obtained from several species of lichens, notably from the *Roccella tinctoria*. As materials dyed solely with it fade readily in the sunlight, another dye is usually employed at first and the A. is used to give an added brilliance.

**Archilochus**, Gk. lyric poet, probably of seventh century B.C., b. at Paros, which he left to join the colony of Thasos. Killed in battle between the Parians and Naxians. He enjoyed a very high reputation among the ancients, especially for his iambic satiric poems. The few fragments of his work which remain, though vigorous and wide in range, hardly justify extravagant eulogy.

**Archilute**, a large lute of the theorbo type with 2 sets of strings, the pegs of which were set at different distances in the double neck; the longer bass strings had no fingerboard and could therefore not be altered in pitch during performance.

**Archimagus**, or the Anglicised form **Archimago**, was used to denote a chief magician, a mighty worker of things 'mystic, wonderful.' In Spenser's *Faerie Queene* it is applied to the personification of hypocrisy.

**Archimandrite**, the title of the highest order of superiors of convents in the Gk. Church, almost corresponding to that of abbot in the Lat. Church. Russian bishops are chosen from the As.

**Archimedes** (287-212 B.C.), the most celebrated mathematician and engineer of antiquity; b. at Syracuse. He is said to have been a kinsman of King Hiero. His mathematical studies relate chiefly to the relation of spherical and rectilinear surfaces and bodies, but he is most famous for his discoveries in hydrostatics and mechanics. He estab. the principles of the lever, and

of the equilibrium between a floating body and the hydrostatic pressure of the liquid in which it floats, and invented many military engines which postponed the fall of Syracuse. He was killed when the city was taken by the Romans.

**Archimedes' Screw**, a machine for raising water. It may consist of a tube wound spirally round a cylindrical axis or a cylinder enclosing a screw so as to form a spiral chamber from end to end. The lowest portion of the screw just dips into the water, and as the cylinder is turned a small quantity of water is scooped up. The inclination of the cylinder is such that at the

ARCHIMEDES' SCREW

A, Opening for entry of water.

next revolution the water is raised above the next thread, whilst the lowest thread scoops up another quantity. The successive revolutions, therefore, raise the water thread by thread to emerge at the top of the cylinder. The machine is used in Holland for draining purposes, and the same principle is sometimes used for raising grain to a higher level in a continuous stream.

**Archinard, Louis**, b. at Havre in 1850, a famous Fr. general. He entered the naval artillery, served in Senegal, became major (*chef d'escadron*), 1884, went to the Sudan, took Segou-Sikoro, and was made lieutenant-colonel. In 1891 he took Nioro, Youri, and Bissandougou, and in 1892 he was recalled to France and made colonel. He afterwards returned to the Sudan as commander-general, which position he held until 1893.

**Archinus**, an Athenian who lived during the latter part of the fourth and the beginning of the fifth century, was the companion of Thrasybulus. He helped to overthrow the thirty tyrants of Athens, and was mainly instrumental in bringing about the famous amnesty when the democracy was restored in 403. It was owing to him that public documents were written in Ionian instead of in Attic characters.

**Archinto** was the name of a celebrated family of Milan whose prin. members were: (1) A. (1500-58), archbishop of Milan. (2) Alessandro A., a theologian who d. in 1558. (3) Count Filippo A., b. in 1649, governor of Cremona 1692-94. (4) Giuseppe A. (1649-

1712), cardinal and archbishop of Milan. (5) Carlo A. (1669-1732), son of Giuseppe A., who pub. Muratori's *Scriptores rerum Italicarum*, and founded the Palatine Society.

**Archipelago**, a Gk. term (=chief sea) originally applied to the Aegean Sea, and now to any sea thickly scattered with islands.

**Architects**, American Institute of, is the national organisation of architects in the U.S.A. The institute was founded in 1857, and has its headquarters at the Octagon, Washington, D.C. It is governed by its officers and a board of directors, who meet quarterly. These are elected by the delegates, from the 58 chapters throughout the country, at their ann. meeting. Among its publications is the monthly *Journal of the Institute of Architects*. The object of the institute is to serve as a fellowship for those engaged in the profession of architecture, to protect their interests, and to raise the level of the art and science of architecture. In recent years much attention has been given by the institute to the co-ordination of the art of architecture with those of painting, sculpture, and landscape gardening.

**Architects**, Royal Institute of British, founded 1834, incorporated 1837, re-incorporated 1887. The chief Eng. architectural body. It holds examinations and confers the diplomas of Associate (A.R.I.B.A.) and Fellow (F.R.I.B.A.).

**Architects**, Society of, founded 1884, incorporated 1893; held examinations twice a year. The society has now been absorbed by the R.I.B.A.

**Architectural Association**, a body constituted in 1847 for the purpose of giving instruction in those branches of A. knowledge which are not covered by the training received in the offices where the pupils are engaged. It awards certificates, medals, and prizes, and finally prepares for the examinations of the Royal Institute of Brit. Architects. It works in full agreement with the other societies, its fees are moderate, and its lecturers include the most able men of the time.

**Architectural Societies**, see ENGINEERING AND ARCHITECTURAL SOCIETIES.

**Architecture** (Lat. *architectura*, Gk. ἀρχιτεκτονία—*archi-*, chief, and *tektoni-*, a builder). In the widest sense of the word, A. includes all kinds of building and construction, with 4 main divs. Eccles. A. deals with the erection of churches and houses dedicated to God; civil A. has to do with buildings for the ordinary purposes of the State and the individual; military A. deals with fortifications and constructions for attack and defence; naval A. concerns itself with the construction of ships, and all the fittings incident on their use. But this is by no means the general meaning of the term A., which may better be defined as building become an art, building which is not controlled only by aims of use

and comfort, but also by aims of beauty, grandeur, and other æsthetic principles. Until the Renaissance, A. was universally regarded as the chief of the arts, and it is here that we can easily see portrayed much of the spirit and the genius of each of the races which have employed it. Like every other art, it has ever been conservative, but in the change of the A. we may see mirrored changes in gov. or in prevailing influence or the steady progress of decay. Most especially is this true of the Gothic A., for the splendid cathedrals of Europe in one or other of the Gothic styles are the greatest and clearest embodiment of the spirit of the Middle Ages. It was a spirit which, though shared by a Europe united at last by the ties of religion, yet showed itself variously in the individual countries. It is noticeable, too, that though architectural features have been handed from nation to nation, yet originally each people had its own system, a system regulated primarily by the climate and the building materials at hand. For A. did not spring into being fully armed; her beginnings are, on the contrary, extremely modest. They are to be sought in the huts of primitive hunters, shepherds, and farmers. The first material used for these erections must plainly have been wood, and this theory is confirmed by the fact that even the stone erections of Egypt are accurate copies of wooden buildings. Even in the great Gk. orders, indeed, the imitation of wood construction still remains, e.g. in the dentils of the entablature, which are a copy of the wooden rafters projecting over the edge of the building. Next, probably bricks, moulded and dried in the sun, were used, and finally stone was cut and moulded.

*Egypt.*—Though investigations seem to show that the earliest stable buildings of mankind were erected in the valley of the Euphrates and the Tigris, yet it is to Egypt, the valley of the Nile, that we must look for our most anct. remains of A., which date back to the period of the Anct. Empire, c. 4000 B.C. At that time the cap. was at Memphis, and it is round this tn. that the early tombs are found. To the same period belong the 3 pyramids generally known by the names of the kings who erected them as Cheops, Cephren, and Mycerinus. The pyramids were erected to receive the body of the king, and are all built on a square base, from which, in the case of Cheops, the largest, the pyramid rose to a height of 480 ft., the length of 1 side of the base in the same pyramid being 760 ft. Neither the pyramids nor the *mastaba* tombs of the same date possess marked architectural features, and it is not until about 2775 B.C. that, in the tombs at Beni-Hassan (Upper Egypt), we find the germ of an important style. These tombs are cut in the solid rock, and here various types of columns are found in use, one of them being the prototype of the Gk. Doric order. But it was not

until the New Empire under the Theban kings (c. 1700 B.C.) that the great age of Egyptian A. began. Of its temples, some were entirely excavated, some were partly excavated, partly structural, and some were entirely structural. Round about Thebes are to be found many magnificent remains of the industry and conceptive power of this period. On the E. bank of the Nile are the great temple of Karnac and the temple of Khuns, on the W. bank lay the sepulchral temple of Deir-el-Bahri and the Ramesseum. The temples generally consisted of 5 prin. parts: (1) the pylon, 2 massive stone towers on either side of the doorway; (2) the courtyard, open to the sky in the centre. This was surrounded on 3 sides by a double colonnade, and led to (3) the hall of columns, lighted only by a clerestory, and having rows of columns down the centre. Beyond this is (4) the sanctuary, surrounded on 3 sides by (5) the halls of the priests. This style of temple continued with characteristic Egyptian features until the Ptolemaic dynasty. The most noteworthy points in the Egyptian style are to be seen as early as the Middle Empire, and continue almost unchanged, for the Egyptians seem to have had little power of initiative. First to be noted is the extreme proximity of the columns, which detracted extremely from the appearance of size in the interiors. These columns had capitals of kinds too numerous to classify, the most used, however, being the 'lotus' and 'palm-cluster' types. The temples regularly show curious batter-walls, the origin of which is quite uncertain. The arch was never used in construction.

*Assyria and Babylon.*—The 3 separate empires, the First Babylonian, the Assyrian, and the New Babylonian, were all remarkable for building activity, and all built in much the same style. During the early period, the prin. erections were temples which were built on the top of *ziggurats* or artificial mounds. These temples are sev. stories in height, the stories being built on receding terraces. These and the other structures, such as palaces, which were also placed on mounds, were constructed of sun-dried bricks, faced by burnt bricks and brilliantly coloured tiles. The whole surface of Chaldea is dotted with the remains of these temples, each on its *ziggurat*, but the most famous is that of Birs-Nimroud, which was either founded or rebuilt by Nebuchadnezzar, and which cylinders found on the spot tell us was built in 7 stories and was dedicated to the 7 planets. The Assyrian period was essentially a palace-building epoch, and its chief remains are the palaces at Nineveh, Nimroud, and Khorsabad. The palace of Sargon at the last-named place is one of the best examples of the general type. It was built on a terrace brick-work raised 48 ft. above the ground, and consisted of 3 main divs.: (1) the halls and general apartments

(2) the *barrem*, and (3) the offices and general service rooms. Apart from the building were the *ziggurat* and temple, and in the centre of the buildings was a large courtyard. In the case of the temple of Sargon, this courtyard was entered by portals which probably form the greatest creations of Assyrian A., flanked as they were by 10 winged human-headed bulls, some of which are now preserved in the Brit. Museum. Though externally the Assyrian decoration was of the simplest and most massive kind, yet inside it was more detailed. Stucco, *adobe*, bas-reliefs, and colouring were freely used. A remarkable feature of the buildings was their great length and extreme narrowness. This was doubtless due to the fact that the column was in little use in Assyria, whereas the arch was, and so consequently no width was allowed greater than could be spanned by a single dome or tunnel-vault. The Assyrian style, then, was in direct contrast with the Egyptian. In the one we have rows of columns, straight lintels, and flat ceilings; in the other an absence of columns, compensated for by the use of vaults and arches. The Assyrian had the greater influence, extending even to China. The temple at Jerusalem, the only historical monument of Jewish A., must, according to the biblical narrative, have been built on the Assyrian plan.

*Persia*.—Since the religion of Persia required no temples, and their customs were adverse to elaborate tombs, it is to their palaces that we must look for their architectural works. The first of these is the palace of Cyrus, erected at Pasargadæ in the sixth century B.C. There are but few remains left, and these show it to have been built on the simplest of plans. Later remains at Persepolis and Susa are more interesting. At the former of these towns, the builders made use of a natural platform on a range of hills, which they first enclosed with a stone wall. It was approached by a magnificent flight of steps at the N.W., each step being 22 in. wide, with a tread of 15 in. and a rise of 4 in. On this platform are to be found the ruins of the palace of Darius, the Palace of the Hundred Columns (also erected by Darius), and the palace and hypostyle hall of Xerxes. The last named is far the most important, and is, indeed, one of the architectural wonders of antiquity, for, though it consists only of a hall and 3 porticoes, it covers a greater area than any Gothic cathedral except that of Milan. The columns are 65 ft. high from base to capital. They are fluted after the Grecian model, and the capitals are of 2 kinds, the one double bull-headed and the other formed of an Ionic capital set on end over a lotus capital evidently copied from the Egyptian. Of the original number of 72 columns in black marble, only 17 are now *in situ*. At the head of the great stairway stands a propylæum, or entrance hall, flanked by immense human-headed bulls worthy to be

ranked with the Assyrian productions. After the erection of the great palaces of Persepolis and Susa, the hist. of Central Asiatic A. is almost a blank until the time of the Sassanian dynasty. We say almost, for one important monument of the Parthian monarchy has recently (1931-32) been investigated—the palace of El Hadr, in the valley of the Tigris. The city was besieged by Trajan in A.D. 116, and is mentioned then as a large city, containing a temple of the sun. This is probably the square building at the back of the palace. The remains show that the barrel-vault tradition was continued, but that the ornament was under the influence of the great W. styles. The first of the Sassanian kings came to the throne about A.D. 225, but no monuments of the next 100 years remain, at about which time we have the palace of Serbistan. This shows that the old Persian and Parthian traditions were continued, though an enlarged acquaintance with Rom. work is indicated by the improvements in the plan. Stone is to be found taking the place of brick, and the dome is introduced to cover the prin. portions of the building, such as the great hall in this palace. Other palaces are at Ctesiphon and Firuzabad, and these are formed on the Assyrian model, even more than that at Serbistan. The barrel vault, disused by the old Persians but revived by the Parthians, is used in all the chambers. The palace at Ctesiphon is built of brick, for it is situated in the S. plains near Bagdad, where no stone is to be found. It is, however, of far greater dimensions than the others. Its main front must have measured 312 ft., and its height must have been 115 ft.

*China*.—We have already noticed that the normal architectural styles are founded on the primitive hut, but that of China forms a notable exception. The early Chinese tribes were certainly nomadic, and their norm for buildings was the tent. The temples are no more than large houses. They are built chiefly of wood, and decorated in bright colours with tiles, etc., and the construction is remarkable in that the roof is not supported by the walls, but by a wooden framework. It is, in fact, put on before the panels of the wall are filled in. The complete structure strongly resembles an enclosed tent, and the appearance of a Chinese city is that of a vast encampment. Though the use of brick and stone has been known to the Chinese since very early times, these materials are not much in request. The Great Wall of China is the only great erection of stone, and that fails to come into the domain of A.

*India*.—The Indian styles must be divided into 3 distinct groups: the Buddhist, the Jaina, and the Hindu. The first of these comprises various classes of buildings, of which the chief are the *topes*, temples containing relics or marking a spot of peculiar sanctity,

and the *vihas* or monasteries. The symbolic sculpture is the point of chief interest about them. Columns are used, short and with a superabundance of ornament. The Jaina temples consist of a square shrine-cell, lighted from the door only, to which a large hall gives entrance. The hall with columns is so arranged as to support the weight of a large dome which rises from the cell. The sculpture is excessively rich, and the whole style is far lighter and more delicate than the Buddhist. The Hindu A. again subdivides into 3 classes: the N., Central, and S. Indian. These vary among themselves, but all bear a strong resemblance to the Jaina style. The S. (or Dravidian) style has the cell surmounted by a storied tower, instead of the curved pyramidal roof which is to be found in the N. The Central (or Chalukyan) style shares the features of the other two. Everywhere attention is given to detail rather than to the general appearance.

*Greece.*—The finished A. of Greece stands alone among the As. of the world in its entire perfection, and, as in the realms of literature, it is the Gks. pre-eminently who have ruled and guided the whole of Europe, so is it in A. But its development was gradual, and to this probably we owe its excellence. The Mycenaean period, sometimes known as the Cyclope or Pelasgic, differed considerably from the Hellenic period which followed it, but from the commencement of this latter (c. 700 B.C.) we see a gradual improvement in the application of the same principles. Simplicity, unity, and the harmony of minutely exact proportions are the characteristics of the final styles. Of the Mycenaean period, chiefly before 1000 B.C., but few monuments remain, and some date from the still earlier Minoan age. Of these last the prin. is the palace of Knossos in Crete, discovered by Dr. Arthur Evans. Other remains are at Argos, Mycenae, Athens, and Tiryns, at which place the palace was excavated by Dr. Schliemann. Only the bases of the timber columns are in position, but the material used is quite clear. The walls were built of roughly shaped masses of stone united, not by cramp-irons as later, but by clay mortar. From the Mycenaean tombs we learn that the arch, the absence of which is so conspicuous in Hellenic A., was perfectly well known. One is to be found at Cnidus, and another at Delos, the latter a triangular-headed opening formed by 2 inclined blocks. Among the earliest of the beehive tombs found around Mycenae is the so-called treasury of Atreus, which may be taken as an example of the general construction. It consists of 3 parts: the *dromos*, a long passage which gives entrance to the *tholos*, a large domed chamber; off this room is a small tomb-chamber excavated in the rock behind. The diameter of the *tholos* is about 50 ft., and the height is also about 50 ft. Somewhat

similar tombs have been found at Orchomenus, in Boeotia, and all are obviously modelled on the simplest form of hut. The famous Gate of Lions at Mycenae also belongs to this age. The Hellenic period dates from c. 700 B.C. till the Rom. occupation in 146 B.C., but the greatest masterpieces seem all to have been erected between 480 B.C., the date of the battle of Salamis, and the death of Alexander in 324 B.C. Since it was to their temples that the Gks. gave their highest work, it will be well here to give a short description of the plan on which they were built. The chief hall, called the *naos*, or cell, contained the statue of the god or goddess in whose honour the temple was erected. Behind this was another smaller room—the treasury. The two were of the same width, and thus formed an oblong. There was a portico both at the front and the rear, and the whole was surrounded by a colonnade. The temple, with its colonnade, was generally raised from the ground on a stylobate of 3 steps. The larger temples also contained rows of columns inside to support the roof. The simple span roof was terminated at the 2 ends by a triangular pediment above the façade, and this was usually filled with sculpture. The earliest to be developed of the 3 great orders of Gk. A. was the Doric, which, as we have seen, may possibly be traced to an Egyptian origin. In the most ant. of the temples, that of the Heraeum, at Olympia, the original timber columns were all gradually replaced by stone ones, and indeed in almost every part does the Doric column show its wooden origin. It follows the usual Gk. construction, containing internally a range of 8 columns on each side, of which the alternate ones are connected with the side by short walls. The columns were massive, and it is in the gradual lightening and increase of symmetry in them that the chief development is to be looked for. The temple of Athena at Corinth, generally dated 650 B.C., is equally massive, the columns again being monolithic. A little later are the temple of Selinus, in Sicily, others at the same tn. and also at Agrigento, Paestum, and Syracuse. At the beginning of the fifth century B.C. we have the temple of Zeus, at Olympia, peripteral hexastyle (i.e. surrounded by columns, the porticoes at each end having 6) in plan; and the so-called Thesion, now generally recognised as the temple of Hephaestus. But the highest point, both of conception and realisation, is reached in the Parthenon, the temple on the Acropolis dedicated to Athena Parthenos (Athena the Virgin). It was commenced in 454 B.C. and completed in 438, Ictinus and Callicrates being the architects. In plan it is peripteral octastyle (i.e. with 8 columns in each portico) and stands on a stylobate of 3 steps. Here are found in use the means used by the Gks. to counteract optical illusions. If the line of the shaft of a column were made absolutely

straight, it would appear concave; to remedy this, the column is actually made convex. The entablature, too, was raised some inches in a gentle curve, to counteract the illusion produced by the drop of the pediment, and this required a similar rise in the stylobate. The appearance of straight and stern simplicity which the trabeate style favoured was really secured by a combination of delicate curves. The columns, too, are not equidistant, but are placed closer together at the corners of the building, thus securing an air of great strength. The propylæa which gave access to the Acropolis were also of the Doric order, though slightly later in date than the Parthenon. The origin of the Ionic order is by no means so distinct. One of the earliest examples is the archaic temple of Diana at Ephesus, c. 550 B.C., and about 100 years later comes the temple of Niké Apteros (Wingless Victory) at Athens. The internal columns of the propylæa at Athens were of the Ionic order, but the most perfect example is to be found in the Erechtheum, also on the Necropolis, N. of the Parthenon. The slope of the hill, and the fact that it occupies the site of 3 anc. shrines, have caused curious irregularity in the plan, which is apteral (i.e. with no side colonnades). It consists of 2 shrines, of which the E. is dedicated to Athena Pallas, and the W. to Erechtheus and Poseidon. The shrine of Athena has a portico of 6 columns. On the N. leading to the shrine of Erechtheus is a porch with 6 columns (4 on the N. and 1 at each side), and on the S.W. is the famous caryatid porch, or tribune, probably the best application of this system of columnation. The temple of Diana at Ephesus was the most important temple in Asia Minor. Its remains were excavated by the architect Wood (1869-74), and many are now in the Brit. Museum. According to Pliny, it had 100 columns, of which 36 were sculptured, and it was probably on account of the magnificence of these that the temple, which had been rebuilt by Alexander the Great, was included among the seven wonders of the world. The Corinthian order, which is more ornate than the Ionic and Doric, was a late development, and was never much in use among the Gks. The chief difference lies in the capital, which is much deeper than in the other styles, and is filled with acanthus-leaf sculpture, normally 2 tiers of 8 leaves surmounted by volutes springing from stalks which rise from between the leaves of the upper tier. The earliest examples, however, show a perfection which can only have been arrived at after long preparation. The Choragic monument of Lysicrates at Athens dates from 335 B.C., and the Tholos at Epidaurus is probably somewhat earlier. The first mentioned is a monument erected to Lysicrates as a reward for his success in the choric dances. It consists of a stone base, on which is a circular marble

pedestal round which are 6 engaged columns. The flutings are peculiar in terminating at the top in the form of leaves. In the Tholos at Epidaurus, a small circular temple, a ring of 14 Corinthian columns is enclosed in a Doric peristyle, but only half-columns are to be found in the Philippeion at Olympia, a monument erected by Philip of Macedon, c. 338 B.C. Here, too, the peristyle is of another order—the Ionic. The Tower of the Winds, at Athens, so called from the sculpture on it, was erected c. 50 B.C. to contain a water-clock and sun-dial. It is octagonal in plan, and on 2 of the sides are porticoes with Corinthian columns, of which the capitals are plainer than the usual type. The most important of the Gk. Corinthian erections is the temple of Jupiter Olympius at Athens, which, though commenced 174 B.C., was not completed until A.D. 117, under Rom. influence. It has 8 columns at each end, and is surrounded by a double peristyle. The capitals are the finest specimens of the Gk. Corinthian order extant.

*Rome.*—Broadly speaking, there are but 2 principles on which A. can rest—that of the arch and that of the beam. The Grecian was the last and greatest of the trabeated systems; the Rom. the first of all the arched styles. The substitution of the Rom. arch for the Gk. lintel was the greatest revolution in the hist. of A.; and this principle derives from the earliest inhab. of Italy, the Etruscans, who exercised the chief influence on Rom. building until the conquest of Greece and the consequent plundering of their art treasures and the importation of their architects. The use of concrete we also owe to the Romans. The early Etruscan work was done chiefly in sun-dried brick, and so has mostly perished. Remains such as tombs, arches, bridges, and gateways show a close affinity with the Egyptian and early Pelasgic work. The Romans at first must have followed this, but no important buildings exist before 100 B.C., when the Gk. style was already introduced. The Doric order is hardly used at all, the Ionic rarely, and on the Gk. plan. But the Romans took up and developed the Corinthian style with vigour. Its ornateness accorded well with their ostentation and vulgarity. They also developed a composite order based on the Corinthian with the addition of an Ionic volute at each of the 4 corners directly under the abacus. It must be remembered, too, that the Rom. buildings were erected in all parts of the world which they conquered, and were not, as were all previous styles, confined to a comparatively small area. *Fora*: These served a variety of purposes. They were the prin. mkt.-places and were surrounded by shops, and later by the prin. temples and public buildings. Every tn. had its forum, and that of Pompeii was especially fine. Rome had sev. fora. The oldest was the Forum Romanum, to which were afterwards added the Fora of

Trajan, Julius Cæsar, Vespasian, and Nerva. Statues and triumphal arches frequently found a place in them. *Temples*: These were of 2 kinds, rectangular or circular, the latter kind being probably derived from Etruscan models. From the same source came the general use of the *podium*, a continuous pedestal upon which the temples were set. Access was given by a flight of steps leading to the front portico, where alone detached columns were set. The Rom. cella was much wider than the Gr., and was often filled with statues and other art treasures. The prin. rectangular temples in Rome of which remains still exist are

Maxentius and Constantine. *Thermæ*: The great public baths are a characteristic feature of Rom. civilisation, and they were largely built by the later emperors as bribes to the people. The remains and drawings made by Palladio in the sixteenth century show the general plan. There was a large central block containing the baths proper. Around this were open spaces for athletics, and then another ring of apartments consisting of lecture halls, theatres, etc. The thermæ of Caracalla and Diocletian, both at Rome, are the largest. *Theatres and Amphitheatres*: The only theatre at Rome

ST. CLEMENT'S, ROME

Anderson

those of Fortuna Virilis, Mars Ultor, Castor and Pollux, Vespasian, Antoninus and Faustina, Venus and Rome, and Saturn. At Nîmes is the *Maison Carrée*, at Spalato the temple of Æsculapius, at Baalbec the temple of Jupiter, and at Palmyra the temple of the Sun. Of circular temples the chief is the Pantheon at Rome. Others at Rome are the temples of Mater Matuta and Vesta; in the prov., the temple of Jupiter at Spalato and of Venus at Baalbec. The Pantheon, Corinthian throughout, consists of a huge domed rotunda, 142 ft. in diameter, in front of which is an octastyle portico. It is lighted by a single opening, about 30 ft. in diameter, in the centre of the dome. *Basilicas*: These were originally erected simply as courts of justice, but they soon became meeting-places where business could be transacted and where merchants could meet. They are interesting as the link between classic and Christian architecture. They were generally roofed with wood, and sometimes had internal rows of columns. The chief are the Basilica Julia, on the Forum, one of the most anct., the Basilica Ulpia, and the basilica of

is that of Marcellus. The theatre of Orange (S. France) has a stage 203 ft. wide. They were generally constructed on the slope of a hill to facilitate the cutting of the seats. The largest amphitheatre is the Colosseum (Rome), built by Vespasian and Domitian, consisting of a vast ellipse 620 ft. by 530 ft. *Triumphal Arches and Pillars*: The arches consisted either of a single arch, or of a large arch with a small one on each side. Of the first type are the arch of Titus (Rome), and those of Trajan at Ancona and Beneventum; of the second are those of Septimius Severus and Constantine at Rome. Trajan's column, of the Rom. Doric order, adjoining Trajan's basilica (the Ulpia), is the chief of the columns. *Tombs*: In accordance with Etruscan custom, the Rom. tombs were numerous. They were generally monuments, and were placed at the sides of the public ways. *Palaces*: Though only ruins remain, these show that the originals must have been vast and imposing. The greatest were the palaces of the Rom. emperors on the Palatine, while in the provs. that of Diocletian at Spalato is a fine example. *Dwellings*: Ideas of

the city dwellings of the Romans can be gathered only from Pompeii and Herculaneum, and here the scale does not seem to be so magnificent as Pliny would lead us to expect. They are mostly 1-storied, though we know that in Rome the houses were much higher. Hadrian's villa, near Tivoli, is the largest of which we have remains. Its grounds occupy some 7 sq. m., and it includes theatres, gymnasia, thermae, etc.

*Early Christian.*—The hist. of early Christian A. from the date of the Edict of Constantine (A.D. 313) to the time of Pope Gregory the Great is somewhat obscure. The early Christians were in the main poor people, and their churches must at first have been built in the cheapest and plainest way. Many of the pagan temples were converted into churches, but the statement that basilicas were so changed has been much controverted. Be that as it may, the general type of Christian church during the 3 centuries in question is distinctly on the basilican plan. The basilica consisted of a great hall divided by 2 rows of columns. There was an apse at each end, and in 1 of these was a raised platform, on which stood the magistrate's chair, and benches round the wall for his officers. In the church, the bishop occupied the place of the magistrate, the clergy the place of his officers. Instead of the E. apse, is generally found a courtyard or atrium, with a covered colonnade round. The general plan, then, is a simple oblong, but sometimes slight lateral projections occur between the main hall and the apsidal end. Among the early Christian churches at Rome may be mentioned the Lateran, which has now entirely lost its anct. character, the old St. Peter's, St. Paul outside the Walls, St. Clement's, and Santa Maria Maggiore. The circular temple was imitated in the baptisteries, which were then kept separate from the churches, and in the unique church of San Stefano Rotondo. This basilican A. was introduced into England, and united with the Celtic to form the A.-S. type. In Italy itself it fell with the Rom. empire, and for 2 centuries there is no definite style. The Romanesque style is developing. In the E., however, with Constantinople, the anct. Byzantium, for centre, a new type was rising.

*Byzantine.*—The political separation between E. and W. at the end of the eighth century was intensified by the theological dispute on the Filioque clause in the Creed, and this finally separated the architectural styles of the 2 parts of Christendom. Yet before this time there had been differences, though the line of demarcation is not clear, and these are due to the influence of E. and Gk. architects and principles. The Byzantine style is characterised by the general use of the dome, placed, too, over square apartments, whose sides are brought to the circle by means of pendentives. Smaller domes were

frequently grouped round a large central one. Churches on this type are numerous from the time of Justinian. In A.D. 527 this monarch erected the church of SS. Sergius and Bacchus, but his greatest work was the church of St. Sophia (Holy Wisdom) at Constantinople, begun in 532 and completed in 537. It shows the high-water mark of the style, and has since been the general model for churches of the Gk. Orthodox communion. Further than this, imitations of St. Sophia form a distinct branch of Mohammedan A. The oval-ended nave is 265 ft. long by 107 ft. wide, and the centre is roofed by the great dome 107 ft. in diameter. To the W. of the building is the narthex, and beyond this the atrium, with colonnades as in the basilican churches. The walls were decorated with splendid mosaics and paintings which have been partially obliterated by the Muslims, who now possess the church, and who have made it into a mosque. Other early Byzantine churches are St. Irene, and the churches of the Theotokos and the Chora, all at Constantinople, and the church of the Holy Apostles, which, though utterly destroyed in the fifteenth century, is important as giving the plans for the church of St. Mark at Venice. Generally, the external appearance of Byzantine buildings is simple but picturesque, for all the constructional features are effective. Internally, the decoration is magnificent and highly coloured.

*Romanesque.*—The term covers the A. of the whole of W. Europe, which, growing up after the decay of the Rom. Empire, continued till the rise of the pointed arch in the thirteenth century. Though there are diversities in the separate countries, the main feature throughout is the round arch. Various methods of subdiv. are employed. The question of vaulting, too, is important. At first the Rom. barrel vault was used, but the difficulty of vaulting irregular oblique divs. and its great ugliness led to the introduction of groin vaulting and the insertion of transverse ribs which ultimately divided the space to be covered into a series of small compartments. Even in Rom. times (e.g. in Diocletian's palace at Spalato), the column had been allowed to bear an arch directly, instead of its being considered an inseparable part of its entablature, and this system is further developed under the Romanesque style. Since it was a development of the early Christian type, the basilican plan was at first in general use, but in the twelfth century this gave way to the cruciform plan. Square, octagonal, and circular towers are also a feature of Romanesque work. *It. Romanesque.*—The plan of the basilica is retained, and but few improvements are made. In the S., Norman and Saracenic influences are at work, and in the N., Ger. A strange effect is often produced in the plan by the extension of the transept, which is made very

wide, over the nave. This is well seen in the church of San Nicola at Bari, where the projection is very slight. The projecting porch is also a common feature. The cathedral of Monreale (Sicily) shows the general Sicilian style, which is under Norman and Byzantine influences. The walls are ornamented with mosaics and arabesque borders, over slabs of white marble. One of the finest examples of the A. of central Italy is the church of San Miniato, at Florence. It is divided longitudinally into aisles, and transversely into 3 nearly square divs.

always separate from their churches and have no buttresses or external ornament. They are broken only by the windows which light the staircase inside. *French Romanesque*: The disturbed state of the country during the early ages meant that no united progress could be made in building, and it is not until the time of Charlemagne that a school can be said to have arisen. Barbaric influences were also at work destroying the original Rom. form. The style developed somewhat differently in the S., where it was richer and more luxuriant, and in the N., where the

W. F. Mansell

BYZANTINE: INTERIOR OF ST. SOPHIA, CONSTANTINOPLE

by clustered piers which support great arches. This would seem to be a sign of the coming vaulting in compartments some feet above the nave, and is built over a crypt which is open to the nave. The roof, which sustained damage in the Second World War, is of open timber, gaily painted and gilded, and a feature of the decoration is the black and white marble panelling. Pisa Cathedral belongs to the same class. The transepts are now fully developed, and here have segmental apses at each end. The beauty of the cathedral lies more in internal decoration than in a logically developed style. The campanile, or leaning tower, and the detached baptistery are also noteworthy. The church of Sant' Ambrogio at Milan, which suffered severely from bombing in 1943, and San Michele at Pavia are the 2 most important buildings in the N. Italy or Lombard style. Others are Sant' Antonio at Piacenza, and San Zenone at Verona. The campaniles, or bell towers, are peculiar to It. art. They are

nearest approach was made to the coming Gothic. In the extreme N., the Norman style was developing. In the S., and particularly in the prov. of Aquitania, there are a number of small churches roofed with cupolas, but the most important domed church is the cathedral of Angoulême. It has a long aisleless nave, and is cruciform in plan. The nave is roofed with 4 stone domes, and there is likewise a dome at each end of the transept. The church of Notre-Dame-la-Grande at Poitiers (Anjou) is distinguished for its richness of decoration. *Ger. Romanesque* is frequently called *Rhenish*, for it was chiefly developed in the Rhine valley, and there its chief monuments remain. The system of vaulting was introduced much later than in the other countries, and probably the cathedrals of Spire and Mainz were the first Ger. churches where the system was carried right through, that is, about the eleventh century. The Romanesque A. also continued much later in the Rhine

valley, and, in consequence, the results achieved were superior in construction even to those of France. It has, indeed, much in common with the Lombard style, and shows much less variety than the Fr., because of the restricted area over which it extended. At the monastery of St. Gall in Switzerland a manuscript was found in the eighteenth century which gives a plan for a monastery. It seems to have been prepared by Eginhard, a friend of Charlemagne, and shows a church with nave and 2 aisles, with an apse at each end. Around the church are

beautiful sculpture. *Anglo-Saxon*: This period embraces all the architectural work that was done in England from the coming of Augustine until the time of Edward the Confessor, when that monarch began the building of Westminster Abbey, *novo edificandi genere*, as William of Malmesbury tells us. It developed in England from a combination of the Celtic and Rom. elements, and so 2 types of churches were used, the square-ended (Celtic) and the basilican apsidal-ended. Peculiarities of the A.-S. style by which it may be distinguished from Norman

W. F. Mansell

#### ENGLISH ROMANESQUE: THE GALILEE CHAPEL, DURHAM CATHEDRAL

to be found the abbot's lodging, public school, guest-house, dispensary, refectory, dormitory, cloisters, etc. At Cologne a number of triapsidal churches are found, the 3 apses taking the place of choir and transept. Such are the churches of the Holy Apostles, and St. Maria im Capitol. The great cathedrals of Worms, Mainz, Trèves, and Spire are all worthy monuments of the eleventh- and twelfth-century Rhenish work. The Aachen Cathedral, originally built by Charlemagne, has been considerably altered in Gothic times. *Sp. Romanesque*: During the Romanesque and early Gothic periods the S. of Spain was under Moorish dominion, and the A. there was Saracenic. In the N. no great Romanesque church remains, for constant rebuilding has been in progress. San Isidoro at Leon, and San Vicente at Avila are late Romanesque, and show rich and

are these: (1) 'Long and short work,' which consists of laying long blocks of stone alternately horizontally and vertically at the corners of buildings and in door-jambs; (2) occasional triangular-headed arches and doorways; (3) the use of baluster shafts in windows, each head being cut out of a single stone; (4) windows with 2 splay, the window being in the centre of the wall, and not flush with the outer face; (5) Celtic scroll-work carving. The Saxon arch, where it exists, is always semi-circular. Specimens of Saxon work are to be found at Barnack (Northampton), Sompting (Sussex), etc. *Norman*: This is the second div. of Eng. Romanesque, and, as we have seen, was introduced before the Norman Conquest. It prevailed to the time of Henry II., when a period of transition set in, and the style began to approximate to the Gothic type known as Early

Eng. The pillars are generally low and massive, the arches heavy and round-headed. The capitals are large and with square abacus, the windows small and narrow with semicircular heads. The ordinary plan of the Norman church was cruciform with a low tower rising at the intersection of the nave and choir with the transepts. Sometimes there are aisles, and sometimes the E. end terminates in an apse. Doorways are frequently enriched with much carving and sculpture, a fine example being the W. porch at Lincoln Cathedral. Norman architects were much attached to arcades as wall decorations. Very frequently these are made to intersect, and this is believed by some writers to be the origin of the pointed arch.

W. F. Mansell

ENGLISH GOTHIC: SALISBURY CATHEDRAL

*Gothic.*—Almost simultaneously in France and England a change came over the spirit of the A. about the end of the twelfth century. The pointed arch, which had already appeared in isolated examples, comes into general use, and from this beginning came a radical change which can be summed up in a sentence. In previous styles the chief line was the horizontal, in Gothic it was the vertical. As the style developed there came too, a marvellous lightness. As the stately piles were lifted up to heaven they seem to have partially lost their earthly nature, to have become spiritualised and hallowed for their sacred purposes. The spirit of Gothic A. is in the truest sense the spirit of the Middle Ages,

the spirit of faith and whole-hearted striving after God. The development proceeded on much the same lines throughout Europe, but it will be wise to deal with it in England somewhat more in detail. Here it is usually divided into the Early Eng. (1200-75), Decorated (1300-75), Perpendicular (1400-1575). Between each div. a transitional period of about 25 years intervenes, and it must be remembered that these dates are only approximate. *Early Eng.*: It has been said that Eng. Gothic art first sprang into being in the choir at Lincoln, under the inspiration of Bishop St. Hugh, and it was soon followed by the presbytery at Westminster. Yet for the first quarter of the thirteenth century, during the miserable reign of John, little other work was produced. Then came a triumphant burst of church building. The glorious cathedral of Salisbury was built throughout, and in the rest of the country there are few mighty minsters or par. churches that have not some evidences of Early Eng. art. The N. transept of York Minster, the nave and stately W. front of Wells, the choirs of Southwell and Beverley, Glasgow Cathedral, the W. front of Ripon, the 9 altars at Durham, the Galilee of Ely, the W. end of St. Albans are only a few of the noble creations of this period. Salisbury Cathedral is the most perfect example of Early Eng., for it was erected with no previous Norman structure to hamper the plan, which is that of a double cross, and there is a noble central tower and spire. The nave is long and narrow, with piers composed of clustered columns of Purbeck marble and detached marble shafts, surmounted by a triforium with trefoiled arches and a clerestory, with double lancet windows. At the E. end is a Lady chapel, extended behind the high altar. The chief peculiarities of this style are the pointed arches, piers composed of insulated cylindrical columns surrounded by slender detached shafts, dog-tooth ornament, lancet windows, and a peculiar bell-shaped capital with stiff-leaved foliage. *Decorated*: This is the highest development of Gothic A. in England, the summit which had to be followed by decline. This stiff-leaved sculpture became more natural. New forms of expression were found. Yet the fourteenth century brought with it much elaborateness, and this developed into an extravagance of idea and execution which destroyed the simplicity of the early work. There was a love, too, of width and openness as well as of height. Windows are made wider, and the arches are wider spaced. The naves, too, are made less long and narrow. The tracery of the windows becomes almost a separate dept., and bewildering beauty and variety are found. During the early part of the century the tracery is largely geometrical, composed of figures such as circles and trefoils, but, as the style advances, it becomes flowing and reticulate. Famous windows of this period

are the W. window at Exeter, the E. at Carlisle, the W. of York, and the E. of Lincoln. In large churches the triforium story is now omitted and the clerestory windows are increased in size. Another feature of the Decorated style is the form of piers, composed of 4 or more semi-cylindrical piers, not detached, but united without any band. Roll-mouldings are common, and the ball-flower ornament is peculiar. The bell-shaped capital is retained, but the foliage is elaborate and the lines are natural. *Perpendicular*: While on the Continent the A. was degenerating into the Flamboyant (so called from the flame-like waves of the window tracery), in England it developed into the Florid or Perpendicular. Perhaps the earliest sign of change is observable in Gloucester Cathedral, where we see the panel-work and the large windows with their straight-lined tracery. It is from this peculiarity that the style derives its name. The mullions are now vertical, carried straight up through the head of the window, and not branching out in curved or flowing lines as in those of the previous style. The windows are still larger, and afford the glass-painter a greater field for his picture-work. The large lights are frequently divided by transoms which form a series of lower compartments resembling panelling. It is needless to give examples of these developments, for almost every old church and cathedral of the country exemplifies most of them. The triforium is now quite abandoned, and the general form of the piers is octagonal with polygonal base mouldings. The roofs are flatter, and the mouldings in particular show the degeneracy of the workmen, due partly to the Black Death. They are shallow and hard, a favourite being the cavetto, with a 4-petalled flower something like the ball-flower. Fan-tracery is also developed—a form of vaulting which is composed of pendent semi-cones covered with foliated panel-work. A good example is in Henry VII.'s Chapel, Westminster. Throughout the vaulting is intricate and peculiar. *It. Gothic*: The influence of the old Rom. forms naturally continued far longer in Italy than in the rest of Europe. The Romanesque here was more classical, and the churches regularly retained the old basilican plan. In the same way, Gothic never became one of the true It. styles; the Romanesque continued late and the Renaissance came early. The sculptures are better than in the N. countries, but are less symbolical. Colour is freely used, for the marbles of N. and Central Italy supplied abundant material. The use of brick is another feature of the It. work, for there were large parts of the country where no stone could be obtained. Milan Cathedral is the most important Gothic work in the country, and this is definitely under Ger. influence. It was commenced in 1385 by the first duke of Milan, and consecrated in 1418. It is the greatest in size of the medieval

cathedrals with the exception of Seville. In material it is the richest, being constructed throughout in white marble, and the decoration is most gorgeous. Externally it is covered with bewildering tracery, a mass of pinnacles, spires, and statuary glittering in white. Yet, with all this, the building cannot compare favourably with any of the great N. cathedrals. The true Gothic conceptions of the Ger. architect prevailed only in the details, and the plan and general appearance are clumsy. In plan it consists of a nave with 2 small clerestories. There are 4 rows of columns, giving 2 aisles on each side, and the nave terminates in a Fr. circle of columns, enclosed in a Ger. polygonal end. The result is a compromise between the Fr. *chœur* and the Ger. or It. *apse*. Over the central part of the nave is a vault crowned with a lofty spire erected in 1440 by Brunelleschi. Thanks to the architect, the columns are placed much closer together than in most It. work, and the ugly pseudo-Classic capitals are replaced by niches filled with statuary. It had little damage in the Second World War. But It. Gothic improved more rapidly in the secular than in the religious buildings, and a particularly good example of civic art is to be found at Venice, the great merchant city of the Middle Ages, wealthy and powerful. The Doges' Palace or Ducal Palace was erected in the fourteenth century, but the W. face was burnt down, and later rebuilt in imitation of the rest of the building. Each façade consists of an open arcade of 2 stories, and the carving of the capitals is justly famous. The cathedral at Florence shows the wide spacing of the nave arcades already referred to. It was commenced in 1294, but it was not till 1420 that the dome was added. The ground plan is magnificent. A vast nave leads to an enormous octagonal dome, and this is finished by the triapsal end so common at Cologne. It is in the imperfect proportion of the separate parts, and especially in the size of the nave arches, that the cathedral fails. *Fr. Gothic*: In the S. of France Gothic art never reached the heights it attained in the N., and it is in Normandy and the Ile-de-France that the best work was done. The main principles were the same as in other parts of Europe, but the Fr. accentuated the vertical lines by giving their buildings great internal height by the extensive use of spires, pinnacles, and flying buttresses. The great cathedral-building age was the first half of the thirteenth century, and this synchronises with an outburst of crusading zeal. The laity bore the greater part of the expense, and the buildings were not primarily monastic. The 4 great cathedrals of France, are those of Paris, Amiens, Chartres, and Reims, and of the 4, that of Paris is the oldest. It was commenced in 1163, and completed in 1214. The plan consists of a wide nave, with double aisles which are carried round the *chœur* end, peculiar

to Fr. buildings. The transepts have hardly any projection at all over the side aisles. The W. front consists of 2 huge towers forming the grandest of cathedral façades. The insertion of chapels has spoilt the buttresses. Amiens Cathedral is generally considered as the most typically Fr. in plan, and so is often used for comparison with Salisbury as a typical Eng. building. The plan is fundamentally the same as at Notre-Dame (Paris), but the transepts project further and the *chancel* end has a number of small apses. The enormous height of the interior detracts from the effect of the exterior. The 2 W. towers, which make the façade similar to that of Paris, though taller than those of York, are dwarfed by the huge roof behind them. The spire suffers from the same cause, though it is taller than Salisbury spire. Chartres Cathedral is more irregular in plan than the other 2, and its transepts are more strongly marked. There is only a single aisle on each side of the nave, and the width is too great in proportion to the height. The 2 spires at the W. end are the finest of their kind in France. The S. one is plain, but excellently designed, and the N. is of great richness. The original intention was to have erected 8 towers, 1 on each side of the choir, 2 at the E., 2 at the W., and 1 at the end of each transept, but only the W. 2 have been completed. The façade at Rheims is very similar to those at Paris and Amiens, but a row of statues takes the place of the open tracery of Notre-Dame. The absence of the side chapels so often added to the original plan improves the nave, and a wonderful effect is produced by the broadening out of the choir to the width of the transepts. The civic buildings, palaces, and castles of the time form a distinct class, but it is impossible to treat them here. The most famous dwelling-house of the Middle Ages is that of Jacques Coeur at Bourges. All that remains of the royal palace at Paris is the Sainte Chapelle, a Gothic building which shows the huge windows of the N. Ger. Gothic: We have already seen that the Romanesque style continued in use much later among the Gers. than among the rest of the builders of Europe, and when, at the end of the thirteenth century, the Gothic style appears, it is not a development, but a foreign importation. Cologne is the great cathedral of Germany in which all its virtues are summed up. It is built on the plan of Amiens, but the aisles have been made double, one bay has been taken off the nave, and one added to the transept. It is the largest cathedral of N. Europe, covering an area of 91,464 sq. ft. The length is 468 ft. and the width 275 ft., but the actual width of the nave between the pillars is 41 ft. 6 in., whereas the height is 135 ft. This proportion hopelessly dwarfs everything in the building, and the relative shortness spoils both the internal and the external

effect. Everything else is designed with such mechanical correctness that the poetry which is the charm of the Fr. cathedrals seems entirely crushed out. This applies with particular force to the spires, which at the W. façade rise to a height of 510 ft. The open work in the spires, characteristic of Ger. Gothic, is here carried to an extreme. Many have thought that the dignity of the spires is detracted from by the profusion of tracery, and in this respect

W. F. Mansell

## BURGOS CATHEDRAL

An example of florid Gothic architecture in Spain.

Freiburg Cathedral, with its smaller spire, is finer. A still more splendid spire, with less open tracery, is to be found at St. Stephen's, Vienna. This church is singular in having no clerestory or triforium, and in having the 3 aisles nearly equal both in width and in height. Secular A. is again important, and many fine castles, town halls, and gateways date from these centuries. Sp. Gothic: The Spaniards never succeeded in developing a national type of A. for themselves, but regularly borrowed from other countries. The predominating influence was Fr., though this was later replaced by Ger. and It. At all times the Saracenic influence of the S. is apparent. Toledo Cathedral shows one peculiarly Sp. feature—the intrusion of the choir into the nave, i.e. its situation to the W. of the crossing or

transept. It shares with Cologne the defect of excessive shortness, but here it is partly remedied by decreasing the height. In plan it is 5-aisled, with apsidal end. But the greatest cathedral of Spain and the largest mediæval cathedral of any country is that of Seville. The structure is peculiar, and the plan is quite un-Gothic, for the cathedral was erected on the site of a mosque, the outline of which it followed. It is rectangular, with a nave and double aisles, and follows the usual Sp. arrangement for the choir. The nave is 55 ft. wide, and each of the aisles spans 10 ft., the total width being 298 ft. *Belgian and Dutch Gothic*: Wedged in as they are between Germany and France, these 2 countries partake of the nature of their neighbours. The Belgian A. is Fr. with a slight admixture of Ger., while Holland is chiefly affected by Germany. Neither country retains much trace of Romanesque work. The finest cathedral is that of Tournai, the nave of which is Romanesque, while the transept, with apsidal ends, was added in the twelfth century in a transition style. In the fourteenth century the old choir was taken down and a new one with *cheret* end built in fully developed Gothic style. Other interesting churches are the cathedrals of Brussels, Antwerp, and Bruges. In secular work the building of town halls, chief of which are those of Brussels, Bruges, Louvain, and Ghent, was carried to its greatest height.

*The Renaissance*.—The movement known as the Renaissance, or 'New Birth,' arose in Italy in the early part of the fifteenth century, though its harbingers are to be seen during the century before. Its causes were many and various, and its influence may be traced in all the arts and not less in religion. Classic literature may almost be said to have been rediscovered. Gk. scholars from the E. seem to have foreseen the approach of the fall of Constantinople, the cap. of the E. empire, and to have migrated westward. When in 1453 the fall actually came, a general exodus took place. But the return to classical forms is found in every dept. of art, and in A. it was hastened by the discovery of an architectural treatise by Vitruvius, a Lat. author of the first century B.C. This gave rules for building and the proportions for columns, etc.; but since Vitruvius himself had never visited Greece, and was only acquainted with Rom. examples, these were often incorrect. The book possessed no illustrations, so in Italy itself the lack of these was supplied by the inspection of those monuments of the empire which still remained. Italy was, of course, the centre of the new movement, whence it spread over the whole of W. Europe. The main features in the style were the Classic orders, the 4 Rom. orders being used with the addition of a fifth, the Tuscan, which

was a debased Doric form. Yet the style was not entirely imitative, and it was in Italy itself that the greatest freedom was used. The architects were artists before all, and the abundance of old Rom. work about them enabled them to dispense to a great extent with the authority of Vitruvius, which became somewhat too despotic in the rest of Europe. Generally, although important types of church design were developed, the chief energies of the time were devoted to the evolution of a civic style. *It. Renaissance*: Three schools are broadly distinguished in this country, the div. being largely due to social and political causes. By this time the personality of the architect becomes the main factor in the work, whereas in the Gothic buildings the result was achieved by the perfect harmony of many minds working on traditional methods. The *Florentine School* produced the great Brunelleschi (1377-1416), who may be considered as the leader of the movement. His prin. work was the dome of Florence Cathedral, to which reference has already been made. Brunelleschi was associated with Michelozzo in the great secular edifice of Florence, the Riccardi Palace, notable not only for its size, but also for the enormous blocks of rusticated masonry of the lower part, which give an air of great ruggedness and solidity. The other great Florentine architect was Leone Battista Alberti, whose writings on the subject had great influence. His largest work is the church of Sant' Andrea at Mantua, where the front is on the model of a Rom. triumphal arch. The *Rom. school* owes its development largely to the patronage of the popes, whose return from Avignon had taken place at the end of the fourteenth century. The first great Rom. architect was Bramante, and it was he to whom the designing of St. Peter's at Rome was originally given. Sangallo, Raphael, and Peruzzi followed him, and finally Michelangelo took up the work. The original plan was a Gk. cross, but the addition of the 3 more eastward bays to the nave has practically made it a Lat. cross. The bays of the nave are of immense size, and over the central crossing towers the enormous dome, 140 ft. in diameter. The interior has gigantic pillars of the Corinthian order, over 100 ft. high, crowned with barrel vaults of the old type. To the W. is the noblest courtyard in Europe. The Rom. palaces gain much by their simplicity. The *Venetian School* evolved somewhat differently from the other 2, partly because of its greater distance from Rome, and partly because it already had a Gothic style of its own, which continued in use till near the end of the fifteenth century. Between the 2 periods is to be seen one of transition, where Renaissance detail only is used. Examples of this are to be found in most of the palaces. Venetian work is generally graceful and light. The library of St. Mark, erected by Sansovino

and completed by Scamozzi, is the greatest work in this style. The façade consists of a lower open arcade with Doric columns, over which is a glazed arcade of Ionic columns. The whole is surmounted by an entablature spoilt by disproportionate size. The greatest eccles. work was Santa Maria del Miracoli by Pietro Lombardo. *Fr. Renaissance:* The invasions of Italy by Charles VIII. and Francis I. hastened the dispersion of the It. ideas, and led to the general introduction of It. workmen, whose influence on detail is immediately noticeable. Where It. workmanship is absent, the Flamboyant, or decadent Gothic, is to be found holding uninterrupted sway. In the Château de Blois, erected by Louis XII. and Francis I., the transition is to be seen. A more typical example of the ordinary Fr. castle of the time is that of Bury, near Blois. In the centre is a large courtyard with buildings on 3 sides. The fourth side is closed with a wall, in the middle of which is the entrance. The side opposite to this forms the main body of the building, the other 2 sides containing servants' rooms, stabling, etc. Beyond the main body is the garden, and at each corner of the large square is a tower. At the palace of Fontainebleau the chief interest lies in the magnificent adornments of the interiors. The greatest secular work of the Renaissance in France is the Louvre at Paris, and, since its construction was continued from the time of Francis I. to that of Louis XIV., it contains an almost complete hist. of the progress of the style. The building is arranged round a courtyard, 400 ft. square, but the first architect, Pierre Lescot, had intended a courtyard only one-fourth of that size. Two orders of columns are used, the lower Corinthian and the upper Composite, and a number of pilasters adorn a third attic story. The Tuileries Palace, at Paris, is quite near to the Louvre, and is built in the same style. The difficulty of connecting the 2 took some years to solve. *Fr. eccles. A.* first shows the It. influence in tombs, pulpits, altars, and then in additions to churches. It never became so important as the secular, though some important churches employed it. The church of St. Eustache at Paris is structurally Gothic, but all the details are Renaissance, and the same remark applies to St. Etienne du Mont, though here the Gothic element is stronger. The Panthéon and the Madeleine are examples of true Renaissance work. The former was originally intended as the church of Ste. Geneviève, patron saint of Paris, but its aim was changed during the Revolution, and though the building has been reconstructed on 2 occasions, it is now estab. as a burying-place for the famous dead of the nation. It has a triple dome, and the columns used are Corinthian. The plan is a Gk. cross. *Ger. Renaissance* was introduced from France about the middle of

the sixteenth century, and here again it combined with the last phase of Gothic to form a transition period. The A. is almost entirely secular, for hardly any new churches were erected during or after the Reformation period. The Gers. seem to have given their chief attention to the ornament, of which the gable ends generally receive a large share. This is characterised by grotesqueness and distorted quaintness, which, though generally crude and without refinement, are often very picturesque. Heidelberg Castle is the best-known work, and it suffers considerably from this fault of over-ornamentation. The style seems halfway between the more refined Fr. which it copied and the heavy Elizabethan Eng. At Cologne, the Rathaus had a Renaissance porch, showing traces of Gothic. The pillars were Corinthian, but the arches slightly pointed. It was perhaps, the most pleasing production of the period in Germany. Among very late secular work may be mentioned the Brandenburg gate, Berlin, and the only churches to be mentioned are St. Michael, Munich, and the Frauenkirche (in ruins), Dresden. (See further under BERLIN, DRESDEN, etc.) *Sp. Renaissance:* Except for the Moorish influences, the style here is almost the same as that of France, and followed the usual development, in first becoming more classical and then falling away into a Rococo style. It was, if possible, richer here than in any part of Europe, for Spain naturally loves display, and she was then at the height of her power. Secular examples are many, and stretch over the whole of the 3 centuries during which Renaissance A. existed, and whereas in France the best examples are to be found in châteaux and mansions scattered throughout the country, in Spain the towns received most of the buildings, many of which were univs. and monasteries. The earliest known work is Charles V.'s palace, commenced in 1527, and erected at Granada, near to the Alhambra. The building is an exact square, 205 ft. each way, and encloses an open circular court 100 ft. in diameter which was surrounded by an open colonnade in 2 stories, the lower columns being Doric and the upper Ionic. The palace of the Escorial, near Madrid, is chiefly famous for its immense size, for it comprises palace, monastery, college, and church all in 1 plan. The grand entrance leads into a central courtyard, with the college on the right, the monastery on the left, the church immediately opposite, with the palace behind. Among the eccles. edifices of the time may be named the dome of Burgos Cathedral, Granada Cathedral, and Valladolid Cathedral, in all of which the greatest amount of work has been lavished on the magnificent portals. *Belgian and Dutch Renaissance:* The most notable example occurs towards the end of the sixteenth century, and it was not before that time that the style began to be much in use. The remarkable development in Gothic

for the erection of town halls hindered the introduction of anything new. The town hall at Antwerp is the characteristic work. It was designed by De Vriendt in 1565, and owes its origin directly to the wealth and prosperity of the great seaport and trading centre. The length of the façade is 300 ft., and the height is divided into 4 stories, the lower one being composed of a deep arcade. The design is extremely plain, the chief ornament being in the centre, where detached columns are placed before each window, and a pediment crowns the whole. It is

teenth century came the true Anglo-Classic style of which the chief heads were the architects Inigo Jones and Sir Christopher Wren. Inigo Jones, the favourite of James I. and Charles I., had been familiarised with classical models by a long stay in Italy, and his genius would doubtless have shown itself more clearly had not the Commonwealth intervened. His banqueting hall at Whitehall is all that was erected of the royal palace, which was one of the most magnificent conceptions of the Renaissance. Scope was given to Wren's genius by the Great Fire, which offered

#### BLICKLING HALL, NORFOLK

Jacobean house (1620), essentially in the English tradition.

hardly necessary to notice eccles. work, the prin. church being that of St. Anne at Bruges. Throughout the 2 countries it was to the town halls and the other public edifices, such as the Palais de Justice at Brussels, that chief attention was given. *Eng. Renaissance:* In England the movement by which secular A. took the place of eccles. was temporarily hastened by the destruction of the monasteries under Henry VIII. and the consequent appropriation of their revenues. Elizabethan A. shows the transition from the Perpendicular Gothic, of which many features are retained. The chief examples of this style are the country houses, many of which still remain, and the Elizabethan colleges at Oxford and Cambridge, such as Jesus and Wadham at the former and Emmanuel at the latter. Special features in the country houses are the great hall, the broad oak staircase, and the long gallery on the upper floor. The Elizabethan developed naturally into the Jacobean style by the gradual dropping of Gothic details. Then in the seven-

him a unique sphere of work. His prin. work is St. Paul's in London, of which the plan and execution are too well known to need much description. The plan is of the original medieval type, and the internal columns are Corinthian. The base of the dome has a diameter of 109 ft. Externally it is one of the finest in Europe. Wren was also the architect of about 50 city churches, and many secular buildings, such as Chelsea Hospital, part of Greenwich Hospital, and the Temple, London. During the next 2 centuries the Classical style became more and more used for general purposes, under a succession of architects whose names are well known. Nicholas Hawksmoor was a pupil of Wren, and was a contemporary of Sir John Vanbrugh (1664-1726), in conjunction with whom he worked in the designing of Blenheim Palace, distinguished chiefly by the striving after symmetry and monumental grandeur which causes the debasement of A. Other names are those of James Gibbs, the brothers Adam, James Wyatt, Sir John Soane, and Sir William

**Chambers.** The last-named was the architect of Somerset House, London, which is grand, simple, and dignified throughout. Soane was the architect of the Bank of England. Before dealing shortly with the question of present-day A., one other style remains of which mention has already been made in connection with Spain.

*Mohammedan A.*, sometimes termed Saracenic, extended everywhere with the Mohammedan religion, for it is a religious rather than a national growth,

Anderson

MOHAMMEDAN OR SARACENIC:  
THE ALHAMBRA, GRANADA

though in the various nations it differs widely in treatment and detail. The religion prescribed the plan of the mosques, and these were the principles of the earlier work. The typical mosque consists of an open courtyard surrounded by a colonnade, which is deepest on the side towards Mecca and opposite the entrance. Somewhere near the entrance is the minaret, from which the muezzin calls the faithful to prayer. Another type of mosque is founded on the Byzantine church plan, and especially on the church of St. Sophia, which is now a mosque. Decoration is mostly geometrical, for the use of all natural objects is prohibited. Mohammedan A. is generally subdivided according to the various nations where the 'Saracens' have settled, i.e. into Arabian, Syrian, Egyptian, Sp., Persian,

Turkish, and Indian, and these naturally vary in importance. The Sp. may be mentioned particularly because it includes the best-known Mohammedan palace in Europe. The Alhambra, Granada, the most renowned of all Saracenic erections, dates almost entirely from the early fourteenth century. It consists of 2 oblong courts, of which the earlier, the Court of the Lions, is the more elaborate. It measures 115 ft. by 66 ft., and has been described as 'the gem of the Arabian art in Spain.' Other buildings which may be mentioned are the mosque of Cordova, the Sullimaniyeh in Turkey, and the mosque of Kait-Bey near Cairo. The chief feature of Mohammedan work is, as has been said, the geometrical tracery, often of a most intricate kind, and other features are the tall graceful minarets, the various pointed, horse-shoe, multi-foil, and ogee arches, and the pear-shaped eastern domes.

*Modern Architecture.*—From time immemorial almost, the materials of building had remained practically the same and identical all over the world: mud, wood, wattle, brick, and stone. Similarly, the styles of building have a long evolutionary hist. with affinities due partly to the nature of the materials employed, but in part also to evolutionary development. In Europe there were thus for the last 300 or 400 years only 2 styles in A. as distinct from local traditional building—namely, the Gothic and the Classical. Upon these 2 styles the architects, academically trained, had rung the changes by modifications, adaptations, combinations, none of which, however, resulted in the creation of a new style. At the commencement of the twentieth century, however, prompted in part by the preaching of Ruskin and the precept of William Morris, a certain craving for 'honesty' and 'simplicity' began to make itself felt, a desire to let the building materials assert themselves as such: honest brickwork, not stucco pretence, for example, and honest woodwork, especially in interior decoration and furniture, instead of gilding, painting, and veneer. Amongst the pioneers of this movement were the architects C. R. Ashbee in England and C. R. Mackintosh in Scotland. For whilst these tendencies brought about some changes, they did not in themselves constitute a radically new departure. This new departure, however, was made, again in England, as far back as 1850 when Mr.—later Sir—Joseph Paxton (1801-65) designed the building of the Great Exhibition in Hyde Park, re-erected as the Crystal Palace at Sydenham in 1853-54. The Crystal Palace, almost completely destroyed by fire in 1936, was a structure of iron and glass, an entirely new combination of building materials, and one moreover that depends for its existence on an industrial basis such as had theretofore never existed. The material, the form, and the area of this huge structure were in style unlike any A.

that had preceded it. Actually it was nothing more nor less than a huge conservatory—Paxton was not only an architect, but also a gardener. The building was 1608 ft. long; of its 2 transepts 1 was 175 ft. from the floor, and its 2 water-towers were 282 ft. high; in them the first lifts were installed; the area of the whole structure covered 603,072 sq. ft. Thus the Crystal Palace tackled architectural problems which in many ways anticipate the problems the modern engineer-builder has to solve; but which in no way resemble those of the traditional architect. Truly modern building is, in fact, a form of engineering, and depends pre-eminently on the machine and its building products, iron, glass, and reinforced concrete. This latter material was invented by Francois Coignet in 1861, but did not come into general use until 30 or 40 years later. The next great landmark of modern A. is again an engineer's construction—namely, the Eiffel Tower, built by Alexandre Gustave Eiffel in the Champ de Mars in Paris in 1889. It is 984 ft. high and consists entirely of interlaced ironwork. Eiffel dealt with the vertical problems of modern building and its lofty construction anticipated what has become a *sine qua non* of the modern sky-scraper. Whilst in England the work of the local builder and the academically trained architect continued, and even still predominates, economical considerations and industrial developments forced upon the continents of Europe and America the adoption of the new building materials and the construction of buildings that have in their æsthetical significance little if any connection with the A. of brick and stone. In the new iron-constructed building, even the stonework, when it is used and given traditional form, is only a *facing* that has no structural part in the building as such. But the continental builders or engineer-architects are guided in the first place by economic, in the second place by strictly utilitarian considerations, their æsthetics being based on the principle that what is strictly useful must *therefore* also be beautiful. Whilst this principle is, to say the least, doubtful, it cannot be denied that the A. based upon it is often entirely unprecedented in its forms and occasionally impressive in its appearance. Characteristic of this new A. is its entire disregard for, or better expressed, its independence of, the traditional forms of æsthetics due to the totally different method of construction and the predominance of economical considerations which are ethically justified by the pretence that ornament as such is 'romantic' and irrelevant. In the earlier U.S.A. sky-scrapers such as the Woolworth building, 792 ft. high (architect Gilbert), or the Standard Oil Building (architects, Carrère & Hastings) irrelevant Gothic and classical elements were still precariously if conspicuously associated with the steel frame; in more recent

constructions, such as the Graybar Building (architects, Sloan & Robertson), all ornament has disappeared, and A. has resolved itself into an erection of superimposed cubic forms, but with a swift advance to even more striking and dignified types. (See below.) These cubic forms are also associated with the new A. of small dwelling-houses built of reinforced concrete, of which Le Corbusier and André Lurçat are the foremost exponents. Here we have, instead of the vertical arrangement of 'voids'—that is, openings in the façade of the building—a horizontal arrangement. A combination of the vertical with the horizontal arrangement of voids may be seen in the New Olympia Building (architect, Embleton). Further developments of the new A. are the cubes of the Rue Mallet Stevens in Paris named after their architect and which with their flat roofs give the quarter an almost oriental appearance, not aimed at, but the result of modern economical construction. The over-emphasis of uninterrupted horizontals gives the sensation of an endless solid, not resting, but travelling upon voids. Such is the case especially with continental architects, whose new flats and business buildings seem destitute of æsthetic logic, which demands a visible support for every horizontal. It is a sense of movement, of dynamic rather than static qualities, which often gives this new A., of which perhaps Bruno Taut and Erich Mendelsohn in Germany are the prin. exponents, the appearance almost of ship decks of modern men-of-war. The strongest tendency in Ger. A. before the Second World War was to evolve an entirely new style founded on the principles and materials of modern building construction. This style manifested an obvious bias towards unbroken horizontal lines and continuous rows of windows, giving a striped effect in concrete and glass. Some examples of typical modern Ger. buildings were the Chile Haus at Hamburg; the headquarters building of the Ger. Dye Trust at Frankfurt-on-Main, in which architectural effect was acquired through proportion and balance of masses; Shell House, Berlin, a steel shell, interlaced with travelling between the windows; the Laubenganghaus, a tenement block at Reinickendorf; and the Karstadt Dept. Store, a striking example of Amer. 'verticalism' and notable for its purity and its absence of superfluous decoration. (Most of these buildings were either totally destroyed or very severely damaged in the air raids of the Second World War.) By far the most interesting and æsthetically satisfying results these new constructional principles have evolved are to be found in some typically modern purposes, such as hangars, radio stations, and factories of different kinds. Of such may be mentioned the radio station at Kootwijk in Holland, the hangar for dirigible airships at Orey (architect, Froyssinet), the cabinet factory of the Gramophone

Company at Hayes (architects, Wallis Gilbert & Partners), the grain elevators at Montreal, Canada, the refuse converter at Cologne (architect, Mehrtens, Cologne), etc. Efforts to give dignity to these modern principles, in cases where more than practical use is of importance, have, so far at all events, hardly succeeded. One of the best efforts in this respect is the new Horticult. Hall, Westminster (architects, Easton & Robertson), which, though devoid of ornament, has, by reason of the arrangement and proportions of the structural members, especially in its interior, a decidedly pleasing æsthetical effect. More daring are the efforts made by the Fr. architects A. and G. Perret and the Swiss architect Karl Moser of Zürich, with a view to imparting to ferro-concrete and glass the dignity of the old stone-built churches. Messrs. Perret's church of Ste. Thérèse de l'Enfant Jésus at Montmagny has for walls a kind of patterned and pierced screens or *grilles*, and makes, both outside and inside, a vaguely Gothic, but 'meagre' impression. Karl Moser's church of St. Antonius at Basle still suggests a factory building with a chimney rather than a tower. That there is now quite definitely, and owing to similar economical pressure all over the world, an international style of engineer-A. in the making there can be no doubt; but until economical considerations, such as the standardisation of the material demanded by its machine production, and other time-, money-, and labour-saving factors which are now regarded as of primary importance, are put into their proper subordinate place a new style of pure A. is hardly to be expected.

This, however, is an experimental period in which some see, in the more modernist buildings of N. Europe, the dawn of a new A. In England modernist A. looks not to Amer. models, which are adapted to conditions and problems of a special nature, but rather to those of Germany and Holland. The Dutch have originated new ideas in designing large blocks of flats—designs in which the colour and texture of the brickwork are essential features. Everywhere in both Holland and Belgium are to be found very striking effects achieved by original methods of bricklaying, which owe much to the original genius of De Klerk. In the Netherlands, too, was found, for the first time, the A. of reinforced concrete. Buildings constructed and finished in reinforced concrete are made in a mould, instead of being built up of small blocks, and it is this process which gives them a character so different from what we have been accustomed to see. Two of the more outstanding examples of these plastic or non-angular forms of A.—buildings which are the very antithesis of the old types of flat surfaces and hard angles, are the Einstein Tower at Potsdam and Luthman's wireless station at Kootwijk. In these 2 buildings the well-grouped parts are co-ordinated in a mass which almost

suggests a national memorial rather than a utilitarian building, and the clean lines suggest both power and efficiency. Another example of the grouping of simple spacious masses is seen in the bath-house at Hilversum by Dudok, which is also a brick-built building. In Sweden, modernist A., though original in treatment and effect, is not revolutionary, but reveals obvious links with past styles. The city hall, Stockholm, by Ragnar Östberg, has affinities with the civic palace of Venice, and architectural students regard it, together with the Liverpool Cathedral, as one of the architectural triumphs of the twentieth century. But if Sweden's modern A. shows a relationship with the past, both it and the Dutch have common characteristics which dominate the new A. wherever it is found in Europe—a sentiment for clean, unbroken lines and broad surfaces and an arrangement of masses indicative of a concentration on shape or silhouette to the exclusion of mere façade adornment; and in England, too, in recent years architects have begun to concentrate on these characteristics. The Einstein Tower, by Mendelssohn, is a building of altogether original shape, its external form, as the architect himself said, being 'conceived merely as flesh and skin in relation to the structure of the skeleton,' and the shape conforms to the scientific purposes of the building. Sir Giles Gilbert Scott's Liverpool Cathedral is the outstanding achievement of our time in England, although it has its inspiration in the past, being essentially Classical in spirit—Gothic not only in its forms, but in its construction. But though Classical in the unity of the whole design, it is by no means Gothic in its symmetry of plan, having a nave and chancel of equal length on each side of the preaching space, while the whole yields to the impression of a single mass. As regards commercial buildings, Eng. A. is conservative. Reinforced concrete is used a great deal, but mostly it is laid in blocks like masonry, with scarcely any attempt at novelty in design. But the chief preoccupation is with the design of steel-framed buildings, though in this respect England is far behind America, and in general form most of the large new urban buildings show no radical departure from traditional Renaissance lines—limitations imposed really by building regulations on altitudes and frontages. Some of the earlier twentieth-century commercial buildings, such as Harrod's Stores, sacrifice all to window space, so that the building appears to have no visible means of support; but later examples, like the Selfridge building in Oxford Street, compromise between large windows and some measure of solid support in the ground story. Other examples of earlier twentieth-century buildings give the impression of being erected on piles, while their general equipoise is upset by the absence of a solid plinth. New methods of building must, somehow,

be reconciled with a coherent architectural design, and already there are many experiments in this direction, e.g. Adelaide House, a large modern office block standing close to London Bridge. This building, designed by Sir John Burnet and completed in 1925, is remarkable for its inwards-sloping walls, and it partly solves the window problem by making the windows an integral part of the texture of the wall. Bush House, in the Strand, affords an example in London of a modern American building, but makes more concessions

windows regularly spaced and set one above the other; in the informal type, however, symmetry and tradition are more or less disregarded, the windows and gables being set in any position that best conforms with the general plan.

The most notable figure in English architecture of the latter half of last century was Richard Norman Shaw (q.v.), who more than any of his contemporaries developed the 'free Gothic' and 'free Tudor' styles in house-planning and the brick manner known as 'Queen Anne.' He established his reputation largely by his great country houses

*Bedford & Lemere*

THE NEW ADELPHI TERRACE, LONDON  
Officially opened in 1938. Architect, Stanley Hamp.

to tradition than does Adelaide House, its window plan being less like the diagram of a chess board. It is noteworthy for giving London the first illustration of the terraced effect obtained in America by the system of setting back the upper stories. The best example in England of the modern cubist tendency in American architecture is the large building which was completed in 1926 on the site of Devonshire House in Piccadilly; and the grouping of flat-roofed blocks, combined with the sheer height of the walls, lends the building dignity in spite of the over-decorated facade.

Economy, since the First World War, has to some extent restricted the evolution of the modern dwelling-house in England. Often modern houses appear inadequate and inhospitable as compared with, e.g., any old Georgian house; though, as regards the interior, architectural planning has reached a high state of efficiency. As to the exterior design, modern houses of the more formal type are symmetrical, with their

(e.g. Craggside, Dawpool, Cheshire, and Chesters, Northumberland). As in other arts, a dynamic replaced static coherence, as exemplified in timbered upper stories and contrasting textures of rough-cast, stone, and brick aiming at the picturesque and ignoring the demands of any conventional 'style.' If Shaw can be said to have founded a school, there were continental architects who were tending in the same direction, as e.g. the Dutch architect, Cuypers, and the German, Behrens; all these, however, were deriving from the Gothic revival in England through Ruskin and Pugin. Lutyens's New Delhi and Sir Giles Gilbert Scott's Liverpool Cathedral are based essentially on Shaw's principles. C. F. A. Voysey, too, derives from Shaw, but while the latter's houses are large, florid, and elaborate, Voysey's are more restrained, but show less mastery of form. His simple mouldings and well-arranged interiors influenced domestic architecture, one good illustration being that afforded by Charles Rennie Mackintosh's Glasgow Art School.

The work of Behrens, architectural adviser to Germany's one-time prin. electrical manufacturing company, is the most significant in the early years of the present century; for like that of Adolph Loos and Otto Wagner, Viennese architects, it tended to evolve the appropriate relationship of buildings and machines or of A. and engineering. Before the First World War Behrens designed many buildings to enclose machinery, and it was but natural that such buildings should have, in some sense, a machine-like character, for both standardisation and pre-fabrication claimed his attention before 1914; but 'functionalism' or the union of A. and the mechanical never characterised his designs. The merging of these apparent incompatibles is mainly associated with Le Corbusier and Walter Gropius. The famous factory at Alfeld designed in 1911 by Gropius is claimed to be the 'first purely functional modern building,' though the merger of the concepts of machine and A. has later been carried to even greater extremes in America. Gropius stands for the final phase in that important aspect of the growth of modern A., the dissolution of the wall (John Summerson). At the Bauhaus of Dessau (1925) vast sheets of window constructed independently of the floors took the place of solid walling. The weight of the structure was concentrated at points, not distributed along continuous foundations. Thus was a final blow dealt to pyramidal emphasis, and the dynamic principle triumphed over static symmetry. In the early years following the First World War there was apparently great diversity of outlook, and in most countries A. was apparently following out its own idiom. But later there emerged from these diverse and conflicting attitudes one which both in Europe and America is gaining some degree of universality; and the work of such Eng. architects as Maxwell Fry, Wells Coats, and others, if highly modern, reveals the merit of genuine objectivity.

*Modern Amer. A.*—The one great development in A. contributed by the U.S.A. is the skyscraper, many of which buildings, with their soaring ornamental towers, are objects of real beauty, presenting as they do the appearance of gigantic sculptures. The principle which has given the real impetus to the best modern Amer. A. is that which has governed all great periods of architectural development, namely that of appropriateness to function and adaptability to necessity. Striking examples of this principle are the Barclay-Vesey, or the Telephone Building of New York; the State Capitol of Nebraska, in Lincoln; and the Pacific Telegraph Building, San Francisco. In all of these buildings the plan has been ruled by characteristic Amer. requirements. The Telephone Building, in particular, is an object-lesson in the success with which a commercial building has been designed so as to comprise within one harmonious whole all the different debts of a great telephone system. Obviously this type

of building can have no classical or mediæval precedent and in its design must frankly abandon the archaeological element. It is claimed for the city hall of Los Angeles (Austin, Parkinson, & Martin) that it is a successful achievement in the combination of vast administrative accommodation with freedom of classic treatment in detail. In this building the municipal offices are planned in a lofty central tower which shoots up from a large rectangular base, the principle of Classic detail being modified by touches of Romanesque sentiment. It is significant, however, that the Classic element is in detail only. Yet the Amer. attitude towards A., contrary to current Brit. views on America, is essentially conservative, an attitude primarily explained by her Classic training; a training exemplified by the influence of Robert Adam, the Romanesque revival of Thomas Jefferson, the influence of the World's Columbian Exposition at Chicago, 1893, and the academic brilliance of McKinn, Mead, & White. The church of St. Thomas, Fifth Avenue, the Savoy Plaza Hotel, and the Bowery Bank, New York, are examples showing that Gothic, Classic and Romanesque respectively can be incorporated into modern A. with progressive freedom. The ornate mass of the offices of the New York Life Insurance Company (Cass Gilbert), on the site of Madison Square Garden, is Gothic; the lofty Woolworth Building, in New York, is generally styled Gothic, too, yet in these cases the Gothic element is somewhat slight and subordinate to the utilitarian application of archaeological features. There is genuine beauty in such Classic buildings as the Cunard Building, New York, the Stevens Hotel, San Francisco, and the Pacific Oil and Electric Company's building, also in San Francisco; but it is obvious in America that the Classic style of McKinn, Mead, & White is disappearing; the Romanesque influence of H. H. Richardson is also doomed; and even Stanford White is a past name. The old forms are yielding to a school of A. in which form is increasingly functional and national, and decoration governed by the form it decorates, e.g. in the Chanin Building (Sloan & Robertson), a 'set-back' skyscraper building, near the bottom of the rectangular base of which is a frieze of enormous foliage treated conventionally, though somewhat out of scale with the brick piers above and the more successful ornamental bronze band below. Suitability to environment is the keynote to progressive development in the U.S.A. Compromise between plan and function is un-Amer.; such conflict exemplified in buildings with hanging columns, or buildings like the Union Station at Cleveland. Among some of the most typical Amer. skyscrapers which illustrate the rapid development of Amer. A., combining all sections or depths of vast undertakings in a well co-ordinated unity, are the Park Avenue Building, New

York, and the Hollywood Storage Company's warehouse. In these the old style of piling up the orders has completely disappeared; the later style in which upper and lower floors are contained in an order bearing no relation to the floors behind the façade is also absent; the most modern design being to adopt the windows and walls themselves as the unit of scale applied to the whole building, a logical treatment which is a great improvement in style. The 'step back' style is the necessary result of the zoning laws, and has done much to improve design and

stations of the Pennsylvania and the New York Central railroads in New York City.

lend perspective in congested areas. Some of the best recent types are the Barclay-Vesey Building, New York; the Radiator Building, New York; the Fisher Building (Albert Kahn), in Detroit, an enormous yet rhythmically planned and finely massed edifice, full of colour and wealth of material; the City Hall (Austin, Parkinson, & Martin), Los Angeles; the Graybar Building, New York; the Park Avenue Building, New York; the Skelton Hotel; the Chanin Building, New York; No. 333, Michigan Avenue, Chicago; and the Pacific Telephone Company's Building, San Francisco. Of great significance to modern A. in America, too, are the massive cathedrals in Washington and New York, which are being slowly completed, probably the 2 finest modern examples of their kind. The Princeton Univ. Chapel (Cram & Ferguson, who are the architects of the Cathedral of St. John the Divine, New York), completed in 1928, is claimed to be the most scholarly and carefully evolved modern Gothic building in America. Other notable architectural achievements in the U.S.A. are the 2 great cathedral-like railway

**Architecture, Free School of**, an institute at Paris which provides gratuitous training in the principles and practice of A. Foreigners are admitted on the same footing as Frenchmen, but owing to the large number who have applied, the number of them is now allowed to form only a certain percentage of the list. Admission is by examination, the standard of which has been greatly raised of late, owing to the great increase in the number of applicants.

**Architrave**, an architectural term applied to the lowest part of the entablature (q.v.) which rests directly upon the columns. Also applied to the beam over a window or door or other square opening.

**Archives** is the name given to collections of important documents. It is now as a rule only used to denote gov. records, i.e. state A. For further details see RECORDS.

**Archivolt**, in architecture, the band of masonry framing a curved opening.

**Archon**, the highest magistrate in the Athenian and the other Gk. democracies. According to tradition, the last king of Athens, Codrus, was succeeded by his son Medon as A. instead of king. The historical development of the office can probably be traced to the reduction of the power of the original basileus (king), who was left with religious functions only by the military and civil powers being handed over to other officials. At Athens there were 9 As.; the chief, or A. eponymous, who gave his name to the year and dealt with domestic cases; the basileus, with religious powers; the polemarch, who had jurisdiction in military and foreign matters, and 6 thesmothetes, or criminal judges. The office, originally of life tenure, became ann. and open to all citizens.

**Archpriest**, an eccles.; term dating from the fourth century, and originally applied to a senior priest attached

to a cathedral as assistant to the bishop and overseer of the subordinate clergy. The modern representative of the office is a dean. The term had a special application in the early seventeenth century to the superiors appointed by the pope to govern secular priests sent into England. These had been left without a head at the death of Cardinal Allen in 1594. The archpriest had 12 assistants, but was subordinate to the superior of the Jesuits in England. The office, which was much opposed, lapsed in 1621.

**Arch Stone**, a wedge-shaped stone used in the construction of arches. The A. S. of a common bridge has 2 flat faces, inclined to the breadth of the curve, but in the skewed bridge these corresponding surfaces are twisted. Technically called *voussoirs* (see under ARCH).

**Archytas**, Gk. Pythagorean philosopher; fl. c. 400 B.C. Regarded as founder of scientific mechanics. Said to have invented the pulley and 'doubled the cube.'

**Arcis-sur-Aube**, tn. in Aube, France, on R. Aube, 16 m. N.E. of Troyes. The site of an engagement between Napoleon and the Allies under Schwartzburg, March 20-21, 1814, in which Napoleon was forced to retreat. Pop. 2,400.

**Arc Lamp**, an electric lamp in which light is produced by the flow of current between carbon or other electrodes separated by a few millimetres' distance, across which an A. burns with the emission of an intense white or bluish light. A direct-current arc burning in air forms, and a crater is burnt on the tip of the anode, or positive electrode, from which volatilised carbon is projected across the A. path on to the cathode or negative electrode. The crater surface of volatilised carbon has a temperature of over 3000° C., and emits about 170 candle-power to the sq. mm. of surface, normal to the surface, but the arc flame itself emits but little light of a violet colour. A similar A. is also used for the electric furnace and electric welding.

**Arcograph**, see CYCLOGRAPH.

**Arcola**, tn. of Verona, Italy, 15 m. S.E. of Verona, on R. Alpone, trib. of Adige. Pop. 4,500. The scene of Napoleon's victory over the Austrians under Alvinczi, Nov. 15-17, 1796. This forced the Austrians to abandon the relief of Mantua.

**Arcon**, Jean Claude de (1733-1800), Fr. military engineer, b. at Pontarlier. Became famous in Seven Years war at defence of Cassel. Invented floating batteries used in siege of Gibraltar. Member of Senate, 1799.

**Arcos**, Don Rodrigue Ponce de Leon, Duke of vicery of Naples for Spain, 1646-48, whose taxation caused the insurrection of the people of Naples under Aniello Tommaso, or Masaniello as he was called. After 1648 the duke of A. retired from political life.

**Arcot**: 1. Name of 2 contiguous

dist. and a city of Madras, India. N. A. is bounded on the N. by Cuddapah and Nellore, on the E. by Chingleput, on the S. by S. A. and Salem, and on the W. by Mysore. Area 7386 sq. m. S. A. is bounded on the N. by N. A. and Chingleput, on the E. by the Fr. colony of Pondicherry and the bay of Bengal, on the S. by Tanjore and Trichinopoly, and on the W. by Salem. Area 5217 sq. m. Both dists. are flat on the coast; hilly, with jungles, inland. Ceded to E. India Company, 1801. 2. Chief city of N. A., on R. Palar, 65 m. S.W. of Madras. Taken by Clive, 1751; lost to the Fr., but recaptured in 1760. Taken by Hyder Ali, 1780. Passed finally to Brit., 1801. The tn. preserves only a few mosques and tombs as relics of its former grandeur. Above the ruins of the Delhi Gate is Clive's Room. Pop. of N. A., 2,055,594; S., 2,320,085.

**Arctic Animals** do not present great variety in species, except in the case of the lowest forms of life, e.g. the deep-sea fishes, which are unaffected by changes in lat. Molluscs, annelids, and jelly-fish are common to all the N. seas, while such fish as the salmon, cod, and halibut are plentiful, and provide employment for European sailors. Insects are found far N., such as bees, flies, moths, and butterflies, but as the flora is scanty, they do not occur in great abundance. The birds are chiefly sea birds, as petrels, eider ducks, cormorants, auks, gulls, puffins, and gull-mots, and all are migratory. The mammals include the walrus, seals, and several varieties of whale—the white whale and narwhal, grampus, and bottle-nosed whale, but the whalebone whale (*Balaena mystecetis*) is becoming rare; the polar bear, reindeer, elk, fox, wolf, ermine, and musk-ox are the prin. terrestrial mammals. Insectivorous and herbivorous habits are naturally almost absent in A. A., which are piscivorous or carnivorous as they dwell chiefly in the sea or on land. Many of them exhibit the curious phenomenon of becoming snowy-white in winter, and among these are birds, as the ptarmigan, and mammals, as the hares and lemmings, which are brown in summer, and the A. fox, which is slaty-blue in summer; the polar bear is, of course, white all the year round. See *Manual of Natural History of Greenland*, by T. Jones, pub. by the Admiralty, 1875; A. Hellprin, *Geographical and Geological Distribution of Animals*, 1887; S. P. Gordon, *Amid Snowy Wastes: Wild Life*, 1922; V. Stefánsson, *Hunters of the Great North*, 1923.

**Arctic Circle**, The, is an imaginary circle drawn round the N. Pole at a distance of 23½ degrees therefrom, this angle being equal to the angle between the plane of the equator and the plane of the ecliptic. The corresponding circle in the S. hemisphere is called the Antarctic Circle. Within these limits the sun disappears entirely from view for a certain period in the year, and for another period is always visible. The

length of these periods varies with the nearness to the Pole, the nearer the Pole the longer the period during which the sun is continually above the horizon.

**Arctic Exploration.** The first A. voyagers were the old Viking ancestry of the Norwegians, and if they have left no enduring marks to posterity, at least they discovered Iceland and Greenland and colonised them. After the time of Harald Hardraade, the Northmen gave up adventure in the N. seas, and it was only in the fifteenth century, when the Eng. and Dutch led the van of seafaring nations, that A. E. was revived. There was, however, this clear difference between the objective during these earlier times and the modern quest, that whereas Eng. and Dutch explorers were constantly searching for a suppositious N.E. or N.W. passage to China or India, virtually the sole aim of the latter-day explorer has been the almost purely sentimental one of reaching the N. Pole. The first of the navigators, stimulated by the success of Columbus in the field of exploration to renewed efforts to discover a W. route to Cathay, was Sebastian Cabot, who in 1496 sailed from England towards the N.W. Little is known of Cabot's voyage, though it seems, according to a contemporary account, that he must, before turning eastward in despair, have sailed into the gulf of St. Lawrence and partly through the straits of Belle Isle from the N. opening, of which the coast of Labrador sweeps to the W., and so on to Shekateka Bay, where that coast trends eastward (51° N.). In 1553 the Muscovy Company of London Merchants, formed to promote commerce with Russia and the E., prepared an expedition 'for the discovery of Cathay, and divers other regions, dominions, islands, and places unknown,' by the exploration of the seas eastward of the N. Cape. The expedition, consisting of 3 ships, set out from Ratcliffe under the command of Sir Hugh Willoughby. The record of Willoughby's wanderings, probably along the coast of Novaya Zemlya, was learnt from the explorer's own journal when, the following year (1554), some Russian fishermen found him and his crew, frozen to death, at the mouth of the R. Arzina, in Lapland. Richard Chancellor, who commanded the larger of the other 2 ships, reaching Wardhus (Vardöhus) on Vardö Is. in safety. The narrative of Chancellor's expedition, which was written by Clement Adams and preserved by Hakluyt, shows that Chancellor entered the White Sea, till then unknown to the civilised world, and explored the country round Archangel. After this follow the 3 voyages of Martin Frobisher in quest of a N.W. passage to Asia. None of these or any of the attempts made at this time resulted in the wished-for discovery, though some of them were not unproductive of results to geographical science. In his first voyage Frobisher found a bay

which has since been named after him, in 61° N., and landed on an is. since called Gabriel Is., where his party for the first time in the hist. of Englishmen encountered the Eskimos. In 1577 Frobisher made his second journey. He anchored in what was named by him Jackman's Bay, believing, indeed, that he had solved the problem of a N.W. passage to Asia, and landing on what is now known as Fox Land, formally took possession in the name of the queen. Marching into the interior, his party discovered nothing at first but mosses, lichens, and a few juniper bushes and stunted firs. The third expedition sailed from the Thames in May 1578. The only result of the voyage was the finding of what was supposed to be gold, but which in all probability was merely ferruginous or cupreous pyrites, upon an is. in Bear Sound, which they named Countess of Sussex Is. In 1585 John Davis renewed the attempt to discover a N.W. passage to the E., publishing in 1593 a short narrative of his 3 voyages (1585-1587) entitled *The World's Hydrographical Description*. The net results of Davis's first voyages were a better understanding with the natives of Greenland—the W. coast of which he explored up to 61° N., naming it Desolation—and the discovery that land still hemmed him in as far as 67° N. In his last voyage he sailed through Davis Strait and the bay which was not navigated till close upon 30 years later by Baffin and since called Baffin Bay, as far N. as Melville Bay. Thus he was on the direct route to the Pole, but his quest being a short passage to the Pacific, he deviated and sailed westward. Ten years later Barents, the Dutch navigator, made his celebrated voyage in search of a N.E. route to China, and the narrative of his perils and death forms one of the most interesting and pathetic records of human bravery and endurance. The scene of his wintry sojourning was not revisited for nearly 300 years, when Capt. Carlsen, in 1871, landed there and found the wooden house, the ashes still upon the hearth, as the explorers had left it, together with an old clock, Barents's flute, and other interesting relics of the ill-fated expedition, all of which are now in the possession of the Dutch Gov. With Barents seems to end the quest for a short route to the E., or rather that quest is lost sight of in the general exploration of the A. Hudson's first voyage took place in 1607, and resulted in the discovery of the most northerly point of the E. coast of Greenland (73° N.), called Hold with Hope. He penetrated as far N. as 80° 23', and on returning discovered Jan Mayen Is. In 1610 he discovered Hudson Strait and the large bay which has left his name to posterity. His voyages opened the way to the Spitzbergen whale fisheries, 1612-13 Sir Thos. Button, supported by the Merchant Adventurers of London,

entered Hudson Bay, and crossing over westward, explored Southampton Is. up to 65° N. Baffin as pilot and navigator in the *Discovery* investigated the coasts of Hudson Strait in 1615, and later, with the same ship, circumnavigated the great sound with its numerous trib. channels, which has since received the name of Baffin Bay. There was but little in the way of fresh discovery in the years immediately following the efforts of the sixteenth- and seventeenth-century explorers, though much was done to reap the benefits of their discoveries. After the formation of the Hudson's Bay Company, that company's servants, towards the latter part of the eighteenth century, effected some important journeys to explore the shores of the Amer. polar seas, Samuel Hearne navigating the Coppermine R. to the Polar Sea, and Alexander Mackenzie discovering the mouth of the riv. named after him. Dutch rivalry in A. E. resulted in Marten's visit in 1671 to the Spitzbergen group of is., and the best record of the natural hist. and physical features of that part prior to Scoresby's *Account of the Arctic Regions*, in the discovery by Capt. Gillies in 1707 of Gillies Land, and in the opening up of the Dutch whale fisheries of Davis Strait. In 1806 the intrepid fisher and scientific observer, Scoresby, advanced his ship, the *Resolution*, up to 81° 12' N., and 16 years later, forcing a passage through the ice barring the approach to the E. coast of Greenland, he surveyed that coast for a distance of 400 m. In the course of the eighteenth century Russian explorers penetrated to the most northerly parts of Siberia, Lt. Chelyuskin in 1735 reaching the cape in 77° 25' N. which bears his name; while Bering, a Dane, put by Peter the Great in command of the *St. Paul*, set out from Okhotsk to explore the Amer. side of the strait which he had discovered 12 years previously, and which is named after him. After finding Mt. St. Elias he was wrecked and perished in the vicinity of the Aleutian Is.

A. E. appears to have been dropped in England towards the last quarter of the eighteenth century, and it was only with difficulty that the Gov. could be induced to support even voyages of scientific research in polar regions. In 1778, however, Capt. Cook was instructed to sail northward from Kamchatka and look for a N.E. or N.W. passage from the Pacific to the Atlantic. He reached Cape Prince of Wales, the W. extremity of America, and after passing through Bering Strait, found his way barred by ice. In 1815 the search for the N.W. passage was revived in England by the strenuous advocacy of Sir John Barrow, through whose influence a reward of £20,000 was offered for its accomplishment, and £5000 for reaching 89° N. (1818). The most celebrated names during this period of revival were those of Lts. Edward Parry and John Franklin,

whose chief discoveries between 1819 and 1827 were Lancaster Sound, the continuation of which was called Barrow Strait, an archipelago, now known as Parry Is., Melville Is., Fury and Hecla Strait (a channel leading W. from the head of Hudson Bay), and Prince Regent Inlet, a wide opening observed on the third voyage in 1824 to the S. from Lancaster Sound. In 1827 a new chapter opens in A. E. with Parry's attempt to reach the Pole. This attempt was remarkable for the fact that the explorer abandoned his ship and endeavoured to make his way over the northward drift-ice with boats which his party dragged along on sledges. He reached the then highest lat. (82° 45'), but, carried southward by the current, he was forced to return. Prior to Sir John Franklin's ill-starred expedition in 1845, Capt. John Ross, with the financial assistance of Sir Felix Booth, a distiller, set out in a small steamer, the *Victory*, on a private expedition of discovery. The most remarkable feature of this expedition was Ross's sledge journey, after abandoning his ship, across the ice. In the course of his voyage he discovered the gulf of Boothia (named after his patron) and King William Land, and located the position of the N. Magnetic Pole. In 1845 Franklin, with the *Erebus* and *Terror*, set out on his tragic journey through the channels of that dense ice-packed region called by Sir George Nares the Palaeocrystic Sea, to Beechey Is., along the W. shore of N. Somerset (discovered by Parry in 1819), through a southward channel called Peel Sound to King William Is., in the effort to reach some channel to Bering Strait. It appears, however, that the great ice floes from the vicinity of Melville Is. rendered all progress impossible save by rounding the E. side of King William Is.; Franklin did not know that this latter was an is., and so perished with all his party. Numerous expeditions for some years afterwards endeavoured to ascertain Franklin's fate. Sir James Ross, in 1848, was sent with 2 ships, the *Enterprise* and the *Investigator*, by way of Lancaster Sound, and with Lt. McClintock made a long sledge journey along the N. and W. coasts of N. Somerset. In 1850 elaborate and extensive plans of search were organised under Capt. Penny, Austin, Ommaney, Lts. McClintock, Collinson, and McClure. Austin and Penny went through Barrow Strait and discovered Franklin's winter quarters of 1845-46 at Beechey Is. This party wintered on the S. coast of Cornwallis Is. and arranged sledge travelling excursions for the spring, Penny undertaking the Wellington Channel route, McClintock advancing to Melville Is., while Capt. Ommaney went southward, discovering Prince of Wales Is., and Lt. Brown investigated the W. shore of Peel Sound. In 1851 Lady Franklin sent out the schooner *Prince Albert* under Capt. Kennedy and Lt. Bellot of the Fr. Navy,

the Frenchman discovering in the course of a long sledge journey Bellot Strait separating N. Somerset from Boothia, thus proving that this part of the Boothia coast was the N. extremity of the continent of America. In May 1851 Collinson, in the *Enterprise*, penetrated the narrow Prince of Wales Strait between Baring and Prince Albert Is., reaching Princess Royal Is., where McClure had been the previous year. He then wintered in Prince Albert Is. and dispatched travelling parties in the spring of 1852 to explore Prince of Wales Strait and the S. portion of Prince Albert Land. When the ship was free Collinson went E. along the coast of N. America, and after wintering a second time in Cambridge Bay, he examined the shores of Victoria Land up to 70° 26' N. and westward to 100° 45', being within a few m. of Point Victory, where, indeed, he would have learnt the fate of Franklin. This great voyage was only completed in 1854, when Collinson brought back the *Enterprise* safely to England. In the meanwhile McClure, in the *Investigator*, had passed the winter of 1850-51 30 m. from Barrow Strait at the Princess Royal Is., and actually saw a N.W. passage, which, however, he could not reach on account of a branch of the palaeocrystic ice that had baffled Franklin off King William Land. This ultimately forced him southward round Baring Is., whence he endeavoured to drive a passage to the N. between the W. shore of King William Land and the cliff-like ice walls. Eventually, after the narrowest escapes, he took refuge on the N. shore of Banks Land, and in the early part of 1853, after preparing to abandon his ship for the Amer. coast, was fortunately rescued. In 1852 the Brit. Gov. dispatched another expedition, via Lancaster Sound, under Sir Edward Belcher, Sherard, Osborn, Capt. Kellett, and McClintock. McClure's record was discovered by Lt. Meham, one of the sledge travellers of this expedition. This discovery soon led to the succour of McClure, who thus partly by ship and partly by travelling over ice, had now in fact accomplished the N.W. passage, for which long-sought prize he was knighted, and, together with his party, received a grant of £10,000. In 1854 Dr. Rae, whose previous work in A. E. was in 1846-47, when he crossed the isthmus joining Melville Peninsula with the mainland and skirted the shores of Committee Bay and the E. coast of Boothia as far as Lord Mayor's Bay, joined Sir J. Richardson in a search for Franklin. He brought home tidings of Franklin's expedition from the Eskimos, the immediate consequence of which was that McClintock, in the *Fox*, with Capt. Allen Young and Lt. Hobson, prosecuted a thorough search of the W. coast of Boothia, the whole shore of King William Is., and Montreal Is. Eventually this party came upon a paper outlining the voyage of Franklin and telling of his death in June 1847 and the departure of the

survivors in an attempt to make the Great Fish R., in which attempt none ever succeeded, though sev. traces of their straggles were subsequently found. McClintock's voyage proved that Franklin's expedition did in fact discover a sea route from the Atlantic to the channels S. of Victoria and Wollaston Land to Bering Strait, and since that time Capt. Hall and Lt. Schwatka, of the U.S. Navy and Army respectively, have discovered other relics of Franklin's expedition. A notable expedition in quest of Franklin was that of Dr. Elisha Kent Kane of the U.S. Navy, who, sent out by the U.S. Gov. in 1852, to look for the Eng. explorer, made his winter quarters in Van Rensselaer Harbour, and with his boat, the *Advance*, pushed on to Smith Sound, where his further progress was stopped by ice at the entrance. Kane's contributions to A. E. contain a great deal of valuable information as to fauna, flora, magnetic conditions, and climate; the first really authentic and detailed account of the Etah Eskimos; and, by his sledge journey to Cape Constellation, the making known to the world of the marvellous waterways along the W. of Greenland between Smith Sound and the A. Ocean, which afford the acknowledged easiest route to the Pole.

In 1871 Charles Hall, of Cincinnati, took the *Polaris* for 250 m. up the channel which runs N. from Smith Sound. He is credited with having reached an unprecedented lat. by ship, and exploring Grant Land to within 412 m. of the Pole. In 1875-76 Sir George Nares, with Lts. Aldrich, Markham, and Beaumont, touched 83° 20' N., after pushing along Grant Land to 85° W. long. and Greenland to Cape Britannia. In 1883 Lt. Greely, of the U.S. Army, made extremely valuable observations round Lady Franklin Bay (81° 44') on the fauna and flora, climate, tides, and magnetism of this region. During the sojourn of the Greely expedition (1881-84), Lt. Lockwood, by touching 83° 24', gained for the U.S.A. the honour of reaching the then farthest N. The next most important work of this period was the traversing of the great glacier forming the interior of Greenland by Nansen and Peary. Nansen's theory was that a current flowed at some point between the Pole and Franz Joseph Land from the Siberian A. Sea to the E. coast of Greenland; but his objective was never so much to reach the Pole, a matter of possibly secondary importance, as to investigate the great unknown region that surrounded the Pole, and in 1893, in the *Fram*, a ship specially designed to sustain and rise to powerful ice-pressure, he set out on his brilliant expedition to cross the polar ocean by relying on the drift from E. to W. after deliberately forcing the ship into the ice. The *Fram* ultimately emerged from the pack to the N. of Spitzbergen. Dr. Nansen's chief discovery being to

ascertain the existence of a very deep ocean to the N. of the Franz Josef group, which was found to be a continuation of the water to the N. of Spitzbergen. In Apr. of 1895 Nansen with a single companion, Johansen, left his ship, and by means of kayaks and sledges drawn by dogs, reached farthest N. (86° 13'). Dr. Nansen's theories are on the whole sound, and the light he threw on what has been called the polar question estab. his fame for all time. Mr. Peary in 1892 and 1895 made journeys over the inland ice of Greenland, but beyond ascertaining the N. limit of the ice-cap of the Greenland glacier, added little to general information. Then in 1897 the Jackson-Harmsworth expedition in the *Windward* explored Waigatz Is. and the W. part of Franz Joseph Land, discovered a wide channel opening on a northward sea, and made important magnetic and meteorological observations. In 1897 Andr e, with Fraenkel and Strindberg, set out on their unhappy balloon journey. Except for buoys cast overboard, nothing further was heard of this expedition until 1930, when their bodies were found in White Is., near Spitzbergen. The latest of 3 buoys found showed that the balloon reached 82° N. 25° E., but no other traces were discovered until 1930. Then Andr e's diary showed that at 1 time the balloon reached a point a little higher than 83° N. In 1899 Sverdrup, Peary's companion in 1892, led a party in the *Fram* up Smith Sound to explore the N. coast of Greenland, while in the same year Lt. Peary, with the help of Eskimos, followed the same route, and the duke of Abruzzi on the Norwegian whaler *Jason* proceeded to Franz Josef Land. In 1900 various sledge parties were sent N., one, under Captain Cagni, reaching a point 20 m. beyond Nansen's farthest N. The names of prin. note in the twentieth century, notable for Peary's achievement in reaching the Pole, are those of Peary himself, Amundsen, Ejn r Mikkelsen, and Mylius-Erichsen. Peary undertook his last voyage in 1908, shortly before the time that Dr. Frederick A. Cook claimed to have reached the Pole. With a few whites, nearly 50 Eskimos, and 200 dogs, he crossed the frozen seas, passing his own previous record of 87° 6' N. In 1908, and ultimately, on Apr. 6, 1909, gained for the U.S.A. the honour of first reaching the Pole. The rapidity of Peary's travelling may be gauged from the fact that he traversed nearly 150 m. in 5 days going N., and on his return journey over 400 m. in 16 days. He located the Pole on a deep ice-covered ocean, there being no land in its vicinity, his soundings being 1500 fathoms within 5 m. of the Pole. The chief work of Mylius-Erichsen was the completion of the exploration of the hitherto unknown parts of the coast of Greenland, from Cape Farewell, 60° N., for over 1600 m. to 83° N. He d. of cold and starvation after crossing the

inland ice between Denmark Flord and Lambert Land in an effort to identify Peary's Navy Cliff. Mikkelsen, another Dane, recovered Erichsen's records for Denmark in 1912, and it is worthy of note that these records alter the entire cartography of N.E. Greenland; they prove that Peary Channel is no more than a fiord, Hazen or Peary Land merely a N. extension of Greenland and not separate, and that Greenland extends over 20° eastward of Peary's farthest E., the net result being the addition of over 150,000 sq. m. to Greenland, and the discovery that N.E. Foreland (12° W. 83° N.), the E. extremity of Greenland, is within 23° of Spitsbergen. Other explorations of note are those of O. Sverdrup in Grinnell Land and his discovery of Helberg and Rengues Is., the re-location in 1904-5 by the Norwegian Amundsen of the N. Magnetic Pole in 70° N. 97° W., and the investigations of the Eskimos of V. Stefansson from 1908 to 1912. The great feat of Amundsen was the unquestioned accomplishment of the N.W. passage over Franklin's route.

A 'N.E. passage' was only discovered in the late years of the nineteenth century, and even to-day the waters eastward are but cursorily known. Since Nordenskjöld's journey in the *Vega* (1879), Wilkitsky's expedition in 2 ice-breakers in 1915 and Amundsen in the *Maud* in 1919-20 made the journey. Wilkitsky's boats brought back much valuable information on the Arctic coast of Siberia, and since then the Soviet Republic has sent out survey boats to the same region. Thus practical work remained the keynote of exploration as before 1913, it being realised that the objective in the A. should be not so much the discovery of open seas near the Pole, but of land in N. lats. which might be feasible as a base for explorers to the polar seas. Not that efforts do not continue to be made to cross the Pole, for Amundsen's *Maud* tried to follow Nansen's former route, in the hope of drifting to the Pole; but the effort was not successful, though the expedition which, later, was made under Wisting returned with much useful information about the Siberian coast supplementary to that of Wilkitsky. Peary remains the only explorer who has sailed to the Pole, but his reported finding of Croker Land in 85° N. lat. was not confirmed by Amundsen in his polar flight in 1926, nor by the Amer. explorer, D. B. MacMillan, who explored Ellesmere and other Is. during the period 1913-17. One good result of Peary's exploit has been to reconcile explorers to research rather than to more or less useless spectacular discoveries. The Norwegian, K. Rasmussen, throughout the decade 1920-30 has opened up a mine of knowledge on Greenland and the Eskimos, as also have E. Mikkelsen and J. P. and L. Koch (1921-23).

The aeroplane has not been an unqualified success for exploration work.

Amundsen, however, though he failed to reach the Pole in 1926, showed that with sufficient petrol the feat could be accomplished, and in the following year Commander R. Byrd flew to the Pole from Spitsbergen and back, and Amundsen's dirigible *Norge* also crossed from the same base to Alaska. Amundsen was accompanied by Gen. Nobile, the It. designer of the airship, but unfortunately the enthusiasm of Amundsen's adventurous spirit caused him to quarrel with Nobile over the allocation of the credit for the flight as between Italy and Norway, and the 2 parted. Later, however, when it was learned that Nobile was missing on his second flight, Amundsen generously joined in the flights organised for relief. Nobile was eventually rescued, but nothing further was ever heard of Amundsen.

In 1928 Capt. Sir Hubert Wilkins flew from Alaska to Dead Man's Is., Spitsbergen. The flight lasted less than a day, but though no new land was discovered in the waters N. of Canada, useful observations were made on meteorological and navigation conditions in that region. Later in the year Gen. Nobile made 3 flights in his dirigible *Italia*, and on the third reached the Pole, only to be wrecked off N.E. Land. Numerous expeditions were organised for relief by many nations, but the Soviet Icebreaker *Krassin* was the first to reach the stranded party. Meanwhile Nobile had been taken off the ice by a Swedish aviator. Half the crew, however, perished, no trace of them or of the wrecked airship in which they had been carried away being found. With Amundsen, who, as stated above, joined in the relief expeditions, were 5 other men, who also disappeared.

In 1931 Gino Watkins (Cambridge Univ.) tried to organise an air route from the United Kingdom to Canada via Greenland, but lost his life while hunting in a kayak in Greenland (see F. Spencer Chapman, *Watkins's Last Expedition*, 1934). In 1931-32 Prof. Ushakov, of the Soviet Union, explored Northland (formerly Nicholas Is.), a little-known Is. N. of Cape Chelyuskin. In Sept. 1936, the Fr. polar research ship, *Pourquoi Pas*, foundered off Iceland with the loss of all but 1 of its crew, and of the famous Fr. explorer, Jean-Baptiste Charcot (q.v.). In the same year a Soviet hydrographic expedition, on the icebreaker *Sedov*, claimed to have mastered the new sea route in the region of Nordenskiöld Archipelago, investigated for the first time 40 years ago by the Russian explorer, E. Toll. In 1937, the Soviet Gov. estab. a Russian polar station in the vicinity of the N. Pole, and there were reports in that year that the Soviet had annexed the N. Pole itself. Prof. Otto Schmidt, who headed a Soviet expedition in 1937-38, reported that the N. polar summer climate was considerably milder than was expected and even showed temps. above freezing point; and soundings in the Polar Sea had proved that it was more than 3000

ft. deeper than Nansen's researches had led them to expect. See Sir John Ross, *A Voyage of Discovery, for exploring Baffin's Bay and a North-west Passage*, 1819; Sir E. Parry, *Journal of a Voyage for the Discovery of the North-west Passage*, 1819-1820 (and subsequent Journals, 1824-28); Sir John Franklin, *Narrative of Journey to the Shores of the Polar Sea*, 1819-22, 1823; Sir J. Barrow, *Voyages of Discovery and Research within the Arctic Regions*, 1846; J. Payer, *New Lands within the Arctic Circle*, 1876; A. H. Markham, *The Great Frozen Sea*, 1878; Duke of the Abruzzi, *On the Polar Star*, 1903; R. Amundsen, *The North-west Passage*, 1909, and *The First Flight Across the Arctic Ocean*, 1927; R. F. Peary, *The North Pole*, 1910; F. Nansen, *Hunting and Adventure in the Arctic*, 1925; K. Rasmussen, *Across Arctic America*, 1927; R. N. Rudmore Brown, *The Polar Regions*, 1927; R. E. Byrd, *Skyward*, 1928; L. Brontman, *On the Top of the World: the Soviet Expedition to the North Pole*, 1937; H. P. Smolka, *40,000 against the Arctic*, 1937; F. Spencer Chapman, *Watkins's Last Expedition*, 1938; R. J. Cyrtax, *Sir John Franklin's Last Arctic Expedition*, 1939; V. Stefánsson, *Ultima Thule: Further Mysteries of the Arctic*, 1942; J. K. Cross, *The White Magic*, 1948.

Arctic Ocean is usually defined as the area of water within the A. circle. It lies to the N. of Europe, Asia, and N. America, and communicates with the Atlantic by means of the wide sea between Norway and Greenland; Denmark Strait, between Greenland and Iceland; and Davis Strait, between Greenland and Brit. N. America. The only communication which it has with the Pacific is by means of Bering Strait. —A relatively mild climate is found a long way inside the A. circle owing to the influence of the Gulf Stream off the coast of Norway, and, on the other hand, A. conditions are caused to exist far into the Atlantic by means of the A. currents, which flow through Davis Strait and along the E. coast of Greenland. The sea between Norway and Greenland belongs physiographically to the same basin as the A. O., as ridges between Greenland, Iceland, Farøe Is., and the N. of Scotland separate it from the Atlantic region. The region immediately at and around the N. Pole is covered with rough pack-ice, whilst Peary found the depth of the water at the N. Pole itself to be more than 1500 fathoms. The whole ocean, in fact, is covered with immense ice fields, which vary in depth from 5 to 30 ft. The average depth of the ice pack, however, is about 10 ft. It is frozen together in winter but in the summer it is broken up into floes of varying size. Lanes form in the ice pack, and when these lanes close up again the floes are piled up on one another, and the well-known 'hummocky' ice floes result. If hummocky ice is piled up against a shallow shore and so fixed for a great length of time, the appearance is produced which

Nares called the palaeocrystic sea. A permanent layer of fresh water is found in many places outside the edge of the ice pack. This layer, which has a depth of 6 ft. in some places, is formed partly by the melted ice and partly from the outflow of the rivers of Siberia. The ice pack as a whole has been found to drift from the middle of the N. coast of Siberia north-westwards towards the N.E. extremity of Greenland. Large quantities of ice also pass down each year between Spitsbergen and Greenland. The warm surface waters of the Atlantic flow up into the A. regions, passing between Greenland and Norway. When they arrive there they are chilled by contact with the icy A. waters, and gradually sink to the bottom. Finally they return, along the E. side of Greenland, and down Davis Strait, as a cold current carrying with them the icebergs which are such a danger to navigation in the Atlantic. The above is only an adumbration of the circulatory system which exists. The winds, the Gulf Stream, and the various submarine ridges and depressions between the continents and is., are all factors which complicate the movements of the waters. The A. O. is bordered by a fairly broad continental shelf; this renders the ocean as a whole shallow. Along the N. of Europe and Siberia, to 135° E. long. the water is very shallow indeed, and proceeding westward from this point the depth does not exceed 80 fathoms. Between Franz Josef Land and Novaya Zemlya the depth of the water varies from 100 to 150 fathoms, and between Norway and Bear Is. it is 240 fathoms. In the Kara Sea a depth of over 400 fathoms is found. The depth of the ocean E. of 135° long. suddenly increases to 2000 fathoms. The *Fram*, in 1893-96, drifted with the ice pack from 79° N. lat. and 138° E. long. into the neighbourhood of Spitsbergen, and the depth of the sea along her route was ascertained to be more than 1800 fathoms, and frequently over 2000 fathoms. The Nathorst expedition of 1898 found that the greatest depth W. of Spitsbergen was 1720 fathoms. The temp. of the A. O. is found to vary somewhat at different depths. The surface temp. in the polar regions is usually about the freezing point of salt water, 29.2°. It increases at about 110 fathoms to 33°, and between 120 and 350 fathoms the temp. is higher than at any other depth, ranging between 35° and 39.9°. This warm layer is probably due to the influence of the Gulf Stream. Directly underneath this, down to nearly 1000 fathoms, there is a drop in the temp. to about 31.9°. Lastly, from 1000 fathoms to the bottom the water is slightly warmer, and the temp. is fairly uniform, being between 33.1° and 33.4°. Near the Pole itself there appears to be no wind in the winter, and the air is clear; in lower lat., round Franz Josef Land and Greenland, for instance, whilst the temp. is higher, rough winds prevail. These are generally S.W. along the coast of

Norway, and as far as Franz Josef Land, but W. of this region northeasterly winds are general. During the summer fogs and mists are very frequent, and form one of the greatest dangers to explorers. The prin. riva. which flow into the A. O. are the Onega, the Dyina, and the Petchora in Europe, the Lena, the Yenisei, and the Obi in Asia, and the Mackenzie in America. The lofty A. lands are covered in the interior to an enormous depth with snow and ice, and vast glaciers are found in some places—for instance, the Humboldt Glacier on the W. coast of Greenland.

New York Times

#### ESKIMOS HUNTING AMONG THE ARCTIC ICEBERGS

The smaller seas and bays contained in the A. O., Baffin Bay, Bering Strait, Davis Strait, the Greenland Sea, the Kara Sea, the White Sea, etc. are described at length in separate articles.

**Arctiidae**, a family of lepidopterous insects; the tiger moths.

**Arctinus**, of Miletus, auct. Gk. epic poet, probably of the eighth century B.C. His life is unknown. His works, which are said to have included the *Athiopis*, a continuation of the *Iliad*, and *The Sack of Troy*, are lost except for a few fragments, collected in Kiinkel's *Epicorum Græcorum Fragmenta*.

**Arctium**. See BURDOCK.

**Arctomys** is the generic name of the marmots, which belong to the squirrel family (Sciuridae). They are small rodents found in the colder regions. *A. marmotta* is the Alpine marmot. The Amer. kinds are known as woodchucks.

**Arctostaphylos**, or bear berry, is a genus of plants found wild in the mountainous parts of England and Scotland, and the N. of Europe generally. It has been used in tanning and in dyeing a greyish-black colour as well as for

gravelly complaints and for diseases of the urinary organs.

**Arcturus**, or **Alpha Boötis**, perhaps next to Sirius, the best-known star, and the brightest in the N. sidereal hemisphere. It is one of the 11 stars brighter than the first magnitude and the sixth brightest in the heavens, its magnitude being 0.3. A. derives its name from 2 Gk. words, *ἀρκτος*, a bear, and *ὄψα*, tall. It is not in the constellation called Ursa Major (Great Bear), but is on a line drawn through the 2 hinder stars of the tail of the Bear. A. has been the subject of many literary references in auct. and modern times, and perhaps one of the oldest references to it is contained in the book of Job in the Bible (Job ix. 9 and xxxviii. 32), though possibly here, as elsewhere the name, of A. is wrongly used for the constellation the Great Bear. Hesiod in 730 B.C. refers to this star in his *Works and Days*. The poet Shelley, in *The Question*, uses the word in the plural, singing of 'Daisies, those pearl'd Arcturi of the earth, the constellated flower that never sets.' Astronomically A. has many points of interest, not the least being that it is the fastest-moving of the brighter stars, its velocity being 260 m. a second. Its 'proper motion' is 228" a century, which is very high. A. is approaching the earth at the rate of about 4 m. a second. It will however, take a long time to arrive, for its light, travelling at the rate of 186,000 m. a second, takes about 25 years to reach us. In type the star resembles our sun, its spectrum being full of metallic lines, but it is 2000 times more luminous.

**Arceuli**, a tn., Seine, France, 4 m. S. of Paris, of which it forms a suburb. Famous for ruins of an aqueduct built by the Emperor Julian. Pop. 15,000.

**Arcey**, **Grotto of**, a cavity in a hill in the dept. of the Yonne, France, about 3 m. S. of Vermenton. It contains various apartments, in some of which are found stalactites and stalagmites. The cathedral of Auxerre is supposed to have been built of stone from this grotto.

**Ard**: 1. A loch in the S.W. of Perthshire, Scotland. 2. A. or *Ard* means 'height,' and is found in many geographical names in Scotland and Ireland.

**Ardagh**: 1. A vil. in Longford, Eire, formerly the seat of a bishopric. Pop. 1500. 2. A vil. in Limerick, Eire. Pop. 1300.

**Ardalan**, dist. of Kurdistan, Iran (Persia), forming part of the prov. of Irak-Ajemi, and embracing the basin of the Shirwan Rûd. Area 6000 sq. m.: pop. 150,000. Chief tns. Kermanshah (pop. 70,000) (cap.) and Sinna.

**Ardashir**, the modern form of Artaxerxes, and the name of 3 Persian monarchs of the Sassanian dynasty. A. I., A.D. 226-11, founded this line by overthrowing Artabanus, the last Parthian king. A. II., who came to the throne 379, was deposed 383. A. III. was king, 628-30.

**Ardes**, auct. tn. of Italy, 24 m. S. of

Rome. The traditional cap. of the Rutuli. The modern tn. occupies the site of the anct. citadel.

**Ardebil**, a tn. of Azerbaijan, Persia, on the Kara-Su, 100 m. E. of Tabriz. Pop. 16,000. Favourite residence and the burial-place of Persian rulers. Suffered in Russo-Persian war, 1826-28. Stands on important caravan route.

**Ardèche**, 1. Riv. in dept. of same name, France. Rises in Cévennes and flows 60 m. into Rhône near Pont-Saint-Espirit. 2. Dept. in S.E. France. Area 2140 sq. m.; pop. 254,000. The dist., which includes part of anct. Languedoc, is mountainous and largely volcanic. Cap. Privas.

**Ardes**, a tn. of Louth, Eire, on R. Dee. It contains a thirteenth-century church, and 2 fourteenth-century castles. Pop. 1800.

**Ardemano, Teodoro** (1664-1726), was b. at Madrid, and was an architect, painter, and sculptor. He studied painting under Claudio Coello, and afterwards gave his time to mathematics and architecture. He painted the frescoes in the church of St. Francis, Madrid, and among his sculptures are the tombs of a dauphin of France and of a queen of Savoy. The cathedral of Granada is partly his work.

**Arden, Forest of**, dist. in N. Warwickshire, England, originally part of a forest which covered a large part of the midlands. Undulating and still well wooded. It is probably the scene of Shakespeare's *As You Like It*. His mother claimed to belong to the famous Arden family, founded in the eleventh century.

**Ardennes**: 1. Formerly the name of a large, hilly, and wooded dist. embracing parts of Belgium, Germany, and France; now applied to the wooded heights which extend from S.E. Belgium into France, on each side of the Meuse. The highest elevations are about 2000 ft. The industries of the dist. are pasturage and mining. This hill and forest region, watered by the Meuse and Aisne, was the scene of heavy fighting in the early days of the First World War, the Ger. invading armies marching to S.E. Belgium through Luxembourg in the S. Ardennes and through Malmédy near the N. part of the dist. The fate of Liège (Aug. 1914) cleared the road for the Gers. between A. and Visé when, under the duke of Württemberg and the crown prince, they resumed their advance by the hills to the Luxembourg railway lines. After the fall of Liège, Gen. von Bülow, on the pretext that the inhab. of the tn. of A. had attacked Ger. troops, ordered the tn. to be burned and 100 inhab. shot. It was in the A. in the Second World War that Gen. von Rundstedt (*q.v.*) opened his counter-offensive on the Belgian and Luxembourg frontiers on Dec. 16, 1944. In the new year, on Jan. 3, the Amers. launched a powerful counter-attack on the N. flank of the A. salient, which eliminated the last hostile threat and reduced the Gers. finally to a general defensive. See

**WESTERN FRONT IN SECOND WORLD WAR.** 2. Dept. of N.E. France, bordering on Belgium. Area 2020 sq. m.; pop. 245,335. Mézières is the cap. and Sedan the chief tn. The valleys are fertile, and there is much mineral wealth.

**Ardfert**, a vil. in co. Kerry, Eire, about 6 m. N.W. of Tralee. It is the see of a bishop. Pop. 1400.

**Ardglass**, a small seaport, fishing station, and bathing resort in co. Down, Eire. Pop. 500.

**Ardilaun, Arthur Edward Guinness**, first and only Baron (1840-1915). Educated at Eton and Trinity College, Dublin. Head of the great brewing firm of Arthur Guinness & Co. Conservative M.P. for Dublin, 1868-69 and 1874-80. Raised to peerage, 1880. Acquired St. Stephen's Green (Dublin) and Muckross estate (Killarney) for the public.

**Ardingly**, a vil. of Sussex, England, with public school of the same name; 40½ m. from London. Pop. 1,100.

**Arditi, Luigi** (1822-1903), It. musician and composer, b. in Piedmont, graduated at Milan Conservatory 1842. In 1846 he visited Havana as violinist with Bottesini, the double-bass player, and in 1847 went to New York as conductor of the Havana Opera Company. In 1858 he became conductor of His Majesty's Theatre, London, being Patti's favourite conductor. Operas: *La Spia*; *I Briganti*; and *Il Corsaro*. Also composed waltz songs, *Il Bacio* and *Fior di Margherita*. Pub. *Reminiscences*, 1896.

**Ardluke**, an Eskimo name for the grampus.

**Ardmore**: 1. Vil. and watering-place of Waterford, Eire, 6 m. from Youghal. Pop. 200. 2. Co. seat of Carter co., Oklahoma, U.S.A., home of the Chickasaw Indians, 98 m. N.E. of Fort Worth. Pop. 15,600. 3. Tn. of Montgomery co., Pennsylvania, U.S.A., 8 m. from Philadelphia.

**Ardnamurchan Pt.**, headland in Argyllshire, Scotland; the most westerly point of the mainland. The lighthouse on it was built in 1849.

**Ardnaree**, see BALLINA.

**Ardoch**, a vil. of Perthshire, Scotland, 8 m. S.W. of Crieff, containing the best-preserved Rom. camp in Great Britain. Pop. 985.

**Ardoye**, a tn. in the prov. of W. Flanders, Belgium. Pop. 6700. Noted for its cloth-weaving works.

**Ardres**, a tn. in the Pas-de-Calais dept., France. It manufs. lace, net, and arras. Pop. 2700.

**Ardrihaig**, a port of Argyllshire, Scotland, on Loch Gilp and the Crinan Canal, 19 m. S.W. of Inveraray. Pop. 1200.

**Ardrossan**, a seaport of Ayrshire, Scotland, burgh of barony and police burgh, governed by a provost and council. Important harbour, the construction of which was begun by Hugh, the twelfth earl of Eglinton, in 1806. The tn. is noted for its shipbuilding and fisheries, and there are collieries and ironworks in the neighbourhood.

A ruined castle with its dungeon, known as Wallace's Larder, may still be seen. Pop. 13,800.

**Ardsey:** 1. Now incorporated with Barnsley, E. A. par. and vil., 3 m. from Wakefield. Collieries, iron-smelting works, and railway works. Pop. 4000. W. A., 5 m. from Wakefield. Collieries and stone quarries. Pop. 9200. 2. Urb. dist. of W. Riding of Yorkshire, 3 m. from Wakefield. Pop. 7500. Has coal, iron, and woollen industries.

**Ardstraw**, a par. of Tyrone co., N. Ireland, comprising Newton-Stewart, A., and Douglas Bridge. Pop. 8097.

**Ardrea**, or **Artrea**, par. in Tyrone and Londonderry cos., N. Ireland, containing part of Moneymore. Pop. 5000.

**Arduni**, Carlo, an It. author (1815-1881). He became a journalist at Rome, and after the fall of the Republic of Mazzini went to Switzerland and was appointed prof. of It. language and literature at the Polytechnic, Zurich. Among his works are a hist. of Pícenum; *Stefano Porcari*, or *the Last of the Romans*, a drama, 1849; a work on the philosophy of Dante and on literature and art during the It. Renaissance; and one on the philosophy of the fine arts in Italy.

**Ardwick Limestone** is the name given to a calcareous series of beds in the upper part of the coal formation of the dist. round Manchester. It contains remains of shells and fish, and at Manchester has a coal-bed immediately above it.

**Ardwrock**, a castle near Inver, Perthshire, Scotland, where Montrose was imprisoned 1650. It is now in ruins.

**Ardys**, succeeded his father Gyges as king of Lydia, and reigned 678-629 B.C. He took Priene, and made war on Miletus. The Cimmerians, attacked by the nomads of Scythia, invaded the kingdom of A. See Herodotus, i. 14, 15.

**Are**, unit of Fr. land. A square measure, 1 side of which is 10 metres long.

**Area**, quantity of surface. The area of a rectangular surface is obtained in square units by multiplying the length by the breadth measured in the corresponding units of length. The area of a parallelogram = length multiplied by perpendicular height. Area of a triangle = half the length multiplied by perpendicular height. Area of a circle =  $\pi r^2$ , where  $\pi = 3.1416$  and  $r$  = radius. See **MENSURATION** and **SURVEYING** and under **WEIGHTS** and **MEASURES**.

**Areca**, a genus of Palmæ, grows in tropical Asia. *A. catechu* is cultivated all over India for its seeds, the pinang or betel nuts; mixed with lime and the leaf of the betel pepper it is universally chewed. *A. oleracea* or *Oreodoxa oleracea* is the cabbage palm of the W. Indian Is.; its leaves, which grow at the top of the tree, and its nuts are eaten, while the hard trunk is used as a water-pipe.

**Arecibo**, a city on the N. coast of Puerto Rico. Pop. 42,000. Chief exports are coffee and sugar. The harbour is dangerous. Near are the famous caves of Consejo.

**Areimanios**, see **AHRIMAN**.

**Arena**, the central part of an amphitheatre where the fights of the gladiators and wild beasts were held. Its name was derived from the Lat. *arena*, sand, and it was so called because it was usually covered with sand.

**Arenaceous** (Lat. *arena*, sand) **Rocks** is a term applied to those rocks which are formed of any variety of sandstone. The fine particles of quartz, of which sand consists, mingle with particles of other material, such as mica or felspar, and when cemented become rocks. When the clayey cement predominates they are known as *argillaceous rocks*.

**Arenal**, a small tn. of S. America, in the state of Miranda, Venezuela.

**Arenaria**, a genus of Caryophyllaceæ, is known in Britain as the sandwort. There are about 9 Brit. species. Many of the species are alpine; but the *A. verna*, or vernal, *A. sepylofolia*, or thyme-leaved, with others, are found upon the plain.

**Arenas**, **Puntas**, see **MAGALLANES**.

**Arensburg**, formerly a Ger. duchy of the Holy Rom. Empire; later it belonged to the Prussian administrative dist. of Coblenz. A. family is distinguished in Ger. hist. from early times.

**Arendal**, a Norwegian seaport, situated at the mouth of the R. Nid. Pop. 10,400. In the tn. and neighbourhood are paper, cotton, and wood-pulp factories and engineering and shipbuilding works.

**Arendonck**, a tn. in Antwerp prov., Belgium, noted for its manufs. of hosiery. Pop. 5,900.

**Arène**, Paul - Auguste (1843-96), a Fr. writer and poet. Amongst his earlier works are *Jean des Figues*, *Les Comédiens errants*, and *Le Duel aux lanternes*, and the 4 novels, *Le Tort d'Entraye*, *Le Clos des âmes*, *La Mort de Fan*, and *Le Canot des six capitaines*. He also wrote many critical essays and fantastic stories, as well as *Le Prologue sans le savoir*, 1818; *La Vraie Tentation de Saint Antoine*, 1879; *Vingt jours en Tunisie*, 1884; *Contes de Paris et de Provence*, 1887; and *Domine*, 1894.

**Arenenberg**, a castle on the borders of Lake Constance, Thurgau, Switzerland. It was the residence of the countess of Saint-Len, ex-queen of Holland, and of Prince Louis Napoleon, afterwards Napoleon III.

**Areng** is the name of one of the palms that produce sago and palm wine, found in all the Is. of the Indian Archipelago. The only species, *A. saccharifera*, has a trunk 20 or 30 ft. high covered with coarse black fibres. It yields a large amount of sap, which, when first drawn from the tree, is transparent. It soon becomes turbid and milky, and when fit for drinking is of a yellowish colour, with a large amount of astringency. It is very intoxicating. The coarse fibres are made into cables, and sago is obtained from the trunk.

**Arenicola**, see **LUG-WORM**.

**Arensburg**, a seaport on the Is. of Oesel, at the entrance of the gulf of

Riga, Latvia, which exports grains, timber, hemp, and skins. It contains an anct. castle, a Russian and a Lutheran church. It was taken by the Russians in 1710; pop. 5000.

**Arensky, Anton Stepanovitch** (1861-1906), Russian composer, b. in Novgorod. Studied under Zikhe, and, later, under Johansen and Rimsky-Korsakov at Petrograd Conservatory. In 1892 his first opera *A Dream on the Volga*, was successfully performed in Moscow. His other chief works are the opera *Nal and Damayanti* (1899), the ballet *A Night in Egypt*, and cantata *The Fountain of Bakhchisarai*. He also composed church music, songs, symphonies, and a set of variations for strings on a theme of Tchaikovsky and some chamber music. Much of his output is already forgotten, for, though akin to Tchaikovsky's, his music lacks the dramatic eloquence, to say nothing of the versatile technical equipment, of the latter.

**Areolar Tissue**, see CELLULAR.

**Areometer**, an instrument for measuring the sp. gr. of fluids. See HYDROMETER.

**Areopagitica**, a prose work of Milton, being, as its sub-title indicates, *A Speech for the Liberty of Unlicensed Printing*; pub. in 1644, and regarded as his greatest prose work.

**Areopagus**, 'the hill of Ares' (q.r.) in Athens, which gave its name to the judicial assembly of elders held there. It was of great antiquity, and was said to have taken its name from the legend of Ares having been tried there by Poseidon for the murder of his son, Halirrhothius. Its powers and functions were greatly increased by Solon, 591 B.C. It was formed of ex-archons and other men of high moral character, and exercised the right to inquire into men's incomes, to punish idleness and immorality, and to try persons for homicide and conspiracy. It came to an end c. A.D. 400. Paul preached on 'Mars' hill,' A.D. 52 (Acts xvii.).

**Arequipa**: 1. A coast dept. of S. Peru, divided into 7 provs. Area 21,947 sq. m.; pop. 360,000. Mountainous region with fertile valleys. Chief exports are fruit and vegetables, alpaca, coca leaves, and borax. 2. Tn. founded by Pizarro, 1539; pop. 145,000. Damaged by earthquakes in 1582, 1609, 1784, and 1868. Bishopric founded c. 1609. The cathedral was burnt down in 1849, but a new one was subsequently built. It is a univ. tn. with 3 colleges, a medical school, and a public library. It is connected with its port, Mollendo, 90 m. distant, by the A.-Puno Railway. The tn. was captured by the Chileans in 1883 during the war between Chile and Peru. 3. A volcano in Peru, also called Misti, its altitude is 20,000 ft.

**Ares**, the Gk. god of war, identical with Mars of Rom. mythology. The son of Zeus and Hera. He loved Aphrodite, and the pair were made a laughing-stock of the gods. He slew Halirrhothius, who had offered violence to his daughter Alcippe, and was tried

and acquitted on the Areopagus by the Olympian gods, which event is believed to have given rise to the name Areopagus. In the Trojan war he was wounded by Diomedes. The Aloidæ also conquered him, and imprisoned him for 13 months. His temple was on the W. slope of the Areopagus.

**Areson, John** (1434-1550), a prelate and poet of Iceland. The best-known of his poems is entitled *Lamentation on the Passion*. He opposed Protestantism, and fought against Frederick III. of Denmark, was taken prisoner and condemned to death. Printing was introduced into Iceland by him.

**Areteus**, a physician of Cappadocia who lived in Rome during the reign of Vespasian. He wrote 2 treatises in the Ionic dialect on the causes and indications of acute and chronic diseases, and on their treatment, which are still extant.

**Arethaphia** was the daughter of Agiator, and lived at Cyrene in the second century B.C. She was instrumental in killing both her husband, a tyrant of Cyrene, and her brother Leander. She was offered the crown but refused it.

**Arethusa**, one of the Nereids: name of sev. fountains, the most famous being in Ortygia, near Syracuse. In botany, a genus of orchids.

**Arethinian**, or Guldonian Syllables, in music, are those which were used by Guido d'Arezzo, c. 1030, for his hexachords. They were *ut, re, mi, fa, sol, la*.

**Arellino, Pietro** (1492-1556), b. at Arezzo, Tuscany; thought to be the natural son of Luigi Bacci. A writer of satirical sonnets, *sonetti lussuriosi*, burlesques, dialogues, and comedies. Banished from his native tn. on account of a sonnet against indulgences. For a time won the favour of the papal court. Was patronised by Giovanni de' Medici, who introduced him to Francis I. of France. His satire of contemporary court life won for him the name of the Scourge of Princes. His comedies are now regarded as his best work, but all his writings are tainted with licentiousness. A translation of certain of his works into Fr. was pub. under the title of *Académie des Dames*.

**Arellino, Spinello** (1316-1408), a distinguished It. painter, who was b. at Arezzo. He was the pupil of Jacopo del Casentino, and early obtained a reputation as a painter. He executed some frescoes, illustrating the life of San Niccolò, in a church of that saint at Arezzo; painted the prin. chapel of Santa Maria Maggiore, Florence; and the frescoes in the monastery of San Miniato, near Florence, in that of San Bernardo, Arezzo, and in that of Monte Oliveto, near Florence. Six of the frescoes illustrating the life of San Raniero, in the Campo Santo, Pisa, are by A., and are considered by Vasari to be among his best works. In the town hall of Siena are his works based on the life of Pope Alexander III.

**Arellino, Unico**, see ACCOLTI, BERNARDO.

**Arelinus, Guido**, see GUIDO D'AREZZO.

**Aresus** was the son of Acrotatus,

and succeeded his grandfather Cleomenes II. as king of Sparta in 309 B.C. He was attacked by Pyrrhus, king of Epirus, and was killed when engaged in battle in support of the Athenians against Antigonos Gonatas.

**Areus**, or **Areas**, a Pythagorean philosopher of the first century B.C. who was b. at Alexandria. He was one of the masters of Augustus, and it was owing to A. that Augustus spared Alexandria when Antony was defeated by him.

**Arezzo**: 1. Prov. in Tuscany, Italy. Area 1275 sq. m.; pop. 300,500. 2. Tn., cap. of the prov., episcopal see of Tuscany. The anct. Etruscan city of Arretium, terminus of the Via Flaminia. 308 B.C. made a 30 years' peace treaty with Rome; was besieged by the Galli Senones 283 B.C. Colonised by Sulla. During the Middle Ages it sided with the Ghibellines. Defeated by Florence at the battle of Campaldino, 1289; came completely under her rule, 1384. Dismantled by the Fr. in 1800. Guido Tarlati di Pietramala commenced the erection of the walls c. 1320. The cathedral, 1277, which is lt. Gothic, contains beautiful glass windows by Guillaume de Marcillat. There are many notable churches: Santa Maria della Morte, eleventh century; Santissima Annunziata, thirteenth to fourteenth century; San Francesco, 1322. The tn. is the bp. of many famous men, including Petrarch, Vasari, Pietro Aretino, and Guido of Arezzo. Pop. 60,300. Its pre-1940 industries included silk, macaroni, gunpowder, pottery, and tanning. There is a technical school and an academy of science, arts, and letters. In the allied advance in Italy in 1944 A. was entered by the Eighth Army on July 16. The city suffered considerable damage in the Second World War, though, at least, the damage was concentrated in the modern quarter near the station. But shells holed the cathedral and broke all the windows. Heavy calibre bombs hit the abbey. Considerable damage was done to the roof of San Bartolomeo and the facade cracked. The church of S. Bernardo was almost demolished. Damage more or less severe was also sustained by the churches of San Lorenzo and San Francesco. The Palazzo del Capitano del Popolo was half destroyed by bombs, and the interior of the Palazzo Altucci was to a considerable extent destroyed. Also the Casa di Petrarca was largely demolished; serious damage was done by a bomb which struck the Museo Civico, a number of paintings, which had inadvertently been left on the walls, and a collection of ceramics being either destroyed or more or less severely damaged. In the abbey Vasari's painting of 'The Banquet of Esther and Ahasuerus' very fortunately escaped damage but for a few scratches. The best individual items of the Archaeological Museum had been removed to Florence for safety.

**Arfaks Mts.** are situated in New Guinea; the highest elevation is 5000 ft.

**Arfe**: 1. Henrique de A., a distinguished Sp. silversmith, who lived in the early part of the sixteenth century. He made the silver tabernacles of the cathedrals of Leon, Cordova, and Toledo, and also that of the Benedictine monastery of Sahagun. 2. Juan de A. y Villafane, b. at Leon in 1535, was the grandson of the above, and was employed by Philip II. and Philip III. He was the artist of the tabernacles of Avila, Seville, and Osmas, and he made tabernacles for the cathedrals of Burgos and Valladolid, and for the church of St. Martin at Madrid. He wrote *Quitador de Oro, Plata, y Piedras*, Valladolid, 1572; and *Varia Commensuracion para la Escultura y Arquitectura*, Seville, 1585.

**Arfredsonite**, a dark green mineral which occurs in igneous rocks such as nepheline-syenite and phonolite. Its composition is indicated by the following formula:

**Argæus**, a mt. in Cappadocia, Asia Minor. Extinct volcano, 13,100 ft. high. Now called Arjish-Dagh.

**Argali**, the name of a species of wild sheep found in the steppes of Siberia and the mts. of Central Asia. It is the *Ovis Ammon* of Pallas. There are many species in Central Asia, and a similar sheep is found in the Rocky Mts. of N. America and another species in the Himalaya Mts. See SHEEP.

**Argall, Sir Samuel** (c. 1580-c. 1626), Eng. adventurer, b. at Bristol; went to Virginia, 1609; gained the release of sev. Englishmen held captive by Powhatan, a Potomac chief, by abducting his daughter, Pocahontas, in 1612; destroyed Fr. settlements of Mt. Desert, St. Croix, and Port Royal, in Nova Scotia, in 1613; became deputy-governor of Virginia in 1617, resigning on account of charges of tyranny and rapacity in 1619. In 1621 he commanded a fleet against the Algerine pirates in the Mediterranean; was knighted in 1622; in 1625 commanded an Anglo-Dutch fleet against Spain, and died while with Cecil's expedition against Cadiz.

**Argand, Aimé** (1755-1805), b. at Geneva and d. in England; was a chemist who first invented lamps with a burner which admitted air to the flame.

**Argand Burner**, a burner for an oil lamp, in which the wick is in the form of a hollow cylinder, so that air rises within and without the flame, procuring more complete oxidation and therefore a brighter light. The addition of a cylindrical chimney creates a greater draught, at the same time promoting steadiness of the flame by preventing side draughts. The same principle is used in gas burners where the gas is admitted into the space between 2 hollow cylinders. This space is closed at the bottom and provided at the top with a series of small holes through which the gas issues.

**Argao** tn. on the E. coast of Cebu,

Philippine Is. Founded 1608; pop. 40,000. Products are rice, Indian corn, cacao, and cotton. The language is Cebu-Visayan.

**Argaum**, in the Deccan, S. India, where Sir Arthur Wellesley defeated the united forces of Sindhia, a Mah-ratta chief, and the Bhonsla, the rajah of Berar, on Nov. 29, 1803.

**Argeli** (*Ἀργείοι*) is a name Homer sometimes makes use of to describe the whole body of Gks. at Troy. It was probably derived from the inhab. of Argos, which was even then a well-known place. Additional weight is given to this theory by the fact that Argos was used by Homer to designate the whole of the Peloponnesus.

**Argel**, or **Arghel**, the *Solenostemma* A., a species of the order Asclepiadaceæ found in Syria, Arabia, and Africa. Its leathery and acrid leaves are sometimes used in the adulteration of senna.

**Argelander**, Friedrich Wilhelm August (1799-1875), a famous Ger. astronomer, b. at Memel; educated at the univ. of Königsberg. In 1820 became assistant to F. W. Bessel; was director of the observatory of Abo, 1823, and later of Helsingfors, 1832. Appointed prof. of astronomy in the univ. of Bonn, 1837. In 1822 there appeared his treatise on the path of the great comet of 1811, and in 1837 he pub. his researches on the sun's motion in space.

**Argens**, Jean Baptiste de Boyer, Marquis d' (1704-71), Fr. writer. Pub. *Lettres juives*, 1738-42; *Lettres chinoises*, 1739-42, *Lettres cabalistiques*, 1769; and *Mémoires secrets de la république des lettres*, 1743-48. He was b. at Aix in Provence, and entered the army at 15. Most of his writing was done at Amsterdam. He was invited by Prince Frederick (afterwards Frederick the Great) to Potsdam, but his marriage to Mlle. Coëhois, a Berlin actress, offended his patron, and he was obliged to return to France. D. near Toulon.

**Argensola**, Bartolomé Leonardo de (1562-1631), Sp. poet and historian. He pub. in 1609 *Conquista de las Islas Molucas*; and in 1630 a supplement to Zurita's *Anales de Aragón*; in 1634 his poems, which are witty and satirical, appeared with those of his brother. He took holy orders, and was attached to the suite of the count de Lemos. In 1613 he succeeded his brother as historiographer of Aragón.

**Argensola**, Luperco Leonardo de (1559-1613), Sp. dramatist and poet. His tragedy *Filís* is lost; *Isabela* and *Alejandro*, imitations of Seneca, were pub. in 1772. His poems, being translations from Lat. poets and some original satires, were pub. with those of his brother in 1634. In 1585 he was appointed secretary to the duke of Villahermosa, and in 1610 he accompanied the count de Lemos to Naples, where he d. 1613.

**Argenson**, Marc Antoine René de Voyer, Marquis de Paulmy d' (1722-87), Fr. diplomatist and man of letters; son of René Louis de Voyer d'A. Collected the

famous Bibliothèque de l'Arsenal, containing 150,000 vols., which was sold after his death to the Comte d'Artois. Pub. *Mélanges tirés d'une grande bibliothèque*, 1779-87.

**Argenson**, Pierre de Voyer, Vicomte d' (1626-70), fifth governor-general of Canada (1658-61). Educated for the priesthood but forsook the Church for the Army. Came to Quebec in 1658, 1 year after his actual appointment. His tenure was marked by a dangerous attack on the Fr. establishments in Canada by the Iroquois, an attack which was checked by the heroism of the garrison at Long Sault under Dollard. He returned to France in 1661 and rendered distinguished service in the royal armies. It was during his tenure that de Laval arrived in Quebec as first bishop of Quebec and Canada.

**Argent**, see HERALDRY.

**Argenta**: 1. A tn. in Central Italy, 21 m. by rail S.E. of Ferrara. Pop. about 27,000. Most of the tn. was destroyed in the Second World War, and the rest damaged by shell fire. The old brick church of S. Domenico was, however, only slightly damaged, but sev. other famous churches were either destroyed or damaged beyond repair. 2. A city in Pulaski co., Arkansas, U.S.A. Pop. 11,000.

**Argenta**, Jacopo Filippo d', an It. miniaturist of the fifteenth century. He did exquisite work in choir-books, specimens of which are still to be found in the communal library at Ferrara.

**Argentan**, cap. of arron., dept. of Orne, N.W. France; bp. of the historian Mézeray and of Charlotte Corday. Important pre-war industries were stained glass and leather work. It was the scene of severe fighting in the battle of Normandy, 1944. Pop. 5900.

**Argentario**, or **Argentaro**, mt. of Grosseto, Tuscany, Italy, forming a peninsula jutting into the Mediterranean immediately W. of Orbetello. Its culminating point is 2082 ft. high. The harbours of Porto Ercole and Porto San Stefano lie at the foot.

**Argentara**, mt. of Cuneo, Piedmont, Italy, about 10,800 ft. high, forming the highest summit of the Maritime Alps. First ascended in 1879 by Mr. Coolidge.

**Argenteuil**, tn. in the dept. of Seine-et-Oise, N. France. Pop. 59,000. Manufs. are iron goods, chemical products, and plaster. Asparagus, figs, and grapes are cultivated.

**Argenteus**, Codex, or **Silver Book**, the name of a MS. containing the greater part of the 4 gospels in the Meso-Gothic language, now in the library at Upsala, Sweden. It was discovered in the abbey of Werden, Westphalia, and is believed to be a relic of the Gothic Bible trans. by Ulfilas, who lived in the fourth century A.D. The leaves are of vellum, the initial letters are in gold, and the others in silver. The Gothic gospels of the Silver Book were first printed in types approaching to a facsimile by Junius,

1665; in Stockholm, 1671; by Edward Lye at Oxford, 1750; and by Zahn, Weissenfels, 1855.

**Argentières**, vil. in the dept. of Haute-Savoie, France, 6 m. N.E. of Chamonix. In the vicinity is the famous glacier of A., which is the largest in the Mont Blanc group.

**Argentières**, L'. 1. A tn. in the dept. of Hautes-Alpes, France. Pop. 1700.

**Argentina** (Lat. *argentum*, silver), a deep-sea smelt with silvery scales, found in Europe. It belongs to the Salmonidae, and is related to the salmon, trout, and char. Artificial pearls are made from the scales.

(4) Military Zone. There is also the federal dist. of Buenos Aires (71 sq. m.).

**Physical Features.**—The country is very mountainous and rugged in certain dists. The Andes form a continuous chain of mountainous highland, with an average height of 13,000 ft. S. of Buenos Aires there is an extensive mountainous range, the Sierra Ventana. The country is well watered, the prin. rivs. being the La Plata, Paraná, Uruguay, Río Negro, Chubut, and Gallegos. In the N. and E. there are fertile valleys, and wide tracts of lands which for agric. and pastoral purposes could hardly be surpassed. In Patagonia

Canadian Pacific

BUENOS AIRES, LOOKING TOWARDS THE HARBOUR

**Argentine Republic**, or **Argentina**, a federal republic of S. America; its name is derived from the Río de la Plata (riv. of silver). It is bounded on the W. by the Andean range of mts., which separates it from Chile; on the N. by Bolivia, and on the N. and E. by Paraguay, Brazil, Uruguay, and the Atlantic Ocean. Area 1,112,000 sq. m.

The country is divided into provs. and ters. There are 14 provs.: (1) In the N., Salta and Jujuy. (2) On the coast, Buenos Aires, Santa Fé, Entre Ríos, Corrientes. (3) The central provs. of Córdoba, San Luis, Santiago del Estero, and Tucumán. (4) The Andean provs. of La Rioja, Catamarca, San Juan, and Mendoza. The ters. are 10 in number, and are: (1) Neuquén, Río Negro, Chubut, Santa Cruz, and Tierra del Fuego, which form the dist. known as Patagonia. (2) Pampa. (3) Misiones, Formosa, and Chaco in the N.

and to the centro there are vast plains known as pampas, which are covered with shingle and interspersed with clumps of thorny brushwood and tall thistles.

The climate for the most part is temperate and healthy. That part of the country which lies N. of the tropic of Capricorn is extremely hot, and the S. ters. are bleak and windy. High, stormy winds, known as pamperos, blow on the coast from the Atlantic.

**Products and Industries.**—The main industries are agriculture, the pasturage of live-stock and forest products being 95 per cent of the whole. Wheat, oats, maize, and linseed are the prin. crops. Alfalfa, for feeding livestock, is a very successful crop. Cotton, potatoes, sugar, vine, tobacco, rice, and yerba maté (Paraguayan tea) are also cultivated. Other products are peanuts and sunflower seed. The vine is cultivated in Mendoza and

**San Juan** and the wine export to other S. Amer. states is increasing, being valued at £500,000 yearly. Meat-packing houses have been estab. on a large scale, and meat refrigeration is the chief industry. Flour-milling is next in importance. The A. has commerce with practically all the European countries and with the U.S.A., but the greater part of the trade is with Great Britain and France. The prin. exports are: beef and mutton, wheat, maize and linseed, wool, skins and hides, tallow, sugar, spirits, dried fruits, and maté or Paraguay tea.

The minerals of the country might be much more developed than they have been in the past. Some gold is found in Patagonia and in the sub-Andean regions to the N.W. Other minerals are silver, copper, lead, iron, coal, tin, and cement. Tungsten is an important mineral; others are borax, salt, and limestone. Oil has now been found and the A. State Oil-fields at Comodoro Rivadavia produce about 1,129,000 metric tons annually. While the output of private companies is nearly 2,000,000 metric tons.

**Fauna.**—Numerous species of animals exist, of which may be named the chinchilla, fox, skunk, guanaco, coypu, biscacha, armadillo, deer, and ostrich. Birds of beautiful plumage abound, as, for example, parrots, flamingoes, and humming-birds. The extensive pasturage of live-stock has greatly decreased the numbers of wild cattle and horses.

**Population.**—(1914) estimated to be 13,910,000. A census taken in 1774 gives the Buenos Aires dist. pop. as 6000. In 1824 it was only 80,000. In 1869, the year of the first regular census, it was 315,000. The pop. in 1945 was 2,621,000. The extraordinary increase in the past 60 years is explained by immigration. Of the tens. of the Pampa, the ports have grown most rapidly: Rosario, 91,000 (1895), 245,000 (1914), 265,000 (1922), 522,000 (1944); Bahía Blanca, 9000 (1895), 44,000 (1922), 120,000 (1944). The areas of greatest density, however, remain the maize area in the Buenos Aires and Santa Fé provs., and the old agric. colonies on the Middle Salado. In 1914 foreigners numbered 30 per cent of the total pop., all being European except a few tens of thousands of Bolivians and a few thousand Brazilians and Chileans. Immigration is now more under control; in 1919 legislation was passed which requires intending immigrants to produce certificates of good character and ability to work. In 1926 immigrants numbered 340,316; emigrants, 249,475. The general language spoken is Sp., but there are so many immigrants of different nationalities that there is a variety of languages spoken.

The national religion is Rom. Catholicism, but toleration is afforded to other religions.

**The Constitution** is modelled on that of the U.S.A. The president, who must be a Rom. Catholic and a born citizen of the republic, is elected for 6 years, and is assisted by a vice-

president and a Cabinet of 5 ministers. There is a Congress of 2 houses: the Senate, composed of 30 members elected for 9 years, and the Chamber of Deputies, composed of 153 members elected for 4 years, one-half retiring every 2 years. There is also provincial self-gov., which is republican in form.

The Army is a national militia, service in which is compulsory for all citizens between 20 and 45 years of age. After 10 years in the 'active' army, the men serve in the National Guard for 10 years and conclude with 5 years in the Territorial Guard, which latter is only mobilised in war. The Army is organised in 5 divs., 3 cavalry brigades, and 2 mt. detachments. In 1938 the strength was about 40,000 men. The trained reserve numbered 300,000 men. The Navy comprises 2 battleships, 3 cruisers (under 7000 tons), 4 old coast defence ships, 11 destroyers, 3 submarines, 2 patrol vessels, and 14 mine-sweepers. The battleships and coastal defence ironclads have been modernised. The Air Force is organised in 4 groups, each comprising 3 reconnaissance and 1 fighting group. The number of aircraft (1938) was only 150. The Air Force to-day comprises 9 reconnaissance groups and 3 fighting groups.

**Education** is compulsory for the ages of 7 to 14. Primary education is free, being subsidised by the General and Provincial Govs., and secular. Secondary education is also free, but not compulsory. It is controlled by the National Gov. in over 50 national colleges. Normal colleges, mining, agric., commercial, industrial, and training schools are also sustained at public cost. There are national univs. at Buenos Aires, and at Córdoba, which latter has an astronomical observatory. There are 5 provincial univs., the prin. being at Paraná, Santa Fé, Tucumán, and La Plata. The univ. of Cuyo for the provs. of Mendoza, San Luis, and San Juan was founded in 1921.

**Chief Towns.**—Buenos Aires, the cap. of the country, on the estuary of the La Plata, was founded by Don Pedro de Mendoza in 1535. It was made a bishopric in 1620, and a viceroyalty in 1775. It is an important commercial and educational centre and owns flourishing engineering works. Its pop. in 1905 was about 1 million. The prin. tns. are: Buenos Aires, pop. (1945), 2,621,000; Rosario, 522,000; Córdoba, 289,000; Avellaneda, 231,000; La Plata, 200,000; Santa Fé, 154,000; Tucumán, 158,000; Bahía Blanca, 120,000; Ilo Cuarto, 90,000; Lomas de Zamora, 90,000; Mendoza, 102,000; Paraná, 76,000; Corrientes, 68,000; Quilmes, 61,000; Tandil, 58,000; Chivilpoy, 58,000; Mar del Plata, 60,000; Santiago del Estero, 76,000.

**Communications.**—The Rs. Paraná and Uruguay are important channels of trade. In 1939 there were 26,840 m. of railroad, mostly in the hands of Brit. companies, the Brit. capital sunk being £234,000,000. The Córdoba Central railway, from the cap. to Tucumán, is the chief line. There are

now over 30,000 m. of telegraphs and over 50 wireless stations (1939), 1 of which is reserved for communications with England. Sev. aeroplane services are also in operation. There are tramway lines in all the important tns.

The A. R. has not produced many great names in the realm of literature and science. Gregorio Funes (1740-1830), rector of the univ. of Córdoba, was an eminent historian, who won a reputation not merely in his own country, but in the U.S.A. and in Europe. President Sarmiento, during his term of office (1868-74), founded the observatory at Córdoba. The first director of the observatory was Benj. Apthorp Gould (1824-96), a scientist of the first rank, whose brilliant research work did much to kindle an interest in scientific matters. *See further under SPANISH AMERICAN LITERATURE.*

The gold peso or dollar is the unit of value, and equals 96.5 cents. By a law passed in 1899, the paper peso equals .44 of the gold peso. The revenue of the country is chiefly derived from customs and excise, which are heavy. The country has suffered from the unscrupulous use of national credit to promote private enterprise. The internal troubles of the last half-century have caused frequent financial panics, with consequent forcing of paper currency. All banks, national and provincial, are now under the direct control of the State.

*History.*—The country was first visited by Spaniards in 1516. A company of adventurers, under the leadership of Juan Díaz de Solís, landed near the Rio de la Plata in search of a passage S.-westward to the E. Indies. Four years later the Sp. king, Charles I. (better known as Emperor Charles V.), sent Ferdinand Magellan, a Portuguese, on an expedition round the world. Magellan arrived at the wide estuary of the R. Paraná, and being convinced that there was no passage through to the W., he likewise left the country. In 1526 Sebastian Cabot, once a favourite of Henry VIII. of England, now the pilot-major of Charles of Spain, went to La Plata to make astronomical observations. On hearing of mineral wealth in the interior, however, he abandoned his primary object and began exploring. He explored up the Rs. Paraná and Paraguay, built a fort on the Uruguay, and founded a settlement a little beyond the N. of R. Carcarañá, which he called San Espiritu. The Indian ornaments of heavy silver which he sent home to Spain gave the country a reputation of great wealth, and the estuary of the Paraná was called the Rio de la Plata, or the Silver R., in consequence. In 1534 a Basque nobleman, Pedro de Mendoza, organised an expedition on a larger scale than had been attempted before. He arrived at La Plata in the following year and laid the foundations of a Sp. settlement at Buenos Aires. Mendoza suffered great losses. His company of 2500 men was reduced to

500 in 2 years, partly from the repeated attacks of the Indians, and partly through the ravages of disease. Mendoza himself returned to Spain in 1537. His lieutenant, Domingos Martínez de Iralá, remained in the country, and founded the first permanent Sp. settlement in the interior of S. America at Asunción, which for many years remained the headquarters of Sp. gov. In 1538 Iralá was proclaimed by his fellow countrymen the captain-general of the Rio de la Plata. The settlement at Buenos Aires had failed through the assaults on the colonists by neighbouring tribes of Indians. An attempt to re-establish the city was made in 1542 by Cabeza de Vaca, but with no success. In 1580 Juan de Garay, who in 1573 had founded the city of Santa Fé, rebuilt Buenos Aires, and endowed it with a corporation and full Sp. municipal rights. He defeated the Indians, and obtained complete mastery over them. By this time, the Spaniards had penetrated as far as the Andes. Tucumán was founded 1565, and Córdoba 1573. In 1620 Buenos Aires became separate from the local Sp. gov. at Asunción, though it remained under the authority of the viceroyalty of Peru. The colonists were very discontented under the yoke of the home gov. Spain jealously forbade all European powers to trade with her colonies or to settle in the country. This meant commercial ruin to the ports. In 1618, Spain allowed Buenos Aires to send out 2 ships loaded with products of the land. Buenos Aires was prevented also from having any internal trade with Peru by the exorbitant customs duty of 50 per cent, which was levied at Córdoba on all goods sent to or from Buenos Aires. This duty was reduced in 1665, but it was not till 1776 that the policy of exclusion was finally abandoned. In 1713, by the treaty of Utrecht, England gained the right to import negro slaves into Sp.-Amer. colonies. *See ASSAULTO.*

The life of the early settlers, therefore, was not very prosperous. Not only was their trade crippled through the unwise administration of the mother-country, but they themselves were continually harassed by attacks from the native Indians. In 1776, Buenos Aires was made the cap. and seat of the viceroyalty, with jurisdiction over the neighbouring tns. now known as the republics of Paraguay, Uruguay, Bolivia, and the A. Federation. During the period of the Fr. Revolution, Spain and France combined against Great Britain, and the Amer. colonies came in for a share of the warfare.

In 1806 Gen. Beresford besieged Buenos Aires, but was repulsed by the inhab., and in the following year Gen. Whitelock assaulted the tn. and was also compelled to capitulate. The colonists were so elated at their victories, unaided by the Sp. or Fr. armies, that their thoughts inevitably turned towards independence. In the meantime Napoleon had entered Madrid,

and proclaimed his brother, Joseph Bonaparte, king of Spain, and the colonists were not bound by any feelings of loyalty to the Fr. rule. On May 25, 1810, a provisional junta was formed, which marks the beginning of the republic. During the following 4 years, the war of Independence took place, Manuel Belgrano and José de San Martín being the 2 prominent revolutionary leaders. In 1816 a congress of deputies was held at Tucumán, when Don Martín Pueyrredón was elected supreme dictator. Spain was defeated by the combined forces of Chile and Buenos Aires at Chacabuco in 1817, and at Maipú in 1818, but it was not till 1842 that Spain formally acknowledged the independence of the A. During the first half-century of the republic the country was disturbed by continual civil war, due to the jealousy of the provs. of Buenos Aires and to the dissatisfaction of the remaining Sp. adherents. In 1826-28 war was waged with Brazil for the possession of Uruguay. The Brazilians were defeated at Utuzaingo, and Uruguay became independent under the name of Monte Video; in 1838-42 there was war with France; and in 1865-70 occurred the Brazilian-A. war against Paraguay, due largely to the arrogance of Francisco Solano López, president of Paraguay, who had invaded A. ters. He was defeated and killed in 1870 by Mitre, the A. president and general, and peace was restored. Up to comparatively recent years the country was harassed by internal revolutions, which frequently involved a general financial crisis. Towards the end of the nineteenth century the relations between Chile and the A. were embarrassed by quarrels over the boundaries. The A. prepared for war by increasing its navy. The boundary protocol was signed with Chile in Dec. 1900. In the following year the 2 countries referred the question of the frontier to the arbitration of Great Britain, and in consequence war was averted. The death of President Manuel Quintana took place in Mar. 1906, when the vice-president José Figueroa Alcorta assumed presidential office. He was succeeded in 1910 by Roque Sáenz Peña, with Victoriano de la Plaza as vice-president.

Throughout the First World War A. remained neutral, though the bulk of the pop. sympathised with the allied cause. The volume of trade with Germany, though inferior to that with Britain, was great, and the Ger. element in the pop. was by no means negligible. Moreover the Ger. communities were well organised to meet all eventualities, and Brit. propagandist work in A. being poorly conducted, they had but little difficulty in preserving the *status quo*. One of the most significant events in A. hist. in these years was the election of the Radical leader, Dr. Hipólito Irigoyen, to the office of president. Never previously had the Radicals secured control of the gov. in so proudly

conservative a country as the A. During 1917 a serious railway strike, probably fomented by Ger. agitators, brought about acute political tension. Irigoyen's democratic sympathies were said to have indirectly encouraged the outbreak. About this time the notorious *spurious versenkt* warning as to Ger. U-boat intentions was sent to the A. Gov. Sev. A. boats were in fact sunk. The U.S.A. had joined the Allies. Feeling ran high in the A., but though numerous volunteers migrated to join the allied armies, neutrality was preserved.

It is considered by most Pan-Amers. to be an outstanding achievement of the president that in spite of the strongest inducements from outside to join the Allies he kept A. out of the First World War. This abstention enabled the country to make headway in commerce, and, in 1938 the foreign trade was valued at 2861 million pesos. Imports and exports were, respectively, 1461 million and 1400 million pesos. In domestic affairs the chief features of Irigoyen's first administration were the introduction of a minimum wage to save the working classes from the effects of an inflated currency, the raising of the railway tariff, and the unwavering support of national and provincial constitutions. Irigoyen, who had been the chief political force in A. ever since he assumed a commanding position 40 years previously, at first refused to stand for the presidency, partly, perhaps, because he underestimated the chances of his party and partly because his immense estates occupied so much of his attention. He was, however, again inaugurated president in 1928 and but for the revolution of 1930 would in the ordinary course have held office till 1934. The most significant event in the foreign policy of A. in recent times is the unequivocal championship of the complete sovereignty of the S. Amer. republics, untrammelled by any implications or even by the mere existence of the Monroe doctrine. In 1930 a revolution took place, which ended the Gov. of President Irigoyen. The *coup d'état* was effected by a combination of all the fighting services directed by a junta under Gen. Uriburu. The course of the revolution was swift and accompanied by relatively small loss of life and damage to property. The new Gov., the members of which were all men of marked Conservative tendencies, dissolved Parliament but promised to respect the Constitution. The cause of Dr. Irigoyen's downfall was, apparently, popular discontent with one-man rule bordering on dictatorship, a discontent aggravated by economic depression, much the same causes as had led to similar forcible changes in the Govs. of Bolivia and Peru a few weeks earlier in the same year. The *de facto* Gov. estab. after the revolution of 1930 was succeeded by a constitutional régime in Feb. 1932, when Gen. Justo was made president in succession to Gen. Uriburu. In the interest of Brit.

trade a Brit. Empire Exhibition was held at Buenos Aires in 1931, and was opened by the Prince of Wales (Edward VIII.). President Castillo pursued a neutral policy in the Second World War. His policy was not unpopular in A., though in neighbouring countries it was construed as a pro-Nazi policy. In June 1943 there was a military rising at the Campo de Mayo, the great A. military centre, and Dr. Castillo surrendered to the revolutionaries and resigned the presidency. Gen. Rawson, the insurgent leader, issued a manifesto, calling for 'a loyal Amer. union and collaboration, and the fulfilment of pacts and continental undertakings.' But one of the fundamental causes of the revolution is said to have been the alarm prevailing in A. military circles at the arming of A.'s neighbours, notably Brazil, while owing to Castillo's neutrality policy A. could not buy arms. As the United Nations were then the only source of arms, A. inferiority could be remedied only from that quarter: but under Castillo A. had gone so far along the road of isolation that she could not turn back without a change of masters. Towards the end of 1943, however, relations between the United Nations and A. greatly deteriorated on account of the openly Fascist character of the Ramirez dictatorship. In Jan. 1944 the A. Gov. announced the ending of diplomatic relations with Germany and Japan, but there was no real change of heart in official circles and, despite the fact that the great majority of the people were democratic in sentiment and friendly to the United Nations, the A. Gov. continued to tolerate widespread Ger. and Jap. espionage and, probably, collaborated with Gers. in fostering unrest throughout S. America. Moreover relations between the Ramirez Gov. and Franco's Gov. in Spain continued to be as close as ever. But throughout most of the period from the revolution of June 1943; the A. Gov., partly under pressure of external events, had veered steadily towards the left—whence the frequent changes of presidents and ministers. The end of 1945 saw the rise of a 'Caudillo' in the person of Col. Juan Domingo Perón, who had been secretary of the War Ministry in June 1943, and, since then, secretary of labour and welfare, president of the Post-war Council, and, finally, vice-president of A. He was imprisoned by the dictatorship, in the is. of Martín García, but owing to the insistent clamour of the A. workers, was brought back to Buenos Aires as the *de facto* leader of the country. In the general election of Feb. 1946, which was held in an atmosphere of turbulence and violence, Perón was, in effect, the official candidate, and stood for the presidency as the self-proclaimed champion both of the masses against the plutocracy and of A. against the U.S.A. He had the support of part of the army and the allegiance of a large and well-trained police force, who regarded him as a demigod and constituted a veritable Praetorian Guard. During the A. election campaign the Amer. Gov. pub. a memorandum, which

it had addressed to the Pan-Amer. Union, in which evidence from Germany was adduced indicating a continuing partnership between the military dictatorship and an elaborate Nazi organisation in A., and quoting Perón himself as aiming at a 'thoroughly regimented totalitarian State dedicated to the pursuit of a warlike life and a war economy.' Perón's opponent was Dr. Tamborini, a man devoid of Perón's glamour and mystic appeal, who had been minister of the interior from 1925 to 1928. Tamborini was the spokesman for all those who hated Perón, ranging from wealthy landowners and captains of industry to the workmen's leaders and left-wing agitators whom Perón had once imprisoned in the bleak wilds of Patagonia. He also represented his own party, the Radicals, and the democratic union of Socialists, Communists, and progressive democrats, though in A. party and programme count for far less than does a colourful and dynamic personality. The Navy was opposed to Perón because it believes that soldiers should not rule, while the Catholic Church veered towards him on account of the disapproval of Socialists and Communists, and because the Radicals had included the principle of lay teaching in their programme. It was against all this strange and troubled background that Col. Perón was now making his bid for power, and in June (1946) he was inaugurated president amidst scenes of remarkable popular enthusiasm, particularly among his working-class supporters.

**Argentine**, tn. of Wyandotte co., U.S.A., on the Kansas R., 4 m. W. of Kansas city, became part of the latter in 1910.

**Argentite**, or **Silver Glance**, a mineral of the galena group, occurring in isometric crystals. Consists of sulphur and silver, and is found in Cornwall, the Urals, and generally in N. European countries.

**Argenton-sur-Creuz**, a tn. of W. France, dept. of Indre; pop. 5575. Manuf. of shoes and linen goods. 'Excellent wine is produced.

**Argol**, see **ARUKL**.

**Argillaceous** (Gk. ἀργίλλος, clay. Rocks is a term applied to those rocks which are formed entirely or partially of clay (q.v.).

**Argillite**, see PORCELLANITE.

**Argives**, a name given to the Gks.; derived from the city of Argos, which is reputed to be the oldest city of Greece.

**Argo**, the Ship, is the largest of Ptolemy's 15 S. constellations. It is so large that much confusion prevailed formerly as to the names of its different parts. To obviate this difficulty Sir John Herschel suggested its div. into Carina, the Keel; Puppis, the Stern; Vela, the Sails, and Malus, the Mast. A part of Malus was called by Lacaille Pyxis, the Compass. The greater part of the constellation which lies E. of Columba and Canis Major is not visible in Britain, and it is this part which contains all the more important stars. Canopus is the only star in A. of the first magnitude, but at least 2 new stars temporarily outshone it. The variable star Eta Carinae in 1843 was brighter than Canopus. It has a rapid decline in luminosity, and it now appears stationary with a magnitude of 7.5. The constellation is named after the ship *Argo*, which conveyed Jason and his companions to Colchis, the story of which is told in the article ARGONAUTS. The Hindus regarded it as the ship of the sun, while the Egyptians regarded it as the bark of the moon. The name by which this constellation was sometimes known in Europe until about 3 centuries ago was the Ark, a name which may be traced to the tradition in anct. Egypt that the gods Osiris and Isis surveyed the deluge from this stellar ship.

**Argol**, the crude product deposited on the bottom of a cask during alcoholic fermentation. It is used for the preparation of 'cream of tartar' and tartaric acid. The A. is partially purified by recrystallisation from hot water, is dissolved in water and boiled with chalk, when calcium tartrate,  $\text{CaC}_2\text{H}_3\text{O}_6$ , is precipitated. After washing, the tartrate is treated with sulphuric acid, which sets free the tartaric acid. A. is also a Mongolian term for dried dung used as a fuel.

**Argolis**, see ARGOS.

**Argon** (Gk. *ἀργός*, inactive), a gaseous constituent of the atmosphere. Symbol A, atomic number 18, atomic weight 39.94. Up to 1894 it was generally assumed that the atmosphere contained oxygen and nitrogen, with variable quantities of carbon dioxide, hydrogen, water-vapour, ammonia, etc. It is true that Cavendish had in 1785 suggested the existence of a small proportion of another constituent, but little notice was taken of the suggestion until Lord Rayleigh and Sir William Ramsay demonstrated the existence of A. in 1894. Cavendish had added excess of oxygen to air and passed electric sparks through the mixture collected over caustic potash, so that nitrous acid was produced and absorbed. He then absorbed the excess of oxygen with 'liver of sulphur,' and found a small bubble of unabsorbable gas remaining. Over 100 years later Lord Rayleigh

determined with great care the weight of 1 litre of oxygen, of hydrogen, and of nitrogen. The results obtained in connection with atmospheric nitrogen were consistent one with the other, but when nitrogen prepared from ammonia was used, an unexplainable error of about one-half per cent was encountered. In 1894, Rayleigh and Ramsay in association proved that the difference was due to the presence in the atmosphere of an inert gas heavier than nitrogen.

A. may be prepared from atmospheric nitrogen in 3 ways: (1) by passing it over red-hot turnings of magnesium; (2) by sparking the gas with excess of oxygen in the presence of caustic alkali; or (3) by dissolving the more soluble A. in water. Commercially, it is obtained by the practical distillation of liquid air.

As its name implies, A. is an inactive gas, and all attempts to obtain combination with other elements have failed. Its density ( $H = 1$ ) is 19.82. It has been condensed to a colourless liquid which boils at  $-187^\circ$  and freezes at  $-189.6^\circ$ . It is largely employed in filling gas-filled electric filament lamps.

**Argonautidae**, a family of cephalopodous molluscs of the order Dibranchiata and div. Octopoda. They are cuttle-fish, the males of which are very small, and the females, which are much longer, bear a thin shell to hold their eggs. *Argonauta argo*, the paper-nautilus, or paper-sailor, is found in the Mediterranean; *A. tuberculata* in the Indian Ocean.

**Argonauts** (Gk. *Ἀργοναῖται*, sailors of the *Argo*), the Gk. heroes who accompanied Jason in his quest of the Golden Fleece. Æson, king of Ioloe in Thessaly, was deprived of his kingdom by his half-brother Pelias. His son Jason, when he grew up, demanded the throne, which Pelias promised to surrender if Jason would bring the Golden Fleece from Colchis, where it was guarded night and day by a dragon, in the oak grove of Ares. Jason ordered Argus to provide him with a ship with 50 oars, the building of which was superintended by Athena. This ship was called *Argo*, after its maker. Jason embarked with the great heroes of the age, such as Castor and Pollux, Hercules, Theseus, and Orpheus. Æsculapius was their physician, Tiphys the pilot. Their number is variously given as 45, 50, and 54.

The A. landed first at Lemnos, an is. inhabited by women who had murdered their husbands. There they remained 2 years, and raised a new race of men called Minyæ. They next visited Samothrace and Bœotia, whence they were driven by a storm to Salmydessus, where they delivered the land from the persecution of the Harpies.

After many adventures, both by land and sea, they came to Æa, the cap. of Colchis. The king, Æëtes, promised to give up the Golden Fleece if Jason would yoke 2 fire-breathing bulls with brazen feet to a plough

and sow the teeth of the dragon which Cadmus had not used at Thebes. This Jason accomplished through the help of Medea, the king's daughter, who loved him. She provided him with the means of resisting fire and steel, and gave him a drug which lulled to sleep the dragon that guarded the Golden Fleece. The A. fled with their spoil, taking Medea with them, and were pursued by Æetes. In order to hinder her father in his pursuit, Medea seized her brother Absyrtus and strewed the way with his mangled limbs. Zeus, angry at the murder of Absyrtus, raised a storm which drove the *Argo* to the is. of Circe, who refused to absolve Jason.

The A. continued their journey and were guarded through the straits of Charybdis and Scylla by Tethys, the mistress of Peleus, one of their company. They sailed safely past the Sirens, who sang in vain, for Orpheus surpassed them. At the is. of the Phæacians they encountered King Æetes and his fleet. The wife of Alcinoüs, king of the country, was chosen to arbitrate between the Colchians and the A. Secretly by night she had a marriage consummated between Jason and Medea, and, in the morning declared that Æetes' claim to his daughter was void.

After many disasters the *Argo* arrived in the Peloponnesus, where Jason was purified of the murder of Absyrtus, and finally reached Thessaly in safety.

There are many versions of this story. Some scholars regard the quest of the Golden Fleece as a sun myth, while others compare it with the quest of the Holy Grail. The story probably developed from local traditions concerning the early Mediterranean seafarers and merchants.

**Argonne**, a forest and hilly dist. of France in the auct. provs. of Lorraine and Champagne. It is included in the depts. of Meuse, Marne, and Ardennes. Its chief tns. are Ste. Menchould (the auct. cap.), Clermont, Varennes, Beaumont, and Grandpré.

During the First World War, the A. was the scene of bitter fighting against the forces under the crown prince of Germany, whose advance in Sept. 1914 was finally stopped by Gen. Sarraill. In July 1915 the crown prince unexpectedly advanced his lines a quarter of a mile against superior odds, and thereby enhanced the fears of the Allies that through shell shortage they might be unable to resist the great Ger. drive of the summer of 1915. But the Fr. arrested his further advance. Therefore things came to a stalemate on this sector of the front; but the Gers. did not remain idle. The Argonne is a maze of forests, streams, gullies, and ravines. The Gers. took full advantage of this, not only constructing their Kriemhilde system of trenches as a continuation of the famous Hindenburg line, but, profiting by the terrain, built cement 'pill-boxes' for machine-guns over the entire section of the Argonne which they held. This stalemate was finally broken in the autumn of

1918, when Marshal Foch yielded to the insistence of Gen. John J. Pershing, commander-in-chief of the Amer. troops, that the Amer. soldiers should be given a large share in the fighting. The battle, which lasted for weeks, will be for ever memorable in Amer. annals, because more Amer. troops were engaged in it than ever fought under the Stars and Stripes at one time in any of the nation's wars. Twenty-two Amer. divs. were engaged, with a total strength of over 625,000 men. Gen. Pershing had 660 Amer. and 180 Fr. aeroplanes. The total strength of the Amer. and Fr. guns at his disposal was well over 2500. The importance of this battle was that it was calculated to bring the strongest pressure to bear upon the Gers. at this point at the moment when Gen. Haig was hammering away successfully at the Hindenburg line. If the Amers. and the Fr. troops, who were also engaged in this action, should succeed in piercing the Argonne, they would threaten one of the most important series of railway lines upon which the Ger. armies depended not only for supplies and reinforcements, but also for withdrawal in case of defeat.

The objective set the Amers. was to pierce the Forest of Argonne and advance up the W. bank of the Meuse, at the same time that the Fr., under Gouraud, advanced W. of the Argonne. The thrust was so dangerous that, hard-pressed as Ludendorff was all along the line, he had to throw in troops sorely needed elsewhere. He had one great advantage in that the Gers. were on the defensive behind extensive works. He could therefore defend with far fewer troops than his enemies needed for the attack. The Amer. attack opened with great *clan* on Sept. 26, on a front of 18 m., and, by the second day, Montfaucon, dominating a great stretch of country, had been taken. The booty was 100 guns and 8000 prisoners. Owing to the fact that the Amers. had few light railways in their sector and that their motor service of supply was hampered by bad roads, their advance was slowed down and part of the front line ran short of both ammunition and food. But by Oct. 4 these defects had been largely remedied, and the advance was once more resumed through what the Gers. considered to be an impregnable forest. By Oct. 14 the Amers. had captured Romagne, had broken through the Kriemhilde line at various places, and were approaching the partially completed Freya line. Gen. Pershing now divided his forces into 2 armies, the First under Gen. Liggett and the Second under Gen. Bullard (q.v.). In each of these there were Fr. as well as Amer. corps. By Nov. 2 the whole of the Argonne was cleared, the troops had passed through the Freya line and had reached Bazancay. According to the plan agreed upon between Marshal Foch and Gen. Pershing the troops were to push on to Sedan and cut the important railway network. By Nov. 6 Fr. and Amer. troops had reached the suburbs of Sedan, the town itself being full of

retreating Ger. soldiers. Just as in the war of 1870 the Gers. had trapped an entire Fr. army there, so now it seemed as if the Fr. and Amers. would turn the tables on the Gers. The latter, indeed, were only saved by the Armistice of Nov. 11. The Amer. casualties in this long-fought battle were 118,529, of which number 15,599 were killed. In all, the combined Amer. and Fr. armies captured nearly 18,000 men and 468 guns.

**Argos**, anct. city of Peloponnesus. In the Homeric age it was overshadowed by Mycenæ, but during the reign of Pheldon (770-730 B.C.) its supremacy extended over the whole of the E. Peloponnesus. Engaged in frequent wars with Sparta; 461 B.C., alliance with Athens; 229 B.C., governed by tyrants supported by Macedon; 146 B.C., subjugated by Rome; A.D. 1210, captured by the Franks. During the eighteenth century the scene of many conflicts between the Venetians and Turks.

Archæological excavations have brought to light the Heræum, or temple of Hera, and many interesting pieces of sculpture, etc.

**Argos**, in Amphilochia, was a tn. near the gulf of Arta. The ruins at the bottom of the gulf of Karavasara are supposed to be those of A.

**Argosy**, a large ship either for merchandise or war. According to Rycout in *Maxims of Turkish Policy*, chap. xiv., it derived its name from Ragoes, i.e. the ships of Ragusa, but it is more probable that the A. derived its name from the ship *Argo* (q.v.).

**Argostoli**, cap. of Cephalonia, one of the Ionian Is. Pop. 8000. See of the Gk. Church. The tn. has a fine quay and harbour. There is a curious stream flowing from the sea, which is used to drive mills. The chief industries are shipbuilding and silk-spinning. The ruins of Crædili still remain.

**Argot**, see SLANG.

**Arguin**, a small Fr. is. off Cape Blanco, Africa. A. Bank is very dangerous for ships, and was the scene of the wreck of the *Medusa*, 1816.

**Argument**, literally that which is evident or manifest, from Lat. *arguere*, to make clear. (1) Proof, chain of reasoning which is given in support of a proposition. (2) Synopsis, contents of a book, outline of a poem or play. (3) In logic, the middle term in a syllogism. (4) In mathematics, the angle, arc, or other quantity upon which the required quantities are made to depend. (5) In astronomy, the angular distance on the epicycle of a planet from the true apogee of the epicycle.

**Argun**, riv. of Asia. Rises in Great Kinning Mts., W. Manchuria, and flows N.W., forming the boundary between Russian and Chinese ter. and joining the Shilka to form the Amur. Length 440 m.

**Argus**, of Gk. mythology, son of Arestor, surnamed Pandotes, All-seeing, because he had 100 eyes, of which only 2 were asleep at one time. Appointed by Hera to be guardian of Io, whom Zeus had changed into a cow. Zeus commanded Hermes to lull him to sleep with his flute

and then to kill him. Hera transplanted his eyes to the tail of the peacock.

**Argus Pheasant**, the *Argus giganteus*, a galliform bird of the order Neornithes, so called because its long tail-feathers bear ocellated spots. It is a native of the Malay Peninsula and Sumatra.

**Argyll, Dukes of**. The dukes of A. are descended from the Campbells of Lochaw, who were created barons with the title of Baron Campbell. The earldom was created in 1457 by James I., who conferred it on Lord Campbell (d. 1493), from whom the greatness of the family dates. The second earl was killed at Flodden, the third earl d. in 1530, whilst the fourth earl was the first of the great Scottish nobility to become Protestant. The fifth earl was one of the 'lords of the congregation,' but is later found on the side of Mary Queen of Scots, whose troops he commanded at the battle of Langside. After her defeat he again became friendly with the regent Murray, and ultimately became lord high chancellor of Scotland. He d. in 1573. He was succeeded by his half-brother, who d. in 1584, and his successor spent the greater part of his time in fighting for Philip III.

**Archibald Campbell**, eighth earl and first marquess, was b. in 1598 and succeeded to the control of the estates at an early age. He was thoroughly despotic and was described as the most powerful subject in the kingdom, being at the head of 20,000 retainers. He boldly opposed the church policy of the king (Charles I.) in Scotland. He became exceedingly powerful and in 1640 the king was practically forced to create him a marquess. An attempt was made to kidnap him with 2 other Scottish leaders—the 'Incident' in 1641. He was instrumental in the completion of the alliance between the Parliament and the Scots in 1643. He defeated several royalist risings in Scotland; fought a campaign against Montrose in Argyllshire. He was defeated by Montrose at Inverlochy and also witnessed the victory at Kilsyth. He negotiated with the king after the surrender at Newark and attempted to moderate the parl. terms. He lost power when the king was beheaded, and although he supported Charles II. in his attempt to regain the crown, his power passed to the Hamilton family. For complicity in parl. plots he was executed in 1661.

**Archibald Campbell**, ninth earl and second marquess of A., eldest son of the eighth earl and first marquess of A., fought at Dunbar on the royalist side. Was omitted from the Act of Grace of 1654, and, although he submitted, was a prisoner from 1657 to 1660. He was raised to favour and high position by Charles II. He refused to sign the new test in 1680, making a special reservation, and was tried for treason and condemned to death 1681. He escaped to Holland, and there agreed to the Monmouth plot, and, crossing to Scotland, tried to raise the Campbells. He failed, and he was captured and beheaded on the old charge of treason 1685.

**Archibald Campbell**, first duke, d. 1703,

was an active promoter of the Revolution of 1688. He was deputed to tender the crown of Scotland to William III. in 1689. Organised the massacre of Glencoe, 1692. In 1701 he was created first duke.

**John Campbell, second duke**, one of the great founders of the union. His services in this respect were recognised by the bestowal of the title of earl of Greenwich. He was a famous soldier, and fought at Oudenarde. Later in the war he took command in Spain. He was deprived of his offices on his return for his outspoken criticism of the ministry. Restored to favour under George I., he was instrumental in putting down the '15 with so little bloodshed. He was an outspoken and brilliant orator, but his oratory brought him often into disgrace. He continued his public life until 1740, when he resigned his appointments and retired into private life. He *d.* in 1743.

**George John Douglas Campbell, eighth duke**, *b.* in 1823, succeeded his father in 1847. He rapidly became a well-known Liberal politician. He was lord privy seal, 1852; postmaster-general, 1855; secretary of state for India, 1868, and during his period of office did much to bring on the second Afghan war. In 1871 his son married the Princess Louise, fourth daughter of Queen Victoria. He resigned office (lord privy seal) in 1881 on the question of an Irish Land Bill. He was also an opponent of Irish Home Rule. He *d.* in 1900. Amongst the books that he wrote are *The Reign of Law*, *Primer of Man*, *The Unity of Nature*.

**John Douglas Sutherland Campbell, ninth duke**, succeeded his father 1900. He married in 1871 H.R.H. the Princess Louise. He was governor-general of Canada 1878-83. Represented S. Manchester from 1895 to 1900 as a Unionist. Is known also as a writer of both prose and poetry. He *d.* in 1914.

**Argyll and Sutherland Highlanders (Princess Louise's)**. This regiment, which combines the former 91st (Argyll) and 93rd (Sutherland) Foot, raised respectively in 1794 and 1799, was augmented to 27 battalions in the First World War. Its death-roll in the war was 6442. In the heavy fighting round Zonnebecke and Ypres in 1914 the regiment suffered tragic losses near Fromelles (2nd Batt.). It was also conspicuous in the Ypres battles of 1915 (7th Batt.) and at Loos (2nd Batt.). The 1st Batt. was at Salonika in 1916 and in that year the 2nd, 6th, 8th, 10th and 11th Batts. were all engaged in severe fighting in the Somme battles, notably at Martinpuich and Delville Wood; at Arras in 1917 the 11th Batt. suffered losses, and other batts. were distinguished for their fine resistance at the Rouix Chemical Works near the Menin Road (May 1917) and especially in the Vaux-Vraumont sector in 1918 (14th Batt.). Their battle honours before the First World War included the Cape of Good Hope (1806), sev. battles of the Peninsular war, S. Africa (1846-47, 1851-53), the Crimea, Indian Mutiny, S. Africa (1879) and the Modder River and Paardeberg.

E.E. I

In 1930 H.R.H. Princess Louise became colonel-in-chief of the allied A. & S. H. of Canada. In the Second World War the regiment fought in the Libyan battles, and against the Gers. in Greece. Units of the regiment bore the brunt of some of the heaviest fighting in the Malayan peninsula (1941-42). They entered this battlefield over 800 strong; but after fighting a rearguard action down the entire peninsula they crossed over to Singapore Is. with fewer than 100 men, and these were the last to cross the causeway from Johore to Singapore.

**Argyllshire**, a maritime co. in W. of Scotland. The land is cut up into many peninsulas and is., and there are numerous lochs and inland bays. The greatest length is 115 m., and the greatest breadth 55 m. The coastline measures 2289 m., no part of the co. being more than 12 m. from the sea or from a large inland loch. Area 3213 sq. m., of which 623 belong to the is. The country is rugged and mountainous, and contains some of the most picturesque scenery in Scotland.

Climate, rainy and bleak. Winds S.W. and S.E. Average rainfall at Oban per annum 64.18 in. Average rainfall at Upper Glencoe per annum 127.65 in. The average yearly temp. is 48° F. The co. is divided into dists., viz. Cantire, N. and S. Argyll, Lorne, Appin, Cowall, Morven, and Sunart. There are numerous is., of which may be mentioned Mull,Islay, Jura, Tyree, Coll, Colonsay, Jona, and Staffa. The highest peaks are Bidean nam Bian, 3766 ft., and Ben Cruachan, 3689 ft. The prin. lochs are Moidart, Sunart, Linnhe, Fyne, and Long, and the freshwater lochs Awe and Lydoch. Loch Awe is famous for its salmon and Loch Fyne for herrings. There are no navigable rivs. The Awe and Orchy are short, rapid streams. There are many beautiful glens, e.g. Glen Aray, Strae, Croe, Glencoe (famous for the massacre in 1692), and Glen Lochy (the 'wearisome glen'). The co. is a favourite of sportsmen, there being plenty of deer and game. The land belongs principally to the Duke of Argyll and the Earl of Breadalbane. The chief industry is sheep- and cattle-rearing. Woollens for home use are made near Inveraray. Gunpowder is manufactured at Melford and Furnace, whisky at Campbelltown and Oban. Fishing is an important industry. Easdale and Ballachulish quarries supply excellent roofing slates. Some coal is found near Campbelltown; lead at Strontian, and in Islay and Coll; granite near Inveraray. Other minerals are copper, marble, and limestone. A branch of the L.M.S. railway runs from Tyndrum to Oban. The former W. Highland railway from Glasgow to Fort William was opened up in 1894. Frequent steamers run from Glasgow. The Crinan Canal was built 1793-1801. The co. returns 1 member to Parliament. Pop., which had been decreasing for a century, owing to emigration, principally to Canada, was 70,902 in 1911, but in 1921 it was 76,862, but probably this number included many tourists and visitors to Oban. In 1931 it had dropped to 63,000

\*Q

**Argyrokaastro**, a tn. in Albania, situated in the valley of the Deropul, a branch of the Viosa. It contains a castle, a mosque, and barracks. Taken by Ali Pasha in 1812, it was afterwards surrendered to the Turks. Pop. 11,733. The scene of heavy fighting between the Its. and Gks. in 1941. (See WAR, SECOND WORLD, *Fall of Greece*.)

**Argyropoulos, Joannes** (1416-86), a Gk. scholar, one of the early promoters of the revival of learning, b. at Constantinople; 1434, rector of the univ. of Padua; 1456, prof. of Gk. in the univ. of Florence. Trans. Aristotle.

**Ari, Thorgrilsson** (1067-1148), historian of Iceland, surnamed Frodi, or the Wise. One of the first to commit the Norse sagas to writing. He began the *Landnamabók*, a hist. of the settlement of Iceland, continued by later writers; and wrote the *Konungabók*, a hist. of Norway; the *Islandingabók*, an account of the Icelandic laws; and the *Kristni Saga*, an account of the conversion of Iceland to Christianity.

**Aria**, literally 'air,' denoted a rhythmic, as contradistinguished from a recitative, song, but later implied a vocal piece in three sections, of which the third repeats the first, while the second introduces variety of subject matter, key, and mood. The development of the A. is closely bound up with that of the It. school of music, as the great medium of vocal display. In principle it existed as early as Monteverdi's *Arianna* (1608) and reaches its more elaborate form in Alessandro Scarlatti and Handel. As a definite form the A. is now defunct and composers no longer employ the formal three-section plan. For a full discussion consult Percy A. Scholes, *Oxford Companion to Music*, 1941.

**Aria** was one of the E. provs. of the anct. Persian empire, forming a part of Ariana. It was bounded on the N. by Margiana and Bactriana, on the E. by the Paropamisadae, on the S. by Carmania, and on the W. by Parthia. It was the site of the modern Seistan and the S. part of Khorasan. It is described by Strabo (xl. 10). He says it is watered by the Ra. Arios and Margos, and the Margos is supposed to be the modern Murghab. According to Herodotus, iii. 93, the Parthi, Chorasmii, Sogdi, and Arii formed the sixteenth satrapy into which Darius divided the Persian empire; and in vii. 62 he says that Arii was the anct. name of the Medi. Alexandria Arion in A. was founded by Alexander the Great, and is supposed by some to be the present Herat.

**Ariadne**, daughter of Minos II. of Crete by Pasiphaë, fell in love with Theseus, to whom she gave a thread by which he extricated himself from the labyrinth and escaped from the Minotaur. He accordingly married her, but deserted her in the is. of Naxos. There she was found by Dionysus, who placed among the stars the crown he gave her at their marriage.

**Ariana**, the general name given to the E. provs. of the anct. Persian empire, stretching from Media to the Indus, and bounded on the N. by the Indian

Caucasus and on the S. by the Arabian Sea.

**Ariano**, episcopal see, belonging to Campania, Italy. An anct. Samnite tn. formerly called Aequum Tuticum. Pop. 9399. Frequently devastated by earthquakes.

**Arians**, see ARIUS.

**Ariarathes**, the name of sev. kings of Cappadocia: (1) Son of Ariamnes I., defeated and slain by Perdiccas 322 B.C. (2) Son of Holophernes, and nephew of A. I., became king 315 B.C. (3) Son of Ariamnes II., and grandson of No. 2, died 220 B.C. (4) Son of No. 3, reigned 220-162 B.C., and assisted Antiochus the Great against the Roms., and obtained peace in 188. (5) Son of No. 4, surnamed Philopator, reigned 163-130 B.C. He was expelled by Demetrius Soter, but was restored by the Roms., whom he helped against Aristonicus of Pergamus. (6) Son of No. 5, reigned 130-96 B.C., and was put to death by Mithridates. (7) Son of No. 6, also murdered by Mithridates, who then reigned. (8) Second son of No. 6, was deposed by Mithridates. (9) Son of Ariarathes II., reigned 42-36 B.C., and was deposed and put to death by Antony.

**Arias, Montanus** (1527-98), Sp. orientalist, b. at Fregenal de la Sierra, in Extremadura. Studied at the univs. of Seville and Alcalá and took orders in 1559; 1562, consulting theologian to the Council of Trent; 1571 pub. a commentary on the minor prophets; 1568-73, ed. the Polyglot Bible at Antwerp; 1575-1576, tried at Rome of a charge of heresy, and acquitted.

**Aribert, or Heribert**, of Lombardy, archbishop of Milan, 1018-45. He was one of the leaders of the Ghibelline party, and in 1026 crowned the Emperor Conrad II., whom he had invited to Italy, as king of Milan.

**Arica**, seaport tn. of prov. connected with the prov. of Tacna, N. Chile, about 40 m. S. of Tacna by rail. It is the prin. port for Bolivia, and exports copper, guano, silver, salt, etc. The tn. was the subject of the long dispute between Chile and Peru, which led to mediation by the U.S.A. The settlement, accepted by both countries in May 1929, awarded A. to Chile in return for payment to Peru of a sum of \$1,200,000, and Tacna to Peru. The prosperity of the tn. has been diminished by frequent earthquakes, of which the chief occurred in 1868. Pop., once 30,000, now about 13,000.

**Arichtat**, seaport of Nova Scotia, Richmond co., on Isle Madame. It is the seat of a Rom. Catholic bishop and possesses a good harbour, from which there is some fishing. Pop. of the dist., 3000.

**Aricia**, an anct. tn. of Latium, on the Applan Way, 16 m. from Rome. In 338 B.C. it was subdued by the Roms., and received the Rom. franchise. In its neighbourhood was the celebrated grove and temple of Diana Aricina, on the borders of the Lacus Nemorensis. Her priest, called *Rex Nemorensis*, was always a runaway slave. In order to become her priest he had to slay the existing holder of the office in single combat. The Chigi

Palace was much damaged by bombs in the Second World War.

**Aricina**, see **ARICIA**.

**Aricine**, see **CINCHOVATINE**.

**Arideus**, see **ARRHIDAUS**.

**Ariège**, a dept. in the S. of France, bounded on the S. by Catalonia and Andorra, W. by Haute-Garonne, N.E. by Aude, and S.E. by Pyrénées-Orientales. The E. part is watered by the A., the W. by the Salat. Both rivs. later join the Garonne. Offshoots of the Pyrenees, which lie on the S., cover a large part of the dept. The chief industries are agriculture and vine-growing, iron-mining, and woollen manufacturing. Cap., Foix; area, 1890 sq. m.; pop. 145,956.

**Ariel**, a word signifying lion of God or altar of God, is in Isa. xxix. 1 applied to Jerusalem. In later Jewish times the name is given to a water spirit. One of the fallen spirits in *Paradise Lost* bears this name. See also Pope's *Rape of the Lock* and Shakespeare's *Tempest*. In astronomy, one of the satellites (the inmost) of Uranus.

**Aries**, or the **Ram**, is the first of the anct. zodiacal signs. The Gk. mythology makes A. to be the commemoration of the Golden Fleece, in quest of which the Argonautic expedition was undertaken.

**Arietta** (the diminutive of the lt. word *aria*), in music, a short air.

**Arikara**, a Caddoan tribe of N. Amer. Indians, formerly belonging to the Pawnees. They originally lived on the Missouri, but were driven out of their own dist. by the Sioux, and were later with the Mandans and Grosventres on the Fort Berthold reservation in N. Dakota. They now number a few hundreds. See Dorsey's *Traditions of the Arikara*, 1904.

**Arilus**, or **Aril**, in some plants forms an exterior appendage to the seed. It develops after fertilisation, proceeding from the placenta, and partially invests the seed, after which it falls spontaneously. The mace of the nutmeg and the scarlet covering of the seeds of the climbing bitter-sweet are true arils.

**Arimanes** and **Areimanias** are Gk. corruptions of the Persian name *Ahriman* or *Aberiman*. See **AHRIMAN**.

**Arimaspi**, a mythological people of Scythia, inhabiting the E. coast of the Caspian Sea. According to the fable, they had but one eye, and were engaged in perpetual warfare with the griffins for the gold rolled down by the R. Arimaspius.

**Arimi** and **Arima**, the names of a mythical people, dist., and range of mts. in Asia Minor. In the W. countries the A. were considered as monkeys, which fact caused them to be confounded with the Cercopes whom Jupiter had turned into monkeys. Amongst the old Gk. poets they were a mythical people, and Arima was the scene of the punishment of the monster Typhoeus.

**Arimos**, a riv. in Brazil, joining the Tapajós, a trib. of the Amazon.

**Ariobarzanes**: I. The name of kings of Cappadocia: (1) Surnamed Philoromæus, reigned 93-63 B.C., being elected king by the Romans. During his reign he was several times expelled, but was finally restored

by Pompey shortly before his death. (2) Surnamed Philopator, became king after his father, 63 B.C., but was assassinated in 51. (3) Surnamed Eusebes and Philoromæus, succeeded his father in 51 B.C., and reigned until 42, when he was slain by Cassius. II. The name of kings or satraps of Pontus: (1) Who reigned c. 400 B.C. (2) Son of Mithridates I., reigned 363-337 B.C. He revolted against Artaxerxes in 362. (3) Son of Mithridates III., reigned 266-240 B.C.

**Arion** (c. 625 B.C.), Gk. lute-player and poet, a native of Lesbos. He gave the dithyramb its artistic form. Herodotus tells us that returning to Corinth by sea with much treasure the sailors plotted his death. He pleaded permission to play his lute, and then, throwing himself into the sea, escaped on the back of a dolphin whom the melody had attracted.

**Arioso**, a vocal or instrumental piece of a recitative character, but of the more melodious kind. Also means the kind of melodic singing suitable for the greater arias. Mendelssohn sometimes uses the word for any short air in an opera or oratorio.

**Ariosti**, **Autilio** (c. 1660-1740), It. musician and composer, b. at Bologna. He produced operas at Venice and Berlin, and finally in London. Of some 25 works perhaps the best known are *Coriolano*, *Dafne*, and *Erfille*.

**Ariosto**, **Ludovico** (1474-1533), described by Hallam as having been, 'after Homer, the favourite poet of Europe,' was b. at Reggio. For some years he studied law in compliance with his father's will, but his bent from the first was towards literature. His father d. early, and he then devoted much time to the care of his younger brothers and sisters. He had already written 2 comedies and some good lyrics when, in 1503, he was taken into the household of the Cardinal Ippolito d'Este. His life was busy, for he was perpetually engaged in embassies to Rome and in diplomatic business. Yet he managed in the intervals of business to complete his great work, the *Orlando Furioso*, of which the first ed. in 40 cantos was pub. at Ferrara in 1516. In 1517 he quarrelled with the cardinal, and entered the service of the duke of Ferrara, Ippolito's brother. His situation was not greatly improved, and in 1521 he was appointed governor of the Garfagnana, where his energies were chiefly devoted to the suppression of bandits and the enforcement of order. He was recalled some years later, and in 1532 appeared the finally revised *Orlando*, in 46 cantos. The delight of the poem is in its harmonious, accurate intricacy, its interrupted climaxes, and surprising confluence of scattered incidents. The praises of Cardinal Ippolito and the duke of Ferrara are sung in the comically fulsome asides of the poem, while the cardinal's real meanness and mediocrity are immortalised in the *Epistles*. Next year he d. at Ferrara, where he was buried in the church of San Benedetto. Besides his great work, he wrote 5 plays, 7 satires after Horace, some Lat. poems, and a prose dialogue *Erbolate*, on the subject of

hygiene, *Rime* (sonnets, etc., and elegies), and a fragment, *Cinque Canti*. His distastes and weaknesses make him the eternal contemporary of Horace and Lamb, for whom, similarly, the stirring events of the times in which they lived were not much more than additional perturbations in the never sufficiently calm tenor of their private life.

The subject of the *Orlando* had already been treated by Pulci in his *Morganle Maggiore*, and by Boiardo in his *Orlando Innamorato*, and of this latter work the *Orlando Furioso* is professedly a continuation. It is the triumph of the half-satiric, fantastic, yet lovely style which Boiardo had hardly attained. What raises A. to the level of the greatest poets is the sustained zest of his execution upon the huge scale he chose for representing his own private world. In A., Croce sees the model It. artist, just as in Cavour he sees the model It. politician. The first complete ed. of *Orlando Furioso* was that pub. in Ferrara in 1532. The ed. of Morali (1818) follows the text of the 1532 ed. with great correctness. A good modern ed. is that by Papini, pub. in Florence, 1903. The indifferent translations into Eng. of Sir John Harrington, 1591, and Hoole, 1783, were superseded in 1823 by the spirited rendering of Stewart Rose. See also J. S. Nicholson, *Life and Genius of Ariosto*, 1914; Benedetto Croce, *Ariosto, Shakespeare, and Corneille* (Eng. translation 1920).

**Ariovistus** (first century B.C.), chief of the Ger. tribe of the Suevi. The Sequani, a Gallic tribe, being engaged in a conflict with the Æduli, asked his help. He defeated the Æduli, but settled in the land of the Suevi. The 2 Gallic tribes now demanded assistance from Rome. In 58 B.C. Cæsar entirely defeated the Gers. at Vesontium (now Besançon).

**Arish** or **El Arish**, is a small tn. on a night eminence about half a m. from the Mediterranean shore, on the road from Egypt to Syria. It contains Rom. remains and sev. marble columns, and is the site of the anct. Rhinocolura. It was taken by the Fr. 1779, in whose possession it remained for some time. At A. Sir Sidney Smith concluded a convention with the Fr. army, which was afterwards disavowed by the Brit. Gov.

**Aristænetus**, a Gk. writer of Nicæa who lost his life in the earthquake at Nicomedia A.D. 358. To him are attributed fifty *Erotic Epistles*, which, if less entertaining than those of Alciphron, are among the best-known collections of fictitious letters of Gk. sophists. There is a Ger. translation by Herel, Altenburg, 1778, and sev. Fr. translations.

**Aristæus**, a Gk. divinity whose cult is found in anct. Thessaly, Bœotia, Arcadia, Thrace, etc. According to the general tradition, he was the son of Apollo and the nymph Cyrene, and was educated by Chiron, the centaur. At Thebes he married the daughter of Cadmus (Autonoë) and became the father of Actæon. He was worshipped as the protector of herdsmen and teacher of bee-keeping and the rearing of the olive tree.

**Aristagoras** (d. 497 B.C.), tyrant of Miletus, acted as regent for his brother, Histæus, while the latter was at the Persian court. An attack on Naxos having failed, he raised all Ionia in revolt against Persia, and having obtained aid from Athens, attacked and burnt Sardis. His troops were, however, driven to the coast by the Persians, and he retired to die in Thrace.

**Aristarchus**, the name given to a crater in the N.E. quadrant of the moon. It is the brightest object on the moon and is visible as a luminous spot when all the surrounding region is involved in shadow.

**Aristarchus of Samos** (c. 250 B.C.), a Gk. astronomer, all of whose works are lost except a short treatise *On the Magnitudes and Distances of the Sun and Moon*. He is said to have taught that the earth moves round the sun.

**Aristarchus of Samothrace** (c. 220-144 B.C.), Gk. grammarian and critic. He early settled at Alexandria, where he studied under Aristophanes of Byzantium, whom he later succeeded as keeper of the Alexandrian library. Meanwhile, he was made tutor to the children of Ptolemy Philometor. It is said that in his old age he was persecuted by his former pupil, then ruling Egypt as Ptolemy Physcon, so that he retired to Cyprus and d. there at the age of 72, his death being hastened by voluntary starvation invited by an incurable dropsy. He estab. a school of philologists who long flourished at Alexandria and Rome under the name of Aristarchæans. He himself was wholly engaged in criticism and exegesis, being said to have written over 800 commentaries. He gave his attention chiefly to the poets, and above all to the Homeric poems. His ed. of these latter is the foundation of the present recension. He gave much labour to the purification of the text, removing all interpolations and spurious readings. We are enabled to judge of his comments by fragments which have been preserved in the Venetian scholia to the *Iliad*. See Lehr's *De Aristarchi Studii Homerici*, third ed. 1882, and Ludwig's *Aristarchi Homerische Textkritik*, 1885.

**Aristæus**, reputed to have been sent by Ptolemy Philadelphus, king of Egypt, to the high priest Eleazar to obtain people to translate the O.T. into Gk. A. is said to have gathered together 72 Jewish translators, who assembled on an is. to carry out the task, which, when finished, was called the Septuagint, i.e. the version of the Seventy. This story is related in the Epistle of A., of which there is much uncertainty as to the date. The epistle, however, is now considered to be spurious. See under SEPTUAGINT.

**Aristias** (c. 1798-1884) was a Gk. poet who lived in Wallachia. He is celebrated for his translation of the *Iliad* into Rumanian verse, and he took an active part in the political movements for the independence of Greece.

**Aristides** (c. 530-468 B.C.), surnamed the Just, an Athenian statesman. He was the son of Lysimachus, and came of an

aristocratic family. He was one of the 10 leaders at Marathon (490 B.C.), and persuaded his fellow leaders to alter the arrangement that each should lead for 1 day, and to give Miltiades full power. In the next year he was made chief archon, and his zeal for the conservative policy brought him into conflict with Themistocles, the democrat, by whose influence A. was ostracised c. 484 B.C. In 480 came the invasion of Xerxes, king of Persia, and Themistocles, eager to stop all dissension, secured the passing of a decree recalling all post-Marathonian exiles. A. profited by this, and did good service at Salamis. In 479 he was elected strategus, and shared with the Spartan Pausanias the glory of the victory at Plataea. He later took the lead in the formation of the Delian league. He died poor, and his family were compelled to receive pensions from the State.

**Aristides, Aelius**, surnamed Theodorus, Gk. sophist and rhetorician. He was the son of Eudæmon, and studied under Polemon of Smyrna and Herodes Atticus. After many travels, he settled at Smyrna. Prior to this he had been troubled by illness for 13 years, but this did not hinder him from the pursuit of his studies. In 178, when Smyrna had been destroyed by an earthquake, he secured from the Emperor Marcus Aurelius its rebuilding at the imperial expense. Fifty-five of his speeches are extant, as also certain other work. His 6 *Sacred Speeches* are worthy of note. Prin. ed. Dindorf, 3 vols. 1829.

**Aristides, Quintilianus**, a Gk. grammarian who lived probably in the third century A.D. He is the author of a treatise on music, one of the most important of antiquity. It was first edited by Meibomius.

**Aristides of Thebes** was a painter and contemporary of Apelles. According to Pliny, he was the first to try to give expression to his characters. His best-known picture was one of a child approaching its mother, who lay wounded and dying in the midst of a sacked city.

**Aristion**, see **ATHENION**.

**Aristippus** (fl. fourth century B.C.), founder of the Cyrenaic or Hedonist school, was b. at Cyrene. He was a pupil of Socrates, whose philosophy he partially adopted, making pleasure the final aim of life. He lived, therefore, the life of a philosophic voluptuary, while at the same time retaining restraint over his passions. He passed much of his life at Syracuse at the court of Dionysius, and lived some time at Corinth in intimacy with the famous courtesan, Lais. His doctrines were taught after his death by his daughter Arete, and later by her son, Aristippus the younger.

**Aristobulus of Cassandrea** (fourth century B.C.), a Gk. historian who accompanied Alexander the Great on his campaigns, and later wrote an account of them. Arrian made considerable use of his works.

**Aristocracy**, theoretically a form of gov. administered by the best citizens (Gk. ἀριστος, best). In practice it means gov. by the nobility. See **GOVERNMENT**.

**Aristodemus** (eighth century B.C.), king of Messenia, who waged a 20 years' war for independence against the Spartans. He committed suicide in despair of final success, on the receipt of unfavourable oracles.

**Aristogiton**, a noble Athenian who lived in the beginning of the sixth century B.C. He together with Harmodius plotted the death of the tyrant Hippas and his brother Hipparchus. Hipparchus was murdered at the Panathenaic festival, 514 B.C. Harmodius was immediately killed. A. escaped but was afterwards taken and put to death by Hippas. Four years afterwards Hippas was expelled, and Harmodius and A. were regarded as martyrs, bronze statues being erected to them in Athens. According to Thucydides and Herodotus (vi. 123), the plot arose out of a private quarrel, and was not undertaken in the cause of liberty.

**Aristolochia** is the name of a large genus of herbs or woody vines, the birthworts, as they are popularly called. They are characterised by pungent aromatic rootstocks and irregular flowers. They are cultivated chiefly for the flowers, these being curiously shaped, with peculiar markings. The European birthworts and related species were once famous for their reputed medicinal properties.

**Aristomenes** (seventh century B.C.), a Messenian general who led his countrymen in the second Messenian war. After a number of daring attempts and brilliant successes he was betrayed by Aristocrats of Arcadia, and fled to Rhodes, where he d.

**Aristophanes** (c. 450 – c. 385 B.C.), the most renowned of the Gk. comic dramatists, probably b. at Athens, where he spent his life. His education was of the best, and he favoured throughout the aristocratic and conservative party. His production began early, and altogether 54 comedies are ascribed to him, of which 11 only are extant. These comedies fall into 3 well-defined periods, the first extending from 427 to 421 B.C., the second to 405, the last to 388. His early plays show unrestrained political satire, the second period shows more restraint, and in the plays of the third period the satire is chiefly social. His extant plays of the first period are 5. *The Acharnians* (425) seeks to aid the peace party by drawing the contrast between Lamachus the warlike and Dicaeopolis, an honest countryman, who makes peace with Sparta on his own account, and on whom all blessings are showered. *The Knights* (424) is a vigorous attack on Cleon, who for a while beguiles the populace represented under the name of Demos. Demos is finally rescued and his youth restored. *The Clouds* (423) satirises the Sophists and especially Socrates, the proprietor of a 'thinking shop' where all dishonesty is taught. Alcibiades is represented under the name of Phidippides, the young Athenian. In *The Wasps* (422), A. ridicules the Athenian love of law-suits, and in *The Peace* (421) he continues the theme of the Acharnians, advocating once again a truce with Sparta. To the second

period belong 4 plays. In *The Birds* (414) 2 old Athenians leave the tn. and persuade the birds to build in mid-air the city of Cloud-Cuckoo-town. The gods are thus cut off from the sacrifice of men, and the sceptre is regained from Zeus. Some have seen in this play an allegory of the Sicilian expedition. *Lysistrata* (411) shows the women taking the affair into their own hands and making peace. *The Thesmophoriazuse* (411) contains an attack on the tragic poet Euripides. *The Frogs* (405) continues this literary satire. Dionysus is sent to Hades to fetch a poet, Æschylus and Euripides having just died.

Aristophanes  
Museum

ARISTOPHANES

These two contend for the throne of tragedy, which is finally won by Æschylus. In *The Ecclesiazuse* (392 or 389 B.C.) the dramatist ridicules the mania for communism, while *Plutus* (388) is merely a moral allegory. The works of A. are characterised by wit and hearty humour, by a perfect agreement of matter and form, and by exquisite lyric quality.

**Bibliography.**—Prin. eds. by Meineke (1860), Dindorf (1869), and Blaydes (1880-93). The introduction to Blaydes's ed. has a list of eds. and of translations in Eng. and other languages. Among the best general books are H. Müller-Strübing, *Aristophanes und die historische Kritik* (1873); E. Deschanel, *Études sur Aristophane* (3rd ed., 1892); A. Couat, *Aristophane et l'ancienne comédie attique* (1889); L. E. Lord, *Aristophanes, his Plays and his Influence* (1925). Among translations of various plays are those of J. H. Frore, T. Mitchell, H. Kennedy, B. Rogers, and G. Murray. *Aristophanes of Byzantium* (c. 260-300 A.D.), a famous Gk. grammarian, the pupil of Zenodotus. His pub. valuable

critical eds. of the Homeric poems, of Hesiod, and of the other chief Gk. poets. He also did valuable work as a lexicographer, and introduced critical signs, punctuation, etc. See Nanck's *Aristophanes Byzantii Fragmenta*, 1848.

**Aristotelia** is 'those things pertaining to Aristotle.' See ARISTOTLE.

**Aristotle** (384-322 B.C.), the Gk. philosopher, was b. at Stagira (hence the term 'the Stagirite' for the philosopher), a Gk. colony on the peninsula of Chalcidice, in the year 384 B.C. He came of a family which had long been given to the study of medicine, his father, Nicomachus, being the physician and friend of Amyntas, king of Macedonia. Though he never took up medicine as a profession, it seems probable that A.'s education included this study to a large extent. It is said that he practised medicine when he first came to Athens, and his later inclinations towards natural science may also be traced to his early training.

In his eighteenth year (367 B.C.), he came to Athens with the intention of studying philosophy under Plato. This great philosopher was, however, then absent in Syracuse, on the mission which so strangely connects him as adviser with Dionysius the elder and Dionysius the younger. A., therefore, occupied himself with his own studies until the return of Plato in 364 B.C., when he became his pupil, and continued as such for 20 years. The master soon became aware of the penetration and range of his pupil's intellect, and we are told that he described him as 'the intellect of the school.' At this time, too, it is said that A. taught rhetoric in opposition to Isocrates, who was doubtless a representative example of the teachers of superficial eloquence then popular. In 347 Plato d., having appointed his nephew Speusippus master of the school. This fact induced A., who might well have expected that his own pre-eminence would have gained him this position, to leave Athens. On the invitation of Hermias, despot of Atarneus, he retired with a fellow pupil, Xenocrates, to the court of Atarneus. Hermias was himself an Academic, and his 2 friends lived quietly with him for 3 years until his death at the hands of a treacherous enemy. A. then retired to Mitylene, taking with him Pythias, the niece of Hermias, whom he afterwards married, and by whom he had his daughter Pythias. He had in later life 1 son, Nicomachus, borne to him by his concubine, Herpyllis. This son has, for some unknown reason, given his name to the chief of A.'s ethical writings—the *Nicomachean Ethics*.

In the year 342 A. was summoned to Macedonia by Philip to instruct his son, Alexander, then in his fourteenth year. For 3 years he was engaged in this task, after which he retired for a while to Stagira, which he induced the king to rebuild. Not until Alexander had ascended the throne did the philosopher finally leave Macedonia. So, in 335 B.C., he returned to Athens and the last great period of his life began. He opened a school at the Lyceum, a gymnasium which received

its name from its propinquity to the temple of Apollo Lyceus. The members of the school came to be called Peripatetics, from his habit of walking up and down while discoursing, or, possibly, from their meeting at a place called The Walk. The followers of Xenocrates, who had now succeeded Speusippus as head of the Academy, were known as Academics. This life went on for 12 years, when, in 323, Alexander d. The anti-Macedonian party at Athens began to gain the ascendancy, and the philosopher was accused of impiety on the grounds that he deified the tyrant Hiermias. The charge was absurd, but A., mindful of the fate of Socrates, thought it prudent to retire to Chalcis in Euboea, where, in the autumn of 322, he d.

His writings have unfortunately come down to us in a very confused form. It is certain that many of those attributed to him are not his, and the condition of the genuine works is far from satisfactory. The language of most of them is abrupt, and conversational promises are made and then forgotten; there are sudden breaks in the thread of the argument; sometimes they are redundant, sometimes inconsistent. In a word, it is evident that these writings, which have so profoundly affected the thought of all succeeding ages, were neither completed nor arranged by the writer himself. It has, indeed, been suggested that they are nothing more than the notes taken down by his scholars from dictation, and afterwards ed. by them. This hypothesis is refuted both by the extreme compression of parts of the works and by the fact that A. generally lectured while walking, and a far more probable explanation is that the works as we have them are, in the main, the unfinished notes and discourses of A. himself. Much of their disconnectedness may be attributed to the length of time over which their composition was probably spread, and to the development of his theories during this time. Strabo, the geographer, relates that on the death of A. his library, after passing through many hands, came into the possession of Andronicus of Rhodes, and became the basis of his ed. of the *Works* prepared c. 70 B.C.

The extant writings may be divided on the basis of the mediæval classifications under the heads of Logic, Natural Science or Physics, First Philosophy or Metaphysics, Ethics and Politics, Literature. The works on logic, grouped together by his editors as the *Organon*, comprise *Categoriæ*, on the 10 classes of predicates; *De Interpretatione*, on language, dealing with the proposition and its parts; *Analytica Priora*, in 2 books, dealing with the syllogism; *Analytica Posteriora*, in 2 books, dealing with the method of scientific demonstration; *Topica*, on dialectical syllogism and reasoning from probabilities; *Sophistici Elenchi*, on the fallacies which the Sophists made use of in refutation and their solution. The treatises on natural science include 4 important works on physics: *Physica* *Auscultatio*, treating of the general prin-

ciples of natural science; *De Cælo*, a treatise on astronomy; *De Generatione et Corruptione*, on generation and corruption in general; *Meteorologica*, discussing sublunary phenomena.

A second div., chiefly biological, would include *Historia Animalium*; *De Partibus Animalium*, on the causes of the facts about animals; *De Generatione Animalium*; *De Anima*, on the soul as connected with the body; *Parva Naturalia*, comprising 8 works on sense, memory, dreams, etc. A.'s one work on the subject which he called First Philosophy is the *Metaphysica*, so called on account of its having been placed in the first ed. of his works 'after' the treatises on physics. The work gives a sketch of previous philosophical systems, and then deals with the causes, principles, and properties of Being, and treats of God as the prime Mover of the world. The ethical and political works include *Æthica Nicomachea*; *Æthica Eudæmia*; *Magna Moralia*, all concerning the good of the individual; *Politica*, on the good of the state; *Æconomica*, on the good of the family. This last is probably the work of a later school. In the domain of literature, though the philosopher had intended ultimately to deal with all forms of art, only 2 works are comprised, but one of these, *De Poetica*, has, mainly through the misunderstandings of mediæval commentators, affected the hist. of all European literature. The other, the *Ars Rhetorica*, is less important.

*Aristotle's Philosophy.*—Though A. never allows us to forget the great degree in which he differed from his master Plato, yet it is important to remember that he can always speak of the Platonic tenets as those which we hold. In fact, A. was probably much more in sympathy with Plato than were his immediate successors at the Academy. Yet their difference as to the attitude of inquiry was fundamental, and may thus be briefly put: Plato takes his departure from the eternal, from the universal form; A. from the actual world of nature, from the individual substance. Plato was a poet and an idealist; A., though possessing a great range of interest, is fundamentally a man of science. Their points of agreement and difference are well shown in the *Metaphysica*, where we see that whereas Plato finds reality only in the universal 'idea', A. seeks it in the individual things, which he defines as a combination of the universal-form and matter. Yet both agree that the reality or essence of the thing lies in the idea. But a more important divergence is in A.'s criticism of the Platonic 'ideas' as being only potential and not actual causes of the phenomena of the world. Hence is elaborated the famous doctrine of the 4 causes which combine to produce any individual object, and which give 4 lines of inquiry when investigating it. These are: (1) the material cause, or the material conditions of its existence; (2) the essential cause, giving its essential character and realisation; (3) the actual cause, through the agency of which it comes into being; (4) the final cause, giving the end or result attained

by it. But the work deals also with theology, and A. expressly speaks of the prime and unmoved movement of the earthly and heavenly bodies as God. His language on the subject is simple, and perfectly clear. God is the supreme excellence, more excellent than anything that we can attain to. He is perfect, with eternal and continuous life. The philosopher then explains the anthropomorphic mythology of the time as accretions which have been added for the use of the vulgar to the original conception of a single divinity investing the whole of nature. There are many omissions in the scheme of the first philosophy, and difficulties are multiplied by the fact that A. had to invent many of his technical terms and that he did not always use them in the same sense. The invention of logic was, perhaps, the prin. work of A. He regarded it as no true part of philosophy, but as its handmaid or instrument, and hence the name *Organon* given to the group of treatises on the subject. Even this name was given it by the later Peripatetics. The founder of logic himself gave it no name, neither subdividing the subject nor combining it into a system. It is noteworthy, too, that in his classification of the sciences he gave no place to this one of his own evolution.

A.'s scientific treatises have long since fulfilled their service. His researches show insight, observation, and knowledge; but their intrinsic value was never great, and in later ages they showed signs of becoming a positive hindrance to progress through the reverence felt for his great name.

The metaphysical and physical philosophy, together with the logical treatises, were grouped together by the author as speculative science; while practical philosophy comprised the *Ethics*, *Politics*, and treatises on Art. The *Politics* are the application to the state of the principles which had been applied to the individual in the *Ethics*. Briefly, they consist of the old question: 'What is man's greatest good, and how can it be realised?' There are various degrees of goodness, of which the chief are theoretical wisdom, which is the highest, practical goodness, and goodness of character. The first of these is the contemplation and comprehension of the loftiest principle of the universe. Practical goodness consists in the carrying out of the moral virtues. Goodness of character is the habit of mind which enables a man to choose the mean between extremes of extravagance. These last 2 forms of goodness should not be neglected by the philosopher, but should be developed at the same time as the highest. Since, however, reason is obviously the highest faculty of the soul, being, in fact, the one thing which differentiates man from the other organic bodies and approximates him to God, it should receive the supreme place. In the *Politics* the subjects dealt with are the good of the individual citizen, which should consist in the happiness of virtuous action, and the good of the state. Right govts., then, are those which aim at the general good, and they

may be either: (1) *Monarchies*, the rule of one man excelling in virtue; (2) *Aristocracies*, the rule of a class excelling in virtue; or (3) *Commonwealths*, the rule of the many who excel in virtue. On the other hand, the wrong govts. are perversions of these 3 forms. A wrong gov. may be: (1) a *Democracy*, aiming merely at the good of the majority; (2) an *Oligarchy*, aiming at the good of the few; or (3) a *Tyranny*, aiming at the good of one man. All these last are distinguished by the fact that their aim is the benefit of the ruling body rather than that of the whole community. Last to be considered are the 2 works in which the art of production is dealt with, the *Rhetorics* and the *Poetics*. The first is a treatise on the art of persuasion, and its influence has been almost nil. In the *Poetics*, A. shows himself a literary critic of the first order. After a subdivision of the kinds of poetry, he deals at length with tragedy, which, he says, 'by raising pity and fear, purges the mind of these passions.' Perhaps no literary judgment has given rise to more controversy as to its meaning, controversy which is not yet ended. From the commentators on this work, and not from the work itself, is gathered the famous theory of the 3 unities which was so long attributed to A. himself. Misunderstanding though it was, it has influenced the whole course of European drama. Not until the Middle Ages did the period of A.'s greatness begin, and then he was known only in Arabian translations. From the translations of Avicenna and Averrhoes his philosophy was taken up by the schoolmen, and made the framework in which to arrange the theology of the Christian Church. His writings were generally received as the summary of sciences, and as such they were taken up and reconciled to the Catholic dogmas, which his philosophy was used to express, by the great St. Thomas of Aquinas. With the Renaissance came a natural reaction, but even here, the philosopher himself recovered rather than lost prestige. His works were studied in the original, and many of the errors of his commentators removed.

*Literature.*—The standard ed. of the complete works is still that of Bekker (5 vols., Berlin, 1831-70). Eds. worthy of note containing particular works are Pactus's *Organon* (Frankfort, 1592), Waltz's *Organon* (Leipzig, 1884-86), Aubert and Wimmer's *Historia Animalium* (Leipzig, 1868), Bonitz's *Metaphysics* (Bonn, 1848), Hicks's *De Anima* (Cambridge, 1907), Bywater's *Ethica Nicomachea* (Oxford, 1890), and *Poetica* (London, 1898), Cope's *Rhetorica* (Cambridge, 1877), and Butcher's *Poetica* (London, 1898). Eng. translation of *The Physics* by P. H. Wicksteed and F. M. Cornford, in 2 vols. (1930); Eng. translation in 3 vols. ed. by W. D. Ross (1931); A. S. Owen, *Aristotle on the Art of Poetry* (1931); A. K. Griffin, *Aristotle's Psychology of Conduct* (1931); W. Jaeger, *Aristotle* (trans. 1934); Eng. translation of *The Politics of Aristotle* by Sir E. Barker, 1948.

*Aristotle's Lantern*, a jaw-apparatus

in the sea-urchin, consisting of 5 hard pointed teeth in sockets formed by 5 ossicles. The teeth protrude through the mouth-membrane and are actuated by muscles that enable them to be drawn together or apart, inwards or outwards. The animal is thus enabled to scrape algae and seaweeds from the rocks to feed itself.

**Aristoxenus** (fourth century B.C.), a Gk. philosopher, pupil of Aristotle. He wrote, amongst other works, a treatise on music, rejecting the mathematic system of Pythagoras.

**Arita**, a tn. of Japan, on the is. of Kiushiu. It is famous for the manuf. and export of porcelain. Pop. about 6000.

**Arithmetic**, that branch of mathematics which treats of numbers. The study of A. is included in every scheme of education, mainly on account of its bearing on the practical side of everyday life. Measurement and the calculation of money values are dependent on some theory of number, and it is difficult to realise what we owe to the system of numeration by local value which we have adopted from the Hindus. The Gks. and Roms. used clumsy symbols, and some idea may be formed of the difficulty of calculating in such symbols by attempting, say, to multiply CLIX by MDIV without using the decimal notation. The Hindu, or, as it is commonly called, the Arabic, system was introduced into Europe in the eleventh century, the double rule of three, or compound, proportion was introduced in the sixteenth, and in the next century Napier of Merchiston invented his system of logarithms, since when there has been little advance in the rules of A. proper.

A. as usually taught in schools consists of the consideration of the 4 elementary operations: addition, subtraction, multiplication, and division; the application of those rules to measures of length, weight, money, etc.; the splitting up of numbers into factors, leading to the determination of least common multiple and greatest common measure; the system of fractions, vulgar and decimal, and its application to the determination of values by what is called practice; and the rule of three, or proportion. An attempt is usually made to introduce ideas relating to commercial life by calculations on imaginary transactions involving percentages, interest, simple and compound, stock investments, bill discounting, etc., but sometimes this is relegated to what is called commercial A.

The value of A. as a school subject is threefold: it serves to equip the pupil for carrying on business involving quantities and values, it has a disciplinary or purely educational effect on the mind, as its processes illustrate the methods of reasoning, and it serves as an introductory step to the study of mathematics generally, which in its turn has its educational and purely utilitarian values. The disciplinary value depends mainly upon the methods of teaching, but the practical utility of A. depends upon the ease, accuracy, and rapidity with which the simpler relations of addition and multiplication can be recollected. It is customary and neces-

sary, for the addition of all pairs of numbers up to 10, and the multiplication of all pairs of numbers up to 10 or 12, to be learned 'by heart.' That is, there should be no necessity to call up any mental image of the quantities involved in the addition or multiplication; 7 times 9, for instance, should suggest 63 with certainty at once.

Text-books are numerous, and the number increases yearly, but the following may be referred to as being of general interest: Sir Oliver Lodge, *Easy Mathematics*, chiefly *Arithmetic*, 1905; L. Seeley, *The Grube Method of Teaching Arithmetic*, 1890; D. E. Smith, *The Teaching of Elementary Mathematics*, 1900; F. A. Yeldham, *The Story of Reckoning in the Middle Ages*, 1926; L. T. Hogben, *Mathematics for the Million*, 1936.

**Arithmetical Complement** of a number is the difference between that number and the next highest power of 10, e.g. the A. C. of 6 is  $10 - 6 = 4$ ; of 49 is  $100 - 49 = 51$ ; and of 7642 is  $10,000 - 7642 = 2358$ .

**Arithmetical Mean** is a quantity which has an intermediate value between two other quantities; thus the A. M. between 9 and 17 is 13, i.e. half of the sum of 9 and 17.

**Arithmetical Progression** is a series of numbers which increase or decrease by a common difference, such as 2, 4, 6, 8, 10, 12, or 25, 20, 15, 10, 5. If  $a$  denote the first term,  $l$  the last term,  $d$  the common difference, and  $n$  the number of terms, then  $l = a + d(n-1)$  and the sum of all the terms =  $\frac{(a+l)n}{2}$ .

**Arithmetical Proportion**, see ARITHMETIC and PROPORTION.

**Arius** (c. 256-336), founder of the Arian heresy, was b. in Libya, and became one of the chief figures of the first great controversy in the Church. He went to Alexandria, and was there ordained deacon. In the Meletian schism he sided with Meletius and suffered excommunication. He later repented and was received back into the Church by Achillas, bishop of Alexandria, who then ordained him presbyter, and gave him the charge of one of the city churches. So great was the repute of A., that on the death of Achillas he expected to receive the see, but Alexander was chosen. When quite an old man, about the year 321, A. first broached his heresy, which in a less developed form had long been current at Antioch, where he had received his education. He denied that the Son was co-eternal with the Father, though affirming that He was begotten before time, and that by Him the Father created all things. A.'s aim was to prevent the idea of there being 2 Gods, and to solve this he described the Son as a created Being, though far surpassing all others. Alexander excommunicated his presbyter, who refused to give way, and sought help throughout N. Africa. Alexander also sent a circular letter to the bishops informing them of the course of events. Many favoured A., and the chief of his supporters was Eusebius, bishop of Nicomedia, who had been his fellow student at Antioch. A. was a fine

propagandist, and in his *Thalia* he explained his doctrines in verse set to music which was soon sung throughout the land. The controversy soon reached Rome, and Constantine, failing to realize the importance of the dogma in debate, made efforts for a compromise. This failing, he called the first ecumenical council at Nicea in 325. Athanasius, deacon of Alexandria, was the chief exponent of the orthodox view. The orthodox insisted that the Son was 'of the same substance' (*ὁμοούσιος*) with the Father, and round this word the battle raged. A. was condemned, and, with 2 bishops who supported him, banished to Illyria, while the orthodox creed was promulgated. The continued support of Eusebius of Nicomedia secured the recall of A. in 320, and he secured the ear of the emperor. Constantine, finding it impossible to compel Athanasius, now bishop of Alexandria, to reinstate the heretic, banished the prelate to Gaul in 335. At last, in 336, Alexander, bishop of Constantinople, was persuaded to consent reluctantly to admit A. to communion, but before this was done the latter was taken suddenly ill, and within a few hrs. was dead. After his death, Arianism became practically extinct in the empire before the end of the fourth century. For a couple of centuries longer it lingered among the Goths and other Teutonic tribes who had received Christianity from Arian missionaries, chief of whom was Ulfilas.

**Arizona** (Indian Sp. meaning 'few springs' or the 'dry belt'), a state of the Union, N. America, situated between Utah on the N., New Mexico on the E., Mexico on the S., and California and Nevada on the W. It ranks fifth among the U.S.A. with a gross area of 113,956 sq. m., 100 sq. m. of this being water. The state is divided diagonally into 2 parts by the Mexican Cordilleras. The N. region consists of a plateau, broken by high mts., which in the San Francisco Range attain a height of over 12,700 ft. In the S. and S.W. are wide, desert plains watered by the Salt and Gila Rs. The Colorado and its trib. the Little Colorado, water the N.W. region. The ann. precipitation ranges from 1 to 10 in. in the W. and from 10 to 25 in. in the E. Few crops are grown without irrigation in the lowlands, the climate being dry and clear, suitable for astronomical observations, and the soil unproductive. Several large reservoirs have been constructed, the most notable being the Roosevelt dam. The Yuma project for tapping the lower Colorado has recently been completed. Projects have also been made for supplying water for electrical power to the state copper mines. The most important crop is cotton, but wheat, barley, corn, etc., and semi-tropical fruit are also cultivated. Cattle and sheep are reared on the pasture lands, and the forests (13,668,000 ac.) provide good timber. The state is rich in mineral deposits, the greatest output being in copper, gold, silver, and lead, while granite, limestone, asbestos, and quicksilver are also worked in the state. The chief industry is the smelting and

refining of copper. A state univ. was founded at Tucson in 1885. There is also at Tucson a state agric. school. Enormous subterranean caves, rivaling the Mammoth Caves of Kentucky, were discovered in 1909. The country was discovered by Marcos de Niza, a Spaniard, in 1539, rumours of its wealth having reached Spain through the explorer, de Vaca. In the following year Vasquez de Coronado explored the country, but the earliest settlements were made by Sp. missionaries at Tucson and Tubac about 1772. A. remained under the influence of Spain till 1821, when it achieved its independence. In 1848 it was ceded to the U.S.A., and was organized as a ter. In 1863, becoming a state of the Union on Feb. 14, 1912. In Congress, A. is represented by 2 members of the lower House and 2 senators. In 1940 the pop. was 499,000; in 1946 (estimated), 661,500. There are still 35,000 Indians. Pop. of Phoenix, 65,400; Tucson, 36,800; Bisbee, 5800; Globe, 6100, and Douglas, 8600.

**Ark of Noah**, see DELUGE.

**Ark of the Covenant** was the name of the sacred chest of shittim (acacia) wood borne by the Israelites in the journey in the desert. In contained the 2 tablets of the law (Deut. x. 2). It figured at the taking of Jericho, where it was borne, as was the rule, by the Levites. It was captured by the Philistines and set up in the temple of Ashdod. Finally it found its resting-place in the temple of Solomon.

**Ark Royal**, Brit. aircraft carrier, commissioned in 1939. Standard displacement 22,000 tons; main armament, sixteen 4.5-in. guns; h.p. 102,000; maximum speed, 30.75 knots. She was the third of her name in the annals of the R.N., and, in her record a worthy successor to the first, the ship of 800 tons burthen, which bore the Lord Admiral's flag in the fleet which defeated the Sp. Armada in 1588. In peace time her full complement, including flying personnel, was 1575, a high proportion of whom were always highly trained officers and men. She was torpedoed by a Ger. submarine in the W. Mediterranean near Gibraltar at about 6.30 p.m. on Nov. 12, 1941, and sank some 12 hrs. later. Throughout her 2 years of service in the Second World War no ship was so frequently 'sunk' by enemy propagandists as was the *A. R.*, yet, in fact, beyond a few scratches by splinters of bombs which fell in the sea, she suffered no damage in action until hit by a torpedo and sunk. Early in the war L./C. Franke was actually promoted and received a congratulatory letter from Goering (q.v.) for having 'sunk' her in the North Sea with a bomb. Later the *A. R.* disconcerted the enemy by appearing at Cape Town in search of the *Graf Spee*. It was her aircraft which ensured the destruction of the *Bismarck* (q.v.) in May 1941. Many ships of the It. Navy bore scars from the blows of her bombers, as did numerous bombers and reconnaissance craft of the *Regia Aeronautica*. Altogether some 67 It. aircraft fell victim to those of *A. R.* After being torpedoed she

struggled along for nearly 12 hrs. with a large hole amidships, but at 4.30 a.m. (Nov. 13) her captain (L. E. H. Maund) gave the order to abandon ship. She sank 25 m. distant from Gibraltar. Only 1 man was lost, the whole of the rest of the crew being taken off by a destroyer which came right in under the rails of the carrier, which was then listing heavily. Hundreds of men slid down ropes to the deck of the destroyer. Whalers launched from the ship picked up other men swimming in the sea. The discipline and coolness of men of the R.N. have seldom been more strikingly exemplified. All were landed in Gibraltar.

**Arkansas**, a S.-central state of the U.S.A., bounded on the N. by Missouri, E. by the R. Mississippi, S. by Louisiana and Texas, and W. by Texas and Oklahoma. The surface of the state is very varied. It may be divided about equally into the N.W. highland div. and the S.E. lowland div. Out of the broad alluvial bottoms of low elevation which border the Mississippi R. and its chief W. tribs. rise the Coastal Plains, which extend N.W. to the Boston Mts. belonging to the Ozark Uplift. The Mississippi forms the E. border, while its chief trib., the Arkansas, bisects the state from W. to E. Other important rivs. are the St. Francis and White Rs. to the N., and the Saline, Ouachita, and Red Rs. to the S. The climate is pleasant and healthy, except in the malarial swampy district of the E. The normal rainfall is from 45 to 55 in., but even this is not sufficient for the ricefields, which have to be flooded through artificial means. The chief product is cotton. Irrigation has made rice-growing an important industry, much fruit is grown, and maize and oats. It is the only state in which diamonds have been found. Over a million tons of coal are raised annually and upwards of 25,000,000 barrels of petroleum. Lumber and timber products hold the first place in industry. There are good railroads, except in the mountainous dists. of the N. and W., the chief being those which connect the cities of the N.-central states with the Gulf cities on the S. There are natural hot springs, world-famed as a cure for rheumatism and kindred ills, and the tn. of Hot Springs has sprung up beside them. A. was visited by the Spaniard, de Soto, in 1541, but the first settlement was made by Frenchmen at A. Post in 1686. The Mississippi was explored further by Marquette and Joliet (1673) and La Salle (1682), and the ter., after passing through Fr. and Sp. hands, was purchased by the U.S.A. in 1803. A. was made a ter. in 1819 and admitted as a state into the Union in 1836. Area 53,335 sq. m. One-third of the population is Negro. The railways are required to provide separate cars for them. Pop. 1,949,000. The chief cities are: Little Rock, the cap., 88,000; Fort Smith, 36,500; Pine Bluff, 21,200; N. Little Rock, 21,100; Hot Springs, 21,300; El Dorado, 15,800; Texarkana, 11,000.

**Arkansas City**, city of Cowey co., Kansas, U.S.A., on the A. and Walnut Rs., Manufs. flour and paint. Pop. 12,750.

**Arkansas River** is, next to the Missouri, the largest trib. of the Mississippi. It rises in the mts. of central Colorado, and flows eastward until about 98° W. long. It then flows S.E. until it reaches the Mississippi. Total length about 2000 m.

**Arkeeko**, a seaport on the W. coast of the Red Sea, 3 m. S. of Massowah.

**Arklow**, a small seaport of Eire, in co. Wicklow, some 50 m. S. of Dublin. There is much sea-fishing, and oyster-beds are numerous. Near it are the ruins of Shelton Abbey, the seat of the earl of Wicklow. The city was stormed and dismantled by Cromwell in 1649, and in 1798 it was the scene of sanguinary conflict between the Gov. and the United Irishmen. The tn. stands at the mouth of the R. Avoca, the valley of which is justly famous for its scenery; pop. 5000.

**Arkona**, the N.E. promontory of the Ger. is. of Rügen, in the Baltic Sea. On its summit is a lighthouse whose light is visible for 35 m., and on the W. are the ruins of the temple of the Wend deity, Svantevit.

**Arkwright**, Sir Richard (1732-92), a famous inventor of cotton-spinning machinery, was b. at Preston in Lancashire, the youngest of 13 children. His parents were poor, and he was early apprenticed to a barber. He estab. himself in this occupation at Bolton in 1750, where his profits were increased by his invention of a special method of dyeing human hair. He also gave himself to the study of the cotton machinery, but, as he had little mechanical skill, he secured the assistance of John Kay, a watchmaker of Warrington, in the carrying out of his designs. About 1767 he seems to have invented his celebrated *spinning-frame*, of which the chief value was its provision of the warp, which Hargreaves's spinning-jenny had been unable to supply. In 1769 he took out a patent for this, and erected his first mill at Nottingham. In 1771, with Jedediah Strutt and Samuel Need as partners, he built larger factories at Cromford, in Derbyshire. In 1775 he took out a fresh patent for further improvements, but these patents were continuously infringed on all sides, and in 1781 he took action in the courts. Public opinion, however, was inimical to him, and the verdict was unsatisfactory. The working classes hated him as a labour-saver, but his common sense enabled him to amass a fairly large fortune.

**Arlaud**, Jacques Antoine (1668-1743), a celebrated miniature painter, was b. and d. at Geneva. He was held in great reputation in Paris, and came to England in 1721. In London he painted the miniatures of the Pretender's sister and of the duke of Marlborough. He bequeathed many books and curios to the library at Geneva.

**Arlberg**, a mt. of the Rhetian Alps, between the Tyrol and Vorarlberg, which 2 provs. are connected by the A. Pass, nearly 5900 ft. above the sea. A railway

tunnel, constructed 1880-84, is now in use. Its highest point is 4300 ft.

**Arlen, Michael** (real name, **Dikrân Kouyoumdjian**), novelist, an Armenian; b. at Rustchuk, Bulgaria, in 1895; educated at Malvern College; naturalised Brit. subject, 1922. In 1920 he had pub. *The London Venture*, and 2 years later his *Piracy* obtained favourable notice. Other books of his are: *These Charming People*, 1923; *The Green Hat*, 1924; *May Fair*, 1925; *Lily Christine*, 1928; *Young Men in Love*, 1929; *Babes in the World*, 1930; *Men dislike Women*, 1931. The first 2 of these he has dramatised.

**Arles**, a tn. of S. France, dept. Bouches-du-Rhône, on the l. b. of the Rhône, 17 m. S.E. of Nîmes, united with the Mediterranean harbour of Bouc by a canal.

**Arling**, the old name for the bird wheat-ear.

**Arlington**: 1. A banking post tn. in Massachusetts, U.S.A. Pop. 36,000. 2. Locality in Virginia. Near this Virginian tn., on the heights across from Washington, is situated the most famous of American cemeteries. The building and grounds were once the home of Robert E. Lee, the commander-in-chief of the Confederate armies during the Civil war. The grounds were taken over by the Federal Gov. Here he buried over 33,000 soldiers, among whom are many of the famous Federal officers of the Civil war. The body of the unknown soldier lies here in a splendid monument. Just as every year on Nov. 11 the Brit. royal family attends the services at the Cenotaph in London, so in the U.S.A. every

THE AMPHITHEATRE, ARLES

It is famous for its Rom. remains, which include baths, a palace of Constantine, an aqueduct, and an amphitheatre. Under the later Rom. emperors was one of the most flourishing of the Oltropicaline tns. It was a free city in the twelfth century. The old cathedral of St. Trophime, the finest Romanesque church in Provence, stands in the centre of the tn.; its chief portal, dating from the twelfth century, is a masterpiece of graceful arrangement and rich carving. The fifteenth-century church of St. Julien was destroyed by bombing from the air in the Second World War, and bombs also fell on the arenas and the old Rom. cemetery of Aiscamps. A. possesses flour-mills and oil and soap works, and sheep-breeding is a considerable industry in the vicinity. Pop. 31,014.

**Arlincourt, Charles-Victor Prévôt** (1789-1856), a Fr. author, was b. at the castle of Merantris, near Versailles, and d. in Paris. He held sev. gov. positions, but soon retired and gave his time to literature. Among his works are *La Caroléide*, a poem; *Le Siège de Paris*, a tragedy; and sev. novels.

year on the same date special services are held in A. attended by the President and Cabinet.

**Arlington, Henry Bennet, Earl of** (1818-1885), was b. at Arlington, Middlesex, and educated at Westminster School and Christ Church, Oxford. He was wounded in the Civil war, and employed afterwards by Charles as his agent at Madrid. Returning to England at the Restoration, he was a member of the unscrupulous 'Cabal'; he was created Lord A. in 1663, and earl of A. in 1672. He was impeached as a promoter of popery, a self-aggrandiser, and a betrayer of trust in 1674, and on the impeachment falling through he retired to his Suffolk seat, Euston.

**Arliss, George** (1868-1946), stage and film actor. B. London, Apr. 16. Made his first stage appearance at the old Elephant and Castle theatre, London, 1887. Made his first tour in the U.S.A. with Mrs. Pat Campbell, 1901. In New York created role of Zakkuri in *The Darling of the Gods*, 1902. After that year he devoted most of his acting time to theatres in America, where he became

a universal favourite. In recent years he only played 1 season in England, where he repeated his Amer. success in *The Green Goddess*, by William Archer. He also made a great reputation as a film star with impersonations of Disraeli, Wellington, Rothschild, and Voltaire. President of the Episcopal Actors' Guild of America. Author of plays (*There and Back and Widows' Weeds*), and of an autobiography *George Arliss, by Himself*, 1940.

**Arlon**, a Belgian tn., is cap. of the prov. of Luxembourg. It is a thriving place, having a considerable trade in corn, iron-ware, tobacco, clay pipes, and crockery. It is mentioned as early as A.D. 870; pop. 12,000.

**Arm**, the fore or upper limb in man from the shoulder to the wrist. The *humerus*, or bone of the upper arm, has at its upper extremity a convex spheroidal surface which fits into the glenoid fossa of the scapula, or shoulder-blade. The lower extremity has a small head or *capitellum* for articulation with the *radius*, and a *trochlea* or pulley for guiding the movements of the *ulna*. The *ulna* and *radius* are the bones of the forearm, and are articulated with each other and with the wrist-bones at the lower extremity.

The *deltoid* is the large muscle forming the shoulder cap, and serves to raise the A. from the side; it runs from the shoulder-blade to the middle of the humerus. The chief muscles engaged in lowering the A. again are the *latissimus dorsi*, attached to the front of the neck of the humerus, the *coraco-brachialis*, attached to the middle of the front of the humerus, and the *pectoralis major*, which forms the front fold of the armpit. The A. is flexed by the *biceps*, running from shoulder to elbow-joint in front, and is straightened by the *triceps*, running from shoulder to elbow at the back of the A. The muscles of the forearm consist of the flexors and extensors of the wrist and fingers.

The chief arteries are the *axillary*, passing under the armpit, and becoming the *brachial* as it traverses the upper arm, and the *radial* and *ulnar* arteries, which are the branches of the brachial running down the lower arm.

Fracture of the upper end of the humerus may result from direct or indirect violence. The neck or narrow part underneath the head is the most frequent seat of the fracture, which may result from a fall upon the shoulder, or indirectly from a fall on the outstretched hand or elbow. The bone is usually broken transversely, and after reduction has been effected, there is little risk of displacement again occurring if proper precautions be taken. A pad is placed under the armpit, the A. bound to the side, and the wrist supported by a sling. Fracture of the shaft of the humerus is usually caused by a blow on the A. The pieces frequently fail to unite, as muscular contraction is difficult to overcome. If the fracture occurs above the insertion of the deltoid muscle, the A. is put in splints, bound to the side, and the forearm bent at right angles; if it occurs below the insertion of the deltoid, the A. should hang vertically.

In either case the splints should be kept on for 4 or 5 weeks. Fractures of the lower end of the humerus are commonly caused by falls on the outstretched hand, and if not carefully treated may leave the patient with a stiff elbow. The fracture should be reduced under an anæsthetic, and the A. fixed with the elbow flexed as far as it will go. After a fortnight, passive movements should be commenced, and the amount of bending gradually increased.

Of the bones of the forearm, the *radius* is more liable to fracture, but both may be broken by a direct blow or by a fall. If the fracture is badly set, Volkmann's contracture may supervene. This is a condition in which the straightening of the wrist automatically flexes the fingers, which can only be extended again by bending the wrist. Colles's fracture is a

ARM, WITH FOREARM FLEXED

A, biceps; B, triceps; C, ulna; D, radius; F tendons.

fracture of the lower end of the radius, from  $\frac{1}{2}$  in. to  $1\frac{1}{2}$  in. above the articular surface. It is usually caused by a fall on the open palm when the elbow is slightly flexed, and produces a characteristic displacement of the lower fragment and the hand. When fixing the A. in splints, the fingers should be left unconfined, so that after the first day the patient may move them freely; this is necessary in order that adhesion of the tendons to their sheaths may not occur.

**Armada**, Spanish. Armada is a Sp. word, signifying simply an armed force, but applied specially to the great Sp. fleet fitted out against England in 1588. Philip II., the then king of Spain, had resolved to strike a decisive blow at Protestantism by conquering England, which had been formally handed over to him by Pope Sixtus V. The A. was under the command of the duke of Medina Sidonia, and consisted of 130 great war galleons, with 30 smaller ships of war. It carried 19,295 marines, 8460 sailors, 2088 slaves, and 2360 guns. It was scattered by a storm when it left Lisbon on May 29, 1588, and had to put in to Corunna to be refitted. It passed through the Eng. Channel towards Calais, as it was to work in co-operation with a land force collected in Flanders under the duke of Parma. But instead of going to the coast of Flanders to take in the troops there, the Sp.

admiral decided to sail directly to Plymouth and destroy the shipping in the harbour. In its progress the A. was attacked by the Eng. fleet under Lord Howard, with his lieutenants Drake, Hawkins, and Frobisher, who refused to come to close quarters, but attacked the enemy at a distance, pouring in broadsides with great dexterity. The great lumbering galleons were no match for the swift and easily handled Eng. vessels, and galleon after galleon was sunk, boarded, or driven on shore. The Eng. followed up the A. and harassed them with a running fire all through the week, till they took refuge in the port of Calais. Howard sent 8 fireships into their midst at midnight, and the Spaniards, in terror, cut their cables and stood out to sea. The Eng. ships came up with them at dawn off Gravelines, and after 6 hrs. furious fighting the Spaniards' best ships were shattered to pieces, and drifted upon the sand-banks of Holland with a N.W. wind. More than 4000 of their men had fallen, whilst not more than 100 of the Eng. had been killed. At a hasty council of war the Spaniards decided to return to Spain by sailing round the Orkneys. The Eng. ships were compelled to retire soon, owing to lack of powder, of which the ill-timed economy of Elizabeth had stinted them; but the storms of the N. seas finished the work of destruction. But 54 vessels of the 'glorious A.' returned to the ports of Spain, and those in a hapless plight. The inhab. of the Hebrides and the W. coast of Ireland treated the survivors from the vessels wrecked on their shores to a short shrift. The seamen and sailors who survived were so dispirited by their discomfiture that they were never weary of decanting upon the desperate valour of the Eng., and the unsurpassed violence of the tempestuous ocean which surrounds the Brit. Isles. The Eng. queen had a medal struck bearing the inscription, 'Deus flavit, et dissipati sunt.'—'God blow, and they were scattered.'

**Armadales**, tn. of Linlithgowshire, Scotland, 2½ m. S.W. of Bathgate. Near it are large chemical works. Pop. 5000.

**Armadillo** (genus *Dasyus*) is an edentate mammal peculiar to S. America, consisting of various species; it belongs to a family intermediate between the sloths and the ant-eaters. They are not, however, toothless, but have a variable number of simple molars, interlocking when the mouth is shut. They are covered with a hard bony shell, consisting of shields on the forehead, shoulders, and haunches, and of movable cross bands of plates across the back. They are of nocturnal habits, feeding on insects, worms, fruits, and roots; they are inoffensive, and their flesh is edible.

**Armageddon**, in the Apocalypse, is the place of the 'battle of the great day of God,' when the last fight will take place between the powers of good and evil. Its name is indubitably taken from that famous battlefield (Judges v. 19) in the plain of Esdraelon, where the chief battles of the Israelites were fought.

**Armagh**, an inland co. of N. Ireland, which is bounded on the N. by Lough Neagh, on the E. by co. Down, on the S. by Louth, and on the W. by Monaghan and Tyrone. Its area is about 512 sq. m. The N.W. of the co. is undulating and fertile. The N., however, consists principally of extensive bogs, and on the S. border is a range of barren hills. The chief rivs. are the Blackwater, which separates A. from Tyrone; the Upper Bann, which discharges itself into Lough Neagh; and the Callan, which flows into the Blackwater. There are sev. small lakes. The geological features of A. are: Lower Silurian rocks in the S. and centre; the trap of Antrim, with the underlying greensand, in the dist. round Portadown; carboniferous limestone in the basins of the Blackwater and Callan; granite in the S.E. mts.; and Tertiary strata in the neighbourhood of Lough Neagh. Lead veins have from time to time been worked in various parts of the co. The climate of A. is supposed to be one of the most genial in Ireland, with the least rainfall of any co., and it offers a relatively large area of cultivable soil. The number of cattle, sheep, pigs, and poultry is increasing. Agriculture, however, is not far advanced, the prin. crops being oats and potatoes, but all grain crops are decreasing, and flax, which was formerly grown to a considerable extent, is now neglected. Owing to the linen industry, however, the inhab. are generally in fairly comfortable circumstances. This manuf. is the prin. one, though it has somewhat declined in modern times. Apples are grown in such quantities as to entitle the co. to its name, 'the orchard of Ireland.' Communications are monopolised by the Great Northern railway, whose main line from Belfast divides at Portadown, sending off lines to Omagh, Clones, and Dublin. A branch from Omagh joins the Dublin line to Gorrageewood, and from this line there is a branch to Newry in co. Down. An electric tramway connects Bessbrook, a tn. with important linen manufs., to Newry. Pop. 109,000. The chief tns. are Armagh (7600), Lurgan (12,600), Portadown (11,700), and Bessbrook (2900). Assizes are held at A. The co. returns 4 members to the Parliament of N. Ireland and 1 to that of Great Britain and Ireland. The co. tn., A., is the see of an archbishop of the Protestant Episcopal Church, who is primate of all Ireland. It is of great antiquity, and has a Gothic building dating from the eighth century, and a Protestant as well as a Rom. Catholic cathedral.

**Armagnac** was the name formerly given to a dist. in the S. of France, a part of Gascony now generally included in the dept. of Gers. It has a fertile soil, and is noted for its wine and brandy.

**Armagnac**, Counts of, were members of an anc. ruling family of the Fr. prov. of A.; they held sway from 1319 to 1525. The most celebrated member of this family was Bernard VII., who gave the name of A. to the faction which was opposed to the Burgundians in the Civil war of 1410-35. In 1410 Bernard VII.

married his daughter to the young Duke Charles of Orleans, and henceforth was the head of the Orleans, or A. party. The Burgundians, who were in reality the popular party, had on their side the univ., the common people of Paris, and the powerful guild of the butchers; whilst the A., or aristocratic party, were supported by Queen Isabella and the princes and aristocracy of Paris. Parliament kept aloof from the struggle, supporting neither side. The A. faction had for their banner that of the A. family, a white flag, whilst the Burgundians carried the cross of St. Andrew. The struggle of the rival parties was terminated in Sept. 1435 by the treaty of Arras, when the Burgundian court was reunited to that of France.

**Armament, Limitation of.** See DISARMAMENT.

**Armand-Dumaresq, Charles Édouard** (1826-95), a Fr. painter. His work consisted of military pictures, portraits, and water-colour drawings. The titles of some of his pictures are: 'Charge de la division Desvaux & Solferino,' 'Cambronne à Waterloo,' and the 'Défense de Saint-Quentin.'

**Armature,** the arrangement of coils which in a dynamo passed through the magnetic field, thus inducing a current. The A. may be stationary and the magnets movable, or vice versa. The term is also applied to the piece of soft iron which connects the poles of a horse-shoe magnet when not in use. It affords a good path for the lines of force, and thus tends to retain the magnetism which is lost through an air gap.

**Armed Neutrality,** a league of the N. powers of Europe—Russia, Denmark, and Sweden—formed in 1780, which first gave international validity to the principle that 'free ships make free goods.' A proclamation of Catherine of Russia laid down that (1) neutral ships may sail freely from port to port and along the coasts of belligerents, so long as they do not carry contraband of war; (2) that only real and effectual blockade shall be recognised. The doctrine was accepted by Prussia and Austria in 1781, but refused by Great Britain. The league was suspended at the peace of 1783, but revived in 1800 for a short time. The settlement of the questions in international maritime law involved in the doctrines of the league was only made in 1856 by the declaration of Paris.

**Armengaud, Jean Germain Désiré** (1797-1869), a Fr. writer. He devoted his time to the study of art, visited the museums of Europe, and became a great critic. Amongst his works are: *L'Histoire des peintres de toutes les écoles, depuis la Renaissance jusqu'à nos jours*, 1849; *Les Galeries publiques de l'Europe*, 1856-65; and *Les Chefs-d'œuvre de Rubens à la cathédrale d'Anvers*, 1859.

**Armenia** (or **Hyastan**).—A Soviet Socialist Republic, occupying uplands between the Persian plateau and Asia Minor and bounded on the N. by the Black Sea, on the S. by Kurdistan, on the E. by Azerbaijan, and on the W. by Turkey. Before the First World War, A.

comprised the whole of the lofty tableland in the upper valleys of the Euphrates, Tigris, Aras, and Kur; it was 400 to 500 m. long, about the same in breadth, and covered about 63,000 sq. m. It had ceased, however, to exist politically long before the First World War and was shared between Turkey (35,600 sq. m.), Persia (6520 sq. m.), and Russia (20,600 sq. m.). But the area of the present republic of A. is no more than 11,900 sq. m. It will be convenient in describing the physical features of A. to include the whole of the old tableland, which, intersected by the Tigris, was formerly divided into A. Major and A. Minor. This country is an elevated plateau, partly surrounded by the ranges of Taurus and Anti-Taurus, and in part occupied by other mts., of which M. Ararat is the highest. To the E. of the valley of the Aras, the plateau of Kara Bagh reaches a height of 11,000 ft. The mt. system is mostly volcanic, trachyte and angite porphyry being mainly represented. The numerous cones are for the most part old craters. The Murad Su (E.), and the Kara Su (W.) Euphrates form the head waters of that riv. The head waters of the Tigris are formed by the Shett, rising to the S. of Van Lake, and an arm of the Diarbekr, rising in the Alinjik Dagh. Even the present diminished A. can still claim that the Rs. Euphrates, Tigris, Kur, and Tchorokh all take their rise within its boundaries. There are 3 climatic regions distinguished in A. A region of rains, with a sub-tropical climate, extends along the valley of the Kur from 1815 to the Caspian Sea and the valley of the Upper Tigris; a region of perpetual snow, which on Mt. Ararat, the meeting of the former Russian, Turkish, and Persian boundaries, save on the N.W. side, starts as high as 14,000 ft., but which elsewhere begins at a height of about 11,000 ft.; and an intermediate region, of various grades, including the plateau chains, at a height of 12,000 to 13,000 ft. The last-named zone ranges from a S. European climate on the plain of the Kara Hissar to a mid-European climate, with a late harvest, on the mid slopes of the frontier mts. The volcanic, dry, and treeless plateaus have a very severe climate, with long and bitter winters, and short summers, very hot during the day, but invariably cold at night. The cold N. winds give rise to the storms which render the navigation of the Black Sea fraught with such great danger. Much the richest belt of vegetation is the broad valley of the Aras; but the marshes, caused by the number of irrigating channels, render this the most unhealthy part of A. Since the estab. of the Soviet Gov. (A. was proclaimed a Soviet republic on Apr. 2, 1921), irrigation works have been restored or constructed to a total length of nearly 190 m. There are, however, rich orchards and vineyards, and fields of tobacco, rice, hemp, flax, and cotton. A little corn is cultivated, but the high tablelands are chiefly pastoral in character. The hist. of A. has been

largely influenced by its physical features. The isolation of the valleys, especially in winter, encouraged a tendency to separation, which invariably showed itself when the central power was weak. The mts. have always served as the breeding-place of the independent and proud-spirited mountaineers, and as the sanctuary in times of invasion for the lowlanders. The country stood as an open doorway between the E. and the W. It connected the Iranian plateau with the protected harbours and fruitful lands of Asia Minor, and nations have striven for its possession from the remotest periods of antiquity. The original inhab. of A. are unknown, but about the middle of the ninth century B.C. the mass of the people belonged to that great family of tribes which seems to have been spread over the W. part of Asia, and to have had a common non-Aryan speech. There was, however, intermingled with this race an important Semitic element of Assyrian and Heb. origin. Between 640 and 600 B.C., the country was conquered by an Aryan people, forming a military aristocracy that was recruited from Persia and Parthia. They imposed their language, and possibly their name, upon the conquered inhabs., though apparently but a small amount of intermarriage took place. Many of the Aryan and Semitic Armenians migrated to Constantinople and Cilicia, after the Arab and Seljuk invasions; and the remains of the aristocracy were swept away by the Mongols and Tartars. The diversity of type and characteristics existing amongst the modern Armenians may be due to this fact. In the recesses of Mt. Taurus the peasants are tall, good-looking, agile, and brave. In A. and Asia Minor they are robust, thick-set, and coarse-featured, with straight black hair and large hooked noses. They are good cultivators of the soil, but are ignorant, poor, and superstitious. The townsmen have more regular features, approximating in many cases to the Persian type. They are remarkable for their industry, their aptitude for affairs, and their keen intelligence. They possess the same enterprising spirit which led their ancestors in Rom. times to trade with Scythia, China, and India. They are skilled artisans, bankers, and merchants, and many of the aristocracy have occupied positions in the public service of Turkey, Russia, Persia, and Egypt. The Armenians are essentially an oriental race; they have, like the Jews, whom they also resemble in their widespread dispersion and their exclusiveness, a remarkable indissolubility of national character and faculty of adaptation to circumstances. They are frugal, sober, and intelligent, strongly attached to old manners and customs, but with a promising desire for progress. On the other hand, they are greedy of gain, self-seeking, and unstable in character, and with a love of intrigue which has had an unfortunate influence on their hist. The conversion of King Tiridates, mentioned below is the earliest authentic account of the introduction of Christianity into A. In the same century

Armenian Christians studied at Athens. In the eccles. monophysite controversies of the fifth century concerning the nature of Christ, the Armenian Christians refused to accept the decisions of the Council of Chalcedon, and constituted themselves a separate church. The popes have at various times attempted to force them into reunion with the Rom. Catholic Church, but did not succeed in bringing about a lasting agreement.

All kinds of cereals and cotton, sesame, flax and hemp, rice and tobacco are produced in the valleys and plains; silk-worm breeding, sheep-rearing, and fruit culture are all capable of great development. There are large untapped mineral resources. Naphtha, bitumen, sulphur, and nitre are found, and the mts. yield precious metals, copper, iron, lead, marbles, and salts. Numerous hot and cold mineral springs abound, comparable, almost, to those of Vichy. There is a large carpet industry. To-day a large number of industrial enterprises have been estab., the chief being the Kirovakan Chemical Combine, the Davali Cement Works, a spinning-weaving plant, a large synthetic rubber trust, some soap factories, and cotton-cleaning works. The cap. is Erivan (pop. 111,500). The next tn. is Leninakan, formerly Alexandropol (53,000).

*History.*—The Armenians called themselves Haik, whence the Persian name of A., *Hajastan*; the Medes applied the name of a single obscure clan, A., to the whole land. Under this name they have been known as a nation since the time of Herodotus. Little is known of the early history of A., but it was a separate state as early as the eighth century B.C., when it became subject to Assyria, as it subsequently did to the Medes and the Persians. It was conquered by Alexander the Great in 325 B.C., but regained its independence c. 190 B.C. Its king, Tigranes, son-in-law of the celebrated Mithridates, after having been defeated by the Romans under Lucullus and Pompey, c. 69 B.C., was left on the throne. Shapur I., the second of the Sassanid kings, conquered A., but under Diocletian it was recovered for Rome, and Tiridates the Great returned to the throne. This Tiridates having been converted to Christianity by St. Gregory the Enlightener, A. became henceforward the bulwark of Christianity in Asia. After many vicissitudes of fortune it re-emerged in the ninth century into a state of considerable importance. In A.D. 885 Aschod I., who came of an old and powerful Armenian family, ascended the throne with the permission of the caliphs. He founded the third Armenian dynasty, that of the Bagratides, who claimed descent from King David of Israel. The imposing ruins of their cap. at Ani, between Echmiadzin and Kars, show that the kingdom prospered under their rule. Their dynasty lasted till the eleventh century, when the Gks. seized a part of the kingdom, weakened as it was by internal dissensions, and killed the last king of the Bagratides; the Turks and Kurds overran

most of the remainder, a few chiefs with difficulty preserving their local autonomy. The whole of A. Major was conquered by the Mongols in 1242. The last king of A., Leon VI., was taken prisoner by the Saracens in 1375. The E. part of A. became a Persian prov. in 1472, and the W. part was afterwards taken possession of by the Turkish sultan, Selim II. For a long time now A. was laid waste by the Mongols and the hosts of Timur, and fought for by the Ottoman sultans and Persia, till Russia at length gained possession of the whole of the upper valley of the Araxes. According to travellers, the Armenians enjoyed security of person and protection under the Russians, such as neither Turkey nor Persia granted to them. At the close of the Russo-Turkish war, Ardahan and Kars were ceded to Russia by the treaty of Berlin, 1878, thereby adding 6687 sq. m. and 271,000 persons to Russian suzerainty. There is no doubt that amongst the Armenians themselves at this period there was a widespread desire that Russia should be their ruler, if any nation were. Great Britain on this occasion secretly guaranteed that Turkey should retain her Asiatic possessions on condition that she brought about reforms, and protected the Armenians from the Kurds and the Circassians.

In the First World War A. was a coveted pawn in Germany's 'Drang nach Osten' dreams. Its mts. dominated the centre of the Berlin to Bagdad route. It was essential to the fulfilment of this dream that a vigorous campaign should be waged in A., so as to drive out the allied forces and thereby, ultimately, gain control of the Persian Gulf and the gate to India. In 1915 the Grand Duke Nicholas had concentrated in the Caucasus an army of 200,000 men for a great offensive in A. In the early months of 1916. Owing to the Brit. setback in Mesopotamia in the autumn of 1915 he launched the attack much earlier than he had intended. The Turks were heavily defeated near Erzerum (Jan. 16, 1916) and by the middle of Feb. the seemingly impregnable forts of Erzerum had been conquered and the tn. itself was hastily evacuated, an enormous booty falling into the hands of Gen. Yudenitch. By Apr. the brilliant strategy of the grand duke had resulted in the fall of Bitlis and the capture of the important tn. of Trebizond. Everywhere Cossack cavalry relentlessly pursued the demoralised Turks, and nearly the whole of the Turkish A. was now in the grasp of the Russian armies. Unhappily for allied hopes, the disastrous issue of Gallipoli set free the large Turkish army of that peninsula. Kut was besieged and Gen. Townshend surrendered (April 29, 1916). Thereafter, though the Russians captured Erzincan, their further advance was checked. Soon they had to abandon Bitlis again, and thenceforth the grand duke was on the defensive.

In 1918, during the Russian Revolution, an independent 'Republic of Trans-Caucasia' was formed by the union of A. with Azerbaijan and Georgia. The

'settlement' satisfied the Socialistic propagandists of Moscow as well as those crafty Ger. champions of the *Mittel Europa* dogma whose efforts were directed to detaching as many states from Russia as possible and giving them a hazardous autonomy dependent on themselves. This union, however, was dissolved in 1918, when the Allies recognised the independence of the Armenian republic. By the treaty of May 11, 1920, Turkey, too, recognised A.'s independence. Previously a mandate under the League of Nations had been offered to the U.S.A., but was not accepted. See also ARMENIAN ATROCITIES.

**Armenian Language and Literature.** The Armenian language belongs to the Indo-European family of languages, and is most closely connected with the Iranic group. The old Armenian or Haikan language is still the literary and eccles. medium and is distinguished from the ordinary spoken Armenian, which is of more modern origin, and contains a large proportion of Persian and Turkish elements. The language as a whole has many peculiarities of structure. There are 7 cases, and no distinction of gender amongst nouns; whilst there are in verbs 4 conjugations and 4 tenses. The E. dialect is much purer than that of Constantinople. The language has great strength and flexibility but is consonantal and harsh to the ear. The alphabet has 36 characters. No literary remains of the period before the introduction of Christianity exist save a few old songs and ballads. These suffice to show that the Armenians had adhered to the Assyrian or Medo-Persian system of culture. The Gk. language and literature soon became favourite objects of study, and many Armenian translations were made. At a later period the Gk. alphabet was used by the W., and Syriac by the E. Armenians. Arzan (d. 459) translated the works of St. Athanasius into Armenian, and wrote treatises against idolatry. In the beginning of the fifth century St. Mesrob, with Sahak the Great, wrote the Armenian translation of the Bible, which was esteemed the highest model of classic style. In the fourteenth century literature began to decline, and few works worthy of note were produced after this period; but since their dispersion the Armenians have always cherished their national literature. Armenian literature was purely monkish; there was not, as in the neighbouring country of Georgia, any epic or romantic literature.

Nansen, *Armenia and the Near East*,

1928; D. Tutaeff, *The Soviet Caucasus*, 1942.

**Armenian Atrocities.** After the change in Russian policy and the failure of the powers to secure reforms, following on the treaty of Berlin, the advanced party (Nihilist) amongst the As. determined to try to produce disturbances such as those that had given birth to Bulgaria, and so gain their object. The revolutionary movement was strongly opposed by the A. clergy and the Amer. missionaries; whilst its irreligion, and the self-seeking of its leaders, rendered it unacceptable to the mass of the people. In the summer of 1893 an emissary was captured near Mush, and a raid was made on the dist. by the Kurdish Irregular Horse, acting on the orders of the governor. The As. held their own both then and again when they were attacked in the spring of 1894. The sultan then issued a firman calling upon all loyal subjects to aid in suppressing the revolt, and regular troops were called up from Erzerum. A massacre of a most brutal character ensued, which aroused great indignation in Europe. In Nov. 1894 a Turkish commission of inquiry was sent to Armenia, accompanied by the consular delegates of Great Britain, France, and Russia, who elicited the fact that the action of the authorities was not justified. Great Britain pressed for reforms and coercion of the sultan, but was not supported by the other powers. During the negotiations disturbances occurred, and at Trebizond a massacre took place on Oct. 8, 1895. On Oct. 17 following the sultan accepted the scheme of reforms, but refused to publish it, and in Armenia massacre followed massacre in quick succession until Jan. 1, 1896. In the summer of 1896 there were massacres at Van, Egin and Inksar; and on Aug. 26 the Imperial Ottoman Bank at Constantinople was seized by revolutionists as a protest against the Christian powers who had left the As. to their fate. The Gov. had had warning of this, and at once turned loose the rabble, previously armed and instructed, on the streets; a 2 days' massacre followed, during which from 6000 to 7000 Gregorian As. perished. Resistance only served to aggravate the slaughter, Zeitun being the only place where a successful stand was made. There the people received honourable terms after 3 months' fighting. The actual perpetrators of the massacres were the local Moslems, aided by Lazis, Kurds, and Circassians. No one was punished for the massacres, but many were rewarded. Men and women were butchered in prisons and churches; schools, houses, and churches were plundered, and the destruction of property was enormous; the number of those that were killed was from 25,000 to 33,000, including those at Constantinople. Efforts by Great Britain and the U.S.A. to alleviate the distress met with some success, though opposed by the authorities. The A. revolutionary societies continued their propaganda down to the granting of the Turkish constitution in 1908; meanwhile further massacres occurred here and

there, notably at Mush in 1904 and Van in 1908.

In 1915 Christian Armenia was for the greater part of the year the scene of the most devastating massacres in the tragic hist. of that ill-starred country. In these massacres the most abominable cruelties were practised. Moslem eye-witnesses record that in the suburbs of Mush they saw large numbers of A. men, women, and children lying in the fields. Some had been shot, some stabbed, and nearly all horribly mutilated. On the way, from Mush to Hinis piles of bodies were seen lying at short intervals by the roadside, and between Hinis and Skerkis-Keul were seen 2 ravines filled with corpses, mostly of men, there being about 400 in each ravine. The Turks had, in fact, aimed at exterminating an entire race, in order to destroy any possible chance of A. acquiring autonomy then or at any future time; and such protesting voices as were raised were, in the nature of things, few and ineffective. Further massacres took place at the time of the revival of Turkish aspirations in Europe and the Græco-Turkish war, 1922, and mobs of wretched refugees flocked into Baqubah in Iraq to seek the protection of the Brit. authorities, and later were sent down to Basra.

**Armentières**, a Fr. tn. in Nord, 10 m. W.N.W. of Lille, on the R. Lys, has manufs. of linen and cotton goods, lace, soap, etc., and a large trade in grain. It was the centre of the heaviest fighting in the battle of Picardy during the great and final drive against the Brit. armies (Mar. 1918). In 1914, during the race to the Channel ports, the Gers. captured the tn., but were driven out by the Brit., who occupied it until Mar. 1918, when the Gers. overwhelmed it with shell-fire (second Somme battle). Pop. 21,000.

**Armfelt**, Gustav Moritz, Count of (1757-1814), was b. in Finland. He displayed remarkable courage and spirit during the war between Sweden and Russia, 1788-90, and as military representative of Gustavus III. concluded the peace of Verelä. He went as ambassador to Naples, and entered into correspondence there with certain parties in Sweden for the purpose of overthrowing the regency, which was in the hands of the duke of Sudermania. The plot was discovered and he was deprived of all his powers and titles. He was restored to favour and honour in 1799, when Gustavus IV. received the crown. He was afterwards obliged to flee to Russia, being implicated in the poisoning of the prince of Augustenburg. There he received high honours.

**Armiak**, cloth woven of camel's hair by the Tartars, also a caftan made of A. **Armidale**, a tn. of New S. Wales, Australia. Gold, wolfram, and antimony are mined there and it is the centre of a sheep-rearing dist. Pop. 7000.

**Armiger**, see ESQUIRE.

**Armilla** (Lat., ring), a bracelet which was worn by both sexes among the Medes, Persians, Gauls, and Sabines. Both Gks. and Romans looked upon them as feminine adornments, but in some cases of signal

merit an A. was conferred publicly upon Rom. soldiers.

**Armillary Sphere.** The Lat. word *armilla* signifies a bracelet, and an A. S. is one in which the principal circles of the heavens are shown by means of metal rings put together in their relative position. By its means many observations and calculations were made by the anc. astronomers, but its use for this purpose has been superseded by the celestial globe.

**Armin, Robert**, a comic actor and author, was a contemporary of Shakespeare. He was a pupil of the famous actor Tarleton, and amongst other Eng. actors visited Scotland. He was one of the players licensed by James I., and he played in Shakespeare's dramas. His works are *The Italian Taylor and his Boy*, 1609; *A Nest of Ninnies*, 1608; and *The History of the Two Maids of Moreclacke*, a drama printed in 1609.

**Armine, Sir William** (1593-1651), was a Parliamentarian, and became M.P. for Boston, Grantham, and Lincolnshire. He refused to levy an arbitrary loan in Lincolnshire and was imprisoned. He was afterwards sheriff of Lincolnshire, and of Huntingdonshire; and a member of the council of state, 1648; 1650, and 1651.

**Arminians**, see ARMINIUS, JACOBUS.

**Arminius**, a famous chief of the Ger. tribe of the Cherusci, was b. 16 B.C. Sent as a hostage to Rome, he served in the Rom. army, and reached the rank of eque. Returning home, he placed himself at the head of the discontented tribes near the Rhine, and completely annihilated the Rom. army under the governor, Quintilius Varus. He was assassinated in A.D. 19, having been suspected of aiming at kingly power. A monument to his memory was unveiled near Detmold in 1875.

**Arminius, Jacobus**, or Jakob Harmensen, founder of Arminianism, was b. in 1560 at Oudewater in S. Holland. He studied in the univ. of Leyden, and at Geneva, where his chief theological tutor was Theodore Beza. He was appointed minister of a church in Amsterdam on his return, and was chosen to refute a work which was totally opposed to Beza's doctrine of predestination. He was, however, convinced by the arguments of the work, and on declaring his opinions openly in 1603, he was to the end of his life engaged in a series of bitter disputes with his opponents. A. asserted that God bestows forgiveness and eternal life on all who repent of their sins and believe in Christ; Franz Gomar and his party maintained that God had by an eternal decree predestinated what persons should be saved. A. died of a complicated disease in 1609.

**Armistice** is a temporary suspension of hostilities between 2 opposing belligerent powers by mutual agreement. It is sometimes concluded for a few hours to allow of a parley, burying of the dead, etc.; a general A. is the usual preliminary to a peace. A general, as opposed to a partial or local A., suspends all military and naval operations of the belligerents

and, being concluded by the commanders-in-chief on behalf of their respective govts., requires ratification. The dates of the various As. in the First World War were; Central Empires-Russia, Nov. 29, 1917; Rumania-Central Empires, Dec. 7, 1917; Central Empires-Ukraine, Feb. 9, 1918; Allies-Bulgaria, Sept. 29, 1918; Allies-Turkey, Oct. 30, 1918; Allies-Austro-Hungary, Nov. 3, 1918; Allies-Germany, Nov. 11, 1918. The famous A. of Nov. 11, 1918, was concluded by Marshal Foch and Adm. Wemyss for the Allies with the civil and military representatives of Germany. The allied representatives were, however, acting under the fullest instructions from the Supreme Council in Versailles. This A. was modified sev. times before ratification, and under it the Gers. had to evacuate the invaded territories, including Alsace-Lorraine, within a fortnight and fall back to a stated distance beyond the Rhine, thereby establishing a neutral zone, and obviating any possibility of collision between the troops. Germany was to bear the cost of maintaining the armies of occupation in the Rhineland and Alsace-Lorraine. The other primary conditions imposed on Germany included the surrender of 10 battleships, 14 battle cruisers and light cruisers, 50 modern destroyers, and all her U-boats; also 5000 heavy and field guns, 30,000 machine guns, and 2000 aeroplanes, besides a large quantity of rolling-stock and lorries.

The treaty of Versailles, concluded in 1919, embodied these provisions with, of course, extensive additions. In the forest of Compiègne is an A. monument situated in a *Carrefour de l'Armistice*, which was unveiled on Nov. 11, 1922. It marks the spot where the Gers. signed the A. and bears the inscription: 'Ici le 11 Novembre 1918 succomba le criminel orgueil de l'Empire allemand vaincu par les peuples libres qu'il prétendait asservir.' There exists no similar monument in England, but the Cenotaph in Whitehall serves much the same purpose. In 1940 Hitler, having routed the Fr. armies, forced the Fr. commander, Pétain, to an A., which was signed in the forest of Compiègne on June 22 (regardless of the existence of a Franco-Brit. agreement forbidding the making of a separate A. or peace). This A. was tantamount to unconditional surrender and put the Gers. in occupation of the N. half of France and the whole Fr. coast. With a sense of the melodramatic Hitler's plenipotentiaries met those of France in the forest of Compiègne on the same spot, in the same railway coach as that in which Foch had handed his terms to the Gers. in 1918. A Fr.-It. A. was signed at a villa near Rome on June 24. There was no A. at the end of the war. On Mar. 14, 1945, it was announced in Washington that allied military leaders were prepared to accept unconditional surrender of Ger. units of any size but would not enter into any A. or truce.

**Armisticio**, a ter. of Venezuela, bounded by the states of Los Andes, Zamora,

Bolivar, and the United States of Colombia. Area about 7100 sq. m. The region is fertile, being well watered by the tribs. of the R. Orinoco.

**Armley**, formerly township of West Riding, Yorkshire, England, on R. Aire, formed part of Leeds by Leeds Corporation Act 1926.

**Armorial Bearings**, a general term for heraldic insignia. Strictly speaking, it should be confined to those devices 'borne' on the shield.

**Armorica** was the country of the Armorici, who occupied the coast of Gaul between the Seine and the Loire in the first century B.C. In later times the name was confined to Brittany.

**Armour**. See **ARMS** and **ARMOUR**.

**Armour, Donald John** (1869-1933), Canadian neurologist and brain surgeon, b. in Ontario; son of a Canadian chief justice and president of the Court of Appeal. Lettsoman lecturer, Medical Society of London, 1927, and president of that body, 1929-30. Wrote *Surgery of the Spinal Cord and its Membranes and Injuries to the Brain and Spinal Cord*.

**Armour, Philip Danforth** (1832-1901), Amer. merchant and philanthropist, b. at Stockbridge, New York. In 1863 he founded the firm of A., Plankington & Co., pork packers, at Milwaukee. In 1870 the firm removed to Chicago and was reorganised as A. & Co., becoming the largest of its kind in the world. A. founded the A. Institute of Technology and the A. Mission in Chicago.

**Armoured Cars**. A. C. form part of the Tank Corps and are organised into companies. A company consists of 4 sections of 4 cars each, with 1 extra car. In the First World War conditions on the W. Front only favoured the use of A. C. in the later phases, and they were mainly employed in Egypt, Mesopotamia, Ger. E. Africa, Palestine, the Indian frontier, and Persia, and in these regions they played an important part both in conjunction with cavalry or other troops and as independent units. Medium type A. C. are armed with a machine gun carried in a single revolving armoured turret. The engine and petrol tank are also armoured. The maximum speed is 60 m.p.h., and the radius of action without carrying extra petrol is 400 to 500 m. on good roads and half that distance on loose ground. The crew, including car commander and driver, numbers 4. The general functions of A. C. are reconnaissance and operation as advance guards or rear-guards. They may sometimes be useful for augmenting outposts, and can also be used for independent missions, such as seizing important tactical points in advance or on the flank of the enemy. A. C. are especially useful in co-operating with cavalry, for they can relieve cavalry of tasks entailing extensive movements and, during an advance, can locate and repel slight opposition before the cavalry approach. For patrol work A. C. are invaluable, as was proved in Shanghai in 1927-28. Most of the regular cavalry regiments have been converted into A. C. regiments, by combining squadrons of

A. C. and light tanks operating wholly as mechanised units.

**Armoured Corps, Royal**, created in Apr. 1939, when it consisted of 18 cavalry regiments and all the units of the Royal Tank Corps, which later was renamed the Royal Tank Regiment. Most of these cavalry regiments had already been mechanised, and their incorporation in the R.A.C. confirmed the permanent substitution of the internal-combustion engine for the horse. Strictly the hist. of the R.A.C. begins only in 1939, but its very existence is due to the tank and armoured car, which had records dating from the First World War, and indeed sev. of the regiments now forming part of it first saw service more than 250 years ago. In 1927 an 'Armoured Force' was formed on Salisbury Plain, made up of a reconnaissance group of tankettes and armoured cars, a main group of about 50 medium tanks, supporting artillery, a machine-gun battalion, and Royal Engineers and signal services, but not all armoured. This force was the first armoured formation, and on its work was founded the principles in use throughout the R.A.C. in later years. The conversion of the 11th Hussars and the 12th Lancers in 1928-29 into a 'cavalry armoured car regiment' was the forerunner of wholesale conversion 10 years later, when only the Household Cavalry, 1st Royal Dragoons (converted into an armoured car regiment during the Second World War), and Scots Greys remained horsed cavalry. The formation of the R. A. C. was announced immediately after this conversion, thus concentrating all the armoured units of the Army into 1 corps. The 10 years' delay was regrettable but was due to constantly changing tank design and tactics, parl. refusal to incur heavy military expenditure, and prejudice in favour of the horse. When the bulk of the cavalry regiments were converted, some were mechanised as light tank regiments, and some as 'mechanised divisional cavalry regiments.' The latter performed the role of the old horsed divisional cavalry—i.e., primarily that of reconnaissance and holding ground for short periods—and, for these duties, they were equipped with light tanks and scout carriers very similar to the later Bren-gun carriers. After the Dunkirk evacuation in 1940 these divisional cavalry regiments were not re-formed as such. In Mar. 1940 it had been decided to group them into 'Armoured Reconnaissance Brigades,' and when the B.E.F. advanced into Belgium, these regiments, preceded by armoured cars, led the advance. But after Dunkirk their duties were performed by battalions of the Reconnaissance Corps. Armoured cars were widely used in the First World War, and formed the nucleus of the 'Light Armoured Motor Batteries' of the Machine-Gun Corps, which operated mainly in the Middle E. Later they became incorporated in the Armoured Car Companies of the Tank Corps when it was reorganised after the war. In the period before the Second World War almost all the Brit. armoured cars were in India,

and saw service on the N.W. Frontier. The R.A.F. also used them with advantage in Iraq. The 1st Royal Dragoons (armoured car regiment) played a very notable part in the operations in the W. Desert in 1941-42 and in Tunisia. The Queen's Bays (tanks) also rendered effective service with the Eighth Army and, later, with the First Army against the Axis forces in N. Africa. For reconnaissance work the armoured car still holds its place and should do so unless and until it is displaced by a silent high-speed tank. For operating behind the enemy's lines, a high-speed tank, however, is always the better weapon. The armoured car was originally evolved as a method of transporting a machine-gun; but it has long become a distinct weapon in itself, and one with which all modern armies must be equipped. The fact that no invasion of Britain took place in 1940 enabled the War Office to proceed with mechanisation and motorisation. Thus many of the units re-formed after Dunkirk became 'motor-machine-gun regiments,' and later the motor-machine-gun brigades became armoured brigades, and very soon new armoured divs. were in existence. Some of these armoured forces fought with great success in Libya, Greece, Burma, and elsewhere. When the R.A.C. was formed the Royal Tank Regiment retained its corps badge. The badge of the R.A.C. is a mailed fist in a plain circular frame, with a crown at the top. Training for the corps is carried out at the Armoured Fighting Vehicle School, which comprises the Driving and Maintenance Wing, Wireless Wing, and Gunnery Wing. Consult J. R. W. Murland, *The Royal Armoured Corps*, 1943.

**Arms and Armour** (Lat. *arma*, arms). From the earliest times man's ingenuity has devised weapons of offence and defence. The oldest relics we have are of stone weapons, these in course of time being superseded by bronze and iron. The heads of battle-axes, spears, and arrows made of stone have been found in many parts of the world, the only defensive armour commonly used contemporaneously being shields. The shields of the earliest period were of bronze, and round in shape, being held in the left hand by a handle under the central boss. The Israelites are said to have used a larger and a smaller shield; the larger, trans. 'shield,' 'buckler,' or 'target,' belonged to the heavy spearmen and lancers (1 Chron. xii.), the smaller, rendered in the Bible 'shield' or 'buckler,' was carried by archers (1 Chron. v.; 2 Chron. xiv.). With the advent of bronze and, shortly after, iron, we find swords of various shapes becoming almost universal, while means of protection also greatly increased. The Gks. had shields, helmets, greaves, and cuirasses of bronze; their offensive weapons, usually made of the same metal, consisted of spears, lances, javelins, and swords. Homer, in his works, describes these arms, and refers in the *Odyssey* to the use of the bow. In his time, however, the principal weapon was the spear, the sword being short and

used at close quarters for stabbing. The protective armour was heavy, and later a quilted coat was substituted for the cuirass. The size of the shields, too, was reduced from time to time; the older forms, being sufficiently large to cover the whole body, became more noticeably cumbersome with the increased use of the sword. The Romans had much the same armour, but generally of iron and lighter than that of the Gks. The cuirass of the Romans was shaped to the figure, and furnished with shoulder-guards and a series of pendent plates which extended almost to the middle of the thigh. The Gk. shield was round or oval, while the Romans had 2 common forms, 1 small and round or oval, the other large and rectangular. The Roman shield was commonly of wood, hide-bound, and protected by metal; the sword short, 2-edged, and pointed. The metal cuirass, too, gave way among the legionaries to a leather tunic, strengthened by bronze or iron rings attached to the exterior; and a kind of chain armour was latterly worn by the horsemen. Both the Egyptians and Assyrians were expert in the use of the bow, which found little room in the Gk. or Roman camps. Chariots with swords projecting from the axle on each side and large catapults originated among the Assyrians, while battering-rams were commonly employed. Among these nations the helmet seems to have come into use at an early period, and while it varied greatly in shape, the face of the wearer was usually left unprotected. Greaves, too, were in common use for the protection of the leg between the knee and ankle and were often worn only on one leg, the one advanced in combat. In contrast, the Germanic races relied largely on battle-axes and swords, while their protection consisted of large shields constructed at first of light wood covered with leather. Through Roman influence, these were bound and strengthened by leather and the size was reduced and, at the same time, defensive armour was adopted after the Roman style, with some modifications. By degrees the defensive armour was improved until the time of the Norman Conquest, when we find the invaders armed with long lances in addition to battle-axes and long swords. Bowmen took a prominent position among the Normans, but from the Bayeux tapestry the bows appear to have been only about 3 ft. long. About this time, too, the cross-bow was introduced. Long before the time of the crusades chain mail was in general use among the N. nations. The Holy war, however, kindled an enthusiasm for this kind of personal defence, and under the feudal system the period of the prim. development of body armour was reached. Every man had the A. and A. which appertained to his rank and condition. The old form of helmet was discarded for a larger one, which completely enveloped the head and was fitted with a visor to protect the face, leaving only small apertures for air and sight when down. In the eleventh and twelfth centuries the

armour consisted of a hauberk or tunic of mail for the body, hose of mail for the legs, a conical helmet, and a circular or kite-shaped shield. Towards the end of the twelfth century the round shield became rare, being superseded by triangular or flat-iron-shaped shields. In the second half of the thirteenth century, the mail defences of the limbs were reinforced by shoulder-pieces, elbow- and knee-pieces, and greaves or shin-pieces. The armour was also extended from the man to the horse. During the fourteenth century complete suits of plate armour came into use, and much was done to strengthen the joints and weak spots. Indeed, so perfect did the protection become that it was the exception to cause much injury in fighting without actually beating the armour in. Horses, too, were protected by metal plates which covered the body but allowed free play to the limbs. The face being hidden when the visor was closed, coats-of-arms were engraved or worked upon the shield and cuirass as means of recognition. This work became more and more elaborate, gold being used in the decoration; and surcoats, richly worked with the distinctive arms of the wearer, were commonly worn, the shapes and colours being of infinite variety. The waistbelt from which the sword hung, and which sometimes confined the skirt of the surcoat, was most conspicuous, the art of the goldsmith and jeweller being lavished in its construction. During the early part of the fifteenth century the surcoat disappears and also the horseman's shield, the size of which had been gradually diminishing. The armour grows still more perfect, overlapping plates being used for the joints, the legs completely encased in tubular jambards of metal, whilst the feet were enclosed in sollerets of articulated plates; while the gauntlets are improved by joints corresponding to those of the fingers. Great freedom of action was obtained and comfort was increased by the use of these overlapping plates or tonlets, as they were called, another improvement of the sort being the substitution of the salet for the older and heavier bassinet, a helmet resting on the crown, whence the camail, a piece of chain plate, fell, covering the chin, neck, and shoulders. The salet or salade is a form of helmet, fitting on the head like a cap, but with no visor as a rule, and with a projecting brow.

From this point the advance stops, owing to the introduction of gunpowder into warfare, and we find suits of mail rapidly going out of use, although they are sometimes met with in the seventeenth century. No doubt, too, the need for rapid and long movements had much to do with this, as the armour was proof against early firearms. Strategy and fortifications displaced the old scheme of warfare, and very quickly among foot soldiers we find greaves abandoned and the rest of the armour put away piece by piece, owing to its weight. Pikemen and cuirassiers still retained the breast and back plates in the seventeenth century, together with a steel cap and skirt of

tassets, but these were quickly dying out, and before the close of the century were unknown as methods of defence. But in the Second World War body armour was being supplied to Amer. Army airmen in the form of 'flak jackets' or vests—light but strong armour. Made in 2 sections, the jacket covered back and front from neck to waist. The vest was of fabric, with squares of 20-gauge manganese steel sewn in so that they overlap on all sides, giving complete coverage of chest and neck. The vest would resist a .45 bullet at 30 ft.

The deadly Eng. long-bow was 5 or 6 ft. in length, the arrow itself being 3 ft. The cross-bow, or arbalest, came into England with the Normans, and consists of a steel bow released by a trigger, the whole being set on a wooden stock. Its use was forbidden to Christians by Rome, and was antecedent to that of the long-bow. The first firearms were introduced to England in the fourteenth century, breech-loading cannon being the earliest form with projectiles of shaped stone. The hand gun was not known until 2 centuries later, and then was so heavy as to require a stand. The early forms were fired by a slow-match applied to the touch-hole, and in many respects resembled the cross-bow. These were improved by the invention of the match-lock and again by the wheel-lock and snap-hance, or flint-lock. In these forms the gun remained in use until 1807, when Alexander Forsyth patented the percussion-lock; then followed the needle-gun, and the breech-loading rifle superseded the old muzzle-loading system. Then came magazine rifles, and later rifling, which was an old patent, became customary, when the advent of machinery made accuracy easy. Pistols and revolvers are the result of guns being modified for cavalry, and their advancement is generally concurrent with that of guns, the same principles being applied. The idea of the machine gun can be traced back to the fifteenth century, when numbers of muskets mounted side by side were used for defensive purposes. Many forms of this type were found, but the first single gun was the Gatling, which contained a number of barrels revolving round a central axis. The Gatling was followed by the Fr. Montigny mitrailleuse, the Gardner, and the Nordenfeldt, all of which employed the multi-barrelled system, and were hand-operated. The Maxim gun, introduced in 1883, was the first type of single-barrelled automatic gun, followed by the Hotchkiss the Vickers, the Lewis gun, and many others during the first quarter of the twentieth century. Almost every country has now developed some form of heavy and light machine gun of its own type. The latest developments in A. include the rifle-grenade discharger, the self-loading rifle, and machine guns of larger calibre for use against tanks and armoured vehicles.

Artillery A. have developed from the metal cannon firing rough projectiles to the powerful weapons of the World Wars period, consisting of guns and howitzers

capable of firing explosive shell at long range with great accuracy.

The peculiar objects and properties of the various A. and firearms are dealt with under their respective headings. There are many collections of A. and A. throughout Europe and America. Among the innumerable works on the subject worthy of mention are those of Grose, Howitt, Pollard, and Dr. Meyrick.

**Arms, Coats of, ensigns or armorial bearings,** are the distinguishing devices used to denote particular families, corporate bodies, kingdoms, etc., throughout the world. They are usually granted or assigned by schools of heraldry.

**Armistead, Henry Hugh** (1828-1905), Eng. sculptor, b. in London, educated at Royal Academy under Bailey, Leigh, and Carey; became an R.A. 1879. His work includes part of the frieze at the base of the Albert Memorial, carved oak panels in the robing room at the New Palace of Westminster, the effigies of Bishop Wilberforce at Winchester and Lord John Thynne in Westminster Abbey, and a marble statuette of 'Remorse', now in the Tate Gallery. See *Life* by C. W. Armistead, 1906.

**Armstrong, Archibald, or Archy** (d. 1672), court jester to James I. and Charles I. of England. He greatly disliked Buckingham and Archbishop Laud, and, in the presence of the latter, said the following grace, 'Great praise be given to God and little Laud to the devil.' On hearing of the insurrection in Scotland when Laud endeavoured to introduce the liturgy there, A. taunted Laud, saying, 'Who's a fool now?' Incensed, Charles I. dismissed him from court, and he retired to Arthuret, Cumberland.

**Armstrong, Mrs. Helen Porter,** see MELBA.

**Armstrong, Henry Edward** (1848-1937), Brit. chemist. Prof. of chem. at City and Guilds College, S. Kensington. Awarded the Davy Medal, Royal Society, 1911, for research work in organic and general chem. Much successful research in terpenes, naphthalenes, etc., and physical chem.

**Armstrong, John** (1709-79), a Scottish poet and physician, was born at Castleton, Roxburgh, and educated at Edinburgh Univ. Practised in London. Remembered as the friend of Thomson, Mallet, and other literary celebrities of the time, and as the author of a poem on *The Art of Preserving Health*, pub. 1744, and in which a somewhat uncompromising subject for poetic treatment is gracefully and ingeniously handled. His other works, consisting of some poems and prose essays, and a play, *The Forced Marriage*, are forgotten, with the exception of the 4 stanzas at the end of the first part of Thomson's *Castle of Indolence*, describing the diseases incident to sloth, which A. contributed.

**Armstrong, Samuel Chapman** (1839-93), an Amer. soldier and philanthropist, b. in the Hawaiian Is. Son of missionary parents; served on the Union side in the Civil war, and acquired distinction as a commander of Negro troops. Founded the Hampton Institute for Negroes and

(later) Indians. He was interested in the 'Indian Question.'

**Armstrong, William,** or 'Kinmont Willie,' a famous moss-trooper of Sark in Dumfriesshire. Captured in 1596, he was imprisoned in Carlisle Castle by the Eng. warden and rescued by the Scottish warden, Scott of Buccleuch.

**Armstrong, Sir William George,** first Baron (1810-1900). Brit. engineer, b. at Newcastle-on-Tyne; he was articled to a firm of solicitors and afterwards became a partner. His tastes, however, lay elsewhere, and, in 1840, he produced an improved hydraulic engine, and, 2 years later, a hydro-electric machine. In 1845 he invented the hydraulic crane. The next year he founded the Elswick engine works (Newcastle). Here he commenced the manuf. of the A. rifled cannon (which he invented) and other ordnance, in which he was very successful. In 1858 he was knighted, and shortly afterwards appointed chief engineer of rifled ordnance under gov., which position he retained till 1863, when he returned to Newcastle. In 1887 he was created a peer with the title of Baron A.

**Army. General Sketch of the Hist. of As.**—From the beginning of the hist. of the world we have evidence that more or less organised As. played a prominent part in the hist. of their countries. The early oriental nations, such as Egypt, Assyria, and Persia, all possessed large As., which were easily raised and placed in the field in time of war. A standing A. was, of course, not known, except in so far as the kings had special corps of picked soldiers to act as their bodyguard and to form a nucleus for an A. in time of war. The earliest A. of which we have any record is that of the Egyptian Rameses II., who ascended the throne of Egypt about the year 1300 B.C. He, with an A. which numbered well over a million, is supposed to have conquered W. Asia right up to the boundaries of India. To him also is ascribed the formation of a warrior caste, the members of which had to serve in his As. when necessary, had certain of the taxes remitted as a kind of retaining fee, and were also granted militaryiefs. Herodotus describes the A. gathered together by Xerxes, and which, according to his computation, numbered well over 2 millions of men. This A. took full 4 years to mobilise, and it was only at the end of the fifth year that Xerxes and his A. set forth on their campaign.

Military science was fairly developed by both the Egyptians and the Persians, and the method of raising an A. on a system of quasi-conscription was introduced by the Egyptians. The principles of attack and defence were elaborated by the As. of Assyria. The hist. of Gk. As. falls into sev. well-defined periods. In the most anct. Gk. hist. the As. assembled round their kings and leaders, in what was practically a feudal levy. The Grecian A. before Troy can be taken as an example of this. In the latter days of Gk. hist. a system of conscription can be said to have existed. Every

citizen of Athens had to serve in the A. and had to undergo military training during a given period, after which he was placed in a certain reserve section of the A., and was liable to service when called upon. In many cases military service formed the basis for political gov. The A. was divided into infantry and cavalry, the greater part of the pop. serving as infantry, while the richer men formed the cavalry. For some very long period, however, the cavalry was a very secondary part of the Gk. A. In Sparta the whole nation was the A., every man being compelled to serve between the ages of 18 and 60, the military training being much more severe than elsewhere. The A. was composed of hoplites, the cavalry, and sev. regiments of light-armed troops formed principally from mercenaries. During the fourth century B.C. the As. of Greece underwent a very considerable change. Hitherto they had been national As., now they were to become mercenary As. The expedition of the Ten Thousand was the first expedition of a purely mercenary A.; hence the war became a trade, in which only specially trained and paid soldiers took part. The free soldiers of Greece declined more and more, until we find the mercenary element alone represented. It is necessary to notice in connection with Grecian As. the phalanx formation. This was a formation of parallel lines of soldiers drawn up in a dense and practically impenetrable mass. The early phalanx had about 6 to 8 lines of soldiers, the later development—the Macedonian phalanx—consisted of 16 columns of soldiers armed with Macedonian pikes about 24 ft. long, drawn up in close order. The Macedonian A. of Philip was probably the second standing A. of the world.

In the meantime the Rom. A. had been slowly coming to the front, and with the rise of the Rom. A. we get one of the most perfect forms of military organisation in the world. The Rom., like the Gk., was, as a citizen of the republic, bound to serve the commonwealth as a soldier. All Rom. citizens between the ages of 18 and 46 were bound to serve in the A. They received a good military training during their early military career, and for the first few years they served with the *juniores* or active A., afterwards passing to the reserve (*seniores*), where they continued their service until they reached the age limit. The richer citizens became members of the cavalry, but the greater part of the A. was composed of infantry. During the periods of active service the soldiers received pay. The A. was organised into legions, which in turn were subdivided into centuries and maniples. The sections were commanded by military tribunes, who took their orders from the consul or praetor. Up to the time of Marius the Rom. A. was recruited purely from the Rom. republic, but during the Marian regime the ranks of the Rom. A. were thrown open to the Ita., and even to peoples unconnected with the Rom. republic. The system of cohorts

was also organised by Marius. Such was the citizen Rom. A. up to the time of Augustus. By Augustus the A. was made permanent, and remained stationed on the frontiers of the empire for the purpose of guarding it. In its best days the Rom. A. excelled all others from the point of view of discipline and *esprit de corps*, but gradually the citizen A. changed. The free citizen of Rome no longer regarded it as an honour to form part of the legion; the frontier of the empire was guarded by troops stationed in one particular place and recruited from the inhab. of that country. Barbarians began to assume an important place in the legions, and gradually the power of the Rom. A. passed into the hands of the barbarian mercenaries. Not only had this a grave effect on the A. itself, but it affected very greatly also the policy of the emperors, and in the course of time the Rom. A. made and unmade its own emperors. The Rom. citizen was no longer the finest soldier in the world, but depended on the strength of the mercenaries for the defence of the empire. The decay of the Rom. citizen A. was a potent cause of the ultimate decline of the Rom. empire.

Following the fall of the great Rom. empire, we have to turn to the As. of the Teutonic tribes. These As. were essentially nations in arms. It was the privilege of the freeman to bear arms. None but a freeman could do so, and only then when he had been pronounced worthy of the honour by the 'clan.' These chieftains were invested with absolute power as long as the war continued, but this absolute power was given up as soon as peace was declared. From this system of clan warfare to one of feudal warfare was not a far step. Warriors who fought on terms of equality naturally demanded an equal sharing of the conquered ter. The chieftains divided the conquered lands amongst the warriors of the victorious As., and from this beginning we get the gradual rise of the feudal system. The discipline of the 'barbarian' As. was largely obtained from the Rom. A. Prisoners of war and deserters from the Rom. A. afterwards fought in the barbarian ranks, and in this way the discipline of Rome was rudely learnt. The As. were composed of infantry almost entirely, this infantry being divided into a light infantry which fought in conjunction with what cavalry there was, and the heavy infantry which fought in a wedge-shaped formation, and on which fell the greater burden of the fighting.

The system of 'commendation' was common amongst the Ger. tribes; the young men of good birth commended themselves to some chieftain and became his men. They formed his bodyguard in time of peace, the nucleus of his A. in time of war. Gradually this idea spread, and many small landowners commended themselves to the 'lord,' and in return for his protection rendered certain services to him. When ter. was conquered the land was divided by the lord amongst his followers, and in the course

of time he demanded as a return for these gifts an absolute supremacy over the property and persons of his followers. This was the beginning of the feudal system. Under the early Carolingian kings we have the transition period—the period when the national A., i.e. the nation in arms, and the feudal A. work together; but under the greatest of the Carolingians, Charles the Great, we find the full feudal system in force. From this time until the feudal A., the national A. disappears, and the baronial militia takes its place.

The feudal levy was the gathering together of the lord, his men-at-arms, and his other dependents and retainers. The A. was no longer composed of national levies, but was divided roughly into cavalry and infantry, which div. represented a social as well as a military difference. The lord and his men-at-arms—the cavalry—represented the nobility; the peasant and the serf—the infantry—the poor of the estate. There were many drawbacks in a feudal A.; in the first place, service was restricted. Forty days in the year to 3 months was the longest service which was given, and after that the As. disbanded. Further, no developments took place in military science; true, the barons and the knights improved their armour and their weapons, but always at the expense of the infantry, whom it was policy to keep ill armed and badly equipped. Dependence was placed almost entirely upon the heavy cavalry charge, a charge which swept all before it, until, by a development of tactics, it was shown that it could be met and overthrown by infantry and archers. Following the crusades came various battles in which new tactics were displayed and which showed that the day of the heavy cavalry charge was over. The battles of Falkirk and Bannockburn were both examples of the new development. The combination of missile and shock tactics employed by Edward III. and Henry V. showed that the feudal cavalry of France was effete. The methods of raising an A. adopted by Edward III. showed that the beginning of the end of feudal levies was in sight. Scutage had led to the employment of mercenaries. Edward III. adopted the plan of mercenaries on a large scale; kings could depend on mercenary As., and could by their aid overthrow feudalism. In the same way we get very similar developments on the Continent; the tns. are enfranchised and raise a militia which they are only too pleased to use against their natural enemies, the feudal lords. Again we find that the invention of gunpowder had a great effect on feudalism, an effect which was gradual, but which nevertheless in time led to the overthrow of feudal power. It was not for a considerable time that the making of cannon allowed the effective introduction of artillery. But when artillery became really effective it ultimately caused a revolution in the art of war. Henry V. had used artillery before Harfleur, but it was not until the end of the eighteenth

century that we can say artillery becomes really effective.

The fall of feudal As. was followed almost immediately by the rise of standing As. The earliest example of a standing A. in Europe is the formation of the famous janissary corps in Turkey, which came into existence in 1362. For a century this remained the only standing force, but after the Swiss infantry had proved that they were more than a match for the Burgundian cavalry and when Charles VII. had won repeated victories over the Eng., a standing A. was created in W. Europe. A force of about 9000 men was raised by Charles VII. and divided into *compagnies d'ordonnance*, which were to remain in existence even in times of peace; a few years later a larger force of infantry was raised by the same king. A standing A. gave an overwhelming advantage to the king; and got rid of the necessity of employing mercenaries, who were as much a disadvantage to their employers as they were a check to the enemy. This example was soon followed by other European powers, and the practice of calling out the feudal levy practically ceased from this time. With the beginning of the sixteenth century the new development went on rapidly, and soon practically all troops were armed with firearms. The method of raising a standing A. was similar to the method which had already been used by Edward III. The contracts for the raising of the A. were given to the great nobles, and in this way we get the beginning of our regimental system. The noble commanding the regiment was given a certain sum for the raising of it, and was also granted a certain sum every year for the maintenance of his regiment. At first mercenaries were very largely employed, but later the A. became to a very great extent a national and *voluntary* A. The improvement in arms led to improvements in military science, and to the development of the art of war. Under the great commanders Gustavus Adolphus and Wallenstein great changes were brought about, and instead of the *mêlée* of feudal warfare we find an organised system of military tactics which depended very largely upon the organisation of the military units.

The campaigns of Louis XIV. led to the formation of the larger divs. and brigades which form part of the modern As. Under Frederick the Great we have the beginnings of strict military training and discipline which led the Prussian troops to victory time after time when he was able to carry out his own plans, and which lessened very considerably the defeats with which he also met. The training of the Prussian infantry was due very largely to the great generalship of Frederick I., but the introduction of effective methods of shock tactics was due entirely to the great Frederick. The Fr. Revolution, however, brought with it a very essential change in the methods of raising an A. The bloody wars from which France emerged victoriously by 1797 had led to a serious draining of her resources.

In 1798 the law of conscription was brought forward and passed by Jourdan. By this law every citizen was bound to serve in the As. of France. The whole Fr. pop. between the ages of 20 and 25 was immediately enrolled, and became liable to service when called upon—the A. of France was once again to be the nation in arms. To this great scheme was due to a very large extent the success of Napoleon. It followed, then, quite naturally, that if the other nations of Europe were to keep their positions as powers they must adopt a similar plan, and at the present time all the continental powers have conscripted As.; Great Britain alone maintaining her voluntary A. until 1939 when, owing to increasing tension throughout Europe, a limited measure of conscription was introduced. From the Prussian A. came further developments; As. were raised and trained for a year, being then sent back to their homes as a reserve force, liable to be called upon when necessary. The system proved successful, and with the battle of Sadowa it proved itself so effective that the system of a reserve A. and a short-service system was taken up by practically every power. Now every nation has 3 lines of service, her standing A., her reserve A., and her second line of reserve, a militia, or similar force formed on a territorial basis.

*General Sketch of the Hist. of the Brit. A.*—The A.-S. A. was essentially a territorial militia based on the same system as the great Teutonic As., i.e. that it was the right of every free-man to bear arms in defence of his country. In England it was called the fyrd, and was not of very great use, since the terms of service were not very clearly defined, and the fyrd, except under very special conditions, would not fight outside its own territorial div. The whole system was changed by the Norman Conquest in 1066. By the end of William I.'s reign the feudal system had practically been accepted by everybody in England. On its military side it divided England roughly into 60,000 knights' fees, the holder of each of which was liable to knight's service for 40 days in the year. The feudal levy was, theoretically at least, bound to serve the king anywhere, but in fact there were many drawbacks to the system. The feudal period was barely sufficient for the crushing of a small revolt, and was ridiculous when applied to a foreign war. Gradually, as a result of the desire of the king to have a dependable A. and to crush the barons, the system of scutage (q.v.), instituted by Henry I., grew up. With the money thus obtained the king might raise mercenary troops, and so in future the idea of the king is not so much to raise soldiers from the feudal fiefs as money to obtain soldiers.

The establishment of a mercenary A. was obviously the beginning of the establishment of a standing A., but in the meantime grew up another totally different force. The militia, or, as it was originally called, the *posse comitatus*, was the levy

of all able-bodied men in the country who were liable to be called out at any time to keep the king's peace. The militia raised in this way was liable to be called out for military service at home, but not abroad, although it seems to have served from the beginning in very much the same way as the later militia, as a means of recruiting the A.

The system by means of which the Edwards raised their As., and especially the system used in the Hundred Years war, was a combination of the feudal and mercenary systems. Edward III. and Henry V. both depended entirely upon the resources of England for the men whom they placed in the field, and obtained these men by means of contracts with the great nobles and the captains of free companies, incidentally in this way solving social and economic problems. The captains of each regiment were given contracts, usually for 1 year, by which they were to maintain and arm their soldiers, and in return were to receive a certain fixed sum. The money for the soldiers was supplied from various sources, some coming from the royal revenues, some from parl. grants, some from the feudal fines paid in lieu of service. But all As. were disbanded at the end of a campaign, since the king did not then have the money by means of which they could be maintained. During the Tudor period As. were raised in a very similar fashion; under Henry VIII. we get the organisation of the yeomen of the guard and gentlemen-at-arms, these forming to a certain extent the beginning of the standing A. system.

The accession of Charles I. marks a new period, or at least the beginning of a new period. The A. becomes a source of constant trouble between the king and his parliament. By accepting the petition Charles practically declared that the king had no right to keep a standing A. in time of peace, a doctrine which was endorsed later in the great Revolution. After the Civil war the A. became the most important factor in the politics of the country; the New Model A. may well be regarded as the first Brit. standing A. Cromwell at least realised that it was impossible to fight the Cavaliers, with the whole force of military training and tradition behind them, save with a force that had some equally great object as its motive power. The result of this was the raising first of the 'Ironsides,' later of the New Model A., a regiment and an A. which were founded on the strictest principles of Puritanism. At one time Cromwell had a standing A. of about 80,000 men, fanatically enthusiastic as to the principles of the Civil war and masters of the country. The Restoration naturally led to the disbandment of this force, which could hardly have been expected to hold the confidence of the newly restored monarch, Charles II.; but with the accession of Charles II. we get the beginning of the real standing A. period. Most of the forces were disbanded, but Monk's foot regiment (Coldstream Guards) was kept, and 2 regiments of life guards were

formed from amongst the Cavalier supporters of Charles II. In addition, certain towns and fortresses were garrisoned with permanent troops maintained by royal grant. With the acquisition of territory in Africa and India we get also the formation of permanent regiments for their garrison and protection. During the reign of Charles II. there were formed at home also a few other regiments, chief amongst which may be mentioned the Royal Scots (Dumbarton's Regiment), which had seen continuous service since the ninth century, and the Buffs, which became part of the Brit. standing A. about the same time. James II. raised a standing A. which at one time consisted of 20,000 men, two-thirds of whom were stationed at Hounslow Heath in order to overawe the Londoners. In spite of the protests of Parliament, to whom he had proposed the raising of a larger standing A. in lieu of a militia, he continued to raise men, to use martial law, and to billet his soldiers on private persons. With the Revolution this ceased; James was driven from the country and his A. disbanded. William III. found himself at the beginning of his reign with his Dutch guards and a small part of James's A. as his only standing force, and the only force with which he was to repel the attacks of the exiled James. It was again necessary for the defence of the country that a standing A. should be created, and a standing A. was sanctioned by Parliament, who safeguarded themselves by assuming practical control of it and by the checks which had been placed on it by the Bill of Rights. In the first year of William III.'s reign we find that a Mutiny Act is passed which gives the Crown power to deal by martial law with all military offences such as mutiny and desertion, at the same time repeating the safeguards of the Bill of Rights and denouncing the legality of a standing A. in time of peace. The outbreak of the war of the Sp. Succession saw the raising of a large standing A., an A. which reached the dimensions of about 200,000 men, but which was immediately reduced to a peace footing after the declaration of peace at Utrecht in 1711. During the century which followed, the strength of the Brit. standing A. fluctuated between 18,000 on a peace footing and 200,000 in the middle of the nineteenth century, and on a war footing from 70,000 to 250,000 between the same dates. During the early wars of the eighteenth century the Brit. A. distinguished itself in many battles; at no time perhaps was it better than during the campaigns of Marlborough. But during the Amer. war of Independence the glory and prestige of Brit. arms waned. The early efforts of the Brit. A. during the revolutionary wars were not altogether successful, but the new organisation and training under the duke of York did much to increase its efficiency. Victories can after this be recorded almost everywhere, in Egypt, in India, and in Europe. Between Waterloo and the Crimean war the A. did not undergo many changes. Some

battles were fought in India and the colonies, but the A. rested and supported itself upon the honours which it had won in the Peninsula and at Waterloo. It was a period of stagnation and rest, a rest which was to receive a rude shock in the disasters of the Crimean war. This war opened the eyes of the country to the absolute necessity for A. reform. Between the Crimean war and 1871 England received many lessons from the continental nations. France fought in Italy in 1859, but the real lessons came from Prussia, who proved the overwhelming value of a well-trained reserve in the Seven Weeks war. The other nations realised that in order to keep on level terms their As. also must be reorganised, that the art of war must be more carefully studied, and these lessons were emphasised by the Franco-Prussian war of 1870-71. From that time the War Office received special attention from successive war ministers, and from that time dates the beginning of the short service system introduced into the Brit. A. by Mr. Cardwell in 1871.

1. *Organisation.*—The 'arms' of the A. consist of the infantry, the cavalry, and the artillery, each of which arms is able to perform some function or functions which the others cannot. These 3 main divs. are not the only divs. into arms, since there are others, such as tanks, armoured cars, cyclists, engineers, etc., but until the Second World War they formed the main body of the ordinary fighting machine. Cavalry, however, has all but disappeared from the Brit. A., and, in 1939, a Royal Armoured Corps was formed, into which were incorporated the then existing 18 mechanised regular cavalry regiments and the regular and territorial units of the Royal Tank Corps. (At this time all regiments of cavalry excepting the Royal Dragoons and the Royal Scots Greys—apart from the Life Guards—had been or were in process of being re-equipped with armoured vehicles. The relative importance of each of these arms varies in accordance with the conditions under which they are fighting, it used to be said, e.g. that in flat open country a large number of guns would be necessary, since they are able to command the enemy at a considerable distance; while in 'difficult' country infantry would preponderate, since infantry are more easily able to negotiate the difficulties caused by the physical features of the land; while in 'veldt' country, as in the Boer war, cavalry would be an absolute necessity. But experience of modern warfare, where dive-bombers and armoured units acting in close co-operation secured spectacular results on the W. front, in Poland, and in Russia, in the Second World War, suggests that this analysis requires some modification. Armoured units are, of course, only a variant of very mobile artillery, but they can be used in terrain where the movement of field guns would be difficult or slow, as e.g. in Libya. Again, infantry, unsupported by aircraft, might avail nothing against a

well-equipped invader, as, *e.g.*, in the difficult jungle country of Malaya. Finally, nowhere, except in the outmoded Polish A., or by the Cossacks, were cavalry used at all in the campaigns of the Second World War. The normal proportions of each of the 3 arms immediately prior to the First World War stood at about 5 guns and 160 cavalry to every 1000 infantry, this being, of course, on a peace footing.

It is customary to divide infantry into regiments, battalions, and companies; cavalry into regiments, squadrons, and troops; artillery into batteries which are variously grouped together; and armoured formations into brigades and companies. A lieutenant-colonel commands a battalion, which is divided into 4 companies, each commanded by a captain. The commands of general officers are the brigades of infantry, cavalry, and artillery, or the div. of more than one infantry brigade together with a force of artillery and cavalry, or the equivalent units of an armoured formation.

A brigade is the command of a brigadier or major-general, sometimes of a colonel. It usually consists of one arm only. The infantry brigade consists of 4 battalions of infantry and the necessary administrative complements, a total of about 4000 combatants. A cavalry brigade consists of 2 and sometimes 3 regiments, while a brigade of artillery is a lieutenant-colonel's command.

A div. is a body of troops consisting of all arms. It consists roughly of about 15,000 combatants, and is a general's command.

The term A. corps, signifying the organisation of a number of combatants under one commander, and consisting of divs. of infantry each supplemented by a number of brigades of cavalry and batteries of artillery, was abolished in the Brit. A. in 1906, but restored in the First World War.

The term 'an army' is applied to any organisation of troops consisting of a number of A. corps or divs. under the command of one commander-in-chief. It was held that roughly no 'A.' should consist of more than 150,000 combatants.

**War Reserves.**—Reserve troops fall into 2 divs., the regular reserve (including the supplementary or technical reserve) and the auxiliary forces. The regulars are liable to serve at any time; the auxiliary, which are represented in this country by the territorials and the special reserve, are troops which undergo a certain amount of military training, but which are not constantly under arms. These may, under certain conditions, be called upon to swell the ranks of the A. in time of war, and to go abroad on active service in a national emergency. The reserves of the active regiments rejoin their regiments and form the first line; the second line, composed of men trained but not in constant training, would undertake minor work, and later when trained under war conditions, would be drafted into the field A.

**Mutiny Act.**—The first Mutiny Act was

passed in 1689. Prior to this time the A. had been regarded as personal retainers of the king, and had been governed and disciplined by Articles of War. The passing of the first Mutiny Act gave the control of the A. into the hands of the Parliament, and incidentally, by making the Mutiny Act an ann. Act, caused the calling of ann. Parliaments. Although in many respects the Mutiny Act superseded the king's Articles of War, yet throughout the eighteenth century the Crown was allowed the prerogative of issuing Articles of War for troops outside Great Britain, and on a few occasions the Mutiny Act was allowed to expire. The Mutiny Act of 1803, while still allowing the prerogative of the Crown, at the same time so limited that power by statute that the real prerogative passed entirely into the hands of the Parliament. The Mutiny Act legislated for all serious military offences; the Articles of War was the authority for dealing with such offences. In the nineteenth century the Act and the articles were obviously not harmonising, with the result that on the recommendation of a royal commission their place was taken by the Army Discipline and Regulation Act, 1879. This Act, after being in force for 2 years, was in turn superseded by the Army Act of 1881. It is to be remarked here that the Army Act was a definitely fixed code, yet it superseded an annual Mutiny Act. This Act has been made ann. in order to emphasise the important constitutional point that 'keeping a standing A. in time of peace is illegal except with the consent of Parliament.'

The Army Act is the means by which military punishments are determined. It recites the various offences of which a soldier may be guilty, and prescribes the fitting sentence for such a crime. By it death is presented as the punishment for cowardice and treachery before the enemy, and for a number of other offences in time of war, such as desertion, or leaving a post. Death is further prescribed in peace or war for mutiny or incitement to mutiny. Offences punishable by varied terms of penal servitude follow also. The sentence of 'cashingier' may be inflicted on an officer who has been guilty of 'scandalous conduct unbecoming the character of an officer and gentleman.' Degradation, and severe reprimand, are sentences which may be inflicted upon both officers and non-commissioned officers. See further COURT MARTIAL; MILITARY LAW.

**An A. in the Field.**—At the beginning of a campaign it is necessary that the A. which is taking the field should have an adequate base of operations. The First World War made no change in this respect except in degree. In most cases it is necessary to have a maritime base, and that base, to be of any very great value, should not be too far removed from the scene of operations. This risk was appreciated in the S. African war and in the wars in Afghanistan; an inland base was necessary. In the First World War it became almost anomalous

to speak of a base in these terms; for Boulogne, the maritime base of the Brit. Expeditionary Forces, was no more than a port of disembarkation linked up with other and inland bases for supplies which were located much nearer the lines. The selection of a base must be carefully made, and it is obviously an advantage to secure one on friendly ter., since preparations are thus enabled to be carried out in anticipation of the arrival of troops. In the First World War, France being an ally, this question did not arise, but during the Crimean war it was found necessary to secure a base by force, and Balaklava was taken for this purpose. In the Second World War, Japan seized one base after another in the Brit. and Dutch possessions of the S. Pacific, including Hong Kong, Singapore, and Batavia (1941-42). When the A. moves forward it becomes necessary to establish a line of communication along which the necessary supplies, transports, etc., can move to the help of the A. in the field. Along this line of communication which connects with the base, and which is naturally carefully guarded, reinforcements may be sent to the A. in action, and the sick and wounded may be removed to the hospitals at the base. The development of air transport, however, has now made it possible to ignore lines of communication to some extent and to send air-borne troops as reinforcements to beleaguered armies. In the Russo-Ger. campaigns (1941-42) the Gers. once or twice extricated their forces from the risk of encirclement by these means. The length of the line of communication varies as the distance of the scene of war from the base, and as the length differs so does the difficulty of maintaining and guarding it. This line consists of a series of military stations connected together and with the base by means of roads and railways, sometimes waterways being used, and these military stations naturally are carefully guarded. These principles obtained unaltered in the First World War, except that they were exemplified on a much greater scale. In the presence of a hostile pop. it becomes necessary to guard every possible pregnable point in the line. The persistence of 'partisan' fighting by Russians behind the Ger. front exemplified this necessity in the Second World War. The railways have to be carefully guarded, every bridge and point of divergence must be defended by block-houses, and a column of soldiers must be kept to defend the line from the attack of the enemy, and if possible to keep the enemy away. The reserve and newly raised troops are usually kept doing the duty of guarding the lines of communication for some time before they are actually sent to the front. At certain points in the line lesser bases are constructed, where stores may be accumulated, and where temporary hospitals may be erected. In the First World War, when operations were on a vast scale, an elaborate chain of casualty clearing-stations, field hospitals, and base hos-

pitals was organised for evacuating and tending a continuous army of wounded. The evacuation of wounded by aircraft may, in certain conditions, obviate the necessity for so elaborate a chain. Along the lines of communication are dispatched from the base such supplies of food, arms, and ammunition as are necessary for the troops at the front. These are forwarded to the magazines which are nearest to the field A., and from these it draws its supplies. Further, it is very necessary that a good postal, telegraphic, and wireless service should be maintained, and whereas an already formed line of telegraphic and wireless communication may be used, often it is the duty of the base staff to create and preserve a line of communication. The intelligence dept. plays an important part in the obtaining of information for the A. in the field, but for the keeping up of direct communication by means of posts, telegraphs, heliographs, etc., the base officers are responsible.

During and since the First World War, new weapons and new organisations have given rise to many new problems. Of special importance in the training of all arms for modern warfare is the formation of a comprehensive plan of activity in attack, because success in battle depends on the proper co-ordination of all arms, since modern battles are not won by the efficiency of any one weapon, but by the combined fire effect of all arms, including bombing aircraft. In up-to-date training attention is paid to the co-ordination of the fire of artillery, machine guns, light automatics, and rifles, and to securing that the fire of artillery is brought to bear at the time and place ordered. But when the work of artillery and machine guns has been adequately planned, it is important for modern commanders in the field to remember that forward troops must still push onward, provided they are adequately covered by their own aircraft, and that a determination to advance is essential to success.

It is a commonplace that the principles of war are common sense, and that, in training, each commander must ask himself how far the action he is taking conforms to correct principles. The security of a force is the first responsibility of its commander, in which connection the importance of security, both at rest and on the move, is to be borne in mind. For this purpose, protective troops must not, either from want of vigilance or through inadequate patrolling, compromise the safety of the force they are covering. In the days of earlier experiment with armoured forces (i.e. mixed brigades of formations of infantry with machine guns, armoured cars, tanks, and 6-wheeled or semi-tracked transport wagons) before 1939, skill in driving and maintenance of vehicles, ability to secure concealment by day and night, skill in crossing rivers, dispatch in assembling after dispersion, and protection at rest were all factors which made for success in actions and, in consequence, were exercises in which a modern army had to

be trained. Co-operation with air units also became essential. The battle of Libya in 1942 fully exemplified the immense advantage the Ger. commander, Rommel, possessed in having available an adequate number of personnel skilled in repairing tanks on the battlefield itself.

Students of modern warfare prior to the Second World War were ever at pains to reconcile the real or reputed axioms of Napoleon with the changed conditions imposed by the invention of new weapons, the rapid progress of mechanisation, the perfection of field fortifications, and the development of aerial attack and reconnaissance. There was conflict between those who were mainly concerned with the *problem of attack* and those who still rested their hopes on a *war of movement and surprise*, or, in other words, those who believed that the prolonged static conditions that prevailed in trench warfare of the First World War might well be modified by the application of familiar principles through modern methods. It was clear, even without experience, that there were more ways of overcoming the enemy's army than by storming his positions, just as there were more ways of winning wars than by winning battles. The storming of positions, under modern conditions, is a costly operation and offers generally only a forlorn hope; but it was obvious that the enemy might be forestalled on positions, or forced out of them by manoeuvre, or left in them in false security while his general situation was being undermined elsewhere—which latter contingency was well illustrated in the collapse of Singapore. Modern developments were, even before the lessons of the W. front of 1940 were learned, opposed to the formation of the *continuous front* in the early phases of a war, and experts suggested that, inasmuch as mass armies did not lend themselves to *mechanisation*, it was not improbable that the earliest and most critical phase of a war might well be decided by conflicts between opposing mechanised fractions. Again, it was surmised that the concentration of masses on the frontiers might be prevented by the threat of sustained air attack on marching columns and by the threat from the same arm to the lines of communication. The development in the Second World War of the *blitzkrieg* by the Ger. A. commanders, in which the static Maginot mentality of the Fr. command suffered so humiliating a defeat, and the earlier collapse of the brave but outmoded Polish A. justified all the deductions of those who saw in modern developments of fire-power, mechanisation, and air-bombing the restoration of the *guerre de manœuvre* and the disappearance of protracted trench warfare. (See further in the campaigns described under WAR, SECOND WORLD.)

**A. Administration.**—This includes the whole of the necessary arrangements for the clothing, feeding, paying, and controlling of the A.; the methods by which an A. is raised, maintained, and generally

made efficient. In countries ruled by a sovereign the A. is nominally under his entire control, but usually now in the hands of a minister responsible to a parliament. In the United Kingdom, whereas the nominal control of the A. is in the hands of the king, in reality it is in the hands of the secretary of state for war, who is responsible to Parliament for his actions and for the advice which he gives to the sovereign. He is the head of the War Office, and is assisted by 2 under-secretaries, a permanent one and a parl. one. In 1942 2 joint permanent under-secretaries of state were appointed. The parl. secretary usually sits in the other House to that in which his chief is. Orders concerning matters regarding the fundamental agreement between the sovereign and his troops are issued by the permanent war secretary in the form of royal warrants, which are incorporated in the monthly A. orders.

Within the 20 years before the First World War much reorganisation took place in the A. After the resignation of the commander-in-chief, the duke of Cambridge, in 1895, that office was subordinated to the secretaryship of state for war. Until 1904 the office of commander-in-chief still existed, and until that period that officer controlled the military dept. of the A. The most sweeping reform at the War Office came as a result of the committee presided over by Lord Esher, which presented its report in 1904, and the bases of this reform remain virtually unchanged.

On the recommendations of that committee a permanent committee of imperial defence was formed, with the Prime Minister at its head. This committee was to consider and record all questions of military and naval defence as they affect the whole empire. On it were to sit representatives of the A. and Navy at home, of the Indian A., and of the colonies. The work of the committee was to discuss questions of imperial defence, to obtain all the necessary information for the proper carrying out of defence, and to advise on general defence questions. In addition to this committee was formed an A. Council, which consisted of 4 military and 3 civil members. The military members were the chief of the general staff, the adjutant-general, the quartermaster-general, and the master general of ordnance. Their duties were to supervise special depts. of the A. The civil members were the under-secretary for war, whose work was to supervise all civil business that did not come under the heading of finance and estimates; the financial secretary for war, who supervised all financial matters; the whole council being under the general control of the secretary of state for war. See ARMY COUNCIL.

The office of commander-in-chief was abolished, and an inspectorship-general took its place. The inspector-general was to supervise the A. and to report to the council on its condition. The A.

corps system was rejected, its place being taken by administrative districts. In 1909 followed Lord Haldane's scheme, by which the volunteer A. was replaced by a territorial one, on the basis of co. associations. The militia was superseded by a special reserve which enlisted for 6 years, thus bringing it about that a regular A. would always be ready for foreign service.

**Mechanisation.**—The most striking development in the modern A. is the process of mechanisation. Modern tanks (heavy, medium, and light), for instance, are very different from the old machines which played so dominating a part in the First World War; tractors for artillery (the 'Hathi'); armoured cars; track and semi-track and 6-wheeled vehicles for transport are all factors in the metamorphosis of the present-day A. Field brigades of Artillery have been mechanised (i.e. tractor-driven). Consequent on this change, the administrative duties as to the design, provision, and repair of transport and technical vehicles as between the departments of the quartermaster-general and the master general of the ordnance were in 1927 re-allocated so as to throw the sole responsibility on the latter except as regards vehicles of the R.A.S.C.

**Reorganisation Scheme of 1935.**—Profound changes in the organisation of both cavalry and infantry, involving conversions of regiments of both these arms, were decided upon by the War Office at the end of 1935. As a result of this decision only the Household Cavalry, the Royal Dragoons, the Scots Greys, and a few Indian regiments retained horses. The object of this remodelling scheme was to make the Brit. A. a swifter and more up-to-date fighting force, and, to that end, it was decided, as regards the cavalry arm, (1) to convert the cavalry div. (which consisted of 2 horsed brigades and divisional troops) and the Tank Brigade into a mechanised mobile div. This div. before 1939 consisted of 2 mechanised cavalry brigades, each consisting of 2 motor cavalry regiments and 1 cavalry light tank regiment, the Tank Brigade, and divisional troops; and (2) to convert the cavalry brigade in Egypt into a mechanised formation consisting of 1 armoured car regiment, 1 motor cavalry regiment, and 1 cavalry light tank regiment. The mechanised cavalry units were subsequently divided into (a) cavalry armoured car regiments; (b) motor cavalry regiments; and (c) cavalry light tank regiments. The following famous regiments were converted and thus disappeared as cavalry: 1st King's Dragoon Guards, Queen's Bays, 3rd, 4th, 7th, 8th, and 10th Hussars, and 9th Lancers. Among those that remain horsed are the Life Guards and the Blues or Household Cavalry—largely for ceremonial purposes. It is obvious that the retention of the word cavalry for other than horsed regiments was a misnomer, but clearly designed in the interests of the traditions and precedence of the converted units.

BADGES OF RANKS AND APPOINTMENTS  
(★) IN THE BRITISH ARMY

A★, lance-corporal; B, corporal; C, sergeant; D, staff-sergeant; E, warrant officer, 2nd class; F, warrant officer, 1st class; G, 2nd lieutenant; H, lieutenant; J, captain; K, major; L, lieutenant-colonel; M, colonel; N★, brigadier; O, major-general; P, lieutenant-general; Q, general; R, field-marshal.

The Royal Armoured Corps of 1939 incorporated all the then existing 18 mechanised regular cavalry regiments, besides the regular and territorial units

of the Royal Tank Corps. The cavalry regiments retained their then-existing designations. As regards the infantry arm, the scheme affected all the regular battalions, which became either machine-gun battalions or rifle battalions in order to provide infantry brigades consisting of 3 rifle battalions and 1 machine-gun battalion each. Machine-gun battalions were, however, to comprise anti-tank weapons, and to constitute the heavy infantry support battalions of the A. The rifle battalions were to be equipped with the new light machine gun. Two battalions of the Foot Guards and 13 regiments of infantry of the line became machine-gun units. The remaining (Guards battalions and line regiments were rifle battalions).

The lessons learned in the First World War spelt the doom of the cavalry and pointed also to the necessity for a far more adequate complement of machine guns and other supporting arms for the rifle battalions. The horsed cavalry lacked the speed, wide range of action, and striking power required of mobile troops fighting under modern conditions in which mechanised troops are employed. Moreover, the Tank Brigade required the co-operation of equally mobile troops who could act in areas and under conditions unsuitable to tanks. Thus, the Mobile Div. was so organised as to supply this co-operation. The new organisation for infantry brigades was designed to secure a better tactical co-ordination of infantry weapons, while simplifying modern developments in armament and equipment—these having become ever more complex by reason of the introduction of anti-tank guns, armoured machine-gun carriers, and so forth. In short, this reorganisation not only involved the complete remodelling of a considerable number of cavalry and infantry regiments, but it meant that the system of strategy and tactics on which the training of the Brit. A. was based had been revolutionised.

**Scientific Adviser.**—The A. Council in 1942 appointed a scientific adviser, whose main function was to carry out research in response to the demands of the War Office directorates and branches. His purview was not confined solely to new weapons and equipment but extended also to the examination and improvement of those already existing. In 1946 the A. Council decided that this post should be maintained in peace. The adviser has a permanent establishment in the War Office and also outside it, in the commands and overseas. The questions he deals with may be put under the heads: weapons, logistics, and the soldier in relation to personal equipment and physical and moral endurance. Within the A. organisation the scientific adviser's closest military collaborator is the director of tactical investigation, who is a regular officer and whose duty it is to study the application of the results of scientific research to the use of the A., to examine the information coming in from

our own and hostile sources, and to advise on the tactical employment of new weapons and equipment. This officer works under the director of military training, but maintains touch with scientific matters through the scientific adviser.

**Commandos.**—The name given, during the Second World War, to special units of the British Army, trained for use as raiding parties on hostile shores. A large number were trained as parachutists. Commando raids in Norway and on the French coast were often strikingly successful.

**Commissions.**—As a general rule, officers for the post-war regular A. are provided from candidates who have served for a period in the ranks. The normal avenue of appointment to a regular commission is after training at an A. college, though a proportion of candidates are obtained by direct entry from the univs. and from the auxiliary forces. The normal age for entry to the A. college is 18½ to 19 years; the course at the college is for 18 months and is designed to give a general education with a definite military bias. No fees are payable at the college, which the cadets attend as enlisted soldiers. Candidates are commissioned at the end of the college course, following which those accepted for the technical arms are given a further professional training in science and engineering. Subject to vacancies and to the needs of the A. as a whole, the preferences expressed by cadets are studied in deciding to which corps or regiment a cadet is commissioned. Candidates for the A. college are normally selected on the results of an A. entrance examination, comprising a written educational part together with tests of character and personality. Candidates who have taken the higher school certificate are normally exempt from taking the written part of the examination. In addition, a proportion of the vacancies at the college are allotted to specially selected candidates under-going compulsory A. service or serving on regular attestations; such candidates are not required to take the entrance examination, but are selected for their all-round qualities of leadership, subject to attaining a standard of general education enabling them to undertake the A. college course.

**A. Pay.**—The system and rates of pay of members of the 3 forces below officer rank were reviewed in 1945 (Cmd. 6715) so as to simplify the system and fix rates which should compare reasonably well with civilian rates in gov. industrial establishments. The A. now has a common pay scale in the ranks of corporal and below for all men, whether they are tradesmen or non-tradesmen, the progression of both classes being governed by the award of 'stars' for qualifications attained. There are now only 4 separate rates of pay for privates and 2 for sergeants and those above that rank. The weekly rates are as follows:

	1-Star	2-Star	3-Star
	s. d.	s. d.	s. d.
Private	35 0	42 0	49 0
Lance-Cpl.	38 6	45 6	52 6
Corporal	52 6	59 6	66 6
Sergeant	73s. 6d. and 84s. 0d.		
Staff Sergeant	84s. 0d. and 101s. 6d.		
Warrant Officer II	91s. 0d. and 103s. 0d.		
Warrant Officer I	105s. 0d. and 119s. 0d.		

Increments of 3s. 6d. a week are granted at 5 and 10 years' service to all soldiers; to corporals, sergeants, and W.O.II after 4 years' service as such; and of 10s. 6d. a week to W.O.I after each 4-year period.

Additional pay is granted for certain duties in the air, including parachute duties; but otherwise, with minor exceptions, extra pay for special duties and qualifications is absorbed in the basic rates.

The normal regular engagement is now for 5 years with the colours, but extensions to complete 12 years are granted on a more liberal scale than before the war. Men with service so extended have the right to re-engage to complete a pensionable engagement, which, subject to the necessary legislation, is 22 years, and continuance beyond that period is permissible in certain cases.

The new rates represent a considerable increase on the pre-war rates, particularly for the soldier who is not a tradesman, and very much more than the previous rates of basic pay. The recruit who on entry received 14s. a week before the war, and subsequently 21s., now has 28s. The trained infantryman whose pay before the war was 21s. a week, and subsequently 31s. 6d., now has 42s. a week. Under the new code of pay there is a flat rate of marriage allowance for all married men of the same rank. The basic rate is 35s. a week, with higher rates for men of the rank of sergeant and above. Children of service men are eligible, in common with children of civilians, for the allowances provided by the Family Allowances Act. A new basic scale of pension (common to all 3 services) for men completing 22 years' service, with a higher scale for longer periods, was introduced by the new code. In general, the new scale is considerably higher than the old scale (1930). The code also brought in a new scheme of gratuities for men discharged or transferred to the Reserve without being eligible for service pension, on completion normally of not less than 10 years' service. The maximum gratuity is £200 for 15 years' service.

The post-war code of pay, allowances, retired pay, and service gratuities for commissioned officers was introduced in Mar. 1946 (Cmd. 6750). The new schemes are designed primarily for the post-war regular officer, but the new rates of pay and allowances in fact apply to all officers of the main classes, executive, technical, and administrative, as from July 1, 1946.

Certain special categories of officers, including the medical and dental services, chaplains, officers on legal and educational duties, officers of the Royal Marines, men commissioned from the ranks at relatively late ages or for limited duties, officers on Indian rates of pay, officers of the nursing and women's services, are outside the scope of this code. The new schemes of pay, allowances, retired pay for officers are founded on the same general principles as for other ranks (set forth in Cmd. 6715 above). The various systems and rates of marriage allowances and other allowances are replaced by common systems with common rates for all 3 services, and there is also a common code of retired pay and service gratuities. There is, however, a system of qualification pay for officers of the rank of major and below with not less than 2 years' commissioned service. Qualification pay is not granted for the qualities or degrees of knowledge required by an officer to carry out the normal duties of his corps, but for military and technical qualifications obtained by a proportion of specially qualified officers, e.g. officers who have qualified at the staff college, or who possess a university honours degree in a subject of value to the A. This qualification pay is, for a Lieutenant, 2s. 6d. a day, Captain, 4s., and Major, 5s. The separate allowances for lodging, fuel and light, furniture, and servants, often at varying rates under the old system, have been replaced by a common composite lodging allowance (or in the case of married officers living with their families, by marriage allowance), which varies only with rank. Pay for an officer has now been fixed at a level which, it is assumed, enables him to live without private means. As in the case of other ranks, officers are given, under the new code, a flat-rate system of marriage allowance, taking account only of rank and not of the size of family. The qualifying age for marriage allowance was reduced from the pre-war limit of 30 to 25. The table on p. 512 shows the total annual emoluments for married officers (excluding rations or ration allowance, and any other allowances except marriage allowance).

The full standard rates of retired pay are: Captain, £375 a year; Major, £475; Lieut.-Colonel, £625; Colonel, £825; Brigadier, £900; Major-General, £1100; Lieut.-General, £1300; General, £1500; Field-Marshal, £1800. The grant of retired pay, to officers retired otherwise than as invalids, is normally conditional upon completion of 20 years' service, but where in special cases, in the interests of the service, officers are entered at ages above that of the normal entrant, retired pay may be granted on compulsory retirement after not less than 15 years' service. For invalided officers retired pay is admissible provided that not less than 10 years' service has been given. Gratuities are payable to officers holding permanent commissions who on retirement have not completed sufficient service to qualify for retired pay. The gratuity is £1000 on completion of not less than 10

years' service, and £150 for each complete year of service in excess of 10 years. The maximum total gratuity payable is £2350. Where an officer is permitted to leave the service, except on invaliding, after less than 10 years' service, no gratuity is payable.

Years of service	Expected age	Rank	Basic Pay†	Marriage allowance	Total
4	25	Lt. (at 2 years)	£ 310	£ 228	£ 538

† Qualification pay may be payable in addition.

**Reserve Forces.**—The pre-war A. Reserve numbered about 115,000 men (1939). In 1924 a Supplementary Reserve was created for the purpose of giving to the A. on mobilisation an adequate number of technicians or 'tradesmen.' Its peacetime strength is 25,000. There is no Militia in the old sense. The designation Militia was revived in 1922 for the Special Reserve, recruiting for which was never begun. In 1922 a departmental committee considered the question of reviving the old Militia. Upon their findings the A. Council decided to abandon the resuscitation as unnecessary and uneconomical. In 1939 the name militia was given to the new conscript army of men of 20 years of age. The Territorial Force was reconstituted in 1920 as the Territorial A., equipped as a second line to the Regular A. and with acceptance of a foreign service obligation. Its strength was 160,000 in 1938. In 1939 it was decided to raise its establishment to 730,000. In that year the Territorial A. ceased to have an independent exist-

tence and was merged in the Regular A. (Armed Forces—Conditions of Service—Act, 1939). A local defence volunteer force was formed early in 1940 in view of the threat of a Ger. invasion. This was later renamed the Home Guard, and in 1941 the compulsory principle was introduced for areas where the numbers were insufficient under the voluntary system. A women's corps, called the A. Territorial Service, was also formed during the war, in order to release men for the combatant ranks. Their duties included transport, and work on searchlights and gun stations.

**Educational Training.**—Education of the rank and file has made considerable progress. In 1920 the A. Educational Corps was formed to train officers for educational work in the A. This corps was formed to train officers for educational work in the A. This corps absorbed the old Corps of A. Schoolmasters. Many first-class certificates (Eng., map-reading, arithmetic, geography) are awarded annually, a number of special certificates (equivalent to matriculation). There is also provision at 3 centres, Hounslow, Chisleton, and Aldershot, for vocational training. At these centres a limited number of soldiers in the closing months of their colour service are taught some useful trade. See also TANKS, TERRITORIAL ARMY. For foreign As. see under foreign countries. See J. S. Ormond, *Parliament and the Army, 1612-1904*, 1933; D. H. Cole and E. C. Priestley, *An Outline of British Military History, 1937*; J. K. Dunlop, *The Development of the British Army, 1899-1914*, 1938; C. C. P. Lawson, *A History of the Uniforms of the British Army to 1760*, 1939-41; Cyril Falls, *The Nature of Modern Warfare*, 1941; S. L. A. Marshall, *Armies on Wheels*, 1942; W. G. Lindsell, *Military Organisation and Administration*, 1943.

**Army-worm**, or *Leucania unipunctata*, is the larva of an insect of the order Lepidoptera and family Noctuidæ, which receives its name from its habit of marching in great numbers. It does much damage to Amer. crops. The final stage of its life occurs when it becomes a nocturnal moth.

**Arnaldus de Villa Nova**, see ARNOLDUS. **Arnatta**, see ANNOTTO.

**Arnaud, Arsène**, see CLARETIE, JULIE.

**Arnaud**, or **Arnauld**, or **Ernoldus** (d. c. 1156), the abbot of St. Florentin de Bonneval, and a friend of the great St. Bernard. During the greater part of his lifetime he kept up a correspondence with St. Bernard, whose life he afterwards partly wrote.

**Arnaud, François Thomas Marie de Baculard d'** (c. 1718-1803), Parisian writer and dramatist. He was b. in Paris, where he also d. For some time his literary merit attracted the attention of Voltaire, by whom he was recommended to the king of Prussia. He was for a time at the court in Berlin, but returned to Paris the year before the outbreak of the Seven Years War (1756). During the latter part of his life he lived a life of great poverty and misery. His

chief works are *Les Délassements de l'homme sensible*, *Les Loisirs utiles*, and a number of romances and sacred odes.

**Arnaud, Henri** (1641-1721), pastor and general of the Vaudois of Piedmont, was b. at Enibrun. He was educated at La Tour, and later at the college at Basle and the academy at Geneva. He was in the course of time appointed pastor at the vil. of La Tour. After the expulsion of the Vaudois by Victor Amadeus he became their leader, and probably visited William of Orange in order to obtain help and money. The revolution of 1688 in England gave A. encouragement, and he led the expedition which was to attempt 'la glorieuse rentrée.' After encountering almost unsurpassable difficulties, they were besieged during the whole winter by the Fr. and the Savoyards; but they were forced to retreat and were driven to a valley above La Tour by A. In the following month they were received into favour by the duke of Savoy, who had become an ally of William III. For the next few years A. and the Vaudois helped the allies to fight the Fr. But at the end of the war, the duke again becoming hostile, they were forced to leave the country, and about 3000 of them followed A. into exile in Protestant countries, mainly in Germany. Again the Vaudois, during the war of the Spanish Succession, helped the allies against the Fr., but A. did not fight in person this time. He visited England about 1707. He died at Schonenberg. During his exile he wrote his *Histoire de la glorieuse rentrée des Vaudois dans leurs vallées*, which was trans. into Eng. in 1827.

**Arnaud de Cervole** (d. 1366), a brigand chief who commanded one of those bands which ravaged the S. of France during the thirteenth and fourteenth centuries. He fought with King John at Poitiers in 1356, and with him was taken prisoner. After his release he again returned to the S. of France and exerted his old influence over his band. He pillaged the whole of S. France, and held Pope Innocent VI. to ransom. He again took service with the royal army, and defended Burgundy against the Free Companies; but at the same time he gave it up to his own soldiers to pillage. He was assassinated by one of his followers.

**Arnaud de Villeneuve**, see **ARNOLDUS**.

**Arnaud**, or **Ernoldus**, see **ARNAUD**.

**Arnaud, Angélique de St. Jean** (c. 1624-1681), a nun at Port Royal. She was elected prioress in 1673, and was by her piety and courage an example to all the sisters during the Jansenist persecutions. She was elected abbess in 1678, and retained that position until her death. To her we owe the *Mémoires pour servir à l'histoire de Port Royal* and literary pictures of her 2 famous aunts.

**Arnaud, Antoine** (1612-94), the twentieth and youngest son of Antoine A., a famous Fr. lawyer. He is usually distinguished by the name 'le grand A.' He was originally intended for the bar, but chose rather the study of theology. He became a Jansenist, and his book, *De la*

*fréquente communion*, raised such an uproar that he was forced into hiding for 20 years, and his letters, *A un duc et pair*, a very outspoken attack on Jesuitical methods, were the immediate cause of the famous *Lettres provinciales* of Pascal, but these failed to save A. from being solemnly expelled from the Sorbonne and degraded, 1636. The 'Peace' of Clement IX. suspended attacks on Jansenism, and A. emerged from retirement, and was graciously received by Louis XIV. In his *La Perpétuité de la foi* he now defended transubstantiation and attacked the Calvinistic doctrines. His submissions proved external only and Port Royal became a Jansenist centre. This doctrine was condemned by Pope Alexander VIII. in 1690, and A. once again went into exile and fled to Holland before the storm burst. There he conducted controversies with Jesuits, Protestants, and even with Malebranche. His *Art de penser* (*Port-Royal Logic*), in collaboration with Nicole (q.v.), remained as a text-book until quite recent times.

**Arnaut, Antoine Vincent** (1766-1834), was b. in Paris. Almost immediately after starting his dramatic writings he was successful with his play *Marius à Minturnes*, 1791. He left France during the Terror, but returned and was arrested, and for a short time imprisoned. He was patronised by Napoleon and remained faithful to him during the Hundred Days. Because of this he remained in exile until 1819. Ten years later he was again elected to the Academy, and in 1833 became secretary. Among his works may be mentioned *Blanche de Montcassin*, *Fables*, and *Souvenirs d'un sexagénaire*.

**Arnaut**, a Turkish and Serbian word meaning a native of Albania; an Albanian.

**Arnaut Daniel**, one of the most famous of troubadours. His name remains to us as the name of the greatest of troubadours, owing to the praise bestowed upon him by Dante. He seems to have been a knight of Périgord, who attached himself as a troubadour to the court of King Richard I. of England. He was a great composer of the love song, and both Dante and Petrarch are loud in their praises of the *sestina*, a poetic form which he invented. His versification is complicated and to-day it is difficult for us to understand the admiration which it once excited.

**Arnaut de Mareuil**, a troubadour of the S.W. of France who settled at the court of Toulouse. By his passion for the Countess Adalasia he roused the wrath of his rival Alfonso II. of Aragon and was forced to flee into exile. He probably d. before the end of the twelfth century.

**Arndt, Ernst Moritz** (1769-1860), Ger. poet and patriot. He was the son of an emancipated serf, and was educated at Stralsund, Greifswald, and Jena. Intended for the ministry, he renounced it, and led for some time a wandering life. He 1803 he pub. *Versuch einer Geschichte der Leibeigenschaft in Pommern und Rügen*, a hist. of serfdom which led to its abolition in 1806 in Pomerania. In 1806 he issued the famous call to the Gers. to

throw off the yoke of France, and such excitement did it produce that he was forced into exile in Sweden to escape Napoleon. In 1810 he issued pamphlet after pamphlet full of hatred of the Fr., and issued also his famous songs, *Was ist das Deutsche Vaterland?* and *Was bliesen die Trompeten?* In 1818 he was appointed to the univ. at Bonn, and threw himself into the movement for constitutional reform. He was arrested and imprisoned for a short time because of the boldness of his demands, and was not reinstated as prof. until 1840. He was elected to the Ger. Diet in 1848, but resigned in 1849.

**Arndt, John (Johann)** (1555-1621), a Lutheran divine, b. at Ballenstädt in Anhalt. He studied theology under the tutelage of Lutheran teachers. His most famous work is his *Wahres Christenthum* (True Christianity). In this he points out Christ's life in His people as contrasted with the main Lutheran doctrine. His death for His people. His works are mainly of the mystical and devotional kind.

**Arne, Thomas Augustine** (1710-78), the son of an upholsterer, was b. in London, and educated at Eton. He was intended for the bar, but his love for music decided his career. In 1733 he produced his first opera, *Rosamond*, in which his sister Susanna Maria, afterwards the famous Mrs. Cibber, took the prin. part. He wrote music for Fielding's *Tom Thumb*, Congreve's *Judgment of Paris*, Milton's *Comus* and Thomson and Mallet's *Masque of Alfred*. In the last-named appeared the famous *Rule, Britannia*. In 1744 he was appointed composer to the Drury Lane theatre. In 1746 he supplied music for the masque and the song *Where the Bee sucks in The Tempest*. He composed 2 oratorios, *Abel and Judith*. He was made a Mus. Doc. in 1759. He afterwards became famous as a music teacher. He was buried at St. Paul's, Covent Garden.

**Arnes**, native name of the *Bos bubalus*, or *Bubalus arni*, a buffalo found in the W. Indies. It has large horns and is of great size.

**Arngrim, Arngrímur Jonsson** (1568-1648), Icelandic scholar, surnamed the Learned. The priest of Mel. He wrote *Brevis Commentarius de Islandia*, 1593; a *Supplementum*, on the lives of the kings, 1596; the *Crymogæa*, 1610; and *Specimen Islandiæ*, 1643. See Vigfusson and Powell's *Corpus Poeticum Boreale*, 1883.

**Arnheim, Johann Georg**, see ARNIM.

**Arnhem**, cap. of the prov. of Gelderland, Holland. Situated on the r. b. of the Rhine about 35 m. E.S.E. of Utrecht. Its surroundings are extremely beautiful. Its chief manufs. are cotton and woollen goods, soap, carriages, and tobacco. Sir P. Sidney d. here in 1586. First Allied Airborne Div. landed here Sept. 17, 1944. After 9 days' heroic stand 2000 men were brought back, with heavy losses to the div. on Sept. 26. Brit.-Canadian troops captured A. Apr. 13-14, 1945. See WESTERN FRONT IN SECOND WORLD WAR. Pop. 96,000.

**Arnhem Land**, the name given to a por-

tion of the extreme N. of S. Australia; taken from the name of the ship on which the voyage of discovery to this land was undertaken in 1618.

**Arni**, see ARNEE.

**Arnica**, a genus of Compositæ found in cold and temperate climates. *A. montana*, the leopard's-bane, common to Alpine woods, contains an acrid resin and a volatile oil.

**Arnim, Bettina von** (1785-1859), a Ger. authoress, the sister of Clemens Brentano. In 1807 she made the acquaintance of the poet Goethe, for whom she had a great attachment. The acquaintance, however, came to an abrupt end in 1811, owing to her deliberate insolence to Goethe's wife. She married in 1811 the writer Ludwig von A. (q.v.). Her most famous publication was the *Goethes Briefwechsel mit einem Kinde*, 1835. This purported to be a correspondence between herself and the poet, which was at first believed to be authentic, but was later proved to be grossly interpolated and to a great extent fictitious. See on this Lewes's *Life and Works of Goethe*, 1855. A number of her books are equally unreliable.

**Arnim, Harry Karl von** (1824-81), b. in Pomerania, and brought up by his uncle Heinrich von A., who had been ambas. at Paris and foreign minister. In 1864 he was appointed Prussian envoy at the Vatican. In 1869 he pointed out the difficulties which would arise practically if papal infallibility were allowed to be promulgated. In 1871 he was Ger. commissioner at Paris, and in 1872 he was appointed ambas. He quarrelled with Bismarck, and on a charge of embezzling state papers was sentenced to 3 months', and, on appeal, 9 months' imprisonment. For publication against Bismarck, while in exile, he was sentenced to 5 years' imprisonment. He d. while on his return from exile.

**Arnim, or Arnheim, Johann Georg** (1581-1641), Ger. diplomatist and general, b. at Boltzenburg; served under Gustavus Adolphus in 1613, and in the Polish army, and in 1626 entered the imperial service under Wallenstein. In 1630 he left it for that of the elector of Saxony, and commanded part of his army at Breitenfeld in 1631. He assisted in the negotiations between the elector and Wallenstein during 1633-34; and defeated the Imperialists under Colloredo at Liegnitz, 1634. D. at Dresden while leading the Imperial and Saxon forces against the Fr. and Swedes.

**Arnim, Ludwig Achim von** (1781-1831), a Ger. poet and novelist who was b. at Berlin. He received a scientific training, but his natural tendency was towards literature with a fondness for romance and the supernatural. This is seen in his *Ariels Offenbarungen* and *Hallins Liebesleben* (both pub. in 1804), the latter containing a biography of Rousseau. He collected old popular legends and songs in travelling through Germany, which he pub. in collaboration with Clemens Brentano, in 3 vols., entitled *Des Knaben Wunderhorn*, 1806-8. In 1809 appeared the *Wundergarten*, a collection of tales,

Other works were *Die Gräfin Dolores* (a novel), 1810; *Itale und Jerusalem* (dramatic romance), 1811; and *Isabelle von Ägypten*, 1811. In 1817 he pub. his last notable romance, *Die Kronenwächter*. His works show a gift for invention, but his style is whimsical and incoherent.

**Arnim, Mary Annette, Countess von** (later Countess Russell), authoress, a daughter of H. Herron Beauchamp. She married Count August von A., who d. in 1910. She won popularity with *Elizabeth and her German Garden*, 1818. Her other works include *The Benefactress*, 1901, *The Caravaners*, 1909, *The Adventures of Elizabeth in Rugen*, 1901, *Christopher and Columbus* (a war-time story), 1919, and *Expiation*, 1926; all of them show an acute and lively wit. In those of her works that belong to the 'Elizabeth' series, as well as in others, a frequent theme is the reaction of Ger. and Eng. temperaments upon each other; and in *Christopher and Columbus* she proved herself at home with Amers. in their own land. She became third wife of the second Earl Russell in 1916, but they separated in 1919. Her later novels included *The Enchanted April*, 1922, and *Introduction to Sally*, 1926. She d. in 1941.

**Arnim, General Sixt von** (1851-1930). Ger. general. In the final Ger. offensive, begun Mar. 1918, he commanded that one of the 7 armies which occupied the line from the sea to the R. Lys. His objective was, in conjunction with Gen. von Quast, commanding from the Lys to Arras, to thrust back the Brit. First Army under Gen. Horne upon the Brit. armies which were in retreat to the Aisne and so isolate the Second Army under Gen. (later F.M.) Plumer. He took Mont Kemmel (Apr. 24-26) by violent frontal and flank assaults, but his losses were so severe that he was unable to secure other hills belonging to the same system, and so could no longer jeopardise Ypres. This failure, together with that at Hazebrouck, was the beginning of the end of the great Ger. thrust of 1918.

**Arno**, one of the most important rvs. in Italy. It rises on Mt. Falterona in the Apennines, about 25 m. N. of Arezzo. It is about 140 m. long, and enters the Mediterranean at Leghorn, a few m. S. of the tn. of Pisa. It flows through Florence, where it attains a width of about 400 ft. It is navigable for barges as far as Florence, except in the summer, when it is fordable. It is joined to the Tiber by the Chiana canal. Brit. Eighth Army entered Arezzo July 16, 1944. S. Africans reached outskirts of Florence, Aug. 1; when 6 bridges over the A. were found to be destroyed. Florence was taken by the Allies on Aug. 11. The Fifth Army took Pisa on Sept. 1. See ITALIAN FRONT IN SECOND WORLD WAR.

**Arnobius** (d. 327), a teacher of rhetoric in Numidia who fl. during the late third and early fourth centuries. He was brought up as a pagan, but became a Christian, probably about the year 300. In the first decade of the fourth century he pub. the work *Adversus Nationes*, for

which he is chiefly remembered. The work was a bitter and ironic attack on paganism.

**Arnold**, tn. and par. of Nottinghamshire, England, 4 m. N.E. of Nottingham, in Sherwood Forest. Has manufs. of lace and hosiery. Pop. 11,800.

**Arnold da Brescia** was a native of the tn. of Brescia, and one of the most prominent opponents of the temporal power of the papacy. He was b. probably towards the end of the eleventh century, of noble parents. Educated in Paris, it is probable that he came into contact with Abelard, even though he may not actually have been taught by him. On his return to Italy he became a canon regular, and was noted for his extreme asceticism. Accused by St. Bernard of being a follower of Abelard, he shared Abelard's condemnation in 1140. He attacked St. Bernard, and as a result was forced to flee from France owing to the influence of his opponent. He took refuge at Zurich, where he remained for 5 years. On his return to Rome (1145), A. joined the republican movement, of which, before long, he became the most prominent leader; he made continual attacks upon the clergy, vehemently denying their right to hold property. For 10 years this state of disorder continued. Even on the return of the pope to Rome in 1148, A. remained undisturbed; but on the accession to the papacy of Adrian IV. (Nicholas Breakspear), and the accession to the imperial throne of Frederick Barbarossa, A. was forced to flee into Campagna. Here he was seized and brought to Rome, 1155. In Rome he was condemned, hanged, and burnt, and his ashes were thrown into the R. Tiber.

**Arnold von Bruck** (d. c. 1536), a celebrated musician who fl. at the beginning of the sixteenth century. His bp. is unknown. He lived for some considerable time in Germany, and received an appointment as music master in the chapel of Ferdinand, the brother of the Emperor Charles V., and was dean of the abbey of Lulbach. He composed a great deal of sacred music. He d. at Vienna.

**Arnold of Winkelried**, a Swiss knight and hero of the Unterwalden. During the struggle for independence by the Swiss freemen and peasantry against the Austrian archduke, a battle was fought at Sempach, a small vil. some few m. distant from Lucerne, in July 1386, the Austrians being led by their archduke, Leopold. The Austrians, who numbered about 4000, were opposed by 1500 Swiss. The Swiss struggled heroically against the Austrians, but could make no impression upon the phalanx of heavily armoured pike-bearing soldiers. A. of W., seeing that the only way to defeat the Austrians was to open a way through their ranks, rushed upon the spears, and grasping a number of the long pikes in his embrace, cleared a road for his companions in arms over his dead body. At close quarters the Austrians, hampered by their armour, were annihilated, and the independence of Switzerland was won.

The anniversary of the death of A. is still observed as a Swiss festival.

**Arnold, Benedict** (1741-1801). Every Amer. school child is taught to loathe the name of A. as the classic example of the traitor to his country. B. in Connecticut. A. joined the Amer. Army in the war of Independence and distinguished himself in the battles of Ticonderoga and Quebec. He reached the rank of major-general and was one of the most trusted officers of Gen. Washington. Subsequently, he became aggrieved at the promotion of sev. inferior officers over his head. But he continued at his post, fought at Ridgefield and Saratoga, was commander at Philadelphia in 1775 and then put in charge of the all-important post of W. Point on the Hudson R. in 1780. By that time his resentment had so rankled that he was ripe for treachery and entered into communication with the Brit. command for the betrayal to them of his post. A handsome young Brit. officer, Maj. John André, was sent to meet him. André was captured and hanged as a spy, but A. escaped to the Brit. lines, where he received a command and fought against his fellow countrymen. He sailed for England in 1782 and d. in London June 14, 1801, where he lived more or less in obscurity, a disappointed and embittered man.

**Arnold, Sir Edwin** (1820-1904), Eng. poet, b. at Gravesend, son of a Sussex magistrate, and educated at King's School, Rochester, King's College, London, and Univ. College, Oxford. At the latter place he gained the Newdigate prize for a poem on Belshazzar's feast. He went to India as a schoolmaster, and during the mutiny was able to render signal service to the Gov. Later he became a journalist, and was on the staff of the *Daily Telegraph* (of which he was ultimately editor), and it was he who was largely responsible for the dispatch of Stanley to the Congo. He is, however, best remembered as a poet. His most famous poem is *The Light of Asia* (1879), an epic poem on the life and teachings of Buddha. In *The Light of the World* (1891) he attempted, less successfully, a similar treatment of the life and teaching of Jesus. Amongst his other works are: *The Song of Songs of India*, 1875; *The Song Celestial*, 1885; *With Sa'di in the Garden*, 1888; *Adzuma*, 1893. He was made a C.S.I. in 1877, and K.C.I.E. in 1888.

**Arnold, Matthew** (1822-88), b. at Laleham, Middlesex, on Christmas Eve. His father was the famous headmaster of Rugby School, to which establishment M. A. went to finish his education. From here, having obtained a scholarship at Balliol, he went on to Oxford in 1840. Even at this early time his mind had already turned to literature, and his poem, *Alaric at Rome*, had been recited in Rugby School in 1840. In 1843 he obtained the Newdigate prize with a poem on Cromwell, but *Cromwell* does not give one as good an impression as his earlier poem on Alaric. In the following year he took his degree, and a year later was

rewarded with a fellowship at Oriel College. After leaving the univ. A. for a short time taught classics to the fifth form at his father's old school, but he did not long remain a schoolmaster. In 1847 he became private secretary to Lord Lansdowne, then a leader of the moderate Whigs, and on him A., to a large extent, modelled his politics.

In July 1849 appeared the first of A.'s pub. sonnets, and in the same year appeared *The Strayed Reveller and other Poems*, by 'A.' The publication attracted but little attention, so little, in fact, that the ed. was withdrawn very hastily. This collection, although it contained a number of poems of little merit, at the same time contained much that was very meritorious and that has gained for itself a permanent place in Eng. literature. In 1852 appeared his *Empedocles on Etna and other Poems*, again by 'A.', but this also was quickly withdrawn, to be followed, however, in the next year by a collection of poems, many of which had been already pub., together with an essay which embodied A.'s idea of poetry. A year before the publication of *Empedocles on Etna*, A. had been appointed by Lord Lansdowne to an inspectorship of schools, and he did an immense amount of good to education in England by the work which he performed as an inspector. His official reports were both interesting and instructive, and his reports on the various foreign tours of inspection which he undertook did a great work. His report on Ger. schools he himself considered most important, since he repub. it twice. He had a great admiration for the Ger. system of education. He himself remarked that the Fr. *univ.* lacked liberty, the Eng. science, but the Ger. neither. Many of his advocated reforms were carried out both in schools and univs.

In 1857 A. had been appointed to the chair of poetry at Oxford, and he retained this chair for 10 years, being the first layman to occupy it. Amongst the new poems which were pub. in 1867 we find his greatest poem, *Thyrsis*, a monody on his dead friend, Arthur Clough. He had ceased to be prof. of poetry, but he still occupied a place as a poet second to none, save perhaps Tennyson. By his half-philosophical, half-theological books A. attracted much attention, and he struck the keynote of his philosophy in preaching his favourite doctrine of 'sweetness and light.' His application of literary methods of criticism to the Bible aroused great interest in the country. He argued that much that was wrong in the theology of the time rested solely on the fact that the Bible was read as a scientific work, whereas his own conception of it was that it was literary, and therefore the methods of literary criticism could be applied to it. *Literature and Dogma* (1873) marks the breaking away entirely of A. from Christian doctrines. His methods of criticism were not always fair, nor always in good taste, but his own criticism roused so much bitter feeling that the methods adopted by both

sides contain much that cannot be commended. In 1883 he received a pension of £250 per annum, and in the same year he lectured in the U.S.A. He d. at Liverpool of heart failure, occasioned by his having imprudently vaulted over a fence. He was buried at Laleham.

Amongst his works are included his poem on *Alaric at Rugby*, 1840, and his Newdigate prize poem on Cromwell, 1843; *The Strayed Keveller and other Poems*, 1849; *Empedocles on Etna*, 1852; *Poems*, 1853; *Essays in Criticism*, 1865; *New Poems*, 1867; *Lectures on the Study of Celtic Literature*, 1867; *Culture and Anarchy*, 1869; *Literature and Dogma*, 1873; *Irish Essays*, 1882; *Discourses on America*, 1885. His collected works (including a bibliography) were pub. in 1903-4, and letters in 1895 and 1901. Lives, by A. Birrell, 1892; G. Saintsbury, 1899; F. L. Bickley (*Matthew Arnold and his Poetry*), 1911; Sir A. T. Quiller-Couch, 1918; Sir W. Raleigh, 1923; E. Blunden, 1932; L. Trilling, 1939; E. K. Chambers, 1947. See also C. Dymont, *Matthew Arnold* (selection, with introduction), 1948.

**Arnold, Samuel** (1740-1802), an Eng. musician. He was employed by the musical directors of Covent Garden, for whom he wrote many operas. His first opera was *The Maid of the Mill*, which was produced in 1765. In 1769 he leased Marylebone Gardens, where he produced many operas. In 1773 he was given the degree of Mus.Doc. by Oxford Univ. He became organist of the Chapel Royal 10 years later, and was afterwards appointed to the same position in Westminster Abbey. He is best known as the editor of a collection of cathedral music and of the works of Handel.

**Arnold, Thomas** (1795-1842), headmaster of Rugby, b. at W. Cowes. His early education was received at Westminster, but in 1807 he passed on to Winchester, where he remained until he entered the univ. of Oxford in 1811. He entered at Corpus Christi College, but 4 years later was elected a fellow of Oriel College, where he remained until 1819. His dread of insincerity led him to hesitate deeply before he took orders, but once his doubt of his own realisation of the Christian faith had passed, he became a devout and passionate Christian. After leaving the univ. he settled down at Laleham, near Staines; here he took pupils for preparation for the univ., and also devoted himself to study and to the commencement of his *History of Rome*. Shortly after his arrival at Laleham he married Mary Penrose, the daughter of a Nottinghamshire rector. After 9 years' stay, he was appointed to the headmastership of Rugby School, 1828, and here he proceeded to do what had been prophesied of him, 'that he would change the face of education all through the public schools of England.' Schools were no longer to be mere places where the classics and a certain amount of general knowledge was learnt, but places in which the intellectual and the moral life were harmoniously blended, training places for Christian gentlemen. He found

time to continue his studies amidst his school work, and he did a great amount of literary work. In 1841 he was appointed regius prof. of modern hist. at Oxford, where, during 1841-42, he delivered 8 lectures. In 1842, while preparing to spend the long vacation at his house at Fox How in Westmorland, he was seized with an attack of angina pectoris and d. June 1. He pub. many vols. of sermons, an ed. of Thucydides, a *History of Rome to the Second Punic War* in 3 vols., 1838-1843, and *Introductory Lectures on Modern History*, 1842.

**Arnold, Thomas** (1823-1900), second son of Dr. A. of Rugby. He was educated first privately by Herbert Hill, a cousin of Southey, and afterwards passed through Winchester to Rugby. Abortive attempts at establishing in turn a farm and a school made the offer of a position as inspector of schools eagerly accepted. In 1856 he sought refuge from religious doubts by joining the Rom. Catholic Church. Newman offered him a professorship of Eng. literature at the Catholic Univ. at Dublin. Here he compiled his *Manual of English Literature*, 1862. His broadening views led to a rupture between him and the Catholic Church, which, however, he rejoined. His works include *Passages in a Wandering Life*, 1900, and many valuable eds. of the Eng. classics.

**Arnold, Thomas Kerchever** (1800-53), a prolific writer of educational and theological works. He was educated at Trinity College, Cambridge. He was a determined opponent of the Oxford Movement. He earned a wide reputation for his numerous classical school books. His first scholastic work was *The Essentials of Greek Accidence*, which was an immediate success. His *Practical Introductions* to Gk. and Lat. prose composition appeared in 1838 and 1839. His *Fall of Abel* was a sermon, which was first pub. in vol. iii. of *Family Sermons*.

**Arnold-Forster, Hugh Oakeley** (1855-1909), grandson of Dr. Arnold of Rugby, a politician and authority on army and navy questions. He was educated at Rugby, afterwards passing to Univ. College, Oxford. After gaining recognition as the possessor of a marked talent for hist., he came to London, where he studied for the Bar. Before he achieved any success, however, he became interested in politics, especially those dealing with Irish questions. He pub. *The Truth about the Land League* shortly after his advent into the political arena. His political ideas, in the beginning of Liberal tendencies, changed to a sympathy with the Unionist cause. About 1884 his energies, directed against certain army conditions, led to an adoption of improved organisation. Under the premiership of Mr. Balfour he was offered the position of secretary for war. His determination to advance a special scheme of army organisation for the purposes of efficiency in the event of sudden invasion led to an estrangement between himself and the Cabinet, and its failure, owing to the consequent disruption, resulted. In 1908 he pub. *The Army in 1906*, which

defended his own scheme while it adversely criticised that of his successor, Mr. Haldane. At this time his health gave way, and further active political interest was rendered out of the question. The tariff reform movement had in him one of its early advocates.

**Arnoldus de Villa Nova**, also called **Arnau de Villeneuve** (d. c. 1313), was probably of Sp. origin, and was famous as an alchemist, astrologer, and physician. He lived during the thirteenth and fourteenth centuries, and appears to have studied chem., medicine, and Arabian philosophy. After living at the court at Aragon, he is believed to have lived for some time in Paris. He was forced into exile in Sicily owing to the hostility of the Church towards him. On the illness of Clement V. he was summoned to attend him at Avignon, but d. on the way. Amongst the writings attributed to him on somewhat small authority are *Rosarius Philosophorum*, *Novum Lumen*, *Flos Florum*, and the *Breviarum Practicæ*.

**Arnott, Archibald** (1771-1855), a Scottish physician, was b. at Dumfries. He was military doctor at St. Helena, and there gained the friendship of Napoleon and assisted at his last moments. He pub. a vol. of memoirs of Napoleon.

**Arnott, Neil** (1788-1874), b. at Arbroath. After having graduated M.A. at Aberdeen, he studied medicine, and was appointed surgeon to the E. India Company. He began to practise in London in 1811, and attained eminence as a physician and physicist, being appointed physician extraordinary to the queen in 1837. Author of *Elements of Physics*, 1822-29, and of sev. hygienic inventions.

**Arnotto, or Arnatta**, see **ANNOTTO**.

**Arnould, Sophie** (1740-1802), Fr. operatic singer, b. in Paris; entered grand opera, 1757; the most prominent singer at the Royal Opera, Paris, till 1778. Among her chief parts were those of *Iphigénie* in Gluck's *Iphigénie en Aulide*, *Eurydice* in his *Orphée et Eurydice*, and the prin. rôles in Rameau's works. She was famous for her wit and conversational powers, and was the friend of D'Alembert, Helvétius, Diderot, and Rousseau. See collection of her *bons mots* in *Arnouldiana*, 1813, and her *Life* by the brothers Goncourt, 1857.

**Arnould-Plessy, Jeanne Sylvanie** (1813-1897), a Fr. actress, was b. at Metz. She married Auguste Arnould, a Fr. man of letters. After acting at Paris, she forfeited her rights as a member of the Fr. Theatrical Society by going to act at St. Petersburg, but she afterwards returned to the Théâtre Français in 1855. She created a large number of rôles, but excelled in the part of a coquette.

**Arnprior**, tn. of Renfrew co., Ontario, Canada, on Chats Lake, 38 m. W. of Ottawa. In the neighbourhood are marble quarries and iron mines, and the tn. contains large lumber mills. Pop. 4000.

**Arnsberg** is a tn. on the R. Ruhr, in

Westphalia, Germany, 36 m. E. of Hagen. It was the seat of the anct. Vehmgerichte, and is the cap. of the gov. of A. Pop. 12,000.

**Arnstadt** is a tn. in the former Ger. principality of Schwarzburg-Sondershausen, 10 m. S. of Erfurt, on the Gera. An old Thuringian city, with manufs. of leather, and a trade in corn and timber. Pop. 20,500.

**Arnsvalde** is a tn. in Germany, in the prov. of Brandenburg, 41 m. S.E. of Stettin, situated between 3 lakes. It had manufs. of iron, machinery, matches, and woollens. Pop. 10,200.

**Arnu, Nicolas** (1629-92), a Fr. theologian of the seventeenth century. He was b. at Nérancourt. He was appointed prof. of theology and metaphysics at Padua, where he d.

**Arnulf**: 1. Archbishop of Rheims, A.D. 989. He was an illegitimate son of Lothaire, and succeeded Adalberon through the influence of the Empress Theophano, thereby ousting Gerbert, who had been designated by Adalberon. A. swore allegiance to Hugh Capet, the great rival of Charles Lorraine, uncle of A. and true heir to the throne of France. Later, however, A. supported his uncle's cause, but when Hugh overthrew Charles, A. confessing his treachery, was deposed, and succeeded by the famous Gerbert, afterwards Pope Sylvester II. 2. A count of Flanders, son of Baldwin II. and of Elfrith, daughter of Alfred, king of England. He succeeded to the inheritance of Baldwin, c. 918, and is chiefly remembered for having procured the murder of William Longsword, the Norman. He was succeeded by his grandson of the same name in A.D. 993. 3. A Rom. emperor. He was an illegitimate son of Carleman, and nephew of Charles the Fat, the indolent and cowardly king of the W. Franks, who fl. in the ninth century A.D. A., having been made ruler of Carinthia by Carleman, then marched against Charles, whose cowardice in buying off his foes had disgusted him; and when Charles was deserted by his ministers, A. became king in his place and, repairing to Rome, was made emperor. Displayed signal bravery in a great fight near Louvain against the Northmen. Later, allied himself with the warlike Magyars in the vain hope of breaking up the domains of the Moravians. Died about A.D. 900. 4. Fr. Benedictine monk, or Ernulphus (q.v.).

**Arnus** was the name of a famous Gk. priest killed at Naupactus. Apollo in revenge struck the Dorians with a plague, and was appeased only with funeral games instituted in honour of A.

**Aroa** is the name of a dist. of Venezuela, N.N.E. of the Sierra A., and near the stream of the same name. It contains copper.

**Aroer** is the name of two O.T. places. The first was situated in Palestine (tribe of Gad), near a trib. of the Jabbok. It was opposite Rabba of the Ammonites, and Jephthah fought the latter near A. The other A., also in Palestine, was situated

near Arno. It was in anct. times the frontier tn. of Amorreus, and later of the tribe of Reuben. It belonged to the Moabites in the time of Jeremiah. The ruins of it are now called Arayr. For biblical references see Num. xxxii. 34, 1 Sam. xxx. 28, 2 Sam. xxiv. 5, 1 Chron. v. 8, Isa. xvii. 2, Jer. xlviii. 19.

**Arolsen**, the cap. of the principality of Waldeck, is situated on the Aar, 14 m. S.S.W. of Warburg. The castle, which dates from the eighteenth century, contains a valuable library, Pompeian antiquities, and West's 'Death of Wolfe.' Pop. 3000.

**Aromatari, Giuseppe degli** (1586-1660). b. at Assisi and d. at Venice, was a physician and naturalist. He studied logic, philosophy, and medicine at Padua, and practised as a physician at Venice for 50 years, although he had offers from the duke of Mantua, the king of England, and Pope Urban VIII. He had an immense library, which contained many manuscripts. He wrote *Riposte alle Considerazioni di Alessandro Tassoni sopra le Rime del Petrarca*, Padua, 1611; and also works on medicine and natural hist., including an essay on hydrophobia and a letter on the generation of plants from seeds entitled *Disputatio de Rabie Contagiosa, cui preposita est Epistola de Generatione Plantarum ex Seminibus*, Venice, 1625, and Frankfurt, 1626. His proposed work on generation was not completed.

**Aromatics**, substances characterised by a fragrant, spicy taste and odour, as cinnamon, ginger, eucalyptus, camphor, etc.

**Aromatic compounds** form one of the great divs. of organic compounds. They may be looked upon as derivatives of benzene, and are distinguished from fatty or aliphatic compounds by their molecules containing closed chains. The molecular formula of benzene, for instance, is  $C_6H_6$ , but the molecular formula of another organic compound, dipropargyl, is also  $C_6H_6$ . The chemical behaviour of the 2 compounds is, however, markedly different; dipropargyl combines easily with bromine, giving additive compounds, and is very unstable; benzene is remarkably stable, and gives usually substitution products, that is, products where certain atoms are displaced by an equivalent number of other atoms or radicals, without the state of combination of the rest of the molecule being altered. Examination of the behaviour of benzene led Kekulé in 1865 to the conclusion that the molecule of benzene is symmetrical, and that each carbon atom is directly united to one, and only one, atom of hydrogen. As carbon is assumed to be quadrivalent, its combination in a compound must be expressed in a graphic formula by drawing 4 lines from each carbon atom to the other atoms to which it is directly united. This has been done in sev. ways, each of which agrees with many of the phenomena in the chemical behaviour of benzene. The earlier formulae were:

LADENBURG

A later formul., suggested by Armstrong and Baeyer, appeared to be more satisfactory. In this formula, one valency of each carbon atom appears directed towards the centre, in order to express that by the mutual action of all the 6 valencies the power of each is rendered latent, and this agrees with the facts relating to benzene and its derivatives.

Modern work on valency (q.v.) has thrown new light on the whole problem. Thiele's suggestion that the residual valency of each carbon atom is uniformly distributed round the ring is now accepted, in essentials.

A. Cs. usually contain a larger percentage of carbon than aliphatic compounds, and have a characteristic reaction with nitric acid, producing nitro-compounds; and also with sulphuric acid, producing sulphonic derivatives. When nitro-compounds are reduced, they are converted into amino-compounds, which are converted into diazo-compounds on treatment with nitrous acid in the cold; if the solution is warmed, phenols are obtained. A. alcohols are prepared by methods analogous to those employed in producing aliphatic alcohols: the corresponding halogen derivatives are heated with water, weak alkalis, or silver hydroxide.

**Arona**, a tn. on the W. shore of Lake Maggiore, Piedmont, Italy. It is beautifully situated, and the neighbouring country produces wine. It is engaged in a transit trade between Piedmont and

Switzerland. At the castle adjoining A. St. Carlo Borromeo, archbishop of Milan, was b. Pop. 6300.

**Aroodje of Orooch**, see **BARBAROSSA, HORUK**.

**Aroostook** is the name of a riv. which rises to the N. of Maine, and flows into the St. John in New Brunswick. In length 120 m., it is known in hist. on account of its connection with the much-discussed and troublesome question of the N.E. boundary between Brit. America and the U.S.A.

**Arosa**, a Swiss holiday resort, 19 m. E. of Coir, situated amidst pine woods, at an altitude of nearly 6000 ft.

**Arouet**, François Marie, see **VOLTAIRE**.

**Arpad** (c. 870-907), the hero of Hungarian ballad and romance, and founder of the kingdom of Hungary. He founded the A. dynasty, which lasted till 1301.

**Arpeggio** is a chord in music of which the notes are played in very rapid succession, instead of simultaneously.

**Arpent** is the name of an old Fr. measure for land, which approximately corresponded to the Eng. acre. It was equal to 100 sq. perches, and according to the value of the perch in different localities the A. varied from one and a quarter to five-sixths ac., or in modern Fr. measures, from one-third to one-half hectare.

**Arpino**, the anct. *Arpinum*, is a tn. of S. Italy, in the prov. of Caserta. It is perched on an eminence midway between Rome and Naples, and was the bp. of Caius Marius and Cicero. It was owned successively by the Volsci, the Samnites, and the Romans. It now manufs. woollens, linen, paper, etc. The walls of the old pre-Rom. gate were blasted by the Gers. In the Second World War to make gun emplacements. The Gers. stole the valuable coin collection. Pop. 10,600.

**Arqua Petrarca** is the name of an It. vil. in the Euganean Hills, 12 m. S.W. of Padua. Here on July 18, 1374, Petrarch d. Pop. 1800.

**Arquata del Tronto**, vil. of Ascoli, Italy, on R. Tronto, 17 m. S.W. of Ascoli. Pop. of com., 5300.

**Arquebus**, or **Harquebus**, a hand-gun, forerunner of the modern rifle, dating from the fifteenth century. Those of the earliest construction were fired by a 'match' from the touch-hole. The ball fired by them weighed 2 oz. They were first fired from a forked rest at the height of the chest, but the Gers. invented a hooked form of butt, and elevated the barrel.

**Arques** is a tn. in the Fr. dept. of Pas-de-Calais, 2 m. S.E. of St. Omer. It possesses the finest ruins of an anct. feudal castle in the dept. The R. A., flowing through the dept. of Seine-Inferieure, is navigable from A. to the Eng. Channel. Pop. 4700.

**Arracacia**, a genus of S. Amer. plants of the order Umbelliferae. The tuberous roots of *A. xanthorrhiza* (arracacho) and *A. esculenta* are edible.

**Arracan**, see **ARAKAN**.

**Arrack** is a spirituous liquor manuf. in the E. Indies from a large variety of

substances, fermented rice, or coconut juice, etc. Pure, clear, and transparent, and of the colour of straw, when properly made it has a peculiar but agreeable taste. It contains 52-54 per cent of alcohol.

**Arragon**, see **ARAGON**.

**Arrah** is a tn. in the Shahabad dist. of Bengal, 320 m. N.W. of Calcutta. In 1857, a dozen Englishmen, with 50 Sikhs, defended an ordinary house against 2000 sepoys and 8000 armed insurgents, till finally relieved by Maj. Eyre.

**Arraignment** is an Eng. legal term signifying the calling of the prisoner to the bar of the court to plead 'guilty' or 'not guilty' to the indictment against him. It corresponds to the Scottish legal term 'calling the diet.'

**Arran** is the largest is. in the frith of Clyde, Scotland, lying between the Mull of Kintyre and Ayrshire. It is about 20 m. long, and 11 m. broad at its widest part. Its area is 105,814 ac. In winter a daily steamer maintains communication with Brodick and Lamlash, whilst in the summer the number of steamers which call is much greater. The general aspect of A. is mountainous, the N. peaks being very imposing. An anct. sea-margin encircles the coast with a low platform; the country rises abruptly to the high peaks on the S. and S.W. The geology of A. is of peculiar interest, for within its comparatively confined limits distinct sections of the great geological formations can be observed; the botany, also, of the dist. repays study by the variety and rarity of many of its plants. Relics of anct. times exist in the shape of Dan. forts, cairns, standing stones, etc. A few red deer may still be found in the wilder hilly dist., and blackcock and grouse abound; the game of the is. is, however, strictly preserved. Lamlash, which possesses a very fine natural harbour, and Brodick are the chief vils. The is. is a favourite resort of summer visitors. Pop. 2500.

**Arran, James Hamilton, Earl of** (c. 1515-1575), regent of Scotland during the minority of Mary Stuart. He was created duke of Châtelherault by Henry II. of France. In 1554 he resigned his position as regent to the queen-mother, Mary of Guise, and went to France. He, however, returned to Scotland to take part in the intrigues against Elizabeth. In 1573 he acknowledged James VI.'s authority and laid down his arms.

**Arran, James Stuart, Earl of** (d. 1596). He overthrew Morton, who had been regent of Scotland since 1569, and with the duke of Lennox managed the affairs of Scotland until 1585, when he was deprived of his authority.

**Arrangement of music** is the adaptation of a piece of music to an instrument or instruments other than those for which it was originally composed; as when orchestral compositions are arranged for the pianoforte. The pianoforte A. of Franz Liszt, though occasionally passing the limits of the fitting, are acknowledged to be unexcelled. Many of the master-musicians have arranged their own music.

**Arras**, the cap. of the Fr. dept. of Pas-de-Calais, is situated on the R. Scarpe, 120 m. N. of Paris. It is composed of 2 parts, the old tn., standing on an eminence, and the new tn., in the plain. Amongst the prin. buildings are the cathedral, of the eighteenth century, and the Gothic town hall, dating from the early sixteenth century. The Eng. word *arras* is derived from this tn., so famous was it for its tapestry. It manufs. lace, hosiery, sugar, and agric. implements, and has a considerable commerce in corn and oil; pop. 31,500.

**Arras, Battle of.** The first of the big battles of the third year of the First World War. The previous year (1916) had closed on the doubtful note of the battle of the Ancre (*q.v.*), which if it accomplished anything for the Allies, had at least the merit of definitely pressing the Gers. back to the Hindenberg line. This famous line they reached by Apr. of 1917. As a position it left almost nothing to be desired in point of natural and artificial defences, besides giving to the enemy the advantage of a much shorter front than on the Somme and Ancre. Its flaw was the uncertainty of its axes—the positions round Arras to the N. and those of Laon to the S. In the hope of pushing home such advantages as had been gained in 1916, the Allies were now preparing a general offensive on both these axes. The Fr. were to attack on the Laon front and the Brit. on that of A. The Brit. general advance began on Easter Monday, Apr. 9, after the usual preliminary bombardment, on a front of about 48 m., the objectives being, in the N., Lens and its surrounding cluster of coal villages, and in the S., Quéant, the nearer end of the hard-contested and powerfully fortified Drocourt 'switch' line. Had the Brit. offensive succeeded in taking these 2 points, the road to Cambrai would have been open. All went well in the opening stages, and by Apr. 11 the famous Vimy Ridge, together with 3000 yds. of the formidable Hindenburg line was taken, in addition to over 10,000 prisoners and 160 guns. All arms co-operated smoothly, the work of the tanks being a great advance on their performances of 1916. But though Lens was hemmed in, Quéant, at the other end, was not shaken. It now remained for the Fr. to deliver their blow, and the result was the disastrous battle of the Aisne heights begun on Apr. 16. (*See under AISNE, BATTLE OF TIE*). The idea of the 'decisive blow,' which was to be struck simultaneously at A. and Laon had failed. In Mar. 1918 the Gers. made a desperate attempt to capture A., but the Brit. line held firm and so saved not only that city but also Amiens (*q.v.*). In the Second World War Brit. troops entered A. on Sept. 1, 1944.

**Arrastre**, a Mexican and Amer. mule-mill for grinding ore.

**Array, Commissions of**, *see under COMMISSION, MILITARY*.

**Arreboe, Anders Kristensen** (1587–1637), a Dan. poet. After having studied at Copenhagen Univ., he took holy

orders, and became bishop of Trondhjem in 1618. His conduct of life being, however, such as to disgrace his office, he was deposed therefrom, and lived in retirement till his death. His chief work was the *Hexameron*, or *Six Days of the Creation*.

**Arredondo, Isidoro** (1653–1702), a Sp. painter. He was the pupil first of José García, and then of Francisco Ricci. He was employed by Charles II. to paint his portrait, and the frescoes of the palace of Buen Retiro are his work, but his most famous picture is one of *Psyche*.

**Arreoy**, an old institution of the Society Is. It was believed to involve infanticide for political purposes, but we have very little authentic information about it. Cook brought the first account of it to Europe in 1771, and other accounts have been given by Dr. Forster and by W. Ellis in his *Polynesian Researches*, 1832–36.

**Arrest** is the restraint of a man's person, in order that he may be compelled to obey the law, or be brought to trial. It is defined to be the execution of the command of some officer of justice or some court of record. As, in England, can take place in either civil or criminal cases. In civil cases, however, it is only in somewhat exceptional instances that A. takes place. The chief, and practically the sole, cause of such A. is 'contempt of court'; all the superior courts have power to arrest persons for this reason. This is done by the issue of a writ, by an order of the court or of a judge to the sheriff. Imprisonment for debt was ended by the Debtors Act of 1869, and consequently the writ 'capias ad satisfaciendum' is now rarely issued. It is only made use of in such cases as are excepted from the above Act; such are, when non-payment involves contempt of a competent court, or when a trustee refuses to comply with the order of a court of equity. A debtor may also be arrested to prevent him from absconding or removing his property out of the jurisdiction. A. 'in *meno process*,' that is, during the progress of a suit, is now abolished, with the above exceptions. The following are exempt from A. on civil process: Ambassadors, or diplomatic representatives of foreign courts, peers of the realm, members of Parliament, clergymen during divine service, or on their way to or from service, and all persons attending a court of justice in any capacity, such as witnesses, solicitors, counsel. No person is, however, exempt from A. for contempt of court.

All persons whatsoever are liable to A. in criminal cases; any man may A. without warrant or precept, and outer doors may be broken open for such a purpose. The A. may be either with or without a warrant. A warrant is an order addressed to a peace-officer by a judge or magistrate. If the person named thereon is not in the jurisdiction of the issuing authority, the warrant must be 'backed' by a magistrate of the place where he actually is. A private person is entitled to arrest any one who commits

a felony, or inflicts a dangerous wound on any one, in his presence, any one whom he has good cause to suspect of felony, or any one whom he discovers committing certain offences specially provided for by statute. The remedy for wrongful A. is an action for false imprisonment.

**Arrest of Judgment**, see JUDGMENT.

**Arrestment**, a Scottish legal term is the process by which a creditor detains the goods or effects of the debtor in the hands of a third party till he is paid. It is divided into 2 kinds: (1) A. in security is used when a claim has not yet become enforceable, as at the commencement of the legal proceedings; (2) A. in execution is used following on a decree of the court, or on a registered document. A. merely retains the effects; the process of 'furthercoming' is necessary to realise on them. Such funds as are necessary for the sustaining of life are not liable to arrestment.

**Arretium or Arretium**, one of the most important of the 12 cities of Etruria, especially famous for its pottery, which was a red ware. See AREZZO.

**Arrhenius, Johan** (1811-99), a celebrated Swedish botanist and agriculturist, b. at Klöfala, in Sweden. He was a member of the scientific societies of Upsala and Stockholm; sev. plants have been named after him.

**Arrhenius, Svante** (1859-1927), a Swedish scientist, b. at Upsala; studied and began to teach at Upsala Univ.; became a prof. of physics at Stockholm in 1891. He was awarded the Davy medal in 1902, and became a member of the Chemical Society in 1898. His theory of electrolytic dissociation is a valuable contribution to science; his *Text-book of Electrochemistry* has been translated from the Ger. by McCrue. He pub. *Destinies of the Stars* (Eng. translation by Fries) in 1918, and the year before he d. he issued a revision of 2 of his earlier astronomical works.

**Arrhidæus, or Aridæus** (d. c. 317 B.C.), a son of Philip III. of Macedonia and a courtesan, was half-brother to Alexander the Great, and on his death in 323 B.C. was named his successor. He married Eurydice, grand-daughter of Philip's elder brother, Perdicas, and, being of weak intellect, became the tool of his father-in-law, his wife, then of Antipater and Polysperchon. He and Eurydice were put to death by Olympias, mother of Alexander.

**Arrhythmia**, a medical term applied to irregularity of the action of the heart, manifesting itself in a lack of rhythm in the beat of the pulses, etc.

**Arria**, the wife of Cæcina Pætus, who, when her husband was implicated in the plot of Scribonianus against the Emperor Claudius and condemned to death, resolved not to survive him, and stabbing herself with a dagger, then handed it to her husband with the words, 'Pætus, it does not hurt.' Her daughter Arria would have imitated her example in similar circumstances, but was dissuaded by her husband for the sake of their children. She was sent into banishment.

**Arrlaga, Manoel José de** (1839-1917), Portuguese president and lawyer, b. at Horta, Azores, of a distinguished family which was descended from Don Alfonso III. of Castile. He became the first president of the Portuguese republic, in succession to the provisional president, Dr. Braga. Studied law at Coimbra Univ., and while there was disinherited by his father for his republican sympathies. Elected deputy for Funchal as a republican in the parliament of 1882-84 and for Lisbon, 1890-92. Elected president 1911, defeating Bernardino Machado. Wrote essays on jurisprudence and political economy.

**Arrianus, Flavius** (c. A.D. 100-170), a native of Nicomedia, in Bithynia. He was admitted to the citizenship of Athens, but came over at an early age to Rome; he was a disciple and friend of the Stoic philosopher Epictetus. He was appointed prefect of Cappadocia in 136, and distinguished himself by a campaign against the Alani. He was later, under Antoninus Pius, raised to the rank of consul; this was the first instance before the third century when a first-rate Rom. command was given to a Gk. He spent a considerable portion of his time at Athens, where in 147-48 he was appointed archon. But within 4 years of his being raised to consular rank he apparently retired from public life, and devoted himself to the study of literature in his native place. By his conservation of notes on Epictetus's lectures he ranks as the chief authority for Stoic ethics, whilst his most important original work, the *Anabasis of Alexander*, is our chief authority on its subject. Complete works were ed. by F. Dubner (1846), Eng. translation by Rooke (1812), E. J. Chinnock (1893).

**Arrière Ban**, a feudal summons to all freemen to follow their sovereign to the field with vassals, provender, etc.

**Arrighi, Toussaint, duke of Padua** (1778-1853), a Corsican general, was b. at Corte, in Corsica, and d. at Paris. He distinguished himself in the Egyptian campaign, and in 1809 was made general and duke of Padua. He also took a leading part in the battle of Leipzig, 1813, and in the campaign of France, 1814. In 1849 he was appointed deputy for Corsica at the legislative assembly, and in 1852 was made senator.

**Arria** is an architectural term, which signifies the line in which the 2 straight or curved surfaces of a body, forming an exterior angle, meet each other.

**Arroba** is a measure of weight used in the greater part of Central and S. America. In the Sp. states it is generally about 25 to 35 lb.; in Brazil it equals 32 to 33 lb. It is also used as a measure for liquids.

**Arrö**, a Dan. is. off the E. coast of Sleswig, S. of the is. of Fünen. The surface is flat, but the soil is productive. Arröskjöbing in the E. is the chief tn. Pop. of is., 11,000.

**Arrol, Sir William** (1839-1913), head of the firm of Wm. Arrol & Co., engineers, who constructed the Tay and Forth Bridges and the Manchester Ship Canal

under his direction. Represented S. Ayrshiro in Parliament, 1895-1906.

**Arromanches, Harbour of,** an artificial prefabricated harbour used in the early days of the Anglo-Amer. invasion of Normandy in 1944. Without this harbour it would have been necessary to storm Cherbourg or Le Havre, but great difficulties would have been experienced in attempting to reoccupy those ports, for the Gers., even had they been expelled, would have wrecked the port installations, and the subsequent development of the battle of Normandy would have been very different (*see* WESTERN

new design for the spans and the pontoons of standard Royal Engineers' floating bridging equipment. The prototype was constructed on a Scottish beach early in 1943, and tests showed that 6 spans mounted on floats or about 500 ft. of the floating bridge could be towed in the open sea in any weather up to a given wind force, and that the unit would be complete in itself and ready for joining up. There were, however, many problems apart from that of flexibility. Owing to the 22-ft. tidal range at A. It was clear that the pierheads must be floating in order to avoid the difficulty of a connection with

#### PIER AND PIERHEAD AT ARROMANCHES

The first traffic moving off a completed pier, June 18, 1944.

FRONT IN SECOND WORLD WAR). The specialised civil engineering knowledge and experience essential to such an undertaking were first acquired in 1941-42 in constructing military ports in Scotland to supplement Brit. civil ports and in planning port extensions in the Middle E. to offset the closing of the Mediterranean. This involved the use of vessels specially designed to carry complete repair workshops and heavy lifting and construction gear; self-contained cranes; and sectional dock-gates to replace the permanent structures wrecked by the enemy. At this time, too, special landing craft were developed, and amphibious trucks for unloading stores. But in 1942 the Directorate of Ports and Inland Water Transport, which supervised these developments, was asked to produce piers a m. long to extend from shore to water deep enough for coasters to lie alongside, strong enough to take the heaviest weapons, and capable of being put together in a few days and of riding out summer storms. This meant an entirely

the floating pier on the one side and a widely varying freeboard on the other, which would have necessitated lifting the vehicles off the ships instead of running them over short ramps. Instead of mooring anchors and cables for these floating pierheads, which would have fouled their berths, the principle of spud legs or vertical posts, nearly 100 ft. long and 4 ft. square, as used on dredgers, were developed on a large scale. To raise or lower these spud legs, each pontoon was equipped with an electric power plant and electrically operated winches. Several pierhead pontoons could be assembled together in various ways according to the purpose in view—in line to form a wharf, in extension of the pier to form a jetty, or by combining both forms. Mooring the floating bridge was effected by the 'kite' anchor with a great holding power, and so designed as to allow each pontoon to be moored fore and aft in 6 min. The arrangement of the connection of the bridge girders with the pontoon saddles gave sufficient

play for lateral and vertical movement between the spans of the pontoon. The twisting which occurs as the different pontoons heave in relation to each other was taken entirely by allowing the floor of the bridge span itself to twist and this could be as much as 40 degrees before fracturing. Many types of breakwater were considered in the effort to find one that would not break itself or its moorings, but, for really rough weather, the only immediate alternative was lines of blockships. These, however, were only effective in up to 1 fathom of water and the pierheads had to have 3 fathoms. Hence it was necessary to have some kind of caisson for the bulk of the breakwaters. Six miles of breakwater were required, and dry-dock facilities round the Brit. coast were much strained by the labour of constructing the caissons, which were all about 200 ft. long and in 6 heights varying from 60 ft. down to 25 ft., with dead weights from 7000 tons to 1700 tons each; but the large size constituted the greater part of the breakwater. To increase structural strength the units had cross walls and a central longitudinal water-tight bulkhead, thus forming cells on each side of the bulkhead. Flooding valves of varying sizes were allocated to the watertight compartments, and when all the valves were open the sinking times at A. varied from 5 min. to 20 min. according to the depth of the water and other factors.

Dispatch of the equipment at a towing speed of 4½ knots across the Channel began on the evening of D Day (June 6, 1944), and by June 10 the harbour construction at A. was proceeding well. All the 15 blockships had been planted and some 10 caissons were either sunk or being sunk, and 1500 ft. length of the centre floating pier was in position. But 12 days after D Day a storm of unprecedented force for June sprang up and held for sev. days. On the side W. of A., where the Amers. were establishing their harbour, great damage was done. Many craft broke their moorings and crashed into the partially erected equipment and into some of the caissons. The sea-bed here was of softer sand than had been expected and the surging sea soon scoured it from beneath the caissons and blockships, causing them to break their backs. The piers and pierheads, too, suffered badly. But at A. the damage was not nearly so vital, as the breakwater had been nearly completed before the gale was at its height and so afforded shelter to both craft and pier equipment, while the seabottom here was much firmer. After the storm A. was soon brought up to full efficiency as a port, but on the Amer. side it was decided not to re-establish the floating pier equipment, though the long breakwaters were completed and the harbour used mainly for protected beach discharge from 'ducks' and other special landing craft. A. functioned as a harbour in every sense of the word, and its name will be remembered in the hist. both of

civil engineering and of the world's ports. See Sir Bruce G. White, 'The Harbour of Arromanches' in *The Overseas Engineer*, Oct. 1945.

**Arrondissement** is the name of the largest subdivision of the Fr. dept. It is composed of cantons, which are divided into communes. Each A. has a sub-prefect and council to manage its affairs. France is also subdivided for purposes of defence into 5 maritime divs. termed As. They were instituted under the consulate, suppressed in 1815, but re-estab. again in 1826. They are under the direction of maritime prefects who, by a decree of 1875, must be vice-admirals in the Navy.

**Arroo or Arru**, see ARU.

**Arrow**, see ARCHERY.

**Arrowgrass**, or *Triglochin palustre* and *T. maritimum*, is a plant of the order Juncaceæ, occurring in Britain. The former species is common in marshes and pools, while the latter grows in salt-water marshes.

**Arrowhead**, or *Sagittaria sagittifolia*, is a species of the order Alismaceæ and genus *Sagittaria*; it is a native of Europe. It is a water-plant, only the arrow-shaped leaves and the flowers appearing above the surface. There are also leaves below the water, and these are very thin and ribbon-like; the root is a rhizome.

**Arrow-leaf**, a plant of the *Sagittaria* genus.

**Arrowrock Dam**, a dam 354 ft. high, on the Boise R., Idaho, U.S.A. It was constructed by the Bureau of Reclamation, a body estab. by Act of Congress, 1902.

**Arrowroot**, a farinaceous substance prepared from the roots or tubers of various plants: *Maranta arundinacea* and *M. indica* and *Curcuma angustifolia* the E. Indian A.; *Arum maculatum* the Portland A. Grown down, strained carefully, and dried in the sun, the preparation forms a valuable and easily digested food; it is often adulterated with potato starch. The S. Amer. Indians used to apply the roots of a plant confounded with *Maranta* as an antidote to the effect of poisoned arrows—hence the name.

**Arrowsmith**, Aaron (1750-1823) a distinguished Eng. cartographer, was b. at Winston, in the co. of Durham. He came up to London, and by 1790 had founded a great map-making business, raising the execution of maps to a pitch of excellence never before attained.

**Arrowsmith**, Edmund (1585-1628), was b. in Lancashire, and entered the Society of Jesus in 1624. He pursued his missionary labours in his native county with zeal and success. Twice apprehended for his faith, he was found guilty in 1628, and hanged, drawn, and quartered, in accordance with the custom of that age.

**Arrowsmith**, John (1790-1873), nephew of the elder Aaron A., to whose business he succeeded. His first publication, in 1834, was the well-known *London Atlas*. Helped to found the Royal Geographical Society in 1830. He received a gold medal in 1863 for his services to geographical science.

**Arroya del Puero** is the name of a tn. situated in Estremadura, Spain, about

10 m. to the W. of Cáceres. Pop. about 6000.

**Arroyo, Diego** (1498-1551), a Sp. painter who was b. at Toledo and d. at Madrid. His works consisted of miniatures and portraits, and he also illustrated some works in the library of the cathedral of Madrid.

**Arroyo Molinos** is a vil. in Estremadura, Spain, 27 m. S.E. of Cáceres. Here Lord Hill completely routed the Fr. forces under Gen. Girard on Oct. 28, 1811. He took 1500 prisoners with trifling loss; Thiers and other Fr. historians describe the battle as indecisive.

**Arru Islands**, see ARU.

**Ars Poetica**, or the *Epistle to the Pisos*, is one of the finest of the poems of Horace. The date of it is uncertain, though it appeared before the poet's death in 8 B.C. The title of the *Art of Poetry* for the *Epistle to the Pisos* is as old as Quintilian, but it is now agreed that it was not intended for a complete theory of the poetic art. It is conjectured with great probability that it was intended to dissuade one of the younger Pisos from devoting himself to poetry, for which he had little genius, or at least to suggest the difficulties of attaining to perfection.

The poem is a discussion of dramatic poetry, largely based on Gk. text-books, but full of Horace's own experience and of his own good sense. Young aspirants to poetical fame regularly began with tragedies, and Horace, accepting this as an actual fact, discusses the rules of tragedy with as much gravity as if he were dealing with some really living and national form of poetry. This discursive and fragmentary poem was taken in later ages as an authoritative treatise; and the views expressed by Horace on a form of poetical art with which he had little acquaintance had, at the revival of literature, and even down to the last century, an immense influence over the structure and development of the drama. Just as modern comedy based itself on imitation of Plautus and Terence, and as the earliest attempts at tragedy followed in the steps of Seneca, so in the theory of both Horace, and not the Gks., was the leading influence.

**Ars-sur-Moselle**, a tn. in Lorraine, situated on the Moselle, a little to the S.W. of Metz. Pop. 3600.

**Arsaces**, Persian name occurring on Persian seals. A. I. was the founder of the Parthian dynasty, and of the dynasty of the Arsacides which fl. in the third century B.C. About 255 he raised the standard of revolt against the rule of Seleucids, and, having succeeded in emancipating his countrymen, was elected king. Reigned for 2 years. All Parthian kings officially bore the name A.

**Arsacides**, dynasty of Parthian kings from its founder Arsaces, who wrested a kingdom for himself from Seleucid Antiochus II. about 250 B.C. The greatest kings were Mithridates and Tiridates. The Arsacidean empire was overthrown in A.D. 226 by Ardeshir, founder of the Sassanid empire.

**Arsamas**, or **Arazmas**, is the chief tn.

of a circle in the Russian Region of Corky, situated at the confluence of the Arsha and the Tesha. The tn. has 22 churches, a monastery, and a convent. The tn. has a somewhat dirty appearance, but the inhab. are prosperous and industrious. Manufs. include Russian leather, iron and silver wares, cloth, etc. Pop. 18,540.

**Arsenal**, the name appears in Romanic languages under various forms, and is of Arabic origin; It. *arsenale*, Sp. *arsenal*, Arabic *dar aḥḥinā'ah*, meaning a house of trade or manuf. The word has been adopted to imply (1) a repository or magazine of arms and military stores of all kinds, both for land and sea service; (2) a public establishment where arms and equipment are manufactured; and hence (3) a repository of any kind of warlike equipment. An A. of the premier or first class includes gun and carriage factories, laboratory, ammunition, and small-arms factory, powder factory, and spacious storehouses. In an A. of the second class the factories are replaced by workshops. As an A. is a source of supply during war, great care is taken to erect it in a suitable position. As. of the first class should be situated at the base of operations, secure from attack, at a safe distance from the frontier.

The prin. As. in Great Britain are Deptford, Chatham, Sheerness, Portsmouth, and Plymouth. Gov. foundries are at Woolwich and small-arms factories at Enfield. Malta and Gibraltar are the chief overseas As.

The sub-divs. of branches in a large A. are: (1) storekeeping; (2) construction; (3) administration. Under (1) are the depts. for armoury, ordnance, and magazines. Under (2) come ammunition, laboratories, and firearms of all descriptions, and under (3) clerical work and its officials.

The chief continental naval As. are: *France*, Cherbourg, Brest, Toulon, Bordeaux; *Germany* (before 1939), Kiel, and the inland factory at Essen; *Russia*, Cronstadt, Leningrad, Sebastopol; *Italy* (before 1939), Naples, Spezia, Genoa, Venice; *Spain*, Cartagena, Cadiz, Barcelona; *Portugal*, Lisbon. For Amer. As. see UNITED STATES—Arsenals.

**Arsenic**, a chemical element (symbol As, atomic number 33, atomic weight 74.91), which is generally looked upon as a semi-metal, connecting, with antimony and bismuth, the great div. of non-metals with that of metals. The term is often applied to the white oxide of A. ( $As_2O_3$ ) which is the most important compound commercially.

The element occurs in very small quantity in nature; it is more usually found as the trioxide in arsenolite, as the sulphide in orpiment and realgar, or as a compound with iron, cobalt, etc., as in arsenical iron and mispickel or arsenical pyrites,  $FeSAs$ . The metallic A. of commerce is chiefly prepared by strongly heating mispickel in earthenware retorts from which the air is excluded, when most of the A. sublimes, together with a little sulphur. The crude metal is sometimes

used as a poison for flies, and as a constituent of lead shot, a small quantity of A. hardening the lead and facilitating the formation of the spherical globules. The pure metal may be obtained from the white oxide by heating it with carbon in the absence of air, which may be effected by covering the oxide in a narrow test-tube with dry powdered charcoal, and nearly covering the mouth of the tube with the finger when heating. The A. sublimes on the cool part of the tube as a dark grey powder.

A. has a sp. gr. of about 5.5 and a specific heat of .083. It crystallises in rhombohedra, and rapidly vaporises at temps. above  $100^{\circ}\text{C}$ . The sp. gr. of the vapour is 150 ( $H=1$ ), so that the gaseous molecule of the element must be looked upon as including 4 atoms.

The chief compounds of A. are the hydride  $\text{AsH}_3$ , the arsenious oxide  $\text{As}_2\text{O}_3$ , A. oxide  $\text{As}_2\text{O}_5$ , the disulphide  $\text{As}_2\text{S}_3$ , the trisulphide  $\text{As}_2\text{S}_5$ , the trichloride, tribromide, tri-iodide, trifluoride ( $\text{AsCl}_3$ ,  $\text{AsBr}_3$ , etc.). Arsenious oxide is formed when arsenical ores are roasted in air; it is sublimated as a white powder. A. oxide is produced when the lower oxide is heated with nitric acid. The 2 oxides are the anhydrides of the 2 acids, arsenious acid and A. acid, which may be distinguished by the colours of their silver salts; the addition of ammoniacal silver nitrate producing a canary-yellow precipitate of the arsenious salt or arsenite, and a brick-red precipitate of the A. salt or arsenate.

As the A. compounds are extremely poisonous, it is of great importance that efficient tests of their presence should be known. Organic matter should first be expelled by digesting with hydrochloric acid and potassium chlorate, chlorine being driven off by boiling. The A. is then precipitated as a sulphite, which is dried, mixed with potassium cyanide, and heated. The A. is then deposited as a black sublimate, which is converted into arsenious oxide if heated in air. The oxide may be recognised by the production of a yellow precipitate with ammoniacal silver nitrate solution, or by a precipitate of Scheele's green with ammoniacal copper sulphate. Reinsch's test consists of boiling a strip of copper foil in the given solution with the addition of hydrochloric acid. If A. is present, it is deposited on the copper and may be recognised as in the previous test. Marsh's test depends on the production of the hydride  $\text{AsH}_3$ . An apparatus for the preparation of hydrogen is fitted with a narrow jet, at which the hydrogen is lighted. If a piece of porcelain be held in the flame, no stain is produced if the materials used for the production of hydrogen are free from A. The solution to be tested is poured into the hydrogen-generating apparatus; if A. is present, the flame assumes a lavender tint and a black stain is produced on the porcelain.

In medicine, arsenious oxide is used as an alterative and tonic in doses of from 1-60th to 1-15th gr. The most frequently used preparation is that known as

Fowler's solution, which comprises arsenious oxide and potassium carbonate, together with a small quantity of compound tincture of lavender. This is administered in doses of 2 minims, largely diluted, and gradually increased to 8 minims. In small doses it acts as a stomachic and is valuable in gastric neuralgia and in the vomiting of chronic alcoholism. In larger doses it acts as a nerve tonic, entering the blood by absorption. Used externally, it is a powerful caustic, and its use has been advocated in cancer, lupus, and epithelioma. Large doses of A. preparations produce a burning sensation in the throat, stomach, and abdomen, followed by vomiting, diarrhoea, cramps, exhaustion, and collapse. Symptoms of arsenical poisoning are frequently observed in those working with arsenical pigments, or in those living in rooms where arsenical pigments have been used in the preparation of the wall-paper. In recent years, widespread poisoning was caused by the presence of A. in a supply of invert sugar used in the brewing of beer. By commencing with small doses and gradually increasing the quantity, a certain degree of tolerance is acquired, as in the case of the A. eaters of Styria, who have been known to swallow more than 6 times the minimum fatal dose with no untoward results.

The stomach pump or emetics are to be used in the treatment of arsenical poisoning. Large doses of castor oil are essential to clear out the intestinal tract to prevent reabsorption. A good antidote is provided by freshly prepared peroxide of iron, produced by adding soda or ammonia to the tincture of iron.

**Artenical Pyrites**, *see* MISERABLE.

**Arsenius** (354-450), probably of Rom. extraction. Gained fame for his knowledge of Gk. and Rom. literature. Theodosius the Great appointed him as tutor to the princes Arcadius and Honorius. Afterwards lived a secluded life in an Egyptian monastery at Scetis, and *d.* at Memphis. Wrote a work containing instruction for monks. Commemorated by Rom. Catholics on July 19 and by Orthodox E. Church on May 8.

**Arsenius, Autorianus** (thirteenth century), patriarch of Constantinople. Educated at a monastery in Nicaea, of which he became abbot. Retired into solitary asceticism in a Bithynian monastery. Called to the patriarch of Nicaea A.D. 1253 by Theodore Lascaris II. Excommunicated Emperor Michael, who banished him to Proconessus, where he *d.* 1264. The new patriarch Josephus absolved the emperor, and this led to the quarrel between the Josephists and Arsenites known as the Arsenian schism, which lasted until 1315.

**Arsiè**, vil. of Belluno, Italy. 3 m. S.W. of Fonzaso. Pop. of vil. 1727: of commune, 7127.

**Arsinoë**, an anct. city of Egypt, the name of which was derived from A., the wife of Ptolemæus Philadelphus, but seems to have been changed to Cleopatra. The site of the modern Suez almost corresponds to that of A. (Strabo, xvi. 769).

A. was also the name of one of the anct. provincial divs. of Egypt which corresponds to the modern Fayum.

**Arsinoë**, daughter of Lysimachus, king of Thrace, and first wife of Ptolemy II. Philadelphus (285-247 B.C.). Banished to Coptos for conspiring against her husband. Her son afterwards became king under the title of Euergetes.

**Arsinoë** (b. c. 316 B.C.), daughter of Ptolemy I. Soter and Berenice; married Lysimachus, king of Thrace. Murdered her stepson Agathocles in order to secure the succession. After her husband's death she fled to Ephesus and thence to Cassandria. Afterwards married her brother Ptolemy II. Her devoted husband gave her name to several cities.

**Arsinoë** (d. 41 B.C.), youngest daughter of Ptolemy XIII. and sister of the famous Cleopatra. During Caesar's attack on Alexandria the inhab. recognised her as their queen. Caesar took her to Rome with him. After Caesar's victory she was allowed to return to Alexandria. She was put to death at Miletus after the battle of Philippi by order of Mark Antony, and at her sister's request.

**Arsinothorium**, an enormous fossil mammal of the Ungulate type, discovered by Beadnell in the Upper Eocene of the Fayum deposits of Egypt. It resembled a rhinoceros in appearance and was herbivorous. Its brain was small, the head massive, and it bore 2 pairs of horns.

**Arsis and Thesis** (Gk. *ἄρσις*, from *αἶψα*, I raise). A. is that part of a poetical foot on which the stress of the voice falls, the rest of the foot being called the T. According to original Gk. usage, A. denoted the raising of the hand or foot in dancing, thus denoting the accented part of the metrical foot, and T. denoted the fall of the foot, and thus the unaccented part of the prosodial foot.

**Arsmetrik**, old term for arithmetic in Chaucer's Eng.

**Arson** (Lat. *ardere*, to burn). The malicious burning of a dwelling-house or outhouse of another. Under Rom. civil law it was punishable by death. In anct. laws of England it was known under the term *boeruet*. Under the Saxons it was punishable by death, and still remained a capital crime on the consolidation of the laws in 1827 and 1837. The Eng. law concerning A. was repealed and replaced by the Malicious Damage Act in 1861. By this Act A. was punishable by penal servitude for life or minor degrees of punishment. By the common law of A. it is required that some part of the house or other building be actually burnt. An attempt or intention does not constitute the offence, but the burning of any part, however trifling, is sufficient to complete the offence. If any person be in the house at the time of burning it is a capital offence.

Under the Malicious Damage Act of 1861 persons setting fire to any place of divine worship, dwelling-house, farmhouse, factory, outhouse, any public building, or setting fire to any place with intent to defraud any person, are liable to be sentenced to penal servitude for life,

or for any term not less than 3 years. Setting fire to crops is punishable by penal servitude for not more than 14 years.

In Scotland A. is known under the term *wulfil fire-raising*.

**Art**. There are 2 accepted definitions of the term *art*, neither of which entirely covers all that the word implies. One states it to be the *doing of a thing*, as opposed to the *knowing of a thing*, which the word *science* means, whilst the other embraces all that is not done by man in the way of utility; in other words, all that he does in the way of luxury or pleasure. There is evidence in the world's hist. to support the latter generalisation, for it is found that nations have produced the best A. in the years of prosperity, but that a time of great struggle, or a wave of commercial anxiety, has proved inimical.

E.N.A.  
SPANISH MURAL PAINTING OF THE  
MAGDALENIAN PERIOD

It is usual to go back to the first glimmerings of A. for a clue to the impulses that generated it. Although many modern thinkers see in primitive examples merely the desire to beautify the tool, the cave wall, or whatever surface received the decoration, others have doubts as to whether such efforts were not prompted by religious motives. M. Salomon Reinach points out that all animals represented in the Quaternary period are of the comestible kind, and he infers therefrom that the primitives practised their A. to propitiate the forces controlling their welfare. In the Sp. caves of this period are paintings of over a hundred animals of large size, invisible in the daylight. They must therefore have been executed by artificial light, and it is hard to suppose that such toil for such meagre spectacular result would have been undertaken with mere decorative intent. It has further been computed that the various phases of A. devoted to *teaching* occupy periods amounting to 10 times as many centuries as do those concerned with *pleasing*. The figures in Egyptian and Assyrian processions are mere symbols—a part of ceremonial or contemporary hist. The beginnings of Christian A. show again the use of symbolic figures for the same didactic purpose. Luxury and diversion were clearly not the impulse of

these manifestations, and yet it is impossible to deny that æsthetic ideas were in the minds of their authors. Granting that these pictured forms did teach, they must have done so by impressing the spectator; and where they propitiated they certainly must have pleased. A. can hope to do no more in the twentieth century.

The principles of æsthetics have become so much an essential part of all considerations of A. matters that it is *feeling* more often than *doing* which is implied now by the word *art*. 'So-and-so may be a clever painter, but he is no artist,' is a remark one often hears. It

'LANDSCAPE,' BY TURNER  
National Gallery, London.

derogates the particular painter's work to an early definition of A. when the As. were the trades, the tradesmen being artisans. But feeling alone no more fills the definition of A. than does manual skill alone. A. is only completely expressed when material is re-formed, re-created, re-fused by what R. L. Stevenson called 'the ardour of the blood' and what is known as the *divine afflatus*. The actual re-formation of the stone, metal, or pigment may fall short of the workman's ideal; but if it have realisation enough to frame and hand on the author's message, to show eloquently and appealingly that for which the mind and the heart of the author could find no other utterance, then that work is a work of A.

This 'message,' 'voice,' 'mood' of the work of A. was held by the classic mind to characterise everything under the ægis of the muses (of which *music* was once the adjective or generic term). Thus music, poetry, and the drama depend also upon A. for their perfection. The

industrial As. likewise may be more or less amenable to an exercise of taste making for luxury and diversion. Hence it is that whilst a farrier is not expected to make horse-shoes but in the approved way, the blacksmith working at the same forge may make a gate that one day might find its way into a museum of objects of A. Farriery therefore is not an A., but smithing perchance may be.

To avoid confusion between all such industries possibly amenable to the artistic sense on the one hand, and the higher activities on the other, wherein material is worked, changed, or put together, not for a utilitarian purpose, but solely to form a medium for the author's emotion, the latter are called by the name of the *Fine Arts*. This term is held to cover architecture, painting, and sculpture, but it does not extend, in common parlance, to music or letters. Possibly the difference at the root of this anomaly in nomenclature is that music and poetry exist in the abstract, and painting and sculpture in the concrete. That, however, would not prove that the former are any less fine as As. than the latter. The 'A. of architecture,' as a term, also offers a little difficulty, for whilst in its highest flights architecture may answer every requirement of a fine A., it is in its dual character almost always concerned with the immediate wants of life, which fact is enough to put it outside one definition of A. at least. Macaulay declared it was half a science, and others have decreed it to be more science than A. On the other hand, it is often regarded as the oldest and greatest of the fine As., for the reason that painting and sculpture are subsidiary to the buildings they adorn. But that is as much as to say that the ring is more worthy than the engraved gem it holds; and as for priority, we know that the graphic As. were flourishing before man began to build.

We are led to the conclusion that probably the part of architecture that is fine A. is in reality a variety of sculpture, for it works in 3 dimensions; its beauty and effect are due to design and proportion, and its surface markings count in the complete effect. These are conditions which sculpture beside alone fulfils.

Sculpture and painting remain with a standing against which there seems to be nothing to urge, and the popular idea of what fine A. signifies would appear to confirm this standing. More than ever do the conditions of the pursuit to-day prove them dependent upon the margin that a strenuous age can spare for luxury; notwithstanding the fact that the trades and industries called into being by their application to common needs are more numerous than ever.

All forms of graphic and plastic A. are admitted under the generic names of painting and sculpture, and are broadly divided as *naturalistic* and *decorative*. This div. is often no more than one of point of view, for it is obvious that the Parthenon frieze was both, as were the pictures of the Venetian masters. The various sub-divs. of fine A., such as the

*idealistic*, the *realistic*, the *literary*, and so forth, are necessary to lucid criticism, but they do not affect the question of A., for which all are mediums. The latest developments of naturalistic A. have rather forsaken the literary or story-telling phase, even in book-illustration, which is now more decorative than naturalistic in its best forms. But literary A. will always make a strong appeal to the popular mind, which naturally thinks first of anecdote, being more alive to the joys and woes of life than to the finer-drawn sensations of A. for A.'s sake felt by critics.

The terms *idealistic* and *realistic* are used in criticism to signify 2 opposite methods of approach on the part of the artist. The idealist is one who gives form to incidents and scenes that have generated partly or wholly in his own mind. He may, and usually does, get the germ of his subject from something seen, but the material is gestated, so to speak, and the result appears with more generalisation and psychological import than its actual prototype possessed. The realist, on the other hand, labours to give a likeness of the actual incidents, and if the scene is a beautiful one and lovingly presented, the work may rise to the highest position in fine A., as did some pictures by Holman Hunt and by Millais in his Pre-Raphaelite days. Turner would rank as the greatest idealist. In figure work the poles may be instanced by Watts on the ideal side, and by Melissonier on the real. Sculpture offers Phidias and Donatello respectively. But the case cannot be left so simply stated, because the 2 phases are, in a manner, combined in the finest works of A. It is evident that the idealist is really more in need of knowledge born of observation and study than is the realist, since the former does not oblige himself to copy from nature; and were he, moreover, not realist enough to carry conviction, his idealism would be but futile and meaningless. The more thoroughly a Turner could know the realities of sunsets and thunderstorms, the more magnificent or appalling could he render them by invention. It is the power of communicating the spiritual or romantic force of things to the spectator that constitutes idealism in A. The realist also might imagine scenes, but he would present them in such a way that they might be mistaken for topographical records. They might be beautiful examples of fine A., but they would not be ideal. Fine A. must interpret, however, and inasmuch as the spirit stirs more deeply than the letter, the idealist is in a better position than the realist to set up that correspondence of feeling between artist and beholder which fine A. demands.

Of decorative A. the great mass finds expression in the crafts and industrial A. Much of it takes the form of *ornament*. But mural painting and stained glass belong legitimately to the fine A. when they rise above the level of commercial mediocrity. Recent years have witnessed an increasing movement against natural-

ism, as being a phase antagonistic to the idea of the space decorated. The idea of this space, it is held, should not be forfeited to pictorial ideas. In the belief that such matters as linear and aerial perspective, round modelling, natural action, modulated colour, and other characteristics of realism, prevent the wall upon which they appear from looking like a wall, modern decorative artists have adopted archaism as a safeguard against the naturalistic view of things.

Alinari

WINGED VICTORY OF SAMOTHRACE  
Greek sculpture in the Louvre, P. 115.

The great decorative painters, Michelangelo, Veronese, Rubens, and others, strove, on the other hand, to eliminate the idea of the wall, and to that end represented starry heavens in ceilings, columns and openings in wall spaces, and gave to figures a perspective view from the floor. For the most part decorative A. shows signs of free growth only in sporadic efforts to burst the bonds of its conventions.

An altogether different view-point is, however, possible—namely, that which regards both the idealistic and the realistic approaches as belonging to the category of naturalistic A., and therefore as opposed to another conception of A. which stresses its abstract qualities; that is to say, the qualities which constitute design apart altogether from its relation to nature or the natural objects which it may represent. From that point of view the Egyptian lioness

in the Brit. Museum is better art than Landseer's lions on the Nelson Monument, and the Its. of the Renaissance, generally speaking, are better designers than the Flemish or Ger. artists of the period. Of recent years distinction between the naturalistic or representational and the purely æsthetical or abstract qualities of A. has become more and more emphatic, leading eventually to designs in sculpture and painting which show no or only barely discernible relations to nature or natural objects.

*Alinari*

**MERCURY, OR THE LITTLE IDOL.**

A bronze antique in the Archaeological Museum, Florence.

The hist. of A. overlaps the hist. of civilisation. Quaternary A. dates from 10 to 12 centuries before the Christian era. A gap then occurs until the polished Stone Age, some 4000 years B.C., when pottery and an elegance in the fashioning of tools bespeak taste. Personal ornaments having intricate linear decoration appear in the Bronze Age, when dolmens and cromlechs point to the dawn of architecture. A. in Egypt, which began c. 4000 B.C., had progressed far before bronze and iron were used, producing weapons and ornaments carved and engraved in ivory, gold, and other materials. The vast halls of Egypt with many columns, some of which were 70 ft.

high, were covered with coloured reliefs, and held colossal statues in 'the round.' Assyrian or Chaldean A. was contemporaneous, but its sculpture was almost restricted to bas-relief, although it had fewer conventions than the Egyptian. The most obvious of the latter was that its torsos were almost invariably at a front view, though combined with limbs and heads in profile. Assyrian sculpture was characterised by prodigious technical skill and by types of great muscularity and sturdiness. To this nation is due the invention of the vault and dome. About 3000 to 2000 B.C. Gk. A. rose in the Archipelago with rude representations of the human form. Next Crete became the centre of more realistic and elegant efforts. The palace of Minos at Cnossus—excavated by Sir Arthur Evans—yielded reliefs and paintings pointing to a very advanced civilisation. Schliemann excavated Troy, Mycenæ, and Tiryns, in which spots the evidences of the plastic genius of the period richly abounded. Mycenaean A., influenced by Egyptian and Assyrian, and developed by the Gk. love of life, grew with amazing rapidity into fine sculpture and painting. Of the latter no examples remain, but it is mentioned by Gk. authors in terms of high praise. By c. 450 B.C. Gk. genius, in the persons of Phidias, Polyclitus, and Myron, had risen to the high level evidenced by the frieze of the Parthenon. All archaism had been thrown off when Praxiteles, Scopas, and Lysippus added to the Phidian traditions greater facial expression and sweetness. The victories of Alexander closed the Hellenic period. From this time until the Rom. conquest the Hellenistic period extended. It added landscape to the scope of A., introduced human suffering, as in the 'Laocoon,' and combined realism with its magnificence of life and colour. That the Gk. was always a true artist every discovered object of common utility bears proof. Zeuxis, Apelles, and others were painters of whose work only 1 wreck exists; but decorated vases survive in plenty which show beauty of form and grace of invention. Engraved gems have come down to us unspoilt by time. They have never been surpassed for the perfection of their beauty and skill. The Romans, although they imported Gk. artists and pillaged Gk. soil for objects they had the taste to admire, were nevertheless possessed of a native A. which produced the viaducts, arenas, and other great works of utility. The Romans, like the Assyrians, made use of the arch and the dome. Their statues and reliefs are vigorous and realistic. Especially great are their vivid portrait busts. From the Rom. A. and architecture, influenced by oriental and Hellenistic art, evolved the Byzantine. The early Christian churches were modelled upon the Rom. basilica, and ornamented with mosaics stiff in design but gorgeous in colour. Byzantine A. avoided sculpture in 'the round' as appertaining to idols. Its carvings, embroideries, and enamels were coveted all over Europe, and the epoch was one of great wealth and magnificence.

The Rom. basilica, by the principle of the round and pointed arch, developed respectively into Romanesque and Gothic building. The Gothic, being the later stage, gave rise to a lively, human and intensely naturalistic sculpture, free from the conventions that always hampered the Romanesque.

The fourteenth century saw the first It. painter of genius, one Duccio, who appears to have annulled the claim of Cimabue to that honour. Giotto, the Florentine, was inspired by the naturalism of the Gothic masters. Masaccio, in painting, and Donatello, in sculpture, carried these new views further.

The Renaissance period dates from the fifteenth century, when classic remains recalled men to the older ideals. Its result in architecture was that every

are to-day greatly esteemed. The former are commonly credited with the invention of oil painting, which however, was practised as early as the twelfth century. Jan Van Eyck's portraits are unsurpassed as searching documents of character, Memling holding perhaps the second important place. The realism of the Flemings was associated later with It. idealism in the person of Mabuse and others; but Flemish A. as a whole dealt with realities which it endued with a poetry of its own. Germany showed no such early awakening. In the fourteenth century Wilhelm of Cologne heralded the line of masters, Schongauer and Holbein the elder follow. It is not until the sixteenth century that Germany, with Dürer and the 'Little Masters,' takes her due place. As an engraver Dürer manifested himself as the superior of all.

A SOFFIT OF THE SISTINE CHAPEL BY MICHELANGELO  
Vadcan.

nation adapted the classic elements to its own special needs. Leonardo da Vinci, the most universal genius that ever lived, dominates the Renaissance together with Michelangelo and Raphael. The type of Leonardo's Madonna—which is that of the 'Gioconda'—became a pattern for less talented workers. Michelangelo was likewise a widely gifted genius, though pre-eminently a sculptor. The poetic grace of the human form in action was his passion, wherein he outdid the Gks. in the boldness of his ideas. His greatest work in painting is the ceiling of the Sistine Chapel. Raphael's works are well known. He has been called the 'divine painter' and 'the prince of painters,' and, though not quite so highly esteemed to-day, his sweetness and charm, his mastery and suavity, still command. In Venice painting was distinguished by rich full colour, and a joyous and free style of motive. It boasted the great names of Mantegna, Bellini, Giorgione, Titian, Tintoretto, and Veronese. Although the names of Flemish artists are not household words like those of Italy, yet Gothic A. had been foremost in achieving noteworthy sculpture and painting before Italy in the fifteenth century. Italy and Flanders influenced each other. The brothers Van Eyck, Matsys and others,

Holbein the younger was a portraitist of idealist tendencies, a consummate draughtsman, and a designer of exquisite fancy. After Michelangelo, Italy's artistic fire dwindled. Its traditions became an obsession, and nature was forgotten; but early in the seventeenth century Caravaggio set a new fashion of violent lighting. In Spain, Ribera, and after him Zurbaran, carried on this gloomy style which Velazquez hardly escaped. He, the glory of the Sp. school, was independent to the last degree. His masterpieces did not affect him. Murillo was blander and less direct. He did not profit by the adroit seizure of tonal values which Velazquez displayed. Protestant Holland in the seventeenth century had no call for religious works, but was prolific of portraits, genre subjects, and landscapes. Rembrandt, Hals, De Hooch, Ruysdael, Hobbema, Cuyp, and the Flemings, Vermeer, Rubens, and Van Dyck, are the names of some of the greatest men of this glorious epoch of healthy naturalistic A. Their characteristics are too well known to justify further space here. Under Charles II. Lely painted voluptuous portraits. In France, Louis XIV. dominated the seventeenth century, the A. of which was a decorative echo of his pomp. But Claude

and Poussin saved the period, the latter by his romantic landscapes filled with the glories of light. The eighteenth century returned to life and nature again. Watteau's charming *fêtes* are well known, as are also the galeties of Fragonard. In this century, too, the Brit. school developed a national A. heralded by Hogarth the moralist and satirist. He was followed by the great portrait painters Reynolds, Gainsborough, Hoppner, Romney, Raeburn, and others, Lawrence, in the early nineteenth century, representing the last of the tradition. Of equal importance, and perhaps more significant

Mansell

'ISABELLA OF PORTUGAL,' BY TITIAN  
Prado, Madrid.

consequence, were the Brit. landscape painters Wilson and Gainsborough in the eighteenth and Turner and Constable in the earlier part of the nineteenth century. The special glory of the Brit. school of this period, and apart from Turner and Constable, was the development of water-colour painting, of which latter Cozens, Girtin and Varley were the pioneers, Turner, Cox, De Wint, J. S. Cotman, Prout, Hunt, Müller, the Brit. representatives, with Callow and Birket Foster as their descendants.

Lawrence, Turner, and especially Constable led, after the collapse of the aristocracy, to the development of a bourgeois A. in France, where Delacroix became the protagonist of the Romantics, opposed to the classicists under the aegis of Ingres, who was a pupil of David; the latter a pupil of Greuze and a revolutionary who ended as the court painter to the Em-

peror Napoleon. The Romantic school—in its inspiration a European literary movement—had in the famous Barbizon school, which included Rousseau, Diaz, Troyon, Daubigny, Millet, and Corot, a separate branch which, in its turn, influenced through Courbet and Manet the Realistic conception and led to the development of the more or less scientific Impressionism. The term was derived from a title given incidentally to one of his pictures by Monet, their leader, and the 'school' included, by conventional use rather than strict principle, Camille Pissarro, Sisley, Berthe Morisot, Degas, and the Anglo-Franco-Amer. Whistler. Seurat and Signac represent their Neo-Impressionist offshoot.

Just as France possessed in Chardin in the eighteenth century a Fr. forerunner of the Impressionist school, so England possessed in William Blake a forerunner of Expressionism (*q.v.*). The Romantic movement of the Continent had in the Eng. Pre-Raphaelites, comprising Ford Madox Brown, Rossetti, Holman Hunt, and the earlier Millais, its somewhat belated counterpart. Amongst the Brit. Academic painters of the last century Etty, Hall, Watts, and Orchardson remain of some account, though Sidney Cooper, Lord Leighton, Marcus Stone, Peter Graham, Alma-Tadema, and the later Millais were the popular favourites.

Manet and the Fr. Impressionists exerted an important influence on European artists generally. Amongst them may be mentioned Israels, Mauvo, Mesdag, Jongkind, and the 3 brothers Maris in Holland; Liebermann in Germany; Segantini and Boldini in Italy; Sorolla in Spain; Krøyer in Denmark, etc. In Great Britain, Reid, Guthrie, Lavery, Stanhope Forbes, La Thangue, Sargent, officially an Amer., Clausen, Edward Stott, Wilson Steer, Augustus John, William Nicholson, Walter Richard Sickert, and Sir William Orpen are all more or less associated with this movement, as is also Frank Brangwyn, the first inspired by oriental travel to break away in England from the optical accuracies of the Impressionists, and, next to the Frenchman Puvis de Chavannes, the most important decorative painter of his age.

The decorative qualities of far E. A. had, however, been recognised already as far back as the sixties of the last century, when Jap. colour prints (*q.v.*) first began to arrive in Paris, there creating a veritable furore and modifying the Impressionists' method of design. It may be seen, for instance, in Whistler's 'Battersea Bridge,' now in the Tate Gallery, and it had a powerful effect on the principles of modern design as seen in the evolution of posters and decorative A. It is also here to be noted that photography and the far greater facilities of travel and transport which steam power made possible completely revolutionised the older conception of aesthetics. Discoveries of the A. of primitive peoples, e.g. in Africa and Australasia, and past civilisations, e.g. in Troy, Crete,

Mesopotamia, Egypt, India, Turkestan, Peru, and Central America, made it abundantly clear that the Renaissance ideals and the views of the eighteenth-century aestheticians founded on the excavation of Pompeii and Herculaneum were no longer tenable, since everywhere new forms of aesthetic value were encountered or unearthed.

The greatest individual influence in the resultant revolt against academic, idealistic, realistic, and impressionistic naturalism was, however, that excited, albeit quite unwillingly, by Cézanne

being founded upon natural forms, whilst the last rests pre-eminently on the artist's autonomous creative will. It is essentially the art of the twentieth century. So far as Cézanne experimented in geometry he did so within the organic forms of nature. He reacted against the vagueness and volatility of Impressionism by striving after a spiritual and sensual view of life that aims at a compromise between the temporal aspect of things and the timeless character of existence; and it is evident that his A. deeply influenced such painters as Braque, Juan

'LE PONT DE CRETAIL,' BY CÉZANNE

Villard

This painting was formerly known as 'Le Pont de Melun.'

(*q.v.*), who, himself originally an Impressionist, aimed at combining Impressionistic truthfulness of light, colour, and tone relations with firmly constructed designs such as is found in the classical compositions of Nicolas Poussin. The movement thus started by Cézanne has been conveniently named Post-Impressionism (*q.v.*). The Post-Impressionistic developments have known many different and sometimes contradictory aims, but they have nevertheless one thing in common; they all regard the work of A., whether it be sculpture or painting, primarily as a reality, and not as an illusion or a counterfeit of nature. In this sense there is a sharp cleavage between academic, idealistic, realistic, romantic, and Impressionistic A. on the one hand, and Post-Impressionistic A. on the other, all the former categories

Gris, Léger, and Picasso, as well as the abstractions of the Cubist movement. Picasso, like other artists in revolt from ultra-realism, seeks a philosophy of cubism; at his best he is semi-abstract but none the less organic, at his most extreme, flat and mechanistic. Abstract geometric A. judging from the cave paintings of S.W. Europe, is as old as A. itself. 'The first abstract art is comparable with the extreme geometric abstractions of our own day and the most notable cave-paintings are comparable with the new painting of such artists as Miro and Héliou which seems to be reverting to figured forms through a new semi-abstract' (Geoffrey Grigson). These comparisons are valid if we agree with Picasso, who has said that 'at the source of all painting one will always find a vision subjectively organised, or an

illumination inspired as was that of Rimbaud.' Surrealist painting is an attempt, like surrealist literature, to represent and interpret the phenomena of dreams or the like experiences; but surrealist painters, such as Dalí and Ernst, are, in the eyes of their neo-plasticist opponents, mere literary realists, though Picasso, apparently of the latter school, has in some of his work obviously seized on the more vital possibilities inherent in surrealist expression in modern painting. Whether A. in its modern form will eventually prove more acceptable to more people than at present is problematical; though on this it has been well said that the kind of A. which those of the most finely sharpened senses will most enjoy is 'not art of a frigid, geometric, mechanical idealism, but that viable art, that viable sculpture and painting with an organic intensity, with a contained energy of its own which had produced abroad the succession from Brancusi (idealist sculptor) to Miro, in England by the few such as Wyndham Lewis and Henry Moore' (Geoffrey Grigson). Among the most important 'modern' painters are Gauguin and Van Gogh, who with Cézanne belong to the nineteenth century. Munch (Expressionist), Henri Matisse (Fauvist), Picasso (Cubist), Severini (Futurist), and a whole host of the younger living generation.

In Russia Bolshevism has developed, out of Fr. Cubism and Ger. Expressionism, a purely abstract and political A. serving the purpose of its political aims.

Sculpture (*q.v.*) has also undergone an evolution parallel to that of painting. It began in the nineteenth century with the classicism of Canova, Thorwaldsen and Flaxman, had in the middle of the century Alfred Stevens and later Alfred Gilbert as the imitators of the Renaissance, whilst the most famous sculptor of the century, Rodin, may be regarded as an Impressionist. In the nineteenth century Bourdelle stands for a kind of Rodinesque Gothic Romanticism, Mestrovic for a Serbian National Romanticism, Maillol for Neo-Classicism, whilst Archipenko, a Parisian Russian, and Brancusi represent Post-Impressionism in its most abstract sense. Epstein forms a school in himself.

**1. Exhibitions.**—Whether organised for profit or otherwise, A. exhibitions in Britain have become increasingly popular in modern times. A. galleries are always open in London with private shows of the works of artists who are offering them for sale; while, in recent years, public interest in continental Art has been stimulated by representative exhibitions of Flemish and Dutch pictures in 1927 and 1929, and of It. A. in 1930 at Burlington House. The late Lord Duveen, a great patron of art, founded the *Brit. Artists' Exhibitions* for the purpose of increasing the sales of the works of Brit. craftsmen, and had such works exhibited in the art galleries of Leeds, Birmingham, Manchester, Bradford, Belfast, Plymouth, Liverpool, and Glasgow, on the Continent of Europe, and in S. America. He even exhibited pictures on the *Bjerggaard*, and in 1928 sold one-third of the 300 works shown on a voyage to New York and back. In 1937 an important exhibition of pictures by Sir Joshua Reynolds was held at the house of Sir Philip Sassoon in Park Lane, and was only rivalled in popularity by an exhibition in the same year of landscapes by Constable at the Tate Gallery.

The most popular ann. exhibition is that of the *Royal Academy of Art*, first held in Pall Mall in 1768, and afterwards in Burlington House, where the 180th

summer exhibition was held in 1948. The exhibits include oil paintings, water-colours, designs in architecture, miniatures, engravings, etchings, and sculpture.

*The Royal Society of Painters in Water-Colours* ('Old Water-Colour Society'), Pall Mall, exhibits works of its members and associates in the spring and autumn of each year; the *Royal Institute of Painters in Water-Colours*, 195 Piccadilly, exhibits annually works of any artists selected by their committee. In the same building the *Royal Institute of Oil Painters* gives exhibitions in the autumn on the same principle. *Royal Society of Brit. Artists*, Suffolk St., S.W., exhibits works of outside artists as well as of members; *Royal Society of Painter-Etchers and Engravers*, 5a Pall Mall, exhibits yearly works of its members and associates; *Royal Society of Portrait Painters*, founded in 1891, with a limited membership, selects works of members and non-members. Ann. exhibitions of the *New Ing. A. Club* are held at New Burlington Galleries, W., and consist of works which the artists have felt to be outside the usual scope of those of other exhibitions.

*The Royal Scottish Academy of Painting, Sculpture, and Architecture*, Princes St., Edinburgh, held its 113th exhibition in 1939; the *Royal Hibernian Academy of As.*, whose buildings in S. Frederick Street, Dublin, were destroyed in the Sinn Féin rebellion of 1916, also holds exhibitions; and in Wales the *Royal Cambrian Academy of As.* exhibits in Conwy.

Other well-known galleries with frequent exhibitions in the provs. are the *Royal Glasgow Institute of Fine A.*, the *Royal W. of England Academy*, *Royal Birmingham Society of Artists*, and the *Walker A. Gallery* of Liverpool.

*A. Museums.*—As a nation Britain is rich in the possession of many notable A. treasures, the greatest of which are to be found in London. Some of these are: *The Brit. Museum*, Great Russell Street, W.C.1., which contains a vast collection of ancient sculptures from Rome, Greece (including the Elgin Marbles) and Egypt; goldsmiths' and jewellers' work; ancient pottery; a fine collection of paintings, drawings, engravings (notably some of Albert Dürer), and etchings, located in the print room presided over by Arthur E. Popham, and a unique selection of Chinese paintings collected by Laurence Binyon. *Victoria and Albert Museum*, South Kensington, S.W.7., a large building of great importance to the student, with a well-stocked library on A.; its numerous exhibits are classified according to their materials, exemplifying the use of A. as applied to industry. *The National Gallery*, Trafalgar Square, W.C.2, contains numerous priceless works of the old masters of the It., Flemish, Dutch, and Brit. schools. The *National Portrait Gallery*, adjoining this building, is an interesting gallery of portraits of Brit. celebrities of various centuries. *The Tate Gallery* (National Gallery of Brit. A.), Millbank, S.W.1, is noted for examples of recent Brit. A. *London Museum* Lancaster House, S.W.1, con-

tains arts and crafts of prehistoric, Rom., and Saxon times in the London dist., together with topographical pictures of London. *Hampton Court Palace*, on the Thames, has many beautiful It. pictures and some very rare tapestries. *The Wallace Collection*, Manchester Square, W.1, in addition to its exquisite paintings of Brit. and continental schools, has a treasury of beautiful furniture. *Sir John Soane's Museum*, Lincoln's Inn Fields, W.C.2, is celebrated chiefly for its Hogarth paintings, while *Kenwood House*, Hampstead, N.W.3,

Mansell

'PORTRAIT OF THE ARTIST'S WIFE,' BY  
JAN VAN EYCK  
Flemish School, Bruges.

bequeathed to the nation by the late Lord Iveagh in 1927, is another example of a private house converted into a museum, with a small but valuable collection of pictures. At the Dulwich Gallery there is a collection containing sev. Murillos and valuable pictures from the Dutch school.

Among the provincial A. museums are the *Walker A. Gallery*, Liverpool, famous for its Pre-Raphaelite paintings, its etchings and sculptures, and its Eng. A. of the Middle Ages; the *Manchester Corporation A. Galleries*, with many fine examples of nineteenth-century Brit. artists; the *Birmingham Museum and A. Gallery*, with many representative works of the pre-Raphaelites. The *Bristol A. Gallery* was presented to the city by Sir William Wills in 1905. *Nottingham Castle*, which had been practically destroyed by fire, was restored in 1878 and turned into an A. museum; and the *Leeds Corporation A. Gallery*.

In Scotland, Ireland, and Wales there are fine museums and A. galleries in Edinburgh, Dublin, and Cardiff respectively.

The U.S.A. is becoming an increasingly important centre of A., due to the great benefactions of her millionaires. Thus in recent years the Metropolitan Museum of A. in New York City, which was already one of the great museums of the world, has been enriched by legacies of their entire A. collections by the late Benjamin Altman and Henry Frick. In each case, these gifts were estimated to be worth 25 million dols. There were

Anderson

'THE VISIT OF MARY TO ST. ELIZABETH,'  
BY GIOTTO  
In the Scrovegni Chapel, Padua.

thus added to the museum some of the finest specimens of the work of Rembrandt, Hals, and other masters. The Hispanic Museum in New York, which specialises in modern Sp. paintings, has far more specimens of those modern masters, Sorolla and Zuloaga, than any museum in Spain or even in Europe generally. Through the gift of a Detroit millionaire, Washington, the cap., has a separate A. gallery in which there are housed more specimens of the work of Whistler than are to be found elsewhere. There are also fine A. collections in Boston, Philadelphia, Chicago, Cincinnati, Toledo, and Cleveland.

On the Continent Italy has the greatest wealth of art treasures, Rome and Florence containing not one but many museums of the best It. A., while Venice, Naples, Milan, and other tns. possess their great galleries. In Belgium the finest gallery is in Brussels; in Denmark,

Copenhagen; in France, Paris; in Germany (before the Second World War) in Berlin, Dresden, and Munich (little remains in Berlin and the famous Zwinger of Dresden was reduced to a shell); in Greece, Athens; in Holland, Amsterdam; in Norway, Oslo and Bergen; in Russia (before 1941) Leningrad; in Spain, Madrid; in Sweden, Stockholm; in Switzerland, Zürich.

**A. Sales.**—The change in social conditions in England during the last few years has had a notable effect on A. sales. The maintenance of mansions or ancestral homes having become increasingly burdensome, through economic stringency and high taxation, heirlooms have been sold for the high prices they have been able to command. These sales often attract public attention, partly on sympathetic grounds and partly through excitement roused by Amer. competition. This rivalry in A. collection existed in pre-war days, but not to so great an extent. Yet there were some very notable sales before the war; e.g. Lord Duveen paid £1,000,000 in 1907 for the Rodolphe Kann collection of pictures and *objets d'art*, including a dozen splendid Rembrandts. In the following year the Holland sale realised £138,000 for some 400 lots, which was a record sum for a collection of paintings by modern artists. In 1910 the Yerkes sale in America brought in over 2,707,000 dols., including the sum of 137,000 dols. from Franz Hals's 'Portrait of a Woman'; and the E. H. Gary sale brought in 2,297,000 dols., including 270,000 dols. for Gainsborough's 'The Harvest Wagon.' Mantegna's 'Madonna and Child' sold for £31,000 in 1912 in Berlin, and about the same time Rembrandt's portrait of his son Titus was sold in the U.S.A. for 270,000 dols. In 1915 and 1916, during the early part of the First World War, there was naturally a 'slump' in the sale of heavily priced pictures, though in 1917 Reynolds's portrait of Lady Ann Fitzpatrick as 'Sylvia' was sold for nearly £20,000. But after the war prices soon began to rise and, in 1919, the Hamilton picture sale brought in £169,000, including £8,500 for Turner's drawing of 'Zürich' and £26,700 for Hals's portrait of Joseph Coymen. The sale of Sargent pictures in 1925 showed a total of £146,000 for 160 lots in one day, but sentiment played some part in the sale. But in 1923 the total sum at the auction of the pictures of Sir John Robinson was only £200,000, though the lots included over 100 old masters, numbers of them falling to reach the reserve price. In 1927, however, a record was created in that more than 130 pictures priced at sums exceeding 1400 guineas each had changed hands during the year.

In recent years the paintings which have realised the highest prices at auction sales have been mainly portraits by Rembrandt, Gainsborough, Romney, Hoppner, Van Dyck, Reynolds, and Raeburn. But there is also an increasing demand at the present time for paintings by such Fr. masters as Cézanne, Corot,

and Manet, and the Dutch painter, Van Gogh, though of course these do not fetch the extraordinary prices realised by the old-estab. masters. Probably the record figure for any picture was that obtained by Lady Desborough for the Cowper 'Madonna' by Raphael, the price being about £175,000. The 'Cornaro' Titian, bought for the nation from the duke of Marlborough for £120,000, also ranks very high in the list of the record prices. In the private sale of the duke of Westminster's collection was included Gainsborough's 'The Blue Boy,' which was sold for the Huntington collection of California for well over £100,000, while in the same sale Reynolds's 'Mrs. Siddons as the Tragic Muse' was sold for little less than £100,000. The 'Blue Boy' was actually bought in 1803 by John Hoppner for £65, having been sold 7 years earlier for half that price. Up to that time the highest price at any auction for a Gainsborough picture was £20,000 which was paid for 'The Market Cart.' In 1926 Gainsborough's portraits of Miss Tatton and Master Heathcote each fetched £46,000. £100,000 was paid by a Philadelphian buyer for Lord Lansdowne's 'Mill' by Rembrandt, and the same sum was realised for Franz Hals's 'The Artist's Family.' Reynolds's portrait of Lady Betty Compton, and the portrait of King Philip IV by Velazquez. Other high prices include the following: Gainsborough's 'Hon. Ann Duncombe,' £84,000, and the same painter's 'Harvest Wagon,' £72,000 (resold in America in the Garry collection); Holbein's 'Duchess of Milan,' bought for the nation for £82,000; 'A Spanish Statesman' by Velazquez, £80,000; the portrait of Mary M. Barrett (known as 'Dinkie') by Lawrence, 74,000 guineas; Piero della Francesca's 'Crucifixion'—a small wood-panel—£75,000; Romney's beautiful portrait of Mrs. Davenport, £60,900; Rembrandt's 'Man Holding a Scabbard,' 48,000 guineas, the Rokeby 'Venus and Cupid,' by Velazquez, bought for the nation, for £45,000; Van Dyck's 'Portrait of Anton Triest,' £29,000; Gainsborough's 'Anne, Countess of Chesterfield' and Van Dyck's portrait of Jacques de Roy, each 17,000 guineas; Hobbema's 'Woody Landscape,' £15,750; and Hals's 'Portrait of a Gentleman,' £9,000. These 2 last-mentioned prices illustrate the capriciousness of taste in some cases, for Hobbema's picture was sold in 1890 for £3400 and again, in 1938, for 3500 guineas, while that of Hals changed hands in 1884 for 4 guineas. The Eng. National Gallery secured Raphael's 'Anselmi Madonna' in 1885 for only £70,000 from the duke of Marlborough, while J. Bache, a New York banker, paid £120,000 for the sole example of a male portrait by the same master. In 1947 a set of 12 floral studies by Jacob van Huysum, painted in the eighteenth century for a comparatively modest fee, was sold for £13,500. See also 'CHRISTIE'S.'

The leading sales rooms in London are Christie's, St. James's Place, S.W.; Sotheby's, New Bond Street, W.; Robin-

son & Foster, Queensberry Hall, S. Kensington, S.W.; Puttick & Simpson, New Bond St., W.; and Knight, Frank & Rutley's, Hanover Square, W. Details will be found in the ann. vols. of *Art Prices Current*, and in *The Year's Art*.

Arta, a tn. in Greece in the prov. of A. It derives its name from the R. A., on which it stands. This riv. was, before the Balkan war of 1912, the frontier between Greece and Turkey. A. has many fine buildings, among which are a Byzantine castle; a palace belonging to the Gk. metropolitan; the church of the Virgin of Consolation, built in 819, and many fine mosques and synagogues. Chief manufs. are woollens and cottons, embroidery, Russian leather. Soil is fertile, and gardens and orchards surround the tn. In 1083 it was taken by Bohemund of Tarentum; 1449 taken by the Turks; 1798 Ali Pasha captured it from the Fr.; 1881 ceded to Greece. In Greco-Turkish war of 1897 it was the scene of many slight Gk. successes. Pop.: prov. 52,600; tn. 8000.

Arta, Gulf of, an arm of the Ionian Sea. It is about 23 m. long. Until the Balkan war of 1912 its N. shores belonged to Turkey and its S. to Greece. Fish are plentiful, especially eels, mullets, and soles. On its shores are ruins of many ant. castles.

Artabanus, name of a number of Persian princes, soldiers, and statesmen. The name was also borne by 4 Parthian kings.

One A. was a brother of Darius I., and trusted adviser of Xerxes, his nephew. Another was vizier to Xerxes, whom he murdered in 465 B.C.

The Parthian king A. I. (c. 127 B.C.) perished in battle against a Mongolian tribe.

A. II. (d. c. 40) made king by those Parthian nobles who rejected Vonones, the Rom. nominee, who fled to Armenia. When A. invaded Armenia, Tiberius prudently sent Germanicus to patch up peace. Later, Tiberius, at the instance of the Parthian opponents of A., sent Vitellius to restore Rom. authority in the E. A. eventually concluded a treaty with Vitellius and renounced the throne. Consult Tacitus, *Annales*.

Artabazus, the name of sev. distinguished Persians under the achæmenidean dynasty. An A. led the Parthians when Xerxes advanced against Greece. Another was general under the Persian King Artaxerxes II. He afterwards revolted against Artaxerxes III., but was forgiven. He was made satrap of Bactria.

Artagnan'd', the hero of three of Dumas's novels, *Les Trois Mousquetaires*, *Vingt Ans après*, and *Le Vicomte de Bragelonne*. He is drawn as a Gascon adventurer who goes to Paris to win his fortune, aided by his 3 friends, Athos, Porthos, and Aramis. The historical count d'Artagnan, Charles de Batz de Castelmor (1611-73), was captain in the guards in 1654, sous-lieutenant in the musketeers in 1657, capitaine-lieutenant in 1667, and maréchal-de-camp in 1672.

Artamenes. *Artamènes* ou *le grand Cyrus*, is the title of one of the novels

of Madeleine de Scudéry. It is in 10 vols., and appeared from 1648 to 1653. The character of Sappho, in vol. x., is autobiographical.

**Artanthe elongata** is a shrub of the natural order Piperaceæ, a native of Peru, remarkable for the styptic property of its leaves, which are used for stanching wounds.

**Artaxerxes I.** (465-424 B.C.), son of Xerxes, king of Persia. He slew his elder brother Darius on suspicion of his being guilty of the murder of his father. A. then ascended the throne in 465 B.C. In his time peace was restored between Persia and Athens after a war of 51 years.

**Artaxerxes II., Mnemon** (405-350 B.C.), king of Persia, succeeded his father Darius II. His reign is marked by the revolt of Cyrus, his younger brother, who was assisted by 10,000 Gks., and was defeated at Cunaxa in 401. The peace of Antalcidas terminated the wars with the Gks.

**Artaxerxes III., or Ochus** (359-338 B.C.), king of Persia, succeeded his father, A. II. He murdered 2 of his brothers, and afterwards put to death all the remaining branches of the family. In Egypt he slew the sacred bull Apis and gave the flesh to his soldiers. His eunuch Bagoas poisoned him, and gave his carcass to the cats.

**Artaxerxes, Bebeban** (A.D. 223-240) (in Persia, *Ardashir*), king of Persia, founder of the dynasty of the Sassanidæ, was the son of Babek and grandson of Sassan. Defeated his predecessor Artaban, the last of the Arsacide, and had himself proclaimed king of kings. He restored the old religion of the Magi, made new laws, provided for their administration, and for the education of the people, and then undertook to extend his dominions. War with the Roms. broke out in 232. After fighting for 5 years without gain for either side, peace was made.

**Artedi, Peter** (1705-35), a distinguished Swedish naturalist, was b. at Årund in Angermanland, Sweden, and was drowned in a canal at Amsterdam. He went to the univ. at Upsala, where he was a fellow student with Linneus. He first studied philosophy and theology, but gave up these studies for medicine and natural hist., especially the study of fishes. In 1734 he came to London, where he wrote the preface to his *Ichthyologia*, which work took sev. years to complete. He assisted Linneus in his *Systema Naturæ*, and Albert Seba in his work on natural hist. His works, including *Ichthyologia* and *Synonymologia*, were pub. by Linneus in 1738.

**Artemidorus**: 1. Of Ephesus, a geographer who lived about 100 B.C. Studied at Alexandria and travelled much. Pub. a work on general geography as a result of his investigations. 2. A soothsayer and dream-interpreter who lived about the second century A.D., during the reigns of Hadrian and Antoninus. Called himself *Daldianus*. His work on interpretation of dreams is said to have been written by command of Apollo Daldianus.

The work is in 4 books, and gives a valuable insight into anct. superstitions.

**Artemis**, in Grecian mythology, the goddess of the moon and of hunting, called by the Roms. *Diana*. She was the daughter of Zeus and Leto, and twin sister and counterpart of Apollo. She was b. at Delos, and is thus often called *Ortygia*, from the anct. name of the is. She is represented as being armed with bow and arrows, dealing out death to mortals as punishment for offences against herself and against morality. She is the goddess of chastity, the protectress of youths and maidens, and defies the power of love. She slew Arion for an insult to herself, and transformed Actæon into a stag because he witnessed her bathing. (1) According to Arcadian and Athenian legend she is looked upon first and foremost as the goddess of nature. To her influence the increase of the fruit of the fields is due. She is the goddess of agriculture. She drives away the corn-spirits, is the friend of reapers, and requires her share of the first-fruits. (2) Another view of the original character of A. is that she was the moon goddess. This is probably due to the fact that, as Apollo was identified with the sun god, Helios, it happened as a natural conclusion that A., his counterpart, should be identified with the moon-goddess, Selene. (3) She is also represented as goddess of the nymphs, hunting in the Arcadian mts., seated in a car drawn by 4 stags with golden antlers. By the Roms. A. was identified with *Diana*, a goddess of light, corresponding to *Dianus*, or *Janus*, a god of light, the sun. In art A. is represented as a young and beautiful huntress, modestly attired in the chlamys, with legs bare below the knees. She carries a bow and a quiver of arrows, and is attended by dogs or stags. As the moon goddess she wears a long robe; her head is covered by a veil, and above her brow is the crescent of a moon. The statue, '*Diana of Versailles*,' now in the Louvre at Paris, is an artistic and anct. piece of sculpture.

**Artemisia**, a genus of *Compositæ* very common in N. countries, has many species noted for their bitterness. *A. vulgaris* and *A. campestris* are well-known Brit. species; *A. abrotanum*, old man or southernwood, has a peculiar aromatic scent, and is found in S. Europe and the E.; *A. absinthium*, the wormwood, has valuable medical properties, and grows wild in Britain; *A. dracunculul*, the tarragon, has succulent leaves used in vinegar, and is found in Siberia.

**Artemisia**: 1. Queen of *Halicarnassus* in Caria, one of the allies of Xerxes at the famous battle of Salamis, 480 B.C. 2. Another queen of *Halicarnassus*, wife and successor of Mausolus (352-350 B.C.). She is noted for her love to him, the extraordinary grief with which she mourned his loss, and the magnificent monument which she built to his memory. This monument, called the *Mausoleum*, was adorned with fine Gk. sculptures, portions of which were discovered in 1857 and are now in the Brit. Museum.

**Artemisium**, in anct. geography, a cape of N. Eubœa, Greece, off which a famous naval battle was fought between the Gks. and the Persians in 480 B.C.

**Artemus Ward**, see BROWNE, C. F.

**Arterio-sclerosis**, see ARTERY.

**Arteriotomy**, the cutting or opening of an artery for blood-letting purposes. It is only advocated where it is required to deplete the cerebral circulation to a considerable extent, and the temporal artery or one of its divs. is always selected. When sufficient blood has been let, the artery is completely divided and the ends are ligatured.

ARTERIAL SYSTEM

A, temporal artery; B, carotid artery; C, vertebral artery; D, E, subclavian artery; F, aorta, or great artery; G, axillary artery; H, brachial artery; I, celiac artery; J, renal artery; K, iliac artery; L, femoral artery; M, posterior tibial artery; N, anterior tibial artery.

**Artery**, one of the tube-like vessels through which the blood is propelled by the heart to all parts of the body. They consist of sev. coats; the outer, or *tunica adventitia*, composed of connective tissue; the *yellow elastic coat*; the *muscular coat*; the *elastic penetrated coat*, which is perforated by small apertures; and the *tunica intima*, composed of endothelial cells. The walls undergo degeneration in cases of *arterio-sclerosis*, the elastic coats are destroyed or greatly impaired, and the other walls are thickened. This loss of elasticity involves an increased resistance to the blood current, and consequently increased strain on the heart. The disease is caused by the toxins of malaria, rheumatism, and syphilis; by

chronic alcoholism and lead poisoning; by over-strain and over-eating; and as secondary to Bright's disease. The other chief affection of the As. is *aneurism* (q.v.).

The *aorta* is a large A. rising from the left ventricle of the heart, curves round in an arch, proceeding downwards until it bifurcates into the right and left *iliac* As. The head, neck and upper limbs are supplied by the *innominate*, which divides into the *right common carotid* and the *right subclavian*; the *left common carotid*; and the *left subclavian*. The carotids supply the organs of the head, and the subclavians passing through the armpits are called *axillaries*, *brachials* as they pass down the upper arms, bifurcating into the *radial* and *ulnar* As. in the forearms. Branches are given off from the aorta to supply the tissues of the heart and the viscera of the abdomen. The *iliac* bifurcates into the *internal iliac*, supplying the pelvic viscera, the organs of generation, etc., and the *external iliac*, which becomes the *femoral A.* as it descends the thigh, runs to the back of the limb, where it is called the *popliteal A.*, bifurcating into the *anterior tibial* and the *posterior tibial* As.

The *pulmonary A.* springs from the right ventricle of the heart, and bifurcates into branches for supplying the right and left lung with blood.

**Artesian Wells**, perpendicular borings in the ground through which water rises by natural hydrostatic pressure from water-bearing strata. The name owes its origin to the province of Artois, in France, where their use has been long estab.

The strata composing the earth's crust may be divided into 2 classes, permeable and impermeable, according to whether they allow water to pass through or not. Examples of the former class are sand and gravel, and of the latter, clay and hard rock. Water naturally tends to find the lowest level, therefore streams flowing over impermeable strata collect in hollows to form lakes or find their way to the sea. Suppose, however, that there is an outcrop of permeable strata lying between 2 impermeable layers. The water which falls on the outcrop sinks down as low as possible in the porous layer. There then occurs a condition which may be illustrated by holding a basin inside a larger one with the space between the two filled with water. If the inner basin is perforated at points fairly low down, the water issues with some force. Therefore, when a hole is bored through impermeable strata to reach the accumulation of water in the porous layer, the pressure is often sufficient to force the water to the surface, or at any rate to within pumping distance.

A. W. are of great value when the supply of surface water is insufficient. In Queensland and S. Australia the scanty rainfall is often supplemented by water drawn in this way from great depths. Water-courses that usually run dry in summer have been converted into permanent streams by the surplus from these wells, and it is estimated that the yield

in Queensland is equivalent in irrigating effect to a yearly rainfall of 12 in. over 110,000 sq. m. The water obtained from A. W. naturally contains many mineral salts in solution, and so may be unsuitable for washing or certain manufs., but

the general absence of organic impurities makes it valuable for drinking purposes. In some dists. of the Atlantic coast plain in the U.S.A., the development of A. water supply has promoted a marked improvement in public health.

Many A. W. over 300 ft. deep have been sunk in London, such as those which

supply the fountains in Trafalgar Square. In the neighbourhood of Paris the borings are often much deeper. At Grenelle a well 1798 ft. deep was sunk, the operations lasting from 1834 to 1841. In America many wells are over 2000 ft. deep, and in Putman Heights, Connecticut, there is one 6004 ft. deep.

Occasionally it is found that the water from A. borings is salt or brackish, and invariably the temperature is higher than that of surface water; there appears to be a rise of 1° F. for every 55 ft. of descent down to 1800 ft., after which the rise is more rapid.

Artevelde, Jacob van (c. 1300-45), the celebrated brewer of Ghent, who became governor of Flanders. On the occasion of a revolt against Count Louis in 1388 he was chosen chief of the insurgents. He afterwards united with Edward III. against the king of France and assisted at the siege of Tournai in 1340. In the truce which followed he stipulated the independence of Flanders, and became its governor. He applied himself to his difficult task with great energy and sagacity, but after sev. years he thought it best to make Flanders into a kingdom, and offered the crown to the Prince of Wales. He was massacred in a popular tumult at Ghent.

Artevelde, Philip van (1340-82), son of the preceding, was chosen captain of people of Ghent in a revolt against Count Louis II. in 1382. Defeated Louis, took the city of Bruges, and assumed the state of sovereign. Louis, after having obtained assistance from France, entered Flanders with a Fr. army led by the brave Constable de Clisson. He defeated the Flemings at the battle of Roosbeke and slew their leader.

Arth, vil. of Schwyz, Switzerland, at the S. end of the lake of Zug, 17 m. E. of Lucerne. It is a terminus of the Rigi railway, and stands on the site of the Goldau landslip of 1806. Pop. 5000.

Arthrectomy (Gk. *ἀρθρον*, a joint, *ἐκτομή*, a cutting out), excision of a joint.

Arthritis, inflammation of a joint, usually due to gout or rheumatism. Rheumatic gout, or *A. deformans*, however, has probably no close connection with either gout or rheumatism. It is a chronic disease, involving changes in the cartilages, synovial membranes, etc., and generally producing great deformity in the joints. The actual cause of the disease is still a matter of doubt, but there is an increasing disposition to regard it as being of microbic origin. One joint, usually of the hand, is first affected, and then the corresponding joint on the other side. All the joints of the feet, arms, legs, and trunk may be symmetrically invaded in turn in bad cases. The course of the disease is extremely variable; it may gradually lead to total helplessness, but occasionally improvement may be expected. Although looked upon as incurable, *A. deformans* is not immediately dangerous to life.

Arthropoda (Gk. *ἄρθρον*, joint, *πούς*, foot), a zoological term applied to a group of animals with jointed limbs,

including insects, spiders, and crustaceans. They are segmented animals, often bearing appendages on the segments, are bilaterally symmetrical, covered with a firm cuticle; they have foot-jaws, and the brain is connected with ganglia to the food canal. The name has been used somewhat variously in different systems of classification, but Sir E. It. Lankester restricted it to one section of the div. *Appendiculata*, or segmented animals with a pair of lateral appendages to each ring. The *Appendiculata* are divided into the minute animals *Rotifera*: the *Chaetopoda*, or worms; and the *A.*, where the lateral segments have become specialised into jointed limbs, claws, and jaws. The *A.* were divided by Lankester into *Hyparthropoda*, a hypothetical group to connect the ancestral forms of *A.* and *Chaetopoda*; the *Protarthropoda*, including the genus *Peripatus*, found in Africa, Asia, and Australia; and the *Euarthropoda*, which include the classes *Diplopoda*, or millipedes; *Arachnida*, or spiders; *Crustacea*, as crabs, lobsters, shrimps, etc.; *Chilopoda*, or centipedes, and the *Hexapoda*, or insects.

Arthur, usually described as a hero of mythological romance, but even if the exact historic existence of *A.* cannot be proved, at least some of the deeds ascribed to him can be traced to historical personages. The great authority for the authenticity of a historic *A.* is Nennius, but, as has been pointed out, Nennius lived at least 150 years after the deeds he describes, and no mention of *A.* can be found in contemporary writers. The historic battle of Mons Badon, as great a battle from the point of view of the Britons as the battle of Deorham is from the point of view of the Saxons, can at any rate be ascribed to Ambrosius Aurelianus. This battle is described by Gildas as taking place, as far as we can gather from his data, about the year 516. This great battle, which beat back the W. Saxons and prevented their further advance, is ascribed by Nennius to *A.* Since Gildas, who was a contemporary, whereas Nennius was not, since also Gildas gives the name of all important Brit. chieftains and omits that of *A.*, we can safely conclude that *A.* was not a personage known to Gildas. On the other hand, Nennius gives the names of 12 great battles which *A.* fought, finishing up with the battle at Mons Badon. At this latter battle 960 men are given as having fallen to *A.*'s sword alone. In judging the authenticity of a historic *A.* we must bear in mind that *A.* is a fairly universal personage, but that all nations with which his name is closely identified are those of Brythonic origin. His name occurs in Gaelic history, in Welsh poetry, but of a very much later date than that to which the battle of Mons Badon belongs. Nennius definitely gives us the places where these 12 battles were fought, but archaeologists still dispute the probable sites of these battles. The sites of some of them can be quite easily identified, as e.g. the ninth 'in Urbe Legionis,' i.e. Chester, and the

twelfth at Mons Badon. In the eighth, which was fought 'in Casbello Guinnon,' we are told that *A.* carried an image of the Blessed Virgin on his shoulders, and the heathen were put to flight on that day, and great slaughter made of them through the merits of Our Lord Jesus Christ and through the merits of the Blessed Virgin His mother.' Whatever truth there is, however, in the story of *A.* must be ascribed either to the details given by Nennius or to the data given by Gildas, since much that has been written of *A.* is obviously the invention of a later day, and the *A.* of Geoffrey of Monmouth is almost as impossible historically as is the creation of the mind of Tennyson. The romance of *A.* developed on the lines of medieval chivalry, and the *A.* of the tournaments cannot be compared with an *A.* fighting at Mons Badon, or, as one record describes him, beating back the armoured bands of the Romans on the Rom. walls. It remains now simply to trace the *A.* as we know him in his development by the romantic writers of later centuries. From the Ambrosius of Gildas to the Artorius of Nennius is a long step, and one in which the character and exploits of *A.* have not suffered. But from Nennius to William of Malmesbury is a still longer step, and a step during which the character and exploits of *A.* are developed still more fully and become more and more painted in the light of a contemporary monarch. The *A.* of Gildas, if not also the *A.* of Nennius, must have been simply a Romanised Briton, who led his countrymen against the attacks of a common foe. But later the hand of romance is laid, and not lightly, upon the character of *A.*, and he becomes the centre of a picture of the ideals of chivalry and romance, the perfect knight, the perfect king, the perfect lover. We find the foundations of all Arthurian legend in Geoffrey of Monmouth and later developments in the stories of Sir Thomas Malory and Lord Tennyson. In later romance he has become the beau ideal of the true Christian knight—the knight who, accoutred in the armour of medievalism, goes forth to conquer wrong and free the oppressed. It has already been noted that the stories of our Prince *A.* are universal; the best-known story of how *A.* will come again is told by the Ger. peasantry as how Frederick Barbarossa will come again. The only conclusion that we can draw from so much contradictory evidence is that there may be a historical *A.* but he is certainly not the hero of romance that later ages have made him out to be. In the summer of 1930 an international conference (the first on record) of those interested in the Arthurian legends was held in Cornwall, a spot near the fabled Lyonesse of *A. Le Morte d'Arthur* (Malory); *Poems* (containing the *Idylls of the King*) (Tennyson); and *Two Morte d'Arthur Romances*, are included in Everyman's Library. See also J. D. Bruce, *The Evolution of Arthurian Romance* (Göttingen and Baltimore, 1923-24).

Arthur, Chester Alan (1830-86), the

twenty-first president of the U.S.A., b. at Fairfield, Vermont. He graduated from Union College in 1848; practised law in New York from 1853. Noted for his eloquence in behalf of the coloured people. At the time of the Civil war he was inspector-general and quartermaster-general for the state of New York. He was a Republican and held the office of collector of the port of New York (1871-78). In 1880 he was elected vice-president, and in 1881 became president on Garfield's assassination, but was defeated by James G. Blaine in his candidature in 1884. His administration was marked by measures affecting the tariff, polygamy in Utah, the Chinese, the Navy, and civil service reform. See *UNITED STATES—History*, and Smalley, *Life of C. A. Arthur*, 1880.

**Arthur, Duke or Count of Brittany** (1187-1203), for whose death King John was responsible, was son and heir of Geoffrey, third son of Henry II. In order to destroy his right of succession, King John had him murdered in 1203.

**Arthur, Sir George**, first baronet (1784-1854), lieutenant-general, youngest son of John A. of Norley House, Plymouth. Saw active service in Sicily and in the Walcheren expedition. In 1837 he was made lieutenant-governor of Upper Canada. In 1842 made governor of Bombay presidency.

**Arthur, Sir George**, third baronet (1860-1946), Eng. biographer and soldier, son of the second baronet, Col. Sir Frederick Leopold A.; educated at Eton and Christ Church, Oxford. Given a commission in the Life Guards, 1880. Took part in the battle of Tel-el-Kebir; served in the Nile Expedition, 1884-85. Pub. the first vol. of *The Story of the Household Cavalry*, 1909. In 1914 he was appointed private secretary to Lord Kitchener at the War Office and served in that capacity till Kitchener's death. In 1920 appeared his *Life of Lord Kitchener of Khartoum* (3 vols.), the standard biography. Ed. the letters of Lord and Lady Wolseley, pub. 1922. His *Sarah Bernhardt* appeared in 1923, and his *Life of Lord Wolseley* (in collaboration with Sir Frederick Maurice) in 1924. His second and third vols. of *Household Cavalry* (in collaboration with Capt. Shennan) were pub. 1926. In 1928 he pub. a short biography of *Field Marshal Earl Haig*. A translation of Raymond Poincaré's memoirs (1916) was pub. in 1930. Among his shorter biographies are those of *General Sir John Maxwell* (1932), *Queen Alexandra* (1934), *Queen Mary* (1935), and *King George V.* (1937). Other works: *Not Worth Reading* (an autobiography), 1938; *Wellington to Wavell* (1942), an account of the fortunes of the Brit. Army in the past century; *Concerning Winston Spencer Churchill* (1941), and *Concerning Queen Victoria and Her Son* (1943).

**Arthur, Timothy Shay** (1809-85), Amer. author of moral and domestic tales, especially *Ten Nights in a Bar Room*, which had a great contemporary reputation. He founded *Arthur's Home Magazine* in 1852.

**Arthur's Seat**, a hill roughly in the form of a lion E. of Edinburgh. It is about 822 ft. high, and a fine panorama can be seen from the top. The ascent is easy.

**Artichoke**. Both the true A. (*Cynara scolymus*) and Jerusalem A. (*Helianthus tuberosus*) are species of the Compositæ. The former grows in S. Europe, and its young flowers are edible; the latter, common in Europe and America, has tubers like those of the potato which are also a food.

ARTICHOKE

**Article, Indefinite**, see A.

The definite A. 'the' is allied to the Ger. *der* and the Dutch *de*. In Lat. the definite and indefinite *As* do not exist.

**Articles, The Six**, popularly called 'the six-stringed whip', is the name given to a statute passed in 1539 at the instance of Henry VIII., who was alarmed at the reforming zeal of the Eng. Protestants. These A. asserted the position of the Eng. Church on 6 fundamental doctrines, and were as follows: (1) belief in transubstantiation; (2) communion in both kinds not necessary; (3) celibacy for the priesthood; (4) chastity to be observed when vowed; (5) private mass permitted; and (6) auricular confession necessary. Archbishop Crammer strongly opposed the Act when it was passing through the House of Lords, but the king overbore all opposition. The penalties for contravention of these A. were very severe, and a failure to believe in transubstantiation was punishable by burning alive. Death was also the penalty for a second offence against the other A. This severity was somewhat mitigated by an amending Act in 1544, and the A. were repealed in 1547, after Edward VI. came to the throne.

**Articles, The Thirty-Nine**, see THIRTY-NINE ARTICLES.

**Articles of Association**, the printed list of rules for the conduct of a joint-stock company. See under **COMPANY AND COMPANY LAW**.

**Articles of War** were formerly ordinances issued by the king, or by the

commander-in-chief with the king's authority, governing the conduct of a military campaign and ceasing on its conclusion. Until the passing of the first Mutiny Act (*q.v.*) in 1789 these were the only ordinances regulating the governance of troops, and in times of peace acts such as desertion or disobedience were only liable to the civil law, that is to say, they were merely breaches of contract. The issuing of A. of W. was a prerogative of the Crown which was not taken away by the first Mutiny Act, but in 1803 it was superseded by statutory power to be found now in section 69 of the Army Act, 1881. This power to issue A. of W. is not now likely to be used, for the annually renewed Army Act or Mutiny Act covers the whole ground. Similar in every respect to those of the Army are the naval A. of W., and like them are now embodied in a statute, the Naval Discipline Act. Special A. apply to the native troops in India.

**Articulata** (Lat. *articulare*, to join), an obsolete term applied by Cuvier to segmented animals, as the Crustacea, Myriapoda, Insecta, and Arachnida, now placed under the div. Arthropoda. He included the Annelida, which are not arthropods, and grouped the myriapods with insects.

**Articulation.** In the production of any sound, the tongue is adjusted with relation to the palate at the place called 'place of A.' This is where the tongue has for that sound the maximum elevation. The common use of A. and this technical use are very often used too indiscriminately even by phoneticians.

In anatomy an A. is a junction, or joint, between the bones in the skeleton of a vertebrate animal. Such a joint may be immovable, when the bones are directly united (synarthrosis); or slightly movable, when they are connected by an intervening substance (amphiarthrosis or symphysis); or more or less freely movable, when the articular surfaces are covered with smooth cartilage and surrounded by a fibrous capsule, lined with membrane, secreting a lubricating fluid called synovia (diarthrosis).

**Articulator**, a telephone contrivance to produce smoothness of tone; also a mounter of bones for medical study.

**Artificer Engineers**, a warrant rank in the Brit. Navy, open to engine-room As. of not less than 8 years' service and over 35 years of age. A. E. are on a level with carpenters, and wear the same uniform, with a distinctive stripe of purple cloth on the cuff.

**Artificers, Engine-room**, a rank of petty officers in the Brit. Navy. Candidates for this position must be not less than 21 nor more than 28, and have had some experience in either copper-smith's work, engine-fitting, boiler-making, or general smith's work. There are 4 classes of E. A., the first, or highest, being reached after 12 years' service. A fifth class consists of boys over 15 in training.

**Artificial Flowers**, see FLOWER.

**Artificial Horizon**, see HORIZON.

**Artificial Limb**, a mechanical contri-

vance attached to the stump of an amputated limb and designed to perform the functions as far as possible of the natural limb. An early example, exhibited in the London Royal College of Surgeons, is said to have been made c. 300 B.C. It is an A. leg, made with pieces of thin bronze fastened to a wooden core; the foot, which has vanished, was probably made of wood. Another A. L. of historical interest is the hand of 'Götz of the Iron Hand,' with which he was able to grasp sword and spear.

The great improvement in methods of amputation in recent years has occasioned a corresponding improvement in designs for A. Ls. The surgeon aims at leaving a stump which will preserve the greatest possible length of limb, and which will bear the pressure consequent upon the use of an A. substitute. In the arm the pressure of the appliance is greatest at right angles to the bone, so that the need for a considerable amount of padding over the end of the bone is not so great as in the case of the leg. The 'modified circular' method of amputation, which leaves the cicatrix over the end of the bone, is therefore suitable, as it can be carried out comparatively close to the injured or diseased part. Disarticulation at the wrist-joint leaves a widened stump which is especially suitable for an A. attachment. Amputation through the forearm, if it does not result in the fusion of the ends of the radius and ulna, leaves the power of pronation and supination, that is, of making the movements turning the palm upwards and downwards. Amputation through the upper arm naturally leaves a stiff-arm movement from the shoulder. A hand has been devised by which a certain amount of voluntary and variable movement is imparted to the thumb by means of hydraulic power controlled by an india-rubber ball placed under the arm-pit.

The old method of screwing a hook into the stump of the arm has now been discarded for a spring or snap catch. The Mackay arm is a well-known modern pattern, and is made for high amputation at the shoulder and for amputation at the elbow; the hand is of rubber or wood and the remainder in light perforated metal. Since the First World War, progress has been made in A. Ls., and to-day, with the assistance of harness (usually made of webbing), it is possible for some people to accomplish with their A. Ls. almost as much as they could with their natural limbs. This advance is particularly noticeable in connection with A. hands, for which a mechanism has been invented for grasping and releasing objects by control from the shoulder. Similar progress has also been made in an A. L. for the leg. An essential contributory factor to the success of an A. L. is the determination of the patient to overcome his disability.

A. attachments to the lower limbs also depend upon the extent to which the functions of the limb are impaired. Amputation of a part of the foot leaves the ankle action unrestricted, and the

skin incisions are so arranged that there is no cicatrix or skin-grafting in the part walked upon. It may be generally said that the availability for A. attachments to the lower limb is best served by a 'flap' method of amputation, as the weight must be borne on the end of the bone, and such methods not only provide a sufficient 'cushion,' but can be arranged so that the cicatrix may not come in the line of greatest pressure. It was formerly the custom in amputating the lower leg to sever the tibia just below the knee, so

Saving Society and by the St. John Ambulance Association is called the 'prone pressure' or Schäfer method, and is described in the former body's handbook of instructions thus:

'The apparently drowned person must be placed at once, face downwards, on the nearest flat surface. Place yourself on one side of the patient, facing the head, in a full kneeling position, with knees and hip bent. Put your hands on the small of the patient's back, the wrists nearly touching, the thumbs as near each

*Barbara Wagstaff*

#### TWO METHODS OF ARTIFICIAL RESPIRATION

*Left, Schäfer; right, Sylvester.*

that the A. leg received the bent knee, the stump pointing backwards. The adoption of numerous devices in which the natural action of the ankle is imitated has now led to the preservation of as much of the natural limb as possible, because the extent of curtailment of a limb determines not only the extent of functional loss, but also the amount of leverage available; and consequently the amount of effort required to use an A. L.

**Artificial Respiration,** the mechanical restoration of the act of breathing when it has been suspended by asphyxiation, drowning, poisoning, etc. The natural movements should be imitated as far as possible, and should be performed rhythmically 12 or more times per min. The method practised by the Royal Life-

other as possible without strain and the fingers passing over the loins on either side, but not spread out. Then, bending the body from the knees and somewhat straightening the hip-joints, swing slowly forward, keeping the arms quite straight and rigid, so that the weight of your body is conveyed to your hands. No exertion is required; the necessary pressure is imparted by the weight of your body. In this way the patient's abdomen is pressed against the ground; the abdominal organs are forced against the diaphragm; the diaphragm rises and air is driven out of the lungs, together with any water or mucus which may be present in the air passages and mouth, thus producing expiration.

Next, swing the body slowly backwards to its first position, thus removing its

weight from the hands (which are kept in position) and relaxing the pressure on the abdomen. The organs now resume their former position, the diaphragm descends, the thorax is enlarged and air passes into the lungs, inspiration being produced. Repeat the movements regularly about 12 times a min., swinging the body alternately forwards and backwards from the knees.

Two other common methods are those of Sylvester and Marshall Hall. In the former, the body of the patient is placed upon the back, the shoulders being slightly raised. The operator grasps the arms just above the elbows, and by raising them gently and steadily to their full extent behind the head, induces inspiration. After 2 or 3 secs. they are lowered to the side of the chest and pressed against it, thus causing expiration. The movements, which should be supplemented by friction and preceded by an inversion of the body to drain off water, are often successful even after more than an hr.'s apparently unsuccessful work. In the Marshall Hall method the body is placed on the back with the left arm bent under the head. It is then gently rolled over on to the face, the tongue being held forward, and then back again, so that the thorax is compressed and the lungs are emptied by means of the weight of the body. This should be done every 4 secs. Various other systems are in vogue, and are of advantage in certain cases. *See also* RESUSCITATION and DROWNING.

**Artificial Silk, or Rayon**, as it is now widely called, is prepared by various processes of treating cellulose in solution so as to draw it out into fine threads. Cellulose, which is the basis of all vegetable structure, is for purposes of A. S. obtained usually from cotton or from the wood pulp of spruce trees. As far back as 1754, Réaumur, the Fr. physicist, guessed at the possibility of imitating the product of the silkworm, but it was not until the discovery of nitro-cellulose that A. S. could be produced on an industrial scale. In 1855 Audemars of Lausanne obtained from a solution of nitro-cellulose a thread which he called A. S. and used as a filament for electric globes. From this experiment was derived the nitro-cellulose process, developed by Count Hilaire de Chardonnet in 1886, the first of the 4 different methods by which A. S. is prepared in industry to-day.

**Chardonnet Silk.**—The raw material is washed cotton. From this, nitro-cellulose (gun-cotton) is made, and then dissolved in equal parts of ether and alcohol. The viscous solution, called collodion, is forced through capillary tubes into water. The product is then dried and denitrated by treatment with an alkaline hydro-sulphide.

**Despeissis Silk.**—This A. S., named after M. Despeissis, who invented the cuprammonium process, has the same lustre and elasticity as Chardonnet silk. It is made by dissolving pure cotton cellulose in ammoniacal copper oxide. The dissolved cotton is then filtered and

passed through to the spinnerets or capillary tubes. The resulting threads are coagulated either in acids or alkalis.

**Viscose Silk.**—The cellulose is obtained mostly from wood pulp and treated with caustic soda to form an alkali-cellulose. This is then united with carbon bisulphide to form a xanthate, termed viscose by its inventors, Messrs. Cross and Bevan (1892). After careful filtration the xanthate is conveyed to the thread-forming machines and coagulated by heat.

**Acetate Silk, or celanese**, as it is called, from the product manufactured by the British Celanese, Ltd., is obtained from cotton or wood pulp treated with acetic anhydride. The cellulose acetate, thus formed, is dried and then dissolved in acetone. After filtration, the mixture is ready to be made either into 'dopes' and varnishes, such as are used for aeroplane fabrics, or into silk threads. Celanese is softer than other artificial silks, and is least affected by water. This makes it suitable for fishing lines, etc. It is also used by electricians as an insulator. *See* E. Wheeler, *The Manufacture of Artificial Silk*, 1921.

**Artigas, Fernando José** (c. 1755–1851), S. Amer. soldier and politician, b. at Montevideo; became captain of a corps in the Sp. provincial service, but left this in 1811 for the Revolutionary army. Later he joined the Republican army, but was outlawed by the commander Sarratea, for independent action. He then organised a troop of gauchos, and was so successful that he was recognised as an independent chief and given the whole of Uruguay in 1814. He expelled the Portuguese from Montevideo and became dictator, but was ultimately defeated, and in 1820 fled to Paraguay, from where he was sent into exile in Candelaria.

**Artillery** (from O.Fr. *artillerie*; It. *artiglieria*; Sp. *artillería*). Its former meaning comprised all implements of war, and was generally used in the plural. Then the word was used particularly to denote engines for discharging missiles, as catapults, bows, crossbows, and slings. In modern use the word denotes: (1) all firearms discharged from carriages in contradistinction to small arms; (2) the particular troops engaged in the service of such firearms; (3) the science which treats of the use and management of ordnance.

**Early Hist.**—In the O.T. 'engines invented by cunning men to shoot arrows and great stones' are mentioned. Continual improvements were made, and under the names catapult, ballista, trebuchet, such arms were used in medieval warfare. A small piece of cannon was contrived by Schwartz, a Ger. Cordelier, soon after the invention of gunpowder in 1330. But even on the discovery of gunpowder these weapons were not readily displaced. The first occasion on which guns were used was probably at the siege of Cividade in Italy, when the Gers. employed one piece. It is also said that the Moors of Algeiras used A. in Spain in 1343. According to some historians, guns were used at Crécy

in 1346, when Edward III. used 4 pieces of cannon. The Eng. also used A. at the siege of Calais in 1347. The Venetians employed A. against the Genoese in 1377. At the siege of Harfleur (1415), 25 'master gunners' and 50 'servitour gunners' were employed. A gunner of that time had charge of all guns and stores, and laid and fired the cannon in action.

*Beginnings of Field A.*—In the early stages of its hist. A. was chiefly used as a battering-ram, and did not come into general use until late in the fifteenth century. The *Wagenburg*, denoting a cart armed with guns, came into prominence in the Hussite wars of 1419-24. Small guns were used in 1460 to clear the streets during fighting in London, and heavy ordnance to batter the walls. The greatest example of A. work in the fifteenth century was the siege of Constantinople in 1453, when the Turks used a large force of A. Sev. pieces used at the siege survived until the eighteenth century. These pieces were chiefly used for siege purposes and were highly effective. Many of the barons' castles were destroyed, and a prince who possessed such pieces had no difficulty in overcoming an adversary whose force lacked A.

*Middle Ages.*—In the wars waged by Charles VIII., Louis XII., and Francis I. of France, in Italy, A. played a most conspicuous part in siege and field warfare; e.g. at Ravenna (1512) and Marignan (1515) great execution was made. Nevertheless when the arquebus and other small arms became efficient very little was heard of the field A. The efficiency of the Eng. archers prevented opportunities for developing the arm in England. During Henry VIII.'s reign culverins were used as heavy pieces, and sakers and falcons as lighter pieces. A great Turkish gun carrying 6000-lb. shot was used at the siege of Constantinople.

During the Eng. Civil war guns were in use. Cromwell in his sieges made great use of shells. Before his changes in the position of the A. the pieces were placed in the front of the force. He relegated the heavy pieces to the rear.

*Eighteenth and Nineteenth Centuries.*—Cromwell's policy was followed in the campaigns of Louis XIV. In the days of Turenne heavy guns were much employed. Marlborough also had about 9 pieces per 1000 men, and as he had an army of about 11,000 he used about 99 guns. The pike disappeared about 1700, and then infantry fire power became the decisive factor in battles. The Royal Regiment of Artillery was founded in 1717. In the year 1793 the Eng. force of A. had increased to 4000. For 5 centuries the word A. was strictly limited to mean garrison A. The field A. existed only in time of war. In 1793 horse A. was introduced, and drivers' corps in the following year. Field brigades of 6 guns were then formed, horse A. batteries being styled troops. A troop of horse A. and a field brigade each had 5 guns and 1 howitzer. The

driver corps of 1794 was divided into troops. The addition of one of these to a company of foot A. converted the latter into a field brigade.

*Fr. Revolution and Napoleon.*—During the wars of the Fr. Revolution the A. of the field army received the name of the field A. The field guns were organised into batteries, each complete in itself. The Fr. A. steadily improved in manœuvring power during the Fr. wars. Napoleon himself maintained that the man who was clever enough to bring up an unexpected force of A. unknown to the enemy was sure to win the day.

After 1815 the hist. of A. becomes merely a matter of perfecting a material already discovered. Infantry fire being more variable in its effectiveness, the period 1815-70 saw many changes in the relations of the 2 arms. The introduction of the rifled musket demolished the A. manœuvres of the smooth-bore days. Up to this time A. forces depended very much on case-shot firing or firing their guns at close quarters. On the introduction of the new musket, infantry armed with a far-ranging rifle could keep the guns beyond case-shot firing and compel them to use only round shot or common shell. In the Amer. Civil war, the attacking infantry on reaching close quarters met the full force of the defenders' artillery together with the full force of the musketry. Battles began to be fought at increased ranges and the ineffectiveness of the projectiles used by the A. neutralised the effect of rifled guns. After the Franco-Ger. war many lessons were learnt and many changes were made in the use of A. New ideas on A. spread rapidly, and the quick-firing gun was soon introduced into every army. The original designs have been greatly improved upon, but the prin. still remains. These are, in brief, the mechanical absorption of the recoil by means of buffers, and the development of time shrapnels as projectiles of the field A. Then attention was turned to the increase in rate of fire. A shield was then attached to the gun for the protection of the detachment. One result of the Boer war was to re-introduce heavy ordnance into field armies. Field howitzers also reappeared. At the latter part of the nineteenth century siege and fortress A. also underwent many great changes and developments. During the Franco-Ger. war of 1870-1871 rifled guns 'long and short' for direct and curved fire were used as siege A. At present howitzers are the prin. siege guns.

*Organisation, Brit. Field A.*—A battery of field A. comprises 3 constituents, viz. (1) *material*—guns, carriages, ammunition, and stores; (2) *personnel*—officers, non-commissioned officers, gunners, drivers, and artificers; and (3) *transport*—horses and other animals, motor and other means of transport. The usual number of guns in a battery is 6. Formerly 'mixed' batteries of guns and howitzers were in use. Machine guns are not included under the

title of A. weapons. The vehicles of a battery include ammunition wagons, stores and provision wagons, and forage wagons. Various opinions have been expressed on the amount of ammunition required with a field battery. The larger the amount carried the more independent will be the battery, although it encumbers the battery with more vehicles. Some guns have 3 or 4 wagons of ammunition attached. The battery is generally commanded by a major, with a captain as second in command. The battery is divided into sections of 2 guns each, each under a subaltern officer, who is entirely responsible for everything in his section. These sections are again subdivided into subsections, each consisting of 1 gun and 1 wagon, men, and stores. These subsections are each under the command of No. 1, a sergeant, who is responsible for his subsection to the section commander. 'No. 1' rides with the gun. Another non-commissioned officer rides with the first wagon, and gunners sit on the gun-carriage, wagon, and limbers. The battery also includes baggage wagons, trained signallers, and range-finders.

*Horse A.* differs from field A. in that the whole detachment is mounted, leaving guns and wagons free from the load of men. With int. A. the whole equipment is carried on the backs of mules and other animals. For action the loads are lifted off and assembled.

*Higher Organisation of A.*—In most countries (with the exception of Great Britain) are regiments and brigades of 2 or more regiments. In Great Britain the Royal Regiment of A. still comprises the whole personnel of the arm of the former Royal Horse A., Royal Field, and Royal Garrison A. To each are added the Special Reserve and Territorial A. In Great Britain the administrative and tactical unit is the brigade. Provision is also made for control of *matériel*. The unit mentioned above consists, in case of guns, of 3 batteries (18 guns); in the case of howitzers, of 2 batteries (12 howitzers); and in the Horse A. of 2 batteries (12 guns), and is commanded by a lieutenant-colonel.

*National Volunteer Artillery Association* held its first meeting for shooting for prizes, given by the queen and others, at Shoeburyness, July 1865. Meetings were held and prizes distributed in 1866, but no meetings were held during the S. African war nor during the two World Wars.

*Royal Artillery Institution*, estab. at Woolwich, proposed by Lts. Eardley-Wilmot and J. F. Leffroy in 1838, approved in June of the same year.

The alleged great deficiency of A. in the Brit. Army was much discussed in 1870. At the A. camp at Aldershot the efficiency was reported to be very fine. In 1877 a new organisation of A. was proposed. Great improvement was made in field guns, and impulse given to the subject by the war in S. Africa, 1899-1903. In 1903 the gun committee adopted a new type of field gun, a 15-pounder quick-

firer with effective shrapnel range of 6500 yds. and further range of 1000 yds. It was, however, to be learned by bitter experience in the opening months of the First World War, how inadequate Brit. 4-in. field guns were for modern warfare. (Consult the dispatches of Gen. (later F.M. Earl Ypres) Sir John French, 1914.)

*Development in the First World War.*—Four years of scientific warfare in the First World War saw a consistent and progressive development in the power and influence of A., both in the actual fighting battle and in all the stages which lead up to it. Despite the handicap under which Great Britain started the war, Brit. A. played a large part in that development, and in the later years dominated the enemy's A. to an ever-increasing degree, and the influence of that fact upon the morale both of the Brit. and of the enemy's troops could scarcely be exaggerated. (See F.M. Haig's dispatch, Dec. 21, 1918.)

Ever-increasing demands for guns were made in the first 2 years of the war. These could not be met at once. Existing machinery had to be adapted to enable technical improvements in A. to be effected. Firing tests and travelling trials had then to be carried out before new guns were ready. The hist. of the war proved that improvised A. material was never satisfactory. The only modern heavy howitzer available to the Brit. Army in 1914 was the 9.2 in. Mark I. howitzer, a weapon designed and constructed under the guidance of Maj.-Gen. Sir Stanley von Donop. When in 1916 Gen. Haig was calling for ever more guns, he selected the latest 'Marks' of existing models in order to facilitate construction and ensure uniformity in design. At the same time, the commander-in-chief insisted that every effort should be made to increase the range and accuracy of guns and that there should be no cessation of research and no finality of design.

The 2 main principles on which the construction programme was based were to give a decisive fighting superiority per dir. over the Ger. A., and to use heavy guns only for work that heavy howitzers could not do. The preference for the howitzer over the gun was justified. Its 'life' is greater, e.g. for a 6-in. gun, Mark VII., the 'life' is 1500 rounds, for a 6-in. howitzer, 10,000 rounds. The howitzer, too, is much easier to place in position in the field, and many can be sited in a comparatively restricted area, owing to the higher line of departure of the shell. Though they have less range than guns of a similar shell-power, howitzers are more mobile and, fired at horizontal ranges, their accuracy is greater.

The continuous A. battle which began on the Somme in 1918 and ended in the smothering of the Ger. guns would have been impossible if the proportion of medium and heavy howitzers to heavy guns had not been large—nearly 70 per cent to 30. In 1914 there were in the

original Brit. Expeditionary Force 486 guns and howitzers, 24 of which were of medium calibre; at the armistice there were 6437 guns and howitzers of all kinds (excluding anti-aircraft A., and trench mortars), of which 2211 were medium and heavy A. To accomplish the twofold purpose of destroying the enemy and protecting its own armies, under such conditions as obtained on the W. Front, A. batteries must cover the infantry in attack by 'barrage' fire; dominate the enemy's A., by unrelenting counter-battery work; and delay and hamper the enemy's movements in rear by harassing day and night fire on his roads. The Ger. A. comprised only a few howitzers of 16½ in. calibre. The Fr. field gun was the famous 75-mm. quick-firing gun, with the recoil controlled by compressed air. It was used with deadly results in the defence of Verdun and indeed played almost the dominating role in the first two years of the war.

In France, after the battle of Ypres, 1914, the Gers. held all the high ground N. of the allied front. The power of observation therefore lay with the Ger. A., and the Brit. gunner, but for the help of airmen and the survey sections, who supplied specially mounted maps, would have shot 'blind.' Science played its part in ensuring the correct height of burst of the shrapnel shell. The barometer and thermometer were a valuable part of A. stores, and for night-firing, electric lights were supplied for the aiming posts to make certain of the gun being on the correct line. Accuracy of fire was further secured to the field A. by the establishment of calibration sections; i.e. by firing through screens the exact initial velocity of every gun could be estimated. The result of this scientific progress was that in the Cambrai battle (q.v.) (1917) registration was dispensed with, so that surprise was possible. This element of surprise reached its acme in the battle of Amiens (1918) when over 2000 Brit. guns opened fire from their attack positions for the first time on the actual morning of assault. Counter-battery work became an exact science through the progress made in aerial photography and observation, sound-ranging, flash-spotting and air-burst ranging. Every Brit. gunner officer in France was a reconnaissance officer, whose duty was to keep track of each enemy gun and to have photographed the slightest alteration in the terrain on his front. The later technical improvements in A. design included long-range, modern 6-in., 8-in., 9.2-in., and 12-in. howitzers, 6-in. Mark XIX. guns on field carriages and 9.2-in. Mark XIII., 12-in. and 14-in. guns on railway mountings. Other improvements were instantaneous fuses, gas and smoke shells, stream-line shells, incendiary and star shells. A proposal after the war was that all A. weapons must be able to put up an air barrage against attacking aeroplanes, and hence construction must allow for a very high angle of elevation. (Gen. Sir Noel Birch,

K.C.M.G., in the *Army Quarterly*, Oct. 1920.)

**Second World War Developments.**—The Second World War saw a great development of anti-aircraft and tank guns. Also various types of self-propelled guns were used for assault or close support. One type was a 75-mm. mounted on a light tank chassis, and another a 150-mm. on a medium tank chassis. The advantage of these was that A. accompanied tanks and could fire straight away. The type was first used in the big battle for Libya (1941-42).

The improved Ger. 88-mm. gun was probably the best 3-purpose gun (i.e. anti-tank, anti-aircraft, and field artillery piece) developed during the war. Many new types of A., including very huge mortars and long-range field guns, were under development or construction in Germany in the closing stages of the war. Some of them had rocket-assisted shells. Among these were a 380-mm. howitzer and rocket 'guns' with smooth-bore barrels, 400 ft. long, intended for the bombardment of London. A new 120-mm. anti-tank gun was likewise in development. The Gers. were also working on a 32-in. siege gun, with a barrel 141 ft. long, which fired an 8½-ton projectile. In the last months of the war in the Far E., the Jap. also introduced some heavy mortars and heavy rockets. Amer. recoil-less guns were also a notable development.

**Artiodactyla** (Gk. *ἄρτιος*, pair, *δάκτυλος*, finger), a sub-order of placental mammals forming part of the order Ungulata. The Ungulata are characterised by a hoof-like covering to the toes, and molar teeth with broad crowns suitable for crushing vegetable food. The sub-order A. are distinguished by possessing pairs of symmetrically arranged toes, giving the characteristic appearance of a cloven hoof. The sub-order comprises the following groups: (1) *Pecora*, including giraffe, okapi, deer, oxen, sheep, goats, antelopes, etc., characterised by horns or antlers, 2 or 4 teats, 4 cavities in the stomach, and no upper incisors; (2) *Tylopoda*, including camels and llamas, characterised by absence of horns, few teats, 1 pair of upper incisors, and a cushion-like pad on the foot to bear the weight of the body; (3) *Tragulina*, the chevrotians, or mouse-deer, characterised by absence of horns, no upper incisors, 4 complete toes on each foot, and 3 stomach cavities; (4) *Anoplotherina*, comprising extinct species with complete series of teeth and a general resemblance to carnivorous animals; and (5) *Suina*, or pigs, including Old World pigs, Amer. peccaries, and hippopotamus, and characterised by at least 1 pair of upper incisors, the cheek-teeth prominent, a caecum in pigs, but not in the hippopotamus.

**Artisans' Dwellings.** see HOUSING.

**Artists' Rifles**, the 28th Battalion of the London Regiment. Formed in 1859, as a volunteer corps, by Lord Leighton and other artists, and recruited from artists. Full dress (pre-war) grey tunic, with black and silver facings.

**Artocarpus**, a genus of the Moraceæ

which grow in Asia. *A. incisa* is the bread-fruit tree common to the S. Sea Is.; it has a spurious fruit called a *sorosis* (cf. pineapple), which is roasted and eaten as bread. *A. integrifolia*, the Jack tree, has a prickly fruit which is not so wholesome as that of *A. incisa*. *A. hirsuta* makes good timber.

**Artois**, a prov. in the N. of France, conquered by the Franks in the fifth century. It was given as a dowry by Charles the Bold to his daughter Judith. In 1237 it was made a co. by Louis IX. It passed into the hands of Flanders and Burgundy, but was ceded to France in 1659. Louis XV. created his grandson count of A., who became king as Charles X., 1824. A. is famous for its artesian wells.

In the First World War the first heavy fighting in the A. region was in 1915, when the Fr. and Brit. in co-operation delivered a general attack beginning on Sept. 25, a few m. to the N. of Arras, there being simultaneously an attack by Gen. Castelnau in the Champagne between Rheims and Verdun. The opening stages of the A. advance were crowned with success, of a kind which in these earlier years of the war raised illusory hopes of the dawn of ultimate victory. Fr. troops under Gen. d'Urbal took Souchez and the foot of the famous ridge overlooking the little tn. of Vimy, while the forces of Sir John French carried the enemy's first and most powerful line of entrenchments, extending from W. of the mining tn. of Lens to a point near the notorious Hohenzollern redoubt, covering a front of some 4 miles. Much had been hoped from the activity in Brit. munitions factories, and this activity now bore fruit in the storming of an extremely strong position consisting of a double line of field-works punctuated with large redoubts and strengthened with bomb-proof shelters and a maze of well-organised trenches. Loos fell to the Brit., who pressed on to the outskirts of Hulluch near La Bassée. On the reduction of the Ger. second line the dominating position known as Hill 70, beyond and to the N. of Loos, was captured and a position rapidly consolidated whence it was hoped soon to overcome the third and last line of the enemy. Some considerable success had, at the same time, attended the Fr. onslaught in the Champagne; but thereafter the allied attacks fell away. The important strategic objectives in A. were the railway connections at Lens and at Somme-Py in Champagne, but the Allied advance had spent itself, and it soon became clear to the popular mind in England that some much greater effort in the production of material would be required before any further attempt on a big scale could be made with any reasonable hope of success. (See also ARRAS, BATTLE OF; LOOS, BATTLE OF.)

In 1916 the Gers. delivered a local attack on Vimy Ridge in May, but the battle of that name was fought between Apr. 9 and 11, 1917, when gallant Canadian troops were conspicuous in the

attack. In the same year was fought the battle of Hill 70, between Aug. 15 and 25, in the Souchez R. dist. from Lens to Angres. In 1918 there were heavy engagements in the course of the second battles of Arras (Aug. to Oct.) during the successful operations for the breaking of the Hindenburg line. In the final advance, the last fighting in A. was approximately on Oct. 17, when Douai fell to the Allies.

**Artophorion**, the pyx used in the Gk. Church. See Neale, *History of the Holy Eastern Church*, 1850.

**Artôt**, Alexandre Joseph Montagny (1815-45), a Belgian violinist, who was b. at Brussels and d. at Ville d'Avray. When quite a child he showed extraordinary skill, and was taken to Paris, where he was the pupil of Rodolphe Kreutzer. He became a celebrated player, and was also known as a composer.

**Artôt**, Marguerite Joséphine Désirée Montagny (1835-1907), a celebrated Belgian singer. She first sang at concerts at Brussels, and then, on the recommendation of Meyerbeer, she went to Paris, and made her début in *The Prophet*. She afterwards went to Italy and to Berlin, where she took part in Ger. and It. operas. She was married to Padilla, the famous Sp. singer.

**Arts Council**, the successor to the Council for the Encouragement of Music and the Arts, a wartime organisation formed to serve directly the artistic needs of the public at a time when the normal sources of the supply of aesthetic entertainment were disorganised by the war. These exceptional conditions having passed, the aim of the A. C. is chiefly to supplement the ordinary commercial provision of drama, music, and the visual arts and to encourage it by setting a high standard. As regards the arts of painting, sculpture, and the like the chief need is still the exhibition of good examples of various schools. But as regards concerts and plays the policy of the council is rather to support commendable independent ventures than to provide them directly. Thus, opportunities of helping such forms of music as symphony concerts, adversely affected by rising costs, and grand opera have increased and need careful consideration. Again, the importance of assisting the revival of the drama in the provinces is recognised by the council, whether the revival be accomplished through local effort or by means of touring companies. The report of the A. C. for 1946-47 shows that 53 companies produced 419 plays or ballets, and that 92 exhibitions were shown in 335 places. The council received £320,000 from the Treasury, with a supplementary grant of £30,000 for the Covent Garden Opera Trust. During the same year 951 symphony concerts were given by the London Philharmonic, the City of Birmingham, the Hallé, and the Liverpool Philharmonic Orchestras. Among the grants and guarantees given during the year were £55,000 to Covent Garden; £25,878 for symphony orchestras, and £12,000 for industrial music clubs. The cost to the council of companies

engaged for tours was £41,500. The offices of the A. C. are at 9 Belgrave Square, London.

**Arts, Degrees in**, see DEGREES.

**Arts, Fine**, see FINE ARTS.

**Artveldt, Andries van** (1590-1652), a Flemish painter, who worked for sev. years at Genoa. His pictures were mostly landscapes and seascapes. His portrait was painted by Van Dyck.

**Artvin**, a tn. in the vilayet of Coruh, Turkey. Exports fruit, nuts, olives, tobacco, and hides and skins. Pop. 30,000.

**Artz, David Adolf Constant** (1837-90), Dutch *genre* painter. Inspired largely by Jo-ef Israels (*q.v.*). Among his characteristically realist paintings are 'With Grandmother,' 'The Old Fisherman,' 'In the Dunes,' and 'The Return of the Flock.'

**Aru**, a group of is. in the Dutch E. Indies off the S.W. of New Guinea. Total area 3244 sq. m. The is. are low and swampy, and the coasts are fringed with coral reefs. The vegetation is luxuriant. The natives are Papuans of mixed blood, and resemble the Melanesians of New Guinea. The is. are governed by rajahs, and there is (1941) a Dutch representative called a *spolhouder*. There are Christian churches and Mohammedan mosques. The natives barter for tortoise-shell, pearls, pearlshells, and trepang. Pop. about 22,000.

**Aruba Island**, one of the Dutch Antilles, near coast of Venezuela. Area 64 sq. m. Chief tn., Fort Zoutman. Pop. 9349.

**Arum**, a genus of the Araceæ, is a curiously shaped plant which grows in Europe. *A. maculatum* is the cuckoo-pint, or lords and ladies, found in woods and hedges of Britain.

**Arun**, River, rises in St. Leonard's Forest, flows W. and then S. through Sussex, past Arundel to Littlehampton on the coast. It is 40 m. long, and is navigable for a part of its course.

**Arundel**, an ant. municipal bor. of Sussex, on the Arun. The castle was built by Saxons in the year 800. The duke of Norfolk enjoys the earldom of A. as a feudal honour, by inheritance and possession of the castle without any other creation. Ant. seat of Fitzalans and Howards. There is a Rom. Catholic church erected by the duke of Norfolk. Pop. 2500.

**Arundel, Earls of**. The earldom of A. has been held chiefly by the families of Fitzalan and Howard, and their descendants.

**Richard Fitzalan** (1267-1302), earl of A., son of John, lord of A. (1246-72). Richard was called earl of A. c. 1289. He fought for Edward I. in France and Scotland.

**Edmund**, successor of Richard (1285-1326), married Alice, sister of Earl de Warenne; enemy of Piers Gaveston; declined to march with Edward II. to Bannockburn. In 1321 became connected with the Despencers and sided with the king. Executed at Hereford by partisans of Queen Isabella.

**Richard**, son of Edmund (1307-76), soldier and faithful servant of Edward III. Present at Sluys and siege of Tournai, 1340. Led an Eng. div. at Crécy, and was present at the siege of Calais. Inherited estates of his uncle John, Earl de Warenne, and assumed the title of earl of Surrey. Regent of England, 1355.

**Henry Fitzalan**, twelfth earl of A. (1517-80), son of William, eleventh earl of A. Attended King Henry to Calais; made deputy of Calais, 1532. Commanded Eng. expedition to France and took Boulogne. Made lord chamberlain. Imprisoned in Tower in 1551 for being implicated in Somerset's plot against Northumberland. On Edward's death Henry joined Northumberland, though secretly in alliance with Mary. In Northumberland's absence he denounced him and proclaimed Mary as queen. Made privy councillor and lord steward. He was engaged in intrigues to set Lady Jane Grey on the throne, and was arrested on exposure of the Ridolfi plot in Elizabeth's reign.

**Arundel, Thomas** (1353-1414), archbishop of Canterbury, son of earl of A. Made bishop of Ely when he was 22, and lord chancellor 10 years later. Made archbishop of York in 1386, and archbishop of Canterbury, 1396. In the next year he was banished for high treason. He promoted the elevation of Henry IV., and on his succession he was restored to his see. He persecuted the followers of Wycliffe, prohibited translation and reading of the Bible, and helped to procure the statute, *De heretico comburendo*.

**Arundel Marbles**, part of a collection of ant. sculptures purchased by Thomas Howard, earl of A., in 1624. The gem of the collection is the Parian Chronicle, consisting of fragments of a marble inscription supposed to have been executed in the is. of Paros, c. 263 B.C. In its complete state the inscription recounts, in chronological order, the chief events in Grecian hist. from 1582 to 264 B.C.

**Arundo**, a genus of plants of the Gramineæ which grow in Europe, Asia, and Africa. *A. donax* is our largest cultivated grass, which grows to 10 ft. in height; the stems are made into fishing-rods. *A. phragmites*, or *Phragmites communis*, is the common reed.

**Aruspex**, see HART'SPICES.

**Aruwimi**, a trib. of the Congo. It was explored by Stanley for 100 m. in 1883, and by its means Stanley advanced to help Emin Pasha in 1887. It is maintained by some to be the lower course of Schweinfurth's Welle. It has its source near Lake Albert (Nganza) and is formed by many sub-tributaries. The main riv. flows for most of its length through the great equatorial forest, and in its densest part. It joins the Congo in lat. 1° 12' N. and is navigable for nearly 100 miles as far as the Yambuya rapids.

**Arva**, a co. in Czechoslovakia. It is very mountainous and has extensive

forests; and is watered by the White A. and the Black A., which unite and flow into the Wnag. Area about 800 sq. m. Pop. 85,000.

**Arvad**, or **Aradus** (Jezireh Ruad), an anct. Phœnician city. It occupies a very small is., 2 m. from the coast, near the mouth of the R. Eleutherus (Nahrel Kebir). It is said to have been founded by Sidonians. The inhab. were skilled in all matters of seamanship.

**Arval Brethren**, or **Fratres Arvales**, consisted of a college of 12 priests in Rome. They made yearly offerings to the field Lares for increase in the fruits of the field. Romulus is supposed to have been the founder. It has been suggested by Niebuhr that this college was originally connected with the Lat. element of the Rom. state. The sister college was known as **Sodales Tituli**. The badge of office, which was of lifelong duration, was a chaplet of ears of corn worn on the head with a white band. The prin. festival was held for 3 days in May, when honour was paid to Dea Dia. The latter is supposed to be Ceres, and an account of the festival is preserved in an inscription written in the first year of the Emperor Elagabalus, A.D. 218.

**Arve**, a very rapid, mt. stream which rises in the Col de Balme in the mts. of Savoy, flows through the valley of Chamonix, and joins the Rhône near Geneva. Its length is 60 m., and it obtains its waters from the glaciers of the chain of Mont Blanc.

**Arverni**, name of anct. Gaulish tribe in the Auvergne Mts. in France (the name Auvergne derives from A.). The tribe resisted Cæsar longer than other tribes of Gaul. They adopted Rom. civilisation readily after Cæsar's triumph. During excavations a part of the temple of their 'god of the mountain' was unearthed.

**Arvers**, **Alexis Félix** (1806-50), a Fr. poet and dramatic writer. His first work was entitled *mes heures Perdues*, 1833, a collection of poems, which earned for him the reputation of a poet. His dramatic works consisted of *En attendant*, with Bayard and P. Foucher, 1835; *Les Deux Maîtresses*, with Scribe, 1836; *Les Dames patronnesses*, with Scribe, 1837; *Rose et Blanche*, 1837; *La Course au clocher*, 1839; *Le Beau Martial*, 1839; *Les Anglais en voyage*, 1844; and *Suzon et Suzanne*, 1850.

**Arveyron**, a trib. of the Arve in Savoy. It is an outlet of the Mer de Glace in Chamonix valley. It issues thence through a wonderful grotto of ice, known as the Ice gates of A. The course is short and joins the Arve on the r. b.

**Arvicola** (Lat. *arvum*, field, *colere*, to inhabit), or *Microtus*, the generic name of the voles, near relatives of the mice and rats. It belongs to the order Rodentia and family Muridae.

**Arwangwa**, see **PUNGWE**.

**Arya Samaj**, a society, founded by Dayananda Sarasvati (d. 1882), which regards the Vedas as inspired. It became mainly a political body, aiming at the self-gov. of India, and determined to drive out the foreigner. It is con-

nected with the Brahma Samaj, the Society of God, the name given to the most remarkable modern religious revival in India. This society was founded by one Rajaram Mohun Roy, who was b. in 1774. He had studied Hinduism at Benares, and Buddhism in Tibet. At length, c. 1830, he founded the society known as the Brahma Samaj. The ideal of this society was, whilst denouncing sati and idol-worship, to establish an eclectic system of practical morality, and to bring back into favour an ideal Brahmanism, in the worship of a supreme deity, the essence of the universe. The movement was undoubtedly influenced by Christian and Mohammedan thought, but was nevertheless Brahmanical in character. Rajaram Mohun Roy lived and died a Brahman. After his death, in 1842, the movement became known as the Adi Samaj, or New Society. Debendra Nath Tagore followed Rajaram Mohun Roy, and was in turn followed by Keshub Chandra Sen, from 1838 to 1884. The latter completely changed the character of the movement, substituting God the Father for the Vedic deity, and as a consequence alienated many of his adherents. He lost many more by allowing his daughter to marry the maharajah of Kuch Behar when she was only 14 years of age. His followers went over to the Sadharana Brahma Samaj, or General Society of God. Allied to this movement may be mentioned the Prarthana Samaj, or Prayer Society.

**Aryan** (race and language), or **Arian** (from Lat. *Arianus*, belonging to Aria, the E. part of anct. Persia). The name given to the race from which the inhab. of India and Europe have sprung or for the so-called Indo-European races. It was originally given to the Sanskrit-speaking immigrants who came from India, and was also adopted by the anct. Persians. Properly, however, the word has no ethnological significance, but connotes a language group—i.e., an E. branch, comprising the Slavonic, Indian, Armenian, and others, and a W. branch, which includes the Teutonic and Celtic.

It is universally maintained that about three or four thousand years ago there lived a tribe or tribes of the same race, in some part between the Hindu-Kush Mts. and the Caspian Sea, who called themselves **As**. Although no written testaments of these **As**. are in existence, yet the character and habits of these people have been inferred from facts revealed by philological research. Thus experts in the science of language inform us that the **As**. lived in tns., kept cattle, ploughed the ground, used metals, made boats, could count up to a hundred, recognised family relations, and had various names for God. The line of argument adopted by these experts is this: If, they say, we find the same word to express 'sheep,' 'plough,' 'horse' existing under various disguises in a number of different languages, then the tribe from which these races sprung must have had a word to express 'sheep,' 'plough,' 'horse,' and if they had the name, then

they must have been acquainted with the thing. Language helps us again in fixing the original home of the early As. From the A. names for certain plants and animals we infer that the As. had their homes in those dists. where those plants and animals would exist.

Some of the A. languages are more closely connected than others. The more closely allied languages are arranged in classes known as stocks. The stock is further subdivided into classes known as branches. If we take our own language as an example, we shall find that it belongs to the Teutonic stock. Many other languages also belong to this stock, some of which resemble Eng. more closely than others. Dutch, Flemish, Ger., Norwegian, Swedish, Dan. are all Teutonic languages, but they fall into different groups. Eng., Dutch, and Flemish are Low Ger. languages. When the terms Low and High are used with regard to a language, they signify that the people of whom they are used lived on the lowlands near the coast, or on the higher ground of the interior. Modern Ger. is a High Ger. language. Again, the languages of Iceland, Norway, Sweden, and Denmark form a third group called the Scandinavian group. Thus the Teutonic stock is subdivided into 3 branches, viz. Low Ger., High Ger., and Scandinavian. If we were to give Eng. its full designation, we should say that it is a member of the Low Ger. branch of the Teutonic stock of the A. or Indo-European family of languages. Another stock is the Romanic or Italic. Lat., It., Fr., and Sp. belong to this. They are known as Romanic languages, because they come from a Rom. source. Then, again, there is the Hellenic or Grecian stock, which is represented by modern Gk. The Celtic stock has a particular interest for us, because the inhab. of our is. before the arrival of the Saxons were known as Celts. Celtic dialects are spoken now in parts of Great Britain and Ireland. The Celtic stock falls into 2 branches, Cymric and Gaelic. Under the former head are placed the Welsh language and the Armorican, a dialect of Brittany. The old Cornish, which existed until the eighteenth century, also belonged to the same branch. To the Gaelic group belong native Irish or Erse, the Scottish Gaelic of the highlands, and the Manx of the Isle of Man. The language brought to this is. by Eng. forefathers in the fifth and sixth centuries was a pure Teutonic speech, and it continued to remain pure for a long time. The influx of foreign words into our language was slow at first. On the other hand, although modern Eng. is essentially a Teutonic language, it contains a large Italic element, has received considerable additions to its vocabulary from the Hellenic source, and possesses also many Celtic ingredients. Thus 4 different stocks have contributed to its formation.

Two sub-groups of the Balto-Slavonic group complete the European members of the A. family: the Baltic, including

extinct dialects of Old Prussian and Lithuanian and Lettish; the Slavonic, including Russian, etc., Polish and Czech; and Bulgarian, Serbian, and Slovene.

As the name Indo-European implies, some of the languages of Asia belong to this family. These fall into 2 groups. One group is the Indian, which includes Sanskrit, a dead language having important literature; the modern dialects of India which came from Sanskrit, such as Hindustani and Bengali; and Sinhalese, the dialect of Ceylon. The other group is the Iranian or Persian. Thus the A. family is subdivided into 8 stocks, 2 of them Indian and the other 6 European.

The word Indo-European does not include all the languages of Europe or all the languages of India, e.g. the following European languages are not members of the A. or Indo-European languages Turkish, Hungarian, the Lapp language, the language of the Finns in Finland, and the Basque language spoken in the Pyrenes.

A new connotation was lent to the term Aryan by the so-called Aryan Paragraph, under which in Germany before the Second World War full rights were granted only to Aryans, or persons who could trace their Aryan descent back for at least a period of 100 years. The aim of this policy was anti-Semitic and the policy was a cardinal feature of Hitler's conception of a Third Reich comprising only the pure 'Nordic' peoples of W., Central, and E. Europe. At the time of its introduction there were estimated to be 800,000 Jews in Germany, and such a policy necessarily required some ethnological justification for the persecution of so large a body of Ger. citizens, including many of world distinction. The hypothesis of the Ger. people being the leading representatives of the Nordic 'Aryan' race was taken from the teaching of Gobineau (q.v.) as developed by Houston Stewart Chamberlain (q.v.), the renegade Englishman, von Ranke, Lapouge and others. Gobineau tries to explain hist. as an eternal conflict between the long-headed or dolichocephalic and the broad or short-headed or brachycephalic races, and at the apex of the world's races he places the big blond dolichocephalic or 'Aryan' race; while the later writers go still farther, and relegate the Jews or Semitic races to the Mulatto class. But hist. would seem to show that all the progressive races are composed of the same 3 stocks—Nordic, Alpine and Mediterranean—and, if this be true, the political edifice founded on race prejudice must collapse. The term Aryan, too, can only be applied to speech, and Nordic, which indicates a breed, can only be applied to race. The Jews, like the Gers., were of 2 different races: if they came from Poland they were of the Alpine stock; if from Spain they were of the Mediterranean race like the Sephardic Jews of Palestine; and broadly speaking, the term Jew should be employed only in connection with religion. Most of the

dominant European Jews are really of Alpine stock, and brachycephalic, like the rest of the mid-European peoples; and Ger. Jews, racially, were Alpines, like the S. Gers. Yiddish is merely a medieval Ger. dialect, with a considerable addition of Hebrew words. Consult Julian Huxley, A. C. Haddon, and A. M. Carr-Saunders, *We Europeans*, 1935.

**Arzamas**, see ARSAMAS.

**Arzano**, com. of Italy, 3 m. N. of Naples, containing some beautiful villas. Pop. 8000.

**Arzerum**, see ERZERUM.

**Arzeu**, Algerian seaport between Oran and Mostaganem. Has exports of salt and esparto grass. Near A. are the Kleber marble quarries, and the remains of the anct. tn. of Arsenaria. Pop. 7700.

**Arzignano**, tn., N. Italy, 11 m. S.W. of Vicenza. Has manufs. of silk and thread, and produces wine and oil. Pop. 5000; com. 11,000.

ROMAN AS

Obverse, two-faced head of Janus;  
Reverse, prow of ship.

**As**, this Rom. term had a threefold meaning. It denoted (1) a weight of 12 oz., equivalent to the *libra* or Rom. pound; (2) a copper coin, varying in weight at different periods from 12 ounces to less than half an ounce; (3) a measure equivalent to a linear foot or square acre.

**As**, riv. of W. Siberia, see Ob.

**Asa** (956-916 B.C.), third king of Judah, succeeded his father Abijah. He adopted stringent measures to cast out idolatry from his kingdom, and was a successful warrior, repulsing the Egyptians; and in alliance with Benhadad, king of Syria, defeating Baasha, the Israelite king. See 1 Kings xv.; 2 Chron. xiv.-xvi.

**Asa dulcis**, a synonym of benzoin, is a drug made from the balsamic resin of *Styrax benzoin*, a plant of the order Umbelliferae. It has a soothing effect when locally applied in cases of inflammation or abrasions of the skin.

**Asad** (1715-80), a Persian captain, was b. near Kabul. He was one of the lieutenants of Nadir Shah, and governor of one of the provs. of Persia. He afterwards became one of the counsellors of Mohammed Hassan, against whom he had previously waged war.

**Asafoetida**, a gum resin obtained from the root of *Ferula fetida*. The active principle is an ethereal oil, allyl sulphide. It acts as a stimulating expectorant, and is used in bronchial affections. It is employed, often with remarkable effect, in hysterical ailments, possibly controlling

the erratic nervous phenomena by the moral influence of its disgusting smell.

**Asam**, see ASSAM.

**Asam** was the name of a family of Ger. artists, the prin. members of which were: (1) Hans Georg (d. 1696), whose work consisted of frescoes and oil paintings. (2) Cosmo Damian (1686-1742) a painter, and Ægidius Quirinus (d. 1746), a sculptor, were both sons of Hans Georg. They worked together at the churches of Innsbruck, Munich, Schleissheim, and Mannheim. (3) Cosmo Damian had 2 sons, Franz Erasmus (1720-94), and Engelbrecht, both painters.

**Asaph**, Heb. musician of the times of David and Solomon (1 Chron. xvi. 5). He was the chief of the Levites appointed by David to minister before the ark and offer up praise and thanksgiving (1 Chron. xxv. 1), and is regarded as the founder of the 'Sons of Asaph,' a guild of singers in the second temple (Neh. vii. 44). Psalms l. and lxxii.-lxxxiii. have his name at the head.

**Asaph**, St., Welsh tn., see ST. ASAPH.

**Asaph**, St. (d. c. 596), sometimes called Asaaf, Asaa, or Asa, a Welsh saint of the sixth century, was the grandson of Pabo. He became head of the monastery at the confluence of the Rs. Clwyd and Elwy, succeeding St. Kentigern. It is most probable that he was the first bishop of the see of Llanelwy, which was afterwards known as St. A.

**Asaphus** (Brongniart), a genus of fossil Crustacea (Trilobites), most abundant in the lower Palæozoic strata. *A. buchii* marks the Cambrian or Lower Silurian beds, and *A. caudatus* the Upper Silurian beds.

**Asar**, or **Cesar**, the Swedish name for the long, winding ridges of gravel and sand found in the low-lying parts of Sweden. These ridges sometimes extend for more than 100 in., one main ridge being joined by many trib. ridges. The appearance that these have to a riv. delta has given rise to the belief that the deposits were formed by streams underneath the ice-sheets which covered Sweden during the Glacial Period, and that the direction of the ridges may mark the site of subglacial rivers. Similar ridges of gravel and sand are found in Ireland, where they are called eskers, and in Scotland, where the name kames is given to them, and in the N. states of N. America. Also a Persian gold coin formerly worth about 6s. 8d.

**Asarabacca**. Eng. name of *Asarum europæum*. It is a plant which grows in woods in the N. of England and in Scotland, and the leaves are used as snuff.

**Asarin**, or **Asarone**, a preparation from the plant *Asarum europæum*, smelling like camphor.

**Asben**, see AIR.

**Asbestos** (Gk., unquenchable), the name applied to varieties of fibrous minerals which offer great resistance to heat through their unflammability and poor conductivity. It is a variety of hornblende containing a considerable percentage of magnesia in its composition. The fibres can be woven in cloth, which was used by the ancients to enclose dead bodies

when placed on the funeral pyre, so that the ashes might be retained. The varieties used in manufs. are obtained from chrysolite, a variety of serpentine; and from tremolite and actinolite, varieties of amphibole. The chrysolite A. is yellowish in colour and is extensively worked in the prov. of Quebec, Canada. Amphibole A. is usually white, grey, or blue, and is worked in Corsica, Hungary, Russia, Grignaland W., New S. Wales, and Cyprus (export increased from £25,000 in 1919 to £292,000 in 1929). A. is also produced in considerable quantities in S. Rhodesia, and it is one of that country's chief exports. The crude A. is crushed between rollers with a double movement, so that the fibres are well divided, and then screened.

A. is a poor conductor of heat and electricity, resists the action of many acids, and is incombustible. It may be woven into fabrics, which have been used for firemen's clothing and furnace-men's gloves. Made into felt, it is used for fireproof walls, floors, and roofs. Packing made of A. is used for covering steam-pipes and boilers, fireproof safes, and in the construction of safety curtains for the stages of theatres and music-halls. A. paint is used for covering woodwork in order to make it uninflamable, and A. putty is used for joints, etc. A. is also employed for the manuf. of cloth filters for use with corrosive liquids, and for covering rollers in textile printing works to resist the action of corrosive dyes. Mixed with fireclay, it is rolled into balls and used to radiate heat in gas fires.

**Asbjørnsen, Peter Christen** (1812-85), Norwegian writer and folklorist. After studying at the univ. of his native city, Christiania (now Oslo), served for some years as a country tutor, giving much time to the study of the poetry and folklore of the peasantry. He subsequently returned to Christiania, where he studied medicine and science. From 1816 to 1853 he was engaged by the Norwegian Gov. in scientific work on the coast. Later, he became a gov. inspector of forests. He retired from the gov. service in 1876. In addition to sev. handbooks and memoirs on scientific and practical subjects he wrote in collaboration with his lifelong friend, Jørgen Ingebrektsen Moe, the collection of Norwegian fairy tales which appeared under the title of *Norske Folkeeventyr* (1st series, 1842; 2nd series, 1844; 3rd series, 1871). In 1845 he pub. alone the first book of the *Norske Huldreeventyr og Folkesagn*. The second part appeared in 1848. In these delightfully written classics may be traced much of the modern national spirit in Norwegian literature. They have been trans. into Eng. in Dasent's *Popular Tales from the Norse* (1859; new ed. 1903), and *Tales from the Field* (1874); also Brackstad's *Round the Yule Log* (1881). See Sinding-Larsen and Asbjørnsen's *P. C. Asbjørnsen: Fra Asbjørnsen's Turidill* (1884).

**Asbury, Francis** (1745-1816), first Methodist bishop of the U.S., b. at Hathersworth, England; sent to America in

1771 as Wesleyan missionary, in which capacity he showed untiring zeal and energy. He d. at Richmond, Virginia. See his *Journal* (1852), and Strickland's *Pioneer Bishop* (1858).

**Asbury Park**, a city of Monmouth co., New Jersey, U.S.A., 25 m. from New York City. It is a favourite seaside resort. Pop. 15,000.

**Ascalon** (modern **Askulan**), on the Mediterranean, 12 m. N. of Gaza, and 40 m. S.W. of Jerusalem, one of the 5 chief cities of the Philistines, and the seat of the worship of the Syrian goddess Derceto. It was the bp. of Herod the Great, who did much to beautify it. After the disruption of the Macedonian empire it became trib. in turn to Egypt and Syria. During the crusades it suffered many vicissitudes. In 1099 the Christians gained a victory outside its walls. In 1157 it was captured from the caliphs by Baldwin III., king of Jerusalem. Captured by Saladin in 1187, it later fell into the hands of Richard Cœur de Lion. Its fortifications were finally destroyed by the Sultan Bibars in 1270. From A. is derived the name of the eschalot or shallot, a kind of onion originally grown in the surrounding country.

**Ascania**, the name of a Ger. dynasty founded in the twelfth century by Albert the Bear, first margrave of Brandenburg, whose castle, near Aschersleben, bore this name. This ruling house was closely connected with that of Anhalt.

**Ascanius or Iulus**, in Lat. mythology, the son of Aeneas and the ancestor of the Julii. He accompanied his father on his flight to Italy from Troy, and later founded Alba Longa.

**Ascapart**, a giant, 30 ft. high, who figures in the medieval romance *Bevis of Hampton* (q.v.).

**Ascaris** (Gk. *ἀσκαρίς*), a kind of worm, a genus of thread-worms, or Nematoda, which include sev. intestinal parasites, sometimes of considerable size. *A. lumbricoides*, the roundworm found in man, may attain 14 in. in length; *A. megalocephala*, found in horses and cattle, 17 in. *A. mystax* occurs in dogs and cats.

**Ascasubi**, Colonel Don Hilario (b. 1807), a Sp.-Amer. poet, was b. at Buenos Aires. He took an active part in the contests against Quiroga and Rosas, and realised his political ambitions by the separation of the confederated provs. His studies of the lives of the gauchos bore fruit in his poems, which may be called romances of the pampas. In 1864 he attended the Confederation of Paris as Argentine ambas.

**Ascendant**, see **ASTROLOGY**.

**Ascension**, Brit. is. of volcanic origin, situated in the S. Atlantic, lat. 7° 53' S. and long. 14° 18' W. 760 m. N.W. of St. Helena, 7½ m. long by 6 broad, with an area of 34 sq. m. The is. derives its name from the fact of its having been discovered on Ascension Day, 1501, by the Portuguese navigator, Juan de Nova. It was occupied by the Brit. in 1815 in connection with the captivity of Napoleon at St. Helena, and until 1922 it was under

the supervision of the Admiralty, who maintained a small naval station there. In Sept. 1922, it was made a dependency of St. Helena and placed under the control of the Colonial Office. It is a barren, rocky peak of purely volcanic origin and destitute of vegetation, except at the highest elevation, but has been cultivated to an extent permitting the maintenance of 300 sheep and the growth of shrubs and various vegetables. The climate is very healthy. There is a sanatorium at Green Mt. (2870 ft.), the highest point of the is. Green turtles, land-crabs, and fish are abundant. Noted, too, for its tern. George Town, in the N.W., supplies the only good anchorage. It is connected by telegraph with St. Vincent, St. Helena, and Sierra Leone and is an important station of the E. Telegraph Company. Pop. estimated about 320. See Darwin, *A Naturalist's Voyage*, 1889.

**Ascension Day**, or Holy Thursday, the festival of the Church which commemorates Christ's A. into heaven 40 days after the resurrection, and consequently celebrated on the fortieth day after Easter. The anct. ceremony of heating the bounds is still observed on this day, though the religious connection is obscure.

**Ascension, Right**, in astronomy, the distance of a heavenly body from the first point of Aries, measured upon the equator. The celestial equator is half-way between the 2 celestial poles, and the celestial meridian is a line (an arc) drawn through a point on that equator. This point, the celestial Greenwich, is known as the first point of Aries (the Ram, the first of the zodiacal signs). The R. A. of a star means therefore the distance in degrees on the celestial equator of an intersecting arc (drawn from the Pole through the star) from the celestial meridian—in other words, its celestial long. In every hour of time 15° of equatorial arc passes the meridian, so that if the first point of Aries passes the meridian at 12 o'clock midnight, the bright star Capella, which has a R. A. of 79° was on the meridian 5 hrs. 16 min. earlier. The adjective 'right' which is always used with the term A. is used in the sense of 'proper,' and means that the calculation is made on a *right* sphere, that is, one in which the polar axis corresponds with the polar axis of the heavens.

**Ascetism**. This word, derived from the Gk. ἀσκησις, which signifies the training and discipline undergone by athletes preparing for games, is applied to those practices and beliefs which have as their foundation the idea of the eternal antagonism of spirit and matter, and of the need of the suppression of bodily desires for the purification of the spirit. Mainly of oriental origin, the idea has undergone various modifications at different times, amongst different peoples, and in different religions. Consisting in its lower stages of such mortifications of the flesh as fasting, flagellation, and torture, we find it to include in its higher stages the uprooting of worldly thoughts and separation from the ordinary relations of life. In the schools of Gk. philosophy

varying forms of A. are to be found in the teachings of the Socratic school, with its view of the soul as imprisoned in the body, of the Stoics and Cynics, with their contempt for the material refinements and comforts of life, and of the Neo-Platonists, who regarded marriage and meat-eating as obstacles in the way of the attainment of divinity. In the religion of the early Egyptians we can trace the ascetic tendency in the practices of circumcision, fasting, and abstinence from all uncleanness. Amongst the Jews ascetic practices seem to have been confined rather to special classes, such as the prophets, and to times of special distress and urgency, the more pronounced form of eremitism not appearing until shortly before the time of Christ amongst the Therapeutæ in Egypt and the Essenes in Palestine. Its most acute forms are to be met with in the self-mortification of the Hindu fakirs and dervishes, while we may look for its most spiritual manifestations in the meditations and penances of the Buddhists and Persian Sufis. With the earliest Christians A. evinced itself in celibacy, poverty, fasting, wearing of sackcloth, night vigils, and other similar practices, gaining in strength from the belief in the early reappearance of Christ. Fanatical extremes of self-mortification were reached by such men as Anthony the Hermit, Paul of Thebes, and Simeon Stylites. But with the decay of the spiritual life of the Christians the idea may be said to have crystallised itself into monasticism, the most highly organised form of A. The tendency to extreme A. was early attacked in the Christian Church by healthy minds of the type of Jovianus and Vigilantius, and this opposition, growing in the hands of such men as Peter of Bruys, Henry of Lausanne, Wycliffe, and Jerome of Prague, culminated in the Reformation of the sixteenth century. But the ascetic idea, though dethroned from supremacy in its monastic garb, has continued to play an all-important part in Christian belief and practices. At the basis of the Christian code of conduct, it has assumed in modern times definite shape in many of the doctrines of Puritanism, Quakerism, and Methodism, being familiar to us in sabbatarianism, and opposition to theatre-going, dancing, and card-playing.

**Asch**, chief tn. of the dist. of A., in Czechoslovakia, 14 m. N.W. of Eger. Has manufs. of silk, cotton, woollen goods, and lace, and bleaching, dyeing, and brewing industries. Pop. 22,900.

**Aschaffenburg**, tn., Bavaria, in dist. of Lower Franconia, 25 m. S.E. of Frankfurt. Before 1939 it had manufs. of paper, tobacco, clothing, and cellulose. It was the site of a Rom. fortress. The Renaissance castle of Johannisburg overlooks the tn. Pop. 37,000.

**Ascham**, Roger (1515–68), Eng. classical scholar and writer, was a native of the Yorkshire vill. of Kirby Wiske, near Northallerton. He was adopted by Sir Anthony Wingfield, who had him educated with his own sons. Impressed by A.'s scholarship his patron sent him in

1530 to St. John's College, Cambridge, where he proved himself a brilliant classical student and gained a fellowship. He took his B.A. degree in 1534, and his M.A. in 1537. The fame of his knowledge of Gk. brought him many pupils. The year 1545 saw the publication of his delightful prose treatise on archery, *Tozophilus*, which secured for him the favour of Henry VIII. and a pension of £10. In 1546 he succeeded Sir John Cheke as public orator of his univ., and in 1548 became tutor to the Princess Elizabeth, an appointment which he relinquished 2 years later owing to a quarrel with the lady's steward. From 1550 to 1553 he was in the suite of the Eng. ambas. at the court of Charles V., during which time he visited various places on the Continent, including Italy. In 1553 appeared his *Report on the Affairs of Germany*. During his absence abroad he was appointed Lat. secretary to Edward VI., an office which, through Bishop Gardiner's influence, he was able to continue under Mary in spite of his Protestant views. Under Elizabeth he became secretary and tutor, retaining these offices till his death. His chief work, *The Scholemaster* (ed. by Prof. Mayor, 1863), a treatise on education, was pub. by his widow in 1570. His letters are to be found in Dr. Giles's ed. of his works (3 vols., 1864-65). See also Katterfeld's *Roger Ascham*, 1879.

**Aschersleben**, tn. of Saxony, Germany, transferred after the liquidation of Prussia to the Soviet zone of occupation (1945); 36 m. N.W. of Halle. Had woollen, sugar, metal, and chemical manufs., and brine baths. Pop. 24,400.

**Asclano**, tn. of Tuscany, in prov. Siena. Contains sev. fine fourteenth-century churches. Remains of Rom. baths were found in 1898. Pop. 8300.

**Asciadiacea** (Gk. *asciadior*, little bottle), the sea-squirts, an order of Tunicates which may be fixed and individual, free-swimming and colonial; the adults have neither a tail nor a notochord. *Molgula* and *Ascidia* are genera.

**Ascite** (Gk. *ascis*, skin-bag), or abdominal dropsy, is caused by an abnormal collection of serous fluid in the peritoneal cavity. The fluid, which coagulates on standing, is usually clear and of a pale yellow colour.

**Asclepiadaceae**, an order of dicotyledonous plants resembling very closely the Apocynaceae. The reproductive organs are extremely curious; the 2 carpels are free at the base, but unite in 1 style, and to the edge of the stigma the anthers of the 5 stamens are joined. The plants are insect-pollinated. The flower is regular and hermaphrodite, the calyx has 5 free sepals, and the corolla 5 joined petals. Many species grow in N. America, and *Asclepias tuberosa* is largely cultivated in Europe.

**Asclepiades**: 1. A Gk. lyric poet of Samos, who fl. in the second century B.C. Supposed to have been the master of Theocritus and inventor of the metre called after him, *metrum Asclepiadeum*. The Gk. Anthology contains

39 epigrams ascribed to him. 2. A famous physician of Prusa, in Bithyria, who settled in Rome and founded the Methodical school of medicine. His treatment, consisting of open-air exercise, bathing, and change of diet, was based on the theory that disease is caused by the irregular distribution of the corpuscles of the body.

**Asclepiad**, a form of metre in poetry which derives its name from the Gk. poet Asclepiades. It consists of 12 syllables accented as follows: spondee, 2 choriambi, and an iambus (— | — — | — — | — — | — —). This is known as the little asclepiad, in contradistinction to the greater, which has 3 choriambi in the middle of the line. The asclepiad is not a common form, the Rom. poet Horace only employing it in 3 of his odes.

Example of the little asclepiad:

Dună | rēm pătērās || grătăquē cōm |  
mōdūs  
Cēnsō | rīnē mōis || rērā sōdā | ūbūs.  
(iv. 8.)

Example of the greater asclepiad:

Ō crū | dēlls ādhūc || ēt Vēnēris ||  
mūnērībūs | pōtēs  
Inspē | rātā tūm || quūm vcnlēt || plūmā  
sūpēr | blā.  
(iv. 10.)

**Asclepias** (milkweeds), a genus of tropical plants, the type of the order Asclepiadaceae. Many possess medicinal properties, and the name is derived from Æsculapius, the god of medicine. *A. syriaca* is the Syrian swallow-wort; *A. tuberosa* is the N. Amer. butterfly weed; *A. incarnata* is the swamp milkweed, cultivated in Britain.

**Asclepius**, see ÆSCULAPIUS.

**Ascoli**, David d', Jewish author of the sixteenth century. He issued a manifesto against Pope Paul IV. for unfair measures against the Jews, and was the author of *Apologia Hebræorum* (Strasburg, 1559).

**Ascoli**, Francesco (Cecco) Stabili d', (1257-1327). It. poet and astrologer, incurred the enmity of the Inquisition, was driven from the professorship of astrology at Bologna, and finally burnt at the stake.

**Ascoli**, Graziadio Isaia (1829-1907). It. philologist, was b. at Görz, the son of Jewish parents. As a result of his *Studi Orientali e Linguistici*, he was in 1861 appointed prof. of philology at the Milan Academy, which position he held till 1902. His chief work was *Fonologia Comparata del Sanscritto, del Greco, e del Latino*, 1870. He also pub. *Lettere Glottologiche*, 1886, and articles in the *Archivio Glottologico* of Milan.

**Ascoli Piceno**, city and prov., Central Italy (the Marche). The prov. has an area of 798 sq. m., and a pop. of 250,000. The city, on the R. Tronto, is built on the site of the ant. Asculum Picenum, and contains various architectural remains of Rom. times. Constantine the Great is said to have built the cathedral. The city has manufs. of glass, pottery, majolica, paper, etc. In the Second World War its most notable bridges were destroyed by the Gers. Pop. 39,000.

**Ascoli di Satrignano**, episcopal city, prov. of Foggia, S. Italy, 19 m. S. of Foggia. Supposed to be the site of the anct. Asculum Apulum or Satranium, the scene of the defeat of the Romans by Pyrrhus (279 B.C.). Pop. 8400.

**Ascomycetes**, a large group of fungi whose spores are contained within asci or tubes. In the group are such forms as truffles and morels.

**Asconius Pedianus, Quintus** (2 B.C. to A.D. 83), was the author of valuable commentaries on Cicero, which have helped to clear up many obscurities. The MS. was discovered by Poggio Bracciolini in 1416, and has been well ed. by Orelli and Baizer in their ed. of Cicero. See also Madvig's *De Asconii Pediani Commentariis Disputatio* (Copenhagen, 1828).

**Ascot Heath**, Berkshire, 6 m. S.W. of Windsor, is famous for its circular race-course, nearly 2 m. long, the scene of the annual Ascot meeting in June. King Edward VII. took great interest in the alteration and improvement of the course in 1902.

**Ascot Vale**, suburb of Melbourne, Australia, on Saltwater R.

**Asculum**, anct. name of Ascoli, (*q.v.*).

**Asellio, Gasparo** (1521-1626), It. surgeon, is best known by his discovery of the lacteal vessels, on which subject he wrote his *De Lactibus* (Milan, 1627). He was for some time prof. of anatomy and surgery at Padua.

**Asellus** (Lat., little ass), a small isopod crustacean commonly found in ponds and stagnant water in Britain. It belongs to the family Asellidae, and is allied to the wood-lice.

**Asepsis**, the absence of injurious microorganisms. A condition is said to be *aseptic* when no pathogenic germs are present; *antiseptic* when there is present some substance designed to destroy or prevent the development of such germs.

**Ases**, or **Æsir**, a name of a race of gods in Scandinavian mythology. Odin was their chief, and Thor, Balder, Bragi, Heimdal, and Loki were the next in importance; the chief goddesses were Freyja, Frigg, Saga, Snotra, and Idun. Their home was Asgard (*q.v.*).

**Asexual**, a biological term applied to plants and animals which can reproduce their kind and are yet devoid of sex. In the case of some algae (plants which include sea-weeds), *e.g.* *Ullothrix*, a cell will produce sev. ciliated spores which either form new plants by themselves, or by fusion with identically similar (and consequently sexless) spores. The case of some animals, *e.g.* *Amœba*, the solitary cell divides in two, thus forming 2 individuals; this process is known as *self-division*, and occurs also in low plant life. Budding or germination is the outgrowth of buds on a parent plant or animal which form new life of a similar character.

**Asgard**, lit. the tn. of the Æsir, was, according to Scandinavian mythology, the home and habitual residence of the gods, or Æsir. Like the Gk. Olympus it rose from the earth, called midgard or middle world. Here Odin and the

12 Æsir dwelt, assembling in council every day under Yggdrasil, the ash-tree. The mansion of the gods was called Gladsheim, that of the goddesses Virgulf; here also was Walhalla, the home of heroes slain in battle.

**Asgill, Sir Charles**, son of the first baronet, was taken prisoner in the Amer. war of Independence, and chosen by lot to be executed in the place of Capt. Lippincot, whom the Eng. refused to yield to Washington for hanging an Amer. officer. A. was ultimately released, and became a general.

**Asgill, John** (1659-1738), pamphleteer and lawyer, acquired great notoriety as the author of the pamphlet *An Argument*, etc., which denied the necessity of death, and maintained that heaven was attainable without passing through death. For this he was expelled in turn from the Irish (1703) and Eng. (1707) parliaments. He was ultimately imprisoned for debt, but continued to issue pamphlets from the Fleet prison.

**Ash**, the name applied to sev. plants of the order Oleaceæ and genus *Fraxinus*, which are related to the olive, privet, and lilac. *F. excelsior* is the common A.; *F. ornus* is the manna A. or flowering A. of S. Europe. The fruit of the A. is winged for wind-distribution, and the wood provides an excellent timber. The prickly A. of America belongs to the same order, and is called *Xanthoxylum americanum*.

**Ash of Jerusalem**, old term for woad or dyers' weed.

**Ash, Edward** (d. 1829), an Eng. physician, is known because of his discovery that every time metals which are unequally oxidisable are brought in contact, electricity is generated; this is the base of the galvanic battery.

**Ash, Mountain**, or Rowan-tree, is the *Pyrus aucuparia* of the order Rosaceæ, and is related to the pear and apple. The fruit is leathery.

**Ash-Wednesday**, the first day of Lent,

derives its name from the Catholic ceremony of sprinkling on the heads of penitents ashes from the burning of the undistributed branches of consecrated palm. The custom is said to have been instituted by Gregory the Great, and was finally sanctioned by Pope Celestino III. in 1191.

**Ashango**, the name of an African tribe of the Fr. Congo. There are sev. sub-tribes, including the pigmy Obongos. The As. are fetish-worshippers and slaveholders, and are remarkable for being fully clothed.

**Ashanti**, a co. of the Gold Coast Colony, W. Africa, consists largely of forest country. It is divided into 2 provs., the E., with headquarters at Kumasi, and the W., with headquarters at Sunyani; each of these being subdivided into dists. under commissioners who exercise limited jurisdiction. The country is inhabited by a large number of confederated tribes, the prin. of which are the Bekwais, Kokofus, Nkwantas, Kumasis, Agunas, Mampons, Nautas, Kumawus, Bompatas, Juabins, and Adjesus. Each tribe has its own head chief, but from time immemorial the king of Kumasi was recognised as the king paramount of the confederation. The country is hilly, and, on the whole, unhealthy. The land is fertile and well cultivated near the tns., producing, amongst other things, rice, maize, millet, cocoa, sugar, fruits, gums, and timber. Gold, rubber, kola, and cocoa are exported in considerable quantities. Kumasi (Coomassie) is the chief tn. Until 1896, when it became a Brit. protectorate, A. was a separate native kingdom. The As. have long been noted for their warlike and predatory tendencies. Their incursions on the Fantis led to the first Brit. expeditions, 1807-11. In 1874 Sir Garnet Wolseley captured and burned Kumasi. Another expedition, in 1895-96, ended in the removal of the king, Prempeh, and the establishment of the protectorate. Further troubles were suppressed by the expedition of 1900, and the country was definitely annexed by Great Britain in 1901. Before the Brit. settlement, human sacrifices were a regular part of the fetish religion. The As., according to tradition, derive their origin from the fugitives driven southwards about 300 years ago by Moslem tribes from Senegal and the Niger. Kumasi, the cap., with 40,000 inhab., has buildings which would compare with many in the more popular thoroughfares of London. Yet but a couple of hrs.' journey northward, elephants, buffalo, and bongo still roam the country and, startled by the whirr of motor cars on the fine motor-roads (of which there are now some 1160 m.), turn back into their ever-narrowing lairs. Some thousands of children are taught either in the gov. or missionary schools of A. In Kumasi may be seen African gentlemen possessed of various academic qualifications, and dressed in European garb. The native women also are dressed in London and Paris frocks, with silken stockings and high-heeled shoes. This new generation rubs shoulders with the

older, composed of grey-haired aristocrats in woven togas, and chiefs borne along in hammocks covered with leopard skins, men who formerly took part in the human sacrifices which made A. once a by-word. The whole secret of the change would seem to be the prosperity which has come with the cocoa trade, the wealth from which has built schools and roads and railways. Agriculture is expanding and coffee plantations are also being formed. There are rich forests of mahogany and cedar. The annual gold output is valued at £500,000. Railway tracks traverse the once forbidding Prah. Kumasi is the railhead of 2 lines which link up the coast now only 12 m. distant. A great motor-road passes N. over swamps, escarpments, and rivs. to emerge from the forest belt into a land of open orchard country. Pop. 578,000 (650 Europeans). The peaceful relations which, under the Gold Coast Gov., have been maintained for many years between A. and the neighbouring tribes have been marked by frequent petitions from the Gold Coast Colony as well as from A. for the return from exile of Prempeh, the former chief of Kumasi. The Gold Coast Gov.'s confidence in the loyalty of the As. led to the granting of this request in 1924 and to approval being given in 1926 of his election by the As. as head chief of the Kumasi tribe. Prempeh d. in 1931, and was succeeded by his nephew, Osei Agyeman Prempeh II., as Omanene of Kumasi, July 7, 1931. In 1935 the Golden Stool of A., which since the seventeenth century has been accepted as the symbol of the soul of the A. nation, was restored to the A. people, when Osei Agyeman was proclaimed the new Ashantibene (or A. overlord) Prempeh II. In effect the restoration marked the revival of the old A. confederacy for purposes of domestic policy. The Golden Stool is so named because it is covered with plates of pure gold and hung with golden balls.

**Bibliography.**—J. Dupuis, *Journal of a Residence in Ashanti*, 1824; H. J. Ricketts, *Narrative of the Ashanti War*, 1831; J. Beecham, *Sketch of Ashanti*, 1841; J. D. Rattray, *Ashanti*, 1923, and *Religion and Art in Ashanti*, 1927.

**Ashbourne**, or **Ashborne**, mkt. tn. Derbyshire, on the Dove, 13 m. N.W. of Derby. The fine cruciform church, dating from the thirteenth century, has a beautiful spire, over 200 ft. high, which is known as the 'Pride of the Peak,' and a fine monument by Banks. The tn. has a

grammar school, founded in 1585. Two engagements took place here during the Civil war. Pop. 4500.

**Ashbourne, Edward Gibson**, first Baron (1837-1913), was born at Dublin. He was M.P. for Dublin Univ., 1875-85; attorney-general for Ireland, 1877-80; lord chancellor of Ireland, 1885-92, and 1895-1906. He was created a baron in 1885, the year of the passing, under his guidance, through Parliament of the Land Purchase Act known as the Ashbourne Act.

**Ashburnham, John** (1603-71), friend and agent to Charles I., assisted that monarch in various negotiations of the Civil war, including the treaty of Uxbridge and the visit to the Scots army. He contrived the king's flight from Hampton Court. He was banished after Charles's death, but returned at the Restoration.

**Ashburton, a tn., S. Devonshire**. It became a town, 10 m. N.W. of Totnes. It became a stannary tn. in 1328 by a charter of Edward III. It has a fine cruciform church, St. Andrew's. Until the Reform Act of 1832 it returned 2 members to Parliament; from then till 1868 one. Pop. 2500.

**Ashburton, a tn., co. of A., S. Is.**, New Zealand, on the A. H. 50 m. S.W. of Christchurch. Pop. 13,000.

**Ashburton River**, N.W. of W. Australia, 400 m. long, flows into the Indian Ocean near Exmouth Gulf.

**Ashburton, Alexander Baring**, first Baron (1774-1848), son of Sir Francis Baring, founder of the famous banking house of Baring Brothers, succeeded his father in 1810 as head of the business. From 1806 to 1832 he was the Liberal member for Taunton, Callington, and Thetford. In 1833 he became the moderate Conservative member for N. Essex. He was president of the Board of Trade in Peel's gov., 1834-35, and was created a baron in 1835. As special commissioner to the U.S.A. he concluded the A. treaty of 1842, which settled the N.W. frontier between Canada and the U.S.A.

**Ashburton, John Dunning, Baron** (1731-1783), a distinguished lawyer, became successively recorder of Bristol, 1766; solicitor-general in the duke of Grafton's administration, 1767; M.P. for Calne, 1768; chancellor of the duchy of Lancaster, and privy councillor. He was created a baron in 1782. See Henry Roscoe, *Lives of Eminent British Lawyers*, 1830.

**Ashburton, William Baring**, second Baron (1799-1864), is best remembered for the *salon* of his first wife, who entertained many distinguished politicians and writers.

**Ashbury, par. and vil., Faringdon dist., Berkshire, England**, 6½ m. E. of Swindon. Near it is Wayland Smith's forge. Pop. 500.

**Ashby-de-la-Zouch, mrkt. tn., Leicester-shire**, 16 m. N.W. of Leicester. Has manufs. of leather goods and hats. The name derives its suffix from the Norman family of La Zouch, who built a castle here. The castle was rebuilt in the fifteenth century by Sir William Hastings, and served for some time as a prison of Mary Queen of Scots. It was demolished

by the parliamentarians during the Civil war. The fine old church of St. Helen contains a 'finger pillory' and the tombs of the Hastings or Huntingdon family. The Ivanhoe saline baths, built in 1826, have been much frequented for their cures in rheumatic and scrofulous complaints. Pop. 5000.

**Ashdod** (modern Isdud, or Esdud), Palestine, 22 m. S.W. of Joppa, now a mud vil., was formerly one of the chief Philistine cities. The Philistines brought here the ark of the covenant and placed it in the temple of Dagon. It figures in the N.T. under the name of Azotus. It was captured by the Assyrians in the eighth century, and by the Egyptians in the seventh century. After being sacked by the Maccabees it was rebuilt by the Romans.

**Ashdown Park**, seat of the Earl of Craven, W. Berkshire, 3½ m. N.W. of Lambourne. In the vicinity is the supposed site of Ethelred and Alfred's great victory over the Danes in 871, and the cromlech known as Wayland Smith's cave.

**Ash, Simeon** (d. 1662), nonconformist divine, educated at Emmanuel College, Cambridge. When the Civil war broke out he became chaplain to the earl of Manchester, and after the war became rector of St. Austin and a Cornhill lecturer. He was a moderate Cromwellian, and was among the divines who went to meet Charles II. at Breda. Joint author with William Goode of *A Particular Relation of the most Remarkable Occurrences from the United Forces in the North*, and author of *A True Relation of the most Chief Occurrences of and since the late Battell at Newbury, 1644*, both vindications of the earl of Manchester; and sev. sermons.

**Asher** (Heb., blessed), one of the tribes of Israel, whose lands reached from Lebanon to Dor; descended from A., the eighth son of Jacob, borne to him by Zilpah, the handmaid of Leah. A genealogy of A. may be constructed from Gen. xlii. 17; Num. xxvi. 44; 1 Chron. vii. 30. It is also mentioned in Gen. xxx. 13; Judges vi. 35, and vii. 23; and Joshua xix. 24-31, where the ter. of the tribe is given. As few of the places named have been identified, the locality is doubtful, but was probably in S. Palestine.

**Ashera**, a goddess of the Phœnicians, or the idol which she symbolised. Mentioned in the O.T., and it is probable that she was associated with tree-worship. It is trans. 'grove' in the A.V. The rites were associated with the worship of Astoreth, from which the former name is supposed to be derived.

**Ashes**, the residue from the burning of animal and vegetable matter, and to a certain extent of mineral bodies also. Vegetable A. are composed of oxygen, hydrogen, and carbon. Animal A. consist principally of phosphate of lime, with traces of salts of lime, magnesia, and soda. Mineral A., such as those of Vesuvius, are found to contain alumina, oxide of iron, charcoal, and potash among other ingredients.

**Ashes**, The, the mythical trophy for which England and Australia compete in test match cricket. Its origin goes back to 1882 when Australia beat England at the Oval, and a sporting jour. published a mock In Memoriam notice: 'In loving memory of English cricket, which died at the Oval on Aug. 29, 1882. The remains will be cremated and the ashes taken to Australia.' Since then in every season, when a series of test matches are arranged between the 2 countries, the teams are said to be competing for the A.

**Asheville**, co. seat of Buncombe co., N. Carolina, U.S.A., at junction of Swannanoa and Fr. Broad Rs., 210 m. W. of Raleigh. Situated in a picturesque climate, it is a favourite health resort. It has manufs. of cotton, tobacco, leather, and machinery. Pop. 51,000.

**Ashfield**, a manufacturing and residential suburb of Sydney, New S. Wales, Australia. It is about 5 m. from Sydney to the S. Pop. 40,460.

**Ashfield**, Edmund (fl. 1680-1700), an Eng. painter, pupil of Michael Wright. He was, according to Horace Walpole, equally clever with oils and pastels.

**Ashford**, a mkt. tn. in Kent, on the R. Stour, 14 m. from Canterbury. It has a fine old church, and the tn. does a large trade in brewing, brickmaking, and tanning, among other industries. At the new end of the tn. there are large railway workshops. Pop. 15,200. Municipal bor., 44,000.

**Ashik** (1513-71), a Persian poet. He held sev. important posts in the gov. of his time, and occupied his leisure by writing poetry. His prin. work is a *Book of Poets*.

**Ashikaga**, a tn. in Japan, about 70 m. from Tokio. Founded in the 8th century, it was once the seat of an anct. academy of Chinese lore, and a statue of Confucius is still existent here. A big trade was done in cotton and silk before 1941. Pop. 45,000.

**Ashington** (anct. *Assandun*), a vil. in Essex, England, where Edmund Ironside was defeated by Canute in 1016.

**Ashington**, a tn. of Northumberland, Eng., 4 m. from Morpeth. Centre of a coal-mining dist. Pop. 30,000.

**Ashira**, a Bantu tribe inhabiting the coastal dist. W. of the Fr. Congo, and between the Congo R. and the Equator. They are coal black and of good physique, and are skilful workers in iron and copper, and in cloth-weaving.

**Ashkenaz**, a N. race mentioned in Gen. x., who lived in Armenia. They were supposed to be descended from Gomer.

**Ashland**: 1. A city, Ashland co., Wisconsin, U.S.A., situated on an arm of Lake Superior. It has large iron and timber industries. Pop. 11,000. 2. A city of Boyd co., Kentucky, U.S.A., with a large trade in iron and woollen goods. Pop. 29,000. 3. A tn. in Oregon, U.S.A., a popular health resort. Factories. Pop. 4,000. 4. A bor. of Schuylkill co., Pennsylvania, U.S.A., 12 m. N.W. of Pottsville. Has coal mines and machine

shops. Pop. 3,000. 5. A vil. of Hanover co., Virginia, U.S.A., 17 m. N.W. of Richmond; the seat of the Randolph-Macon College. Pop. 1,300.

**Ashlar**, a squared building stone used in masonry. It is laid in regular courses and used direct from the quarry unprepared.

**Ashley**, Anthony, see SHAFTESBURY, EARL OF.

**Ashley**, Lord (1621-83), Eng. politician, was the early title of Anthony Ashley Cooper, first Earl of Shaftesbury (q.v.).

**Ashley**, Sir William James (1860-1927); prof. of hist. at Toronto, and later at Harvard and Birmingham Univs. Wrote much on hist. and political economy. His works include: *Introduction to English Economic History and Theory*, 1888-93; *The Tariff Problem*, 1903; *Progress of the German Working Classes*, 1904. Knighted 1917. Rendered service on committees on prices during the First World War.

**Ashmole**, Elias (1617-92), an eminent antiquary, the founder of the Ashmolean Museum at Oxford. He was b. at Lichfield. He studied law, and in 1638 became a solicitor in Chancery. In 1631 he was sworn an attorney of the Common Pleas. In 1645 he became one of the gentlemen of the ordnance in the garrison at Oxford, and afterwards entered Brasenose College, applying himself to natural philosophy, mathematics, and astronomy. In 1660 Charles II. appointed him to the position of Windsor herald. He was called to the bar in the same year and made an F.R.S. A fire in 1679 lost him the greater part of his library. In 1682 he presented to Oxford Univ. the collection of curiosities which he had received from John Tradescant of Lambeth, the celebrated gardener, and from the latter's father. His writings include *Fasciculus Chemicus* or *Chemical Collections*, *Theatrum Chemicum Britannicum*, and *The Way to Bliss*, a treatise on the philosopher's stone.

**Ashmolean Museum**, at Oxford, founded in 1679 by Elias Ashmole, and up to 1894 kept in a house in Broad Street. The natural hist. exhibits were then taken to the Univ. Museum, and the rest of the collection to the new Univ. Galleries in Beaumont Street. The Selden and Arundel marbles are among the most valuable exhibits possessed by this museum, and there is an interesting collection of Sumerian antiquities gathered at Kish, Iraq.

**Ashmunein**, a small vil. of Upper Egypt. It is situated a few m. from the l. b. of the R. Nile. It possesses the anct. ruins of Hermopolis Magna.

**Ashokan Reservoir**, a reservoir constructed 13 m. W. of Kingston, New York, for collecting the main part of the New York water supply from the Schoharie, Esopus, and Catskill watersheds. Approximately 12 m. by 1 m. with a maximum depth of nearly 200 ft.

**Ashover**, a par. of Derbyshire, near Chesterfield, which manufs. lace and hosiery. Pop. 2,500.

**Ashraf**, a small scattered tribe of African Arabs. They inhabit a region near Tokar, and the Amarar country to

the N. of Suakin. They claim descent from Mohammed, hence their self-designated name (Shurata), Sheriff being the term applied to his descendants.

**Ashridge Park**, a park in Herts, England. Formerly an estate of the dukes of Bridgewater and earls of Brownlow. A portion, including Ivinghoe Beacon, has been acquired by the National Trust and another portion forms part of Whipsnade Zoological Gardens.

**Ashridge College**, originally the Bonar Law College, Berkhamsted, Hertfordshire, the Conservative centre for educating persons in economics, politics, social science, and in political hist., with special reference to the development of the Brit. Constitution and the growth and expansion of the Brit. Empire. It is now, without political affiliation, the A. College of Citizenship.

**Ashtabula**, a city of A. co., Ohio, U.S.A. It has an excellent harbour. Among its manufs. are leather, worsteds, and agric. implements. The name A. is an Indian word meaning fish-river. A great proportion of the pop. are of Finnish extraction. Pop. 21,000.

**Ashtaroth**, see ASTORETH.

**Ashtead**, a tn. in Surrey, England, 15 m. from London, on the S. railway. A Rom. villa was unearthed from its large common in 1925. Pop. 3300.

**Ashton-in-Makerfield**, an urb. dist. in Lancashire, England. There are large collieries, and iron goods are extensively manufactured. Pop. 20,500.

**Ashton-under-Lyne**, a manufacturing tn. in the Salford dist. of Lancashire, on the N. b. of the R. Tame. Dukinfield, a transpentine suburb, is in Cheshire. A. is 64 m. from Manchester; the chief industry is cotton, and there are many collieries in the dist.; hats, woollens, and silks are also manufactured in the neighbourhood. Pop. 52,000.

**Ashton, James Williamson**, first Baron Ashton (1842-1930). Eng. manufacturer and benefactor, son of James Williamson of Lancaster. Succeeded to a lucrative business his father had estab. in the manuf. of Amer. leather cloth and linoleum. He derived a great fortune from these factories, which were situated in Lancaster and elsewhere. His subscriptions to war loans were enormous, and he took stock to the value of £3,000,000 in the Thousand Million War Loan alone. Was a generous benefactor of his native town, Lancaster, and also gave largely to St. Anne's-on-Sea. Was high sheriff of Lancaster in 1885, and in 1886 represented the Lancaster div. in the House of Commons, a seat which he held until 1895, when he was created Baron A. of A. Later, he gave to Lancaster a new tn. hall and municipal buildings, besides maintaining the park which had been made from a bleak upland by his father.

**Ashton, John** (d. 1691), a Jacobite. He was for a time a servant of James II., and supported his master during his exile. He was found with treasonable documents, and was executed at Tyburn. He acted on the day of his death with considerable

fortitude, handing to the sheriff a paper which was afterwards pub. on the Continent to the consternation of the authorities.

**Ashurada**, a Russian naval station, on is. of same name in bay of Astrabad, Caspian Sea. It was acquired by Russia in the reign of Nicholas I., and was formerly of great importance. It is now secondary to Krasnovodsk.

**Ashwell, Lena** (Lady Simon) (b. 1872), Eng. actress, daughter of Commander Pocock, R.N. Studied at the Royal Academy of Music. First appearance in 1891 in *The Pharisee*. Managed successively the Savoy Theatre, and the Great Queen Street Theatre, which she reopened as the Kingsway Theatre.

**Asia**, the largest continent, occupies the N. portion of the E. hemisphere, extending beyond the Arctic circle and nearly reaching the equator. It contains about one-third of the whole of the dry land, and one-twelfth part of the whole surface of the globe. The philological origin of the name is unknown, though it seems probable that it was at first used with a restricted local application, gradually extended to the whole continent. Geographically speaking, Europe is a mere appendix to A., and exact delimitation in that sense is impossible, though the line of separation from Africa is better defined by the Red Sea. The N. boundary of A. is the Arctic Ocean, the extreme N. point being Cape Siyevostochny. The S. boundary it is impossible to fix with exactitude, but the volcanic chain of is., which can be traced through the Molucca and Sundra Is., may be taken as the limit. The S. coastline is much more irregular, and broken by the 3 great peninsulas of Arabia, Hindustan, and Cambodia. The Mediterranean and Black Seas form natural W. limits to the continent, as does the Red Sea lying between A. and Africa. The Ural R. and Mts. are the common conventional boundaries with Europe. N. of the Caspian, whilst the Manch depression is used as the limit of A. between the Black and the Caspian Seas, and the Bering Strait, 36 m. wide, separates A. from America. The peninsular area of the continent is one-sixth of the whole, a proportion surpassed only by Europe. Excluding this area, the continent resembles an enormous quadrilateral, of which the centre is 1600 m. from the sea. Whilst over a quarter of the area lies below 650 ft., 1.3 per cent being below sea-level, one-seventh is over 6600 ft. Four great divs. may be described in A.: (1) The N. Lowlands. (2) The Central Mt. System. (3) The E. Margin, including the is. (4) The S.W. Table-lands.

1. *The N. Lowlands*.—The lowlands of A. lie to the N. of a line from the sea of Okhotsk to the Caspian. They may be classified in 2 divs. The Turanian lowlands form the first div.; between them and W. Siberia, which forms the second div., is the Kirghiz steppe; the third div., that of E. Siberia, is of a more rugged nature. Turan (Russian Turkestan) is a low, sand-covered plain

forming the Aralo-Caspian depression. The Ust-Urt plateau, E. of the Caspian, and the Kirghiz steppe to the N. are the highest parts. Here the rivs. all evaporate or flow into lakes with no outlet. Thus the Ural flows into the Caspian, the Anu and Syr into the Aral, and the Ili into the Balkhash. W. Siberia is a flat, low-lying, and marshy region between the main stream of the Yenisei and the Ural Mts. The Tobol and the Lower Ob from the S., and the Irtysh and the Ob from the S.E., flow into the low-lying W. region. E. Siberia is a more lofty and uneven land; the Indigirka and the Kolyma drain the N. part, the Upper, Middle, and Lower Tunguska Rs. the W. part, flowing to the Yenisei. The Lena flows through the central regions. Various continuous mt. ranges, the Verkhoyansk, the Stanovoi, etc., running from the Lena delta to Cape Dezhnev, form the E. boundary.

2. *Central Mt. System.*—The central mass of mts. and plateaux widens gradually from the W. to the E. At 2 points in this mass the N. and S. lowlands approach each other more closely, in Armenia and in the Pamirs. Between these 2 points are 3 series of mt. chains, the N., the central, and the S. Between the N. and central chains there is a series of depressions, between the central and S. a series of plateaux. W. of Armenia the Caucasus and Yaila Mts. border the depression of the Black Sea, from which A. Minor on the S. is separated by the Pontic chain. There is in this region much evidence of recent volcanic disturbances. On the E. of Armenia the Elburz, Khorasan, and Hindu-Kush Mts. form the dividing line between the Turan depression and the Iran plateau. The N. ranges are not so clearly defined here, but may be traced in the W. spurs of the Tienshan Mts. The Iranian plateau, on the whole a deserted region, is bounded by narrow folded ridges and furrows, dominated by a massive chain of Cretaceous peaks. The Pamir plateau, bordered on the E. by the Sarikol and Muztaghata ranges, and on the N. by the Tienshan range, is much loftier. The ranges of the Tienshan run both W. and E. from the plateau, but the E. extension is far the more important, forming the boundary of Chinese Turkestan (Sinkiang). The Kunlun range, running due E. from the Pamirs, has on the N. Chinese Turkestan, and on the S. the Tibetan plateau. It extends for almost 2300 m., having the highest average level of any mt. chain in the world. The Tibetan plateau consists of a number of bare parallel ranges and troughs running from W. to E., with an average height of over 13,000 ft. Lofty mts., which are crossed by passes at an altitude of over 15,000 ft., form its boundaries. The Karakoram range, which has the greatest glaciers in the world, Biafo, Baltoro, and Hispar, runs S.E. from the Pamirs and forms the W. end of the platform. The S. end is formed by the Himalayas, with even loftier peaks, among them Mt. Everest, 29,000 ft., and pierced by the

gorges of the Indus, the Sutlej, the Ganges, and the Brahmaputra, among other rivs. These continuations of the folded mt. system form the main lines of S.E. A. The W. chain passes by the Khasi and Arakan ranges and the Andaman and Nicobar volcanic is. to the Malayan chain, also volcanic in character. It is separated from the central chain forming the Malay peninsula, by the Irawadi basin and the Andaman Sea. All these mts., from A. Minor to Malaysia, were folded in the Tertiary period, and are part of the younger mid-world mt. system. Their main feature lines are due to movements of the earth's crust, where only the superficial features have so far been affected by active denudation. The other mts. of Central A. are of a much older date; the valleys have been hollowed out of plateaux, characterised by ant. foldings of the rock layers. The land, however, is partly shaped by fractures, the deep rifts in which the waters of Lake Baikal have accumulated to a depth of over 4500 ft. being the most remarkable example. Similar rifts may be observed in E. Africa. Round Lake Baikal 4 great masses of the highlands can be specified. These are the Sayan and the Altai Mts. in the S.W., the W. Trans-Baikalian to the S.E. and E., and the plateau of Mongolia to the S. These highlands are much less lofty than the mt. systems of more recent origin. The loftiest of them, the Altai, N. of the Dzungaria plain, which connects the Siberian lowlands with the Mongolian plateau, have great glaciers in the upper valleys, and are heavily wooded on the wetter N. slopes. They contain many minerals, including gold. The Malkhan Mts. form the culminating line of the Trans-Baikal plateaux, but do not, as was formerly supposed, form the main divide between the Arctic and Pacific riv. basins. The Mongolian plateau, the average height of which is 3500 ft., is a stony sand-covered steppe, hence its native name of Shamo (sea of sand), or Gobi. The Khirgan Mts. form the E. limit of this region.

3. *The E. Margin of A.*—Along a great circle from Cape Dezhnev, beyond the tropic of Cancer, a series of scarps can be traced, composed of 2 arms, one of which is parallel to the meridian, the other to the lines of lat. This line is climatically and economically significant. In the coast line also, and in the peninsulas and is. of the extreme E., a somewhat similar succession of feature lines may be observed running alternately N. and S. and E. and W. Between these feature lines lie great depressions. In the W. there are Manchuria and the S. China and Tongking basins. In the E. they form the seas of Bering, Okhotsk, Japan, and E. China. The seas between the Philippines and the Marianne Is., and the Sulu, Celebes, and Molucca Seas lie to the extreme S. Three great rivs., the Amur, the Hwangho, and the Yangtse-kiang, rise in the plateaux of A. and break across these E. escarpments to the sea. The fringing is. are mainly volcanic;

the volcanic line forms a great arc through the Moluccas, joining the line already traced by the Andaman and Nicobar Is., Sumatra, Java, and the Lesser Sunda Is.

4. *S.W. Asiatic Table-lands*.—Geologically the Deccan and Arabia are a continuation of Africa, the former resembling S. Africa, the latter N. Africa. The Mesopotamian and Indo-Gangetic plains are formed of alluvium brought down by the rivs. Euphrates and Tigris to the former region, by the Indus, the Ganges, and the Brahmaputra to the latter. All these rivs. form great deltas.

*Climate*.—A. may be divided into 10 climatic regions: (1) The prov. of W. Siberia is very cold in winter and hot in summer. (2) E. Siberia is even colder in winter, and drier; it includes the pole of cold about Verkhoyansk, the coldest spot in the E. hemisphere. (3) The Kamchatka prov. has a moister and more genial climate. (4) China and Japan have a cold winter and monsoon rains in the summer. (5) The Central Asian plateau is exceedingly dry, with very cold winters, its height above sea-level enhancing the cold. (6) The Aral-Caspian plateau is a very dry region with a depressingly hot summer. (7) The Arabian region and Iraq have the same characteristics as the foregoing. (8) The Mediterranean region, including A. Minor, has the best climate, having no extremes of temp. (9) The lower Indus valley is dry and very hot. (10) India, the Indo-Chinese peninsula, and Australasia have a tropical climate, with abundant periodical rains, and a limited range of temp.

During the winter A. as a whole has a lower temp. than corresponding lats. elsewhere; but a higher corresponding temp. in July. The extreme cold of N.E. A. in the winter causes a high pressure of air, which flows S.S.E. and S.W. in January. Thus N.W., N., and N.E. winds prevail at that period in Manchuria, China, India, and S.E. Europe. In July S.W. and W. winds prevail on the W. coasts of India, S. and S.E. winds in S.E. A., and E.N.E., N.E., and E. winds in N.E. A. The rainfall of A. is very unequally distributed. The W. coast of India, the Indo-Chinese peninsula, and the valley of the Ganges receive more than 75 in. of rain per annum, whilst great tracts of the Ural-Caspian depression, Arabia, and Persia, have less than 10 in. annually. Central A. receives from 2 to 5 in. only; S. Siberia and Manchuria from 25 to 50 in.; and the remainder between 10 and 25 in.

*Flora and Fauna*.—The varying areas of vegetation naturally bear some correspondence to the climatic areas. The tundras, a name given to the immense stretches of boggy country whose vegetation is of an arctic character, are found N. of the Arctic circle, and as far S. as 60° N. The cold temperate forests of larch, spruce, fir, and birch lie between 50° and 60° N. The Mediterranean flora, comprising the vine, the fig, the orange, the citron, and the pomegranate in fruits,

and in trees the cedar, the cork, and the evergreen oak, flourishes in A. Minor and Syria. Pistachios and junipers grow in the less arid parts of the plateaux of Iran and Arabia, and date palms in the desert oases. The central steppe and desert, and the low-lying Turan, Tarim, and Gobi regions, large tracts of which are covered with salt wastes or moving sand dunes, have grasses and composites in some parts, willows and poplars along the courses of the streams, and in the loftier areas tamarisks, popples, ranunculi, and other small-leaved plants. The saksane is a characteristic shrub. The high mt. regions and chains are bare of trees. Meadows are, however, found in the N.E. parts of Tibet to a height of nearly 13,000 ft. Above this height are mostly deserts, with here and there a few saxifrages and pyrethra, whilst beyond the altitude of 14,500 ft. nothing is found but the everlasting snow. The valleys of the Pamirs have a scanty vegetation which extends to a much greater height, stunted trees having been found as far up as 23,000 ft. Deciduous forests cover the S.W. slopes of the Himalayas, whilst evergreens flourish on the S.E. The rich steppe land of the Amur region is distinguished by a vegetation which partakes of the nature both of that in the desert and that of the E. coast woodlands, and forms a transition region between the two. In Japan also 2 regions may be distinguished. The N. region has dense forests of deciduous trees, and thick undergrowth; the S. abounds in evergreen trees, such as camphor, laurels, etc. In the E. of the is. of the S.E. region the vegetation is more Australian in character, and eucalyptus trees predominate. The central mt. system separates very different floras. A mixed flora exists in Korea and Amuria, marking a transition between that of the Sino-Jap. region and that of the Siberian country. The flora of Arabia has many points of resemblance to that of N. Africa.

The fauna of A. is separated by the great mt. system into 2 main divs., the palaearctic and the oriental, with a transitional region in the E. Many fur-bearing animals are found in the N. forests, whilst the Arctic waters are the home of the seal, the walrus, and other aquatic mammals. The land animals of this region include the reindeer, the polar bear, the arctic fox, the ermine, the arctic vole, the lemming, the musk-ox, and the brown bear; a few Kamchatkan sheep are still found in the extreme E. Such birds as the ptarmigan, the snow owl, and the guillemot are found. A different fauna characterises the steppe lands to the S. of the forests. Such domestic animals as the horse, the ass, and the camel are kept, and the argali, a large species of sheep which lives in the mountainous regions. Amongst the other animals are the jerboa, the marmot, sev. species of deer and gazelles, and a few tigers. The lofty plateau of Tibet is a special region from a zoological point of view, and has sev. species which are found in no other quarter: the panda, the yak, the wild

ass, or kulan, a distinct kind of argali known as Hodgson's, from its discoverer, and some rodents. The Sino-Jap. region marks a transition in its fauna no less than its flora; many species of deer are found there, also monkeys and tigers. The sea otter is found round the coast; the giant salamander is peculiar to Japan. The pheasant and the silk-worm, which have been removed from their place of origin and bred with success elsewhere, originally came from China. There have been great changes in the fauna of A. since the glacial period, as observation of fossil remains has conclusively proved. Many species of animals have become extinct, amongst them the cave bear, the wolf, the hyæna, the mammoth, and the hairy rhinoceros. Other species are fast dying out, and will in a short time be extinct unless steps are taken to secure the prolongation of their existence, among them the bison.

*Ethnography.*—The peoples of A. may be divided into 6 different groups. The first is the Caucasian type, which is found in W. A., and in India. The second type, the Mongolian, inhabits Central and E. A. and the Indo-Chinese peninsula. The third, or Malay type, is found in Malacca and the Is. of the Indian Archipelago. The Dravidas, who form the fourth type, are found in S. E. India and in Ceylon. The Negritos and Papuas, who dwell in the virgin forests of the Philippines and the Celebes, form a fifth type. The sixth type, the Hyperboreans in N.E. A., are somewhat of a puzzle to ethnologists, and their affinities have not yet been traced. The first 3 types above-mentioned are numerically by far the most important, and form practically the whole pop., the numbers of the Dravidas, Negritos, and Hyperboreans being so small as to be negligible for statistical purposes. It may, then, be said that the Mongolian race forms seven-tenths of the pop., the Malay one-fifth, and the Caucasian a tenth part. Another div. of the whole pop. might be made on linguistic lines, 4 great branches may be observed, each with numerous sub-divs. The Ural-Altaians, or Finno-Tartars, form one group, which may be further subdivided into (a) Samoyedic tribes, (b) Finnish, (c) Turco-Tartars, (d) Mongols proper, (e) Manchurians and Tunguses. The next 2 groups belong to the same main category of polysyllabic peoples, the Jap. forming one, the Koreans the other. The other main group is composed of monosyllabic nations, subdivided into (a) Chinese, (b) Tibetans, (c) Himalayan tribes, (d) Siamese, (e) Burmese, (f) Annamese, (g) Sifars, etc. The use of the terms Asiatic and Oriental, as if they each denoted a clearly defined and homogeneous type, is somewhat misleading. The different Asiatic races differ very remarkably, and no underlying and unifying resemblance can be said to exist. They stand on a level between the natives of Africa and America and those of Europe. The point of mental resemblance which may

be observed in Asiatics, as opposed to Europeans, is the conviction of the unimportance of the individual. He is always considered as a member of some larger and more important body, such as the state or tribe, rather than as a separate and unfettered entity. The result of this mode of thought in politics is despotism, in religion a resigned determinism. It is chiefly due to this attitude that the hist. of A. has large and simple outlines.

*Hist. and Language.*—Few remains of prehistoric man have as yet been discovered in A., but a sufficient number of stone and bronze implements have been found in various parts of India to indicate the similarity in all regions of the first steps in civilisation of the human race. The little amount of knowledge which has been gathered concerning the earliest hist. of the Aryan race shows it as a pastoral people occupying the valleys and mts. along the course of the R. Oxus. The Semitic races, distributed from Syria to the Euphrates and Persia, and perhaps farther E., were their neighbours on the S. These 2 races in the course of time extended across S. Europe, N. Africa, and S.W. A. The Semites gave their language to Arabia, Syria, and N. Africa; whilst the Aryan speech gained prevalence over the greater part of Europe and the temperate zone of A., reaching from the Mediterranean to India. The intrusions of the Aryans into the Semitic regions are supposed to have been caused by pressure from Mongolian tribes on the N., and changes in climate. As an instance of such an intrusion, the invasion of Upper India by the Brahminical race may be cited. As the Aryan language developed into Sanskrit in India, so in Persia it gave birth to 'divine, high-piping Pehlevi,' or Zendic, the language of the sacred books of the fire-worshippers. In India the Aryans seem to have borrowed the Dravidian letters, as in Persia they adopted those of the anct. Assyrians. The Hellenic races, which were a European offshoot of the Aryans, also seem to have possessed no alphabet of their own, and have borrowed a Semitic one from the Phœnicians. Until about 250 B.C. the Bactrian Aryans used an archaic quasi-Phœnician alphabet; at that period the Pali letters, which form the basis of the Devanagari alphabet, are known to have been in use.

The races formerly occupying the plains of Iraq and the mts. adjacent, the Babylonians and Assyrians, are, with the sole exception of the Egyptians, those whose inscriptions and monuments supply the earliest definite records of mankind. These records go to show that powerful kings then ruled over those countries, and that frequent changes in the boundaries of the separate states took place—a state of affairs which lasted as long as the kingdoms themselves continued to exist. It is, of course, impossible to say with any exactitude how long these nations may have been in arriving at such a state of civilisation, but there is no reason

to suppose that the course of evolution was any more rapid than now. We can therefore surmise with certainty that long before 1500 B.C. the Babylonians and Assyrians had attained to a considerable amount of civilisation, but with the exception of these races no idea can be formed as to what was the condition of the continent before that date. The advance of the Chinese along the Hwang-ho, which synchronises with the entrance of the Aryans into Upper India, took place about then; both were striving against races belonging to a still earlier period of the world's hist. The O.T., the date of which is probably about 1600 B.C., forms the earliest distinct narrative we have of these times. From then for the next thousand years few details of Asiatic hist. are available; the kingdoms of Assyria, Babylonia, Media, and Persia were all in turn powerful. From 559 B.C. to 330 B.C., that is from Cyrus to Alexander, Persia was the dominant power in W. A. Previous to that, about 600 B.C., the kingdoms of Babylonia, Assyria, Media, and Persia began to coalesce, before being finally united under Cyrus, 'the great king,' whose empire is said to have extended from the Indus to the Mediterranean. The influence of Egypt and W. A., penetrating into Greece, caused the branch of the Aryan race which occupied that country to blossom forth into the most extraordinarily intellectual community which has ever existed. The Gks. were successful in resisting the advance of the Persian empire, and so in all probability prevented the spread of the W. Asiatics over Europe. That continent was thus left free to evolve the higher type of civilisation, in most respects, which is its characteristic. The downfall of the Persian empire was brought about by Alexander the Great about 330 B.C. After his expedition to India and his death, the Asiatic kingdom of Alexander fell to pieces, and numerous petty sovereigns sprang up in various parts of it. The Roms. for the first time took part in the struggle for A. about 50 B.C., when they took possession of Syria, and in a short time occupied a considerable portion of A. Minor, penetrating at length to the Tigris. The E. part of the old Persian kingdom, called Parthia by the Roms., had meanwhile become independent once more, and its monarch assumed the title of 'the great king,' and made an abortive effort to expel the Roms. from A. A lengthy contest between the Roms. and the Persian empire began in A.D. 226. The successes of Rome in the E. were celebrated in 274 by the famous triumph of the Emperor Aurelian, in which ambassadors from all parts of A., including China, are said to have appeared. The conflicts between the Persians and the Roms. continued for a long time after the div. of the Rom. empire, which took place in A.D. 395, but no material change in the boundaries of the combatants was effected. The Roms. or the Byzantines never advanced beyond Armenia or the Tigris, and

the Persians could never manage to retain a permanent foothold W. of those limits, though they reached Constantinople in A.D. 620. Chosroes I., who reigned from 531 to 579, was the greatest of the Sassanid kings, resisting successfully the Byzantine emperors, the Turks, and the Arabs. He extended his dominions from the Indus to the Mediterranean, and from the Jaxartes to Arabia and the borders of Egypt. Chosroes II., after being at first successful, was heavily defeated by the Byzantine emperor Heraclius at Nineveh in 627, and in the following year was murdered by his troops at Ctesiphon. This event was soon followed by the downfall of the Sassanid dynasty under Arab conquest. After a succession of victories the Arabs entered Susania and Persia proper. The last of the Sassanids, Yazdigerd III., made a supreme effort, and collected an army of 150,000 men, but was utterly beaten in 641 at the battle of Nahavend, and for more than 150 years Persia was a province of the caliphate. The followers of Mohammed continued their victorious career in Syria and Egypt, and the sixth of the caliphs was the most powerful sovereign in A. About A.D. 1000 Sultan Mahmud of Ghazni, a small tyr. in Kabul, conquered the Punjab; the dynasty of the Seljuk Tartars held sway in the eleventh and twelfth centuries from the Hellespont to Afghanistan. Genghis Khan, an independent Mongol chief, overcame Central A., conquered N. China, and overran Turkestan, Afghanistan, and Persia, whilst his successors overthrew the Seljuk dynasty, and conquered the caliphate. It was in the time of Kublai Khan, nephew of Genghis Khan, that the famous Venetian traveller, Marco Polo, whose *Travels* is so interesting and valuable, visited China, and gained the special favour of the Khan. Timur the Tartar, or Tamerlane, defeated and took prisoner Bajazet, descendant of Othman, the founder of the Ottoman empire, in 1402, at Angora, in Galatia. At the end of the fourteenth century all the old and medieval Persian empire became subject to Tamerlane. Tamerlane's career was but meteoric, however, and the Ottoman empire soon recovered; the Sultan Mohammed II. captured Constantinople, and overthrew the E. empire in 1453. China recovered her independence in 1368, but was again subjected by the Manchu Tartars from 1618 to 1645. After this it began to extend its empire over Central A. The discovery by the Portuguese in 1498 of the passage to India by the Cape of Good Hope marks a new epoch in European hist. in A. The Portuguese were the first to found colonies in India, but were soon followed by the Spaniards, Dutch, Fr., Danes, and Brit. The Mongol dynasty, however, was the chief power in India from early in the sixteenth century till late in the seventeenth. During this period the various European nations had been making some progress, and when the Mongol dynasty finally declined before Mahratta- and Afghan onslaughts the

long struggle for the rule of India among Asiatic races—pre-Aryan, Aryan, Afghan, and Mogul—was destined to end in European supremacy. In the conflict between the European races the Brit. after a struggle overcame their most formidable competitors, the Fr., and at length took possession of the whole of the peninsula with the exception of a few places on the sea coast. Russia, in the course of a few centuries, beginning with the conquest of Siberia by the Cossacks between 1580 and 1584, conquered and partly colonised the most favourable parts of the N.W. slope of the lofty plateau of A., and reached the Pacific across its narrow extremity in the N.E. France took possession of an extensive ter., in Farther India. China, before the Second World War, had sunk into a subordinate place, after having been regarded as the third power in A. The war with Japan in 1894-95 showed her weakness; the later war, 1931-33, accentuated it, while the subsequent invasion of China seemed to indicate that a large part of the coast and the N. part of China might be a permanent part of the Jap. empire. For by the twentieth century Japan had become the foremost Asiatic native power, having made great progress in industry during the last 70 years, and showing remarkable aptitude in assimilating the material civilisation, and to some extent the institutions, of Europe. By the early months of 1942 Japan, having entered the Second World War, had overrun Hong Kong, Brit. Malaya, Singapore, the Philippines, the Dutch E. Indies, and Burma. But by the autumn of 1945 Japan was driven into unconditional surrender (see PACIFIC CAMPAIGNS or FAR EASTERN FRONT IN SECOND WORLD WAR). Whether Japan's decisive defeat will be followed by a Chinese renaissance might seem to depend on the solution of the Chinese schism between the Kuomintang and the Communists. It is evident that one result of the Second World War has been the awakening of nationalism in S.E. Asiatic peoples, and always in a militant form—a political phenomenon which seems prejudicial to the continued paramountcy of the W. suzerains.

It is worthy of note that not only the great and most influential religions of the world—Buddhism, Christianity, Mohammedanism—but also those of secondary importance, such as Judaism, Parseeism, Taoism, have all had their origin in A. An unsystematic paganism represents the highest religious achievement of Europe, Gk. philosophy, though very advanced, not being a religion in the true sense of the word. On the other hand, Rom. Catholic Christianity retains but few Asiatic elements, though its origin and essential ideas are Asiatic. Christianity, thus made European, has made but little progress E. of A. Minor, nor has Buddhism made headway W. thereof, whilst Mohammedanism is repugnant to Europeans. It is indeed clear that the religious feeling and sentiment of A. and Europe are radically dissimilar. The mental

constitution of the Asiatic, too, is less easily changed than his institutions, which leads to speculation as to the ultimate effect of the far-reaching changes which have of late years taken place in A. The life of the people must indeed be changed thereby, but the question is whether the characteristics, the personality of the race, will be changed also. That question time alone can answer. See also ARABIA; CHINA; INDIA; MALAYA. See Marco Polo, *Kingdoms and Marvels of the East* (ed. H. Yule), 1903; H. Landsell, *Russian Central Asia*, 1885; A. Asia Minor, Anatolia, or Anadolı, is the name applied to the portion of W. Asia which, projecting from the main mass of the continent, forms a W. peninsula of it. In shape the peninsula is oblong. The name Anatolia, first used in the tenth century, concerning only a part of A. M., was applied to the country under the Byzantine emperors and is retained under the form Anadolı by modern Turks. The boundaries of A. M. before the First World War were the Black Sea on the N., the Aegean Sea on the W., and the Mediterranean on the S. The boundary on the E. was arbitrary; for geographical purposes it could be taken to be a line starting from the gulf of Scanderoun, along the mt. ranges to a point on the Euphrates between Samosata and Malatıah, thence along the course of the Euphrates to near Erzingan, and then to the Black Sea, E. of Trabzon. In 1920, except for a small area around Chanak, on the Dardanelles, the whole of A. M., in spite of the defeat of Turkey in the First World War, had fallen under the rule of the *de facto* Gov. estab. at Angora with the style of the Gov. of the Grand National Assembly of Turkey. This gov. in 1923 became the Turkish Republic under the presidency of Kemal (see TURKEY), who had completely defeated the Gks. in A. M. (see later in this article), so that all the ter. previously conquered by the Gk. protagonists of dreams of Magna Græcia was again in the hands of the Turks. By the treaty of Lausanne 1923 (ratified by the allied

powers in 1924), Turkey was given the whole of A. M. comprised within the Caucasian frontier (as defined by the treaty of Kars, 1921), the N. part of the old Turco-Persian frontier, the Turco-Iraqi frontier, and the boundary between Turkey, and Syria from Jezira-ibn-Oman on the Tigris to a point S. of Payas on the gulf of Alexandretta. This delimitation excludes Batum and Mosul, but includes portions of the 3 sanjaks of Kars, Ardebil, and Artuin under the treaty concluded in 1921 with the Caucasian states. The peninsula consists for the most part of a tableland with an average height of about 2500 ft.; it is crossed by transverse ranges which run at right angles to the bordering mts., the Taurus range and the mts. round the Black Sea. The E. portions of the old Turkish empire are communicated with by passes through the Taurus and Anti-Taurus Mts. The plateau is here and there studded with the isolated cones of extinct volcanoes. The chief summits are the volcanic mt. Argish Dag, 12,650 ft., in the Anti-Taurus range; Bulgar Dag, 11,400 ft., in the Taurus range; and the famous Mt. Ida overlooking the classical plains of Troy. The surface of the plateau is for the most part arid, with large expanses of desert, though in the W. valleys the soil is very fertile. Even the largest rivers are too shallow for navigation save for short distances; among those running into the Black Sea may be mentioned the Yeshil, the Irmak, the Kizil, and the Sakaria. The Black Sea coast is rocky, but regular and unbroken; the W. coast is deeply indented, and is remarkable for the number of is. which are found off it; on the S. coast are the gulfs of Adalia and Alexandretta.

A. M. is very rich in minerals. Copper is found at Arghana, silver at Gumushkhane, Denek, and Akdag Maden, and lead at Berketlümaden, whilst iron ores, alum, nitre, and rock salt are also found. Mining, however, is carried on to a very small extent. The climate of A. M. has been noted in every age for excellence. The mts. are covered with forests of oak, ash, beech, and plane trees. The flora of the country is exceedingly beautiful; evergreens, myrtle bay, and holly flourish in great quantities. Agriculture on the whole is in a backward condition; the plateaux grow wheat, the lower valleys wheat and barley, the lowlands millet and rice. The is. of the archipelago produce honey, fruit, wine, and oil. Many of them are well known in classic hist., such as Patmos, Lemnos, Rhodes, etc. The wild animals still extant number among them the hyena, the lynx, the wolf, the bear, and the wild boar. Camels and asses are used as beasts of burden, whilst excellent breeds of horses, sheep, and goats are reared. The wool of the Angora goat, mohair, is very well known; bees are very largely kept. The prin. exports are raisins and figs from the W. valleys, cotton from the Adana and W. valleys, valonia, a forest product, opium, a product of the

tableland, barley, liquorice, wool, mohair, carpets, sponges, chrome ore, and meerschaum clay. The prin. seats of commerce are Smyrna, Trebizond, and Brusa.

**Communications.**—Whilst the number of good metalled roads is small, light carts can travel over almost every part of the plateau. The following are the chief railway lines: The Anatolian railway (840 m.) from Istanbul to Ankara and Konia; the Bagdad railway (q.v.), starting from Konia, which was, during the First World War, completed as far as Nisibin in Iraq. There are lines between Smyrna (or Izmir), Aidin, and Eghirdir (376 m.) controlled by an Eng. company; Smyrna, Cassaba, and Afium Kara Hisar (440 m.), under a Fr. company; Smyrna and Panderma, under a Fr. company; between Mudania and Brusa (26 m.); and between Samsun and Sivas. Other lines connect Cæsarea with Sivas; Ankara with Ereghli; Keller with Diarbekir; and Kutahia with Tavehaolo.

The pop. of A. M. is made up of sev. races, with the Turkish element predominant. Prior to the First World War, and the Graeco-Turkish war (1921-22), most of the trading classes were Gks. and Armenians, the remainder being, as now, mostly Jews, Arabs, and Kurds. After the First World War and the later war, large numbers of the Armenian pop. migrated to the republic of Erivan or were massacred. The Gk. pop. has almost ceased to exist in A. M., and the Moslem people of Turkey also suffered heavily from the wars. The present pop., according to the census of 1935, is 14,945,000. The chief vilayets (with pop. in thousands) are Izmir (Smyrna) (597), Konya (570), Ankara (534), Balikesir (431), Bursa (443), Sivas (433), Manisa (426), Malatya (410), Erzerum (385), Seyhan (Adana) (384), Trabzon (Trebizond) (361), Kastamonu (361), Kutahya (348), Samsun (338), Kocaeli (Izmit) (335), Zonguldak (322), Tokat (310), Kayseri (310), Kars (306), Afyon (300), Denizli (286), Coru (285), Gaziantep (284), Ordu (283), Coruh (Rize) (272), Yozgat (262), Aydin (261), Gireson (260), Flaziz (256), Bolu (248), Nigde (247), Jeel (Mersin) (244), Antalya (243), Mardin (230), Urfa (230), Cannak, kale (223), Diyarbekir (214), Mugla (197), Sinop (192), Maras (189), Ekişehir (183), Cankiri (178), Isparta (166), Gümüşane (163), Erzincan (157), Kirsheir (146), Mus (144), Van (143), Amasya (128), Aguri (Bayazit) (107), Burdur (96), Chief towns: Izmir (Smyrna) (171), Ankara (123), Seyhan (Adana) (76), Bursa (Brusa) (72), Konya (52).

The hist. of A. M. has a peculiar character owing to its unique geographical position. The bridge between Asia and Europe has, from very early ages, been the battleground of the E. and W. nations. Thus the hist. of the country is rather a chronicle of the march of armies and of the rise and fall of small disunited states, rather than the record of the progress of a single state under an independent

monarch. In the earliest period of which any knowledge can be gathered, A. M. was the home of various non-Aryan tribes who differed but little from each other. Much light has of late years been thrown on the civilisation of the Hittites or Syro-Cappadocians, the centre of whose power is supposed to have been Boghaz Keui. The date of the great Aryan immigration into A. M. from Europe is unknown, but it was declining in the eleventh and tenth centuries B.C. The kingdom of Lydia was the next to obtain supremacy, and following the fall of Lydia in 546 B.C., the Persians became rulers. In 334 B.C. Alexander the Great invaded A. M., but following his death the dynasty of Selencus was the most powerful in A. M., though it never held sway over the whole of the country. Then by degrees Rome conquered practically the whole of A. M., and was the dominant power when Christianity was introduced there. With the introduction of Christianity a great advance took place. The old religions and languages disappeared, and the people, with one language and one religion, began to have a united identity. In the sixth century A. M. was rich and prosperous. From the sixth to the tenth century Persian and Arab raids took place, and in the eleventh century the Seljuk Turks became the chief power. Then the Mongol power gained the ascendancy in the thirteenth century, and with the decline of the Mongol power the Osmanli Turks of Brusa gained the ascendancy from 1307. Tamerlane swept through the country in 1402, and though the Osmanli supremacy was finally re-established, it was after a lengthy contest. The defeat of the Emperor Romanus in 1071 marks the beginning of a new era for A. M. The prosperity and peace of the previous centuries came to an end then, and the country was for long years the prey of wandering tribes of nomads. These wandered through the country, caring nothing for any agric. or urban pursuits, and left the land bare behind them. The ravages caused by Timur in his raid were enormous, and the country has never recovered completely therefrom. The earliest Osmanli sultans enforced the Turkish language, and to a large extent the religion of Islam, on the conquered, and from that time the last traces of W. civilisation disappear in A. M. But, after many years of retrogression, the large Gk. increase—since the First World War somewhat discounted—in the W., the establishment of railways, and the spread of Ger. and Russian interests in the peninsula, all had their effect in turning the tide. After the First World War, the reforms of Mustapha Kemal accelerated this process.

*Hist. during and since the First World War.*—In the First World War there was heavy fighting in A. M. between the Turks and Russians in Armenia (see under ARMENIA). Pending the readjustment of Turkey's boundaries after the Armistice, a mixed Brk. and Gk. force occupied Smyrna. The geographical limits

of the ter. adjacent to Smyrna and the frontier of Turkey in Asia generally were laid down in the treaty of Sèvres (1920). Under the treaty Greece had accepted a mandate for the occupation and administration of the tn. and dist. of Smyrna. But the rise of the Nationalist movement in A. M. revived Turkish hopes of stultifying the treaty, which, though signed, was never ratified. A strong *de facto* Gov. came into power under Mustapha Kemal (see ATATÜRK), with its cap. at Ankara. The Gks., encouraged by the moral support of the Coalition Gov. in England, launched an offensive in A. M. in Mar. 1921. Defeated near Eskişehir, they withdrew towards Ushak in Apr.; they resumed the offensive from Ushak and Brusa in July, and in that month entered Eskişehir. The Turks fell back on the Sakharra R. to defend Ankara, and the Gks., rashly advancing on the cap., were heavily defeated in Sept., and taking up a new line at Eskişehir repulsed Turkish attacks at Afum Kara Hisar in Oct. In July 1922 the Turks opened a well-prepared offensive, and within 2 months the Gks. were in headlong flight, and by Sept. Kemal had recovered the mandated region. Smyrna was hastily evacuated, and the city consigned to flames by the victorious Turks, who massacred a large part of the Gk. pop. in A. M. The final territorial adjustment was made by the treaty of Lausanne (1923). Turkey in Asia now comprises the whole of A. M., and includes Cilicia, which was handed over to the Kemalists forces by the Fr. in 1922, and the sanjak of Alexandretta, ceded by the Fr. in 1939. The whole pop. of A. M. was considerably reduced by the exodus of Gks. and Armenians which ensued on the fall of Smyrna.

**Asiago**, an It. tn. in the prov. of Vicenza, capl. of the Sette Comuni, or Seven Coms. Pop. 3000.

**Asiago Plateau.** Some of the heaviest fighting on the It. front in the First World War took place on the A. P., notably in the anxious period of the Austro-Hungarian invasion of Italy in Oct. to Dec. 1917. The Austro-Ger. forces having taken Gen. Cadorna's headquarters at Udine on Oct. 30, being folled in the effort to force a crossing of the Lower Piave, tried to outflank the new It. lines, which, however, had been reinforced by Brit. and Fr. troops, by a direct assault on the A. plateau and mts. between the Brenta and Piave. Large bodies of Austro-Ger. troops were flung in vain against the mt. masses, but, though the Its. gave up some of the ground, the effort to reach the Venetian plains failed. In the following Dec. the Austro-Ger. forces made a further and desperate attack on the plateau and the upper reaches of the Brenta. Monte Asolone and the summits of Monte Tomba fell to them; but both, together with the Piave bridgehead at Zenon, were retaken by the Its. in Jan. 1918, and their positions on the plateau consolidated. The net effect of the It. setback on the Piave was salutary in that it knitted

It. people together in a firm and patriotic resolve to reform their army and purge their country of treasonable elements.

**Asiatic Quarterly**, a review, the full title of which, in 1891, became *The Imperial and Asiatic Quarterly Review and Oriental and Colonial Record*, being then and for some years afterwards pub. by the Colonial Institute at Woking. It was founded in 1886 to deal with questions of Indian and general oriental interest, and, in 1891, its scope was extended to include African and colonial subjects. Its present-day representative is the *Asiatic Review*, which does not embrace African subjects.

**Asiatic Society, The Royal**, 74 Grosvenor Street, London, W. 1. An institution formed for the furtherance of Indian and oriental studies. Monthly meetings are held every year from Oct. to June inclusive, and at these gatherings papers on recent research and discoveries, and on cognate subjects, are read by highly qualified and travelled authorities. The A. S. also issues learned publications on oriental subjects.

**Asiatic Turkey**, see ASIA MINOR; TURKEY.

**Asiaticus**, see ANTIOCHUS.

**Asiento**, see ASKEPYTO.

**Asinius**, see POLLIO, GAIVS ASINIUS.

**Asir** (i.e. the inaccessible). A region in Arabia belonging to the kingdom of Saudi Arabia; it extends from a line drawn inland from Birk on the S. border of the Hejaz to the N. border of the Yemen, some 10 m. or more N. of the port of Midi. In breadth it extends from about 180 m. E. to Beni Yam in the S. Arabian geographers include it within the Yemen, but since the war between Ibn Sa'ud, king of Saudi Arabia, and Yahia, Imam of the Yemen, there have been political changes in this region. Included in the ter. are also the Farsan ls., which were believed to contain oil deposits. The maritime lowland has many fertile areas near the wadis, which are suitable for some cereals and afford pasture. The chief tns. are Abha (A. Surat) and Jizan (A. Tihama).

**Asirgarh**, a fortress in the Central Provs. of India. It is situated 300 m. N.E. of Bombay. Its position on an isolated mt. of the Satpuras gives it natural advantages for fortification. It was captured by the Brit. twice.

**Askabad**, or **Askhabad**, see POLTORATSK.

**Askari** (Arab. *askar* army). Term used for native soldiers in Africa when trained and officered by Europeans.

**Aske, Robert** (d. 1537), an Eng. rebel, leader of the Pilgrimage of Grace. He was hanged in chains at York as punishment for complicity in treason. A promise to give up the cause was of no avail.

**Askeaton**, a small Irish tn. in the co. of Limerick. Pop. about 800.

**Askier**, see NEWT.

**Askern**, a vil. of the W. Riding of Yorkshire, 8 m. N. of Doncaster. Centre of a mining dist.

**Askew, Anne** (1521-46), an Eng. martyr to Protestantism, b. at Stollingsborough.

The vigour with which she upheld her own faith caused her torture and subsequent death by burning at Smithfield.

**Askew, Anthony** (1722-72), a native of Westmorland. Intended for the medical profession and commenced practice at Cambridge in 1750; but it is as a classical scholar that he is better known than as a doctor. He helped to develop the taste for curious MSS., scarce eds., and fine copies, and laid the foundations of an extensive library, the Bibliotheca Askewiana. His MS. vol. of transcribed inscriptions is in the Brit. Museum.

**Askja**, a volcano of Iceland. It possesses a huge crater measuring 17 m. in circumference, and rises from a bed of lava called Odátharaun. It is the largest volcano in the is. It throws forth volumes of steam incessantly, and by many eruptions has built up a mt. 4633 ft. high.

**Askwith, Sir George Ranken, Baron** (1861-1942). Eng. lawyer, son of Gen. William Harrison A. Educated at Marlborough and at Brasenose College, Oxford. Called to the Bar in 1886. Held junior brief for the Brit. Gov. in the Venezuela arbitration, and, through the influence of Lord James of Hereford, he was appointed counsel to H.M. Commissioners of Works, and for the Crown in peerage claims. He will be remembered for his success as an arbitrator in labour disputes, having received a good training under Lord James. His conciliatory policy settled many strikes and lock-outs, notably the cotton dispute of 1910 and the transport workers' strike of 1911. During the First World War he was chairman of the Gov. arbitration committee under the Munitions Acts. In 1931 he was chairman of the Malta royal commission (see MALTA). Pub. *Industrial Problems and Disputes*, 1920; *British Taverns, their History and Laws*, 1928; *Lord James of Hereford*, 1930.

**Asmara**, a tn. of Abyssinia, Africa, about 50 m. S.W. of Massowah. It was the seat of governmental residence of the former It. colony of Eritrea. It was captured by allied troops on Apr. 1, 1941. It is a modern tn., 75 m. by rail from Massowah, with new motor roads to Hassoowa, Agordat, and Cheren (Keren). Pop. (1939), 85,000 (of whom 50,000 were It.).

**Asmodeus**, an evil genius of Heb. tradition, sometimes associated with Beelzebub or Apollyon. He is mentioned in connection with Solomon in the Talmud. He has often been termed the spirit of matrimonial jealousy, from a chronicle in the apocryphal book of Tobit. Here he slays the 7 successive husbands of the beautiful Sara, daughter of Raguel, because of his own love for her. In *Le Diable boiteux* Le Sage makes him the chief character.

**Asmoneans**, the original name of the Maccabees, a family of heroes who delivered Judaea from the oppression of Antiochus Epiphanes, king of Syria (175-164 B.C.). Their hist. is to be found in the books of the Maccabees, the last 2 books of the Apocrypha.

**Asnières**, French tn. in dept. of Seine

near St. Denis. Great boating centre for Parisians. Manufs. bicycles, perfumery, and pianos. Pop. 52,000.

**Asnyk**, Adam (1838-97), Polish poet and dramatist, b. at Kallisch. He studied medicine and philosophy at the univ. of Warsaw, Breslau, and Heidelberg, graduating as a doctor in 1866. His chief dramatic writings are: *Cola Rienzi* (1869), a tragedy; *Kiejstut* (1878); *Przyjacieł Hioba*, i.e. The Friends of Job (1879).

**Asoca**, or *Jonesia asoca*, a tropical plant of the order Leguminosæ often mentioned in Indian mythology.

**Asoka**, emperor of India, grandson of Chandragupta, the conqueror of Seleucus. He reigned from 264 to 230 B.C. over ter. roughly corresponding in area to Brit. India excepting Burma. He was a disciple of Buddha and organised Buddhism as a State religion. There is evidence of his proselytising zeal in rock inscriptions in various dists. of N. India. Consult Allan Menzies, *The Religions of India*.

**Asolo**, an anct. city of Venetia. Its situation on the hills enables it to boast a magnificent view over the plains to Venice. Its anct. walls and turreted buildings give it a picturesque appearance. In his *Asolando* Browning celebrates the place, and it possesses associations in connection with Caterina Cornaro, queen of Cyprus, and also memories of Canova. Pop. 6000.

ASP

**Asp**, an ophidian reptile closely related to the Brit. adder properly termed *Vipera aspis*, of the family Viperidæ; it is found in S. Europe. The term is also loosely applied to other snakes, as the *Naja haje*, the spy-slang of Africa, of the family Colubridæ. Cleopatra's asp was probably *Cerastes cornutus* or horned viper, of the family Viperidæ, found in Arabia, N. Africa, and Syria.

**Aspalathos**, or *Splato*. See SPLT.

**Asparagus**, a genus of Liliacæ, growing in Asia and S. Europe. The young shoots of *A. officinalis* form a succulent vegetable, frequently forced in Britain and Russia.

**Asparagus Stone** is a variety of apatite (q.v.), a mineral which is formed chiefly of phosphate of lime.

**Aspasia**, a courtesan of Athens of the fifth century. In 445 Pericles, after divorcing his wife, made her his mistress, and later was able by his influence to legitimise a son he had by her. She is

ASPEN

believed to have had considerable influence over him, and by some authorities the Samian and Peloponnesian wars are attributed to her. On the death of Pericles she became the mistress of Lycicles, who d. a year after Pericles in 428. There is a bust of her in the Vatican.

**Aspasius**, a Gk. Peripatetic philosopher who commented on Aristotle at great length. Later writers refer frequently to his remarks upon the *Categories*, *De Interpretatione*, and *De Sensu*, but the works themselves are lost, as also are commentaries upon Plato. However, copies of the commentaries on parts of the *Nicomachean Ethics* are extant. He fl. c. A.D. 80.

**Aspatria**, a coal-mining tn. in Cumberland, England, 20 m. from Carlisle by rail. Pop. 3300.

**Aspe**, a tn. in the prov. of Alicante, Spain, and situated 21 m. W. of the tn. of Alicante. It has a trade in ore and wine. Pop. 8000.

**Aspect**, in astronomy, a position of the planets in certain relative distances. During the vogue of astrology there were 5: conjunction, sextile, quartile, trine, and opposition. Conjunction is applied when 2 planets are in the same lat.; when they are 60° apart they are sextile, 90° quartile, 120° trine, and at 180° (necessarily opposite) in opposition. The only 2 terms surviving are conjunction and opposition.

**Aspen**, a species of Salicacæ grows in colder countries. It belongs to the genus *Populus* (q.v.), and its scientific name is *P. tremula*.

**Aspen**, co. seat of Pitkin co., Colorado, U.S.A., in Roaring Fork Valley. Silver mines in the vicinity. Pop. 2000.

**Asper** is the name of a Turkish money of account. The name means white, and is probably derived from the whiteness of newly coined silver. The A. was a silver coin of very small value, 120 being required to equal in value a piastre.

**Asper, Hans** (1499-1571), a Swiss natural hist. and portrait painter, b. at Zürich; a contemporary of Holbein, and influenced by him in his work.

**Asperges**, the ceremony of sprinkling people with holy water before mass. It is observed in the Rom. Catholic Church, and derives its name from the first word of the invocation *Asperges me, Domine*, etc. The vessel used to hold the water is an aspersorium, while the anointing brush is called an aspergil. The sprinkling of the water itself is called an aspersion.

**Aspergillum**, a genus of molluscs of the family Clavagellidae and order Eulamelli-branchiata. *A. javanum*, the watering-pot shell, is so called from its shape, the bivalve shell occurring at the end of a perforated shelly tube.

**Aspergillus**, a minute fungus of order Pyrenomycetes and family Perisporiaceae; it belongs to the div. Ascomycetes. This fungus, *Eurotium A.*, is the mould often seen on jam exposed to the air.

**Aspern**, a small vil. of Austria, on the Danube near Vienna. In 1809 a desperate and bloody affray occurred there between Napoleon and the Archduke Charles, resulting in a defeat of the Fr. The loss of life amounted to 54,000.

**Aspertini, Amico** (1475-1532), a Bolognese painter, was b. at Bologna. He was a pupil of Francesco Francia, and imitated the painters of different periods, though this did not prevent his criticising very harshly the imitators of Raphael. He excelled at painting frescoes, and decorated a large number of buildings, but his character was more original than his talent, for he painted with both hands at once. He also tried sculpture and engraving, but without any success.

**Asperula**, a widespread genus of Rubiaceae. There are 2 Brit. species, *A. odorata*, the woodruff, and *A. cynanchica*, the squinancy-wort.

**Asphalt**, a naturally occurring form of bitumen. It consists of a mixture of hydro-carbons, the elements carbon, hydrogen, oxygen, nitrogen, and sulphur being present. The manner in which the deposits are produced is a matter of some doubt, but they are probably formed by the oxidation and evaporation of liquid petroleum which has found its way from surrounding outcrops of petroleum-bearing strata. The best known deposit is the 'Pitch Lake,' at La Brea, in the S.W. corner of the is. of Trinidad, which covers an area of about 100 ac. It was known from a very early period, for the buccaneers caulked their ships with the material, and is now worked by the New Trinidad Asphalt Company, who export about 100,000 tons annually. Other deposits of A., somewhat different in composition, are found in Venezuela, Cuba, the Dead Sea, and Switzerland. That found at Val de Travers in Switzer-

land is really a bituminous limestone, and is largely used for preparing A. camite, which contains a great proportion of limestone, and is much in demand in the form of blocks for street paving and floors. A. is also used for damp-courses in the walls of houses, for preparing waterproof flooring and roofing, and as an ingredient in Japan varnish. An artificial A. is made from coal-tar pitch, and for some purposes is an efficient substitute for the naturally-occurring substance.

**Asphalter's Work** (in building, *q.v.*), courses of asphalt, at least  $\frac{1}{2}$  in. thick, are laid on brick or masonry walls just above the ground level, to prevent the damp from rising; underneath buildings to exclude ground air; on flat roofs, etc.

**Asphaltites Lacus**, see DEAD SEA.

**Asphodel**, a genus of Liliaceae which grows in S. Europe. *A. albus*, the white asphodel, is found near the Mediterranean; *A. luteus*, the yellow asphodel, has red berries, and is found wild in Sicily, Dalmatia, the Peloponnesus, and the Crimea.

**Asphyxia** (Gk., pulselessness), the suspension of vital phenomena due to absence of the requisite proportion of oxygen in the lungs. The condition may be brought about by any obstruction to the passage of air to and from the lung, as in drowning, constriction of the windpipe, or the presence of foreign bodies or morbid growths in the air passages; or an insufficient supply of oxygen in the atmosphere breathed; or any interference with the muscular actions which produce breathing, such as may be occasioned by paralysis or great pressure on the walls of the chest and abdomen. In the lungs a continual exchange of gases goes on, oxygen being absorbed and carried to the tissues by the blood, and carbon dioxide being formed by the decomposition of carbonates in the blood. The proportion of carbon dioxide in the air of the lungs remains fairly constant, and this proportion can only be maintained by the inspiration of air rich in oxygen and the expiration of air with a relatively large proportion of carbon dioxide. If there is need for a larger consumption of oxygen, as during muscular exertion, the breathing becomes quicker and deeper; and it is also found that excess of carbon dioxide tends to stimulate the breathing, so that the actual proportions of the gases in the air of the lungs do not alter although the outer air be vitiated. If, however, the supply of air is so restricted or vitiated that the proportion of carbon dioxide within the lung increases, symptoms such as headache and nausea immediately present themselves, the skin takes on a blue tinge, and as the percentage increases consciousness is lost, respiration ceases altogether, and finally the heart stops beating.

The treatment in case of A. consists of first removing the cause and then resorting to artificial respiration. If the cause be inhalation of bad air, the patient must be at once removed to the open air, and the clothing about the neck, chest, and waist loosened. When choking is

threatened through the presence of a foreign body in the air passages, an effort should immediately be made to dislodge it by means of the fingers, as there is risk of sudden A. An attack of vomiting or coughing may also succeed in ejecting the obstacle; or if a surgeon be at hand and the urgency of the symptoms demand it, laryngotomy or tracheotomy, according to the position of the obstacle, may allow air to pass to the lungs.

**Asphyxiants** are chemical substances which have a poisonous effect on the humar system, producing suffocation. Many of them are used in the manuf. of ammunition.

**Aspie** is the name given to the transparent, light-coloured jelly in which fish, meat, etc., are sometimes served.

**Aspidistra** is a small genus of Asiatic Liliaceæ. It has broad leaves, and the species *A. elatior* is often cultivated in Britain as a hot-house plant.

**Aspidium**, the shield-fern, is a genus of ferns of the order Polypodiaceæ. *A. filix-mas*, or *Nephrodium filix-mas*, the male fern, grows in woods and has antiseptic properties; *A. filix-femina* is the lady-fern; *A. lonchitis* the holly-fern; *A. aculeatum* the prickly shield-fern.

**Aspidura**, a fossil genus of echinoderms of the order Ophiureæ. These brittle-stars, related to star-fishes, are found in Ger. Muschelkalk.

**Aspinwall**, see COLON.

**Aspinwall, William H.** (1807-75), Amer. railway builder, b. in New York; in 1837 a partner in the shipping firm of Howland & A. In 1850 he left this to construct the Panama railway across the Isthmus. It was completed in 1855, and the E. terminus was named after him. He was one of the founders of the Pacific Mail Steamship Company.

**Aspirate** (Lat. *spiro*, I breathe). It denotes a sharply defined audible breath, and as such signifies in Eng. grammar the letter *h*. In Gk. the *spiritus asper*, or rough breathing mark, when placed over an initial vowel has the effect of prefixing an *h* in the reading or pronouncing of the word. Besides its significance in Eng. it is also used in application to 2 classes of consonants, i.e. those blended with *h*, as in the Sanskrit, and those followed by *h* in Eng. in examples like *th* and *ch* with *f* and *v*. Thus, in the latter and broader sense of the term, 8 of the 16 Eng. mute sounds are *tene*, i.e. possessing their corresponding aspirate.

**Aspirator**, an apparatus used for drawing air or other gases through vessels connected with it. The simplest form consists of a large bottle filled with water, and supplied with a stop-cock at the bottom. The apparatus through which the gas is to be drawn is connected with the neck of the bottle and the stop-cock is opened. As the water flows out of the bottle, air or gas flows in to take its place through the only available channel, that is, through the apparatus connected with the A.

Another form of A. consists of a narrow tube connected with a supply of water

under pressure. This jet is surrounded by another tube closed at the top and connected laterally with the vessel from which the air is to be withdrawn. Air is carried down with the jet so that a continuous current is set up from the vessel to be exhausted.

**Aspirin**. The trade name for acetylsalicylic acid, formula  $C_9H_7O_4$ . It is also known as acidum and acetosalicum or salacetin, and is made through the action of acetic anhydride on salicylic acid. Though first introduced into medicine under the name of A., other trade names are Genasprin and Aspro, and there are many others. The dose is from 5 to 15 grains, and it is prescribed for rheumatic fever to reduce temp., and it is a widely used remedy for neuralgia and headaches. It has the same action as salicylic acid, but is not so prone to producing such secondary effects as gastric disturbance. Care is to be taken to avoid exposure after administration, as perspiration often follows the dose.

**Aspland, Robert** (1782-1845), Unitarian divine. He was originally intended for the Baptist ministry, but was expelled from that body in 1800 for 'unsoundness,' and entered business, doing 'supply' preaching on Sundays. In 1801 he became minister to the General Baptist church at Newport, Isle of Wight; in 1805 he went to Norton, Derbyshire, and later in that year began his 40 years' ministry at the Gravel Pit Chapel, Hackney. He estab. sev. Unitarian periodicals, was secretary to numerous denominational societies, and in 1813 founded the Hackney Academy at Durham House for the training of Unitarian preachers. See *Memoirs* by R. Brook A. 1850.

**Asplenium**, a genus of ferns of the order Polypodiaceæ, commonly known as spleenworts, and having medicinal properties. *A. trichomanes* is the common spleenwort; *A. adiantum-nigrum* the black spleenwort; *A. ruta-muraria*, the wall spleenwort or wall rue, grows on rocks and old walls. *A. bulbiferum* is curious on account of the young plants which grow on its leaves; *A. rhizophyllum*, the walking fern, roots at its leaf-tips when bent to the ground; *A. nidus*, the bird's-nest fern, is a beautiful tropical plant.

**Aspredo**, the name of a genus of fish belonging to the family of the Silurides, inhabiting the waters of S. America.

**Aspromonte**, a mt. of Calabria, Italy. It is situated at the W. extremity of the range of the Sila Mts. and rises just behind the peak of Reggjo di Calabria. Its slopes are forest-clad, and its height 6420 ft. It was the scene of Garibaldi's arrest in 1862.

**Aspropotamos**, see ACHELOUS.

**Asquith, Herbert Henry**, see OXFORD AND ASQUITH, EARL OF.

**Asquith, Lady**, see OXFORD AND ASQUITH, COUNTESS OF.

**Ass**, a general name for the genus *Assus* of the horse tribe. It differs somewhat from the horse in having a tuft of hair at the end of its tail, in having no warts on its hind legs, and in the

presence of stripes, which are absent in the domestic A. Its characteristics are long ears and an upright mane, together with a proverbial stupidity. The Egyptians used the head of an A. to signify the sign of extreme dullness. It is only fair to add on behalf of the A. that this celebrated stupidity is more superstitious than actual. Although the domestication of the A. took place at a very early date, the common 'donkey' was not introduced into England till the time of Elizabeth. The animal is particularly adapted for transport purposes on account of its surprising hardihood, endurance, and docility when treated kindly. The usually wretched specimens seen in England are more the result of bad treatment than naturally so. In Arabia, Syria, and Egypt, among other places, its careful treatment has resulted in the evolution of an animal of remarkable value, for a Sp. be-ass was worth £200 in 1939. The wild variety is much hunted in Persia, and its flesh, greatly prized. Because of the presence of more sugar and less cheese in its milk, invalids take it with benefit. Its skin is manufactured into shagreen leather, and also used in the making of drums. The variety called albino, i.e. white, was used by the ancients on state occasions and reserved for the highly honoured.

**Assab Bay**, situated on the W. coast of the Red Sea. Formerly an It. trading station; in 1880 it was taken over by an It. Gov. from a private company and used as a coaling station. There is a good harbour and a lighthouse.

**Assahan**, the name of an inland vil. of Sumatra, situated on a riv. of the same name. It is situated in 3° 1' N. lat. and 99° E. long., and is a Portuguese settlement, whose prin. product is malacca.

**Assai**, a beverage much in favour with Brazilians. It is made by soaking in water the fruit of the *Euterpe edulis*, or A. palm. The concoction is said to be very nutritious.

**Assaki, Georg** (1788-1869), a Moldavian poet and historian, was b. and d. at Jassy. He represented the Gov. at the Viennese court, and helped in the production of the statute which reorganised the state of Moldavia. He wrote plays and poems, and a hist. of Russia, and is regarded as one of the fathers of modern Rumanian literature.

**Assal**, an extensive salt lake of Fr. Somaliland. It is nearly 600 ft. below sea-level. Caravans call there to gather the salt that thickly encrusts its shores.

**Assam** is a prov. of the dominion of India, in the extreme N.E., E. of Bengal. The Brahmaputra valley in A. has in a large measure had a separate hist. from the remainder of India. The reason of this is the narrowness of the valley and the peculiarities of its situation. The valley is more than 400 m. long, and for most of its length less than 50 m. wide, though near its mouth it reaches a width of 100 m. Of this scant breadth the Brahmaputra, with the thick, impenetrable jungle on its banks, occupies from 6 to 20 m. The inhab., thus restricted

to a small area, were exposed to incursions from hill tribes and other invaders; this had the effect of keeping down the pop. The Ahams, the inhab. who gave the name to this valley, which was afterwards extended to the whole prov., entered the dist. from the E. in about the thirteenth century. They were, however, engaged in incessant warfare with the Muslims in the W., whose aim was to annex the prov. to Bengal. The valley was conquered by the Brit. in 1826. A. was constituted an autonomous prov. in 1937, with a legislature of 2 Chambers. For the purposes of administration there are 2 divisional commissionerships. During the period of Brit. rule the prosperity and pop. alike increased rapidly. This was largely due to the tea plantations, which were inaugurated in N. A. in 1835. These plantations, worked by coolies from the crowded dists. of W. Bengal, are strictly supervised by Gov. The flora of the prov. is tropical in character, the mts. and hills being covered by dense forests of evergreens. The prin. forest product is rubber, and the lacquer tree of Japan is also cultivated. A good steam coal is worked in the coalfield at Makum; the other minerals include iron ore and limestone, of which there are immense beds in the S. Petroleum is also found. The seat of administration of the governor for the prov. is Shillong. Area 49,473 sq. m., pop. 7,038,000. The dist. of Sylhet, by the Indian Independence Act of 1947, was detached from A. and joined to E. Bengal (Pakistan).

Manipur state, with an area of 8600 sq. m. (pop. 446,000), and the Khasi states, with an area of 3700 sq. m. (pop. 180,000), are under the political control of the governor of A. A. was the theatre of a threatening Jap. invasion early in 1944, when the Tiddim area, Kohima, and the Imphal plain became the chief centres of fighting. The battle round Imphal was fought out between the 4th Army Corps under Lt.-Gen. Geoffrey Scoones, reinforced by brigades of the 5th Indian Div., and the 15th and 33rd Jap. Divs., reinforced by 2 other Jap. and 1 Indian National Army Div. Kohima was relieved after bitter fighting during which the Brit. 2nd Div. and 2 brigades of the 7th Indian Div. stormed the Kohima Hills and defeated and destroyed the 31st Jap. Div. There was no pause after the defeat of the Jap. at Kohima and Imphal; the pursuit was kept up through the worst of the monsoon rains, and the remnants of the Jap. 31st and 15th Divs. were driven back across the Chindwin by the 33rd Corps. For details of this campaign in Manipur see BURMA, SECOND WORLD WAR, CAMPAIGNS IN. See Sir E. Galt, *A History of Assam*, 1926; F. M. Bailey, *China-Tibet-Assam: A Journey, 1911*, 1945.

**Assandun**, see ASMINGTON.

**Assary**, the Rom. copper coin called as.

**Assas**, Louis, Chevalier d', was b. at

Vigan in 1733. Sprung from an old though not aristocratic family, he entered the army while young, and reached the rank of captain in the regiment of Auvergne. The legend runs that, on the night of Oct. 15, 1760, he entered a wood to reconnoitre, and was immediately surrounded by the enemy, who warned him that if he spoke a word he would be killed immediately. Thereupon he uttered his famous cry, still quoted frequently, 'A moi, Auvergne, ce sont les ennemis!' The truth of this story had been much disputed of late years, some asserting that the incident in question never happened, others ascribing the honour of it to Sgt. Dubois. It is remarkable that biographies give but inexact and incomplete information concerning this personage, whose name occupies so striking a place in the national hist. of France.

**Assassin**, a term applied to one who murders another by surprise or by some secret means or treachery. The word is derived from *hashish*, the opiate made from the juice of hemp leaves. It was originally the name for a sect of the Shiites, known otherwise as Ismailites, founded by one Hassan Sabbah in the eleventh century. Till the thirteenth century the sect was in a flourishing state, when the Mogols under Hulagu destroyed its power. During his youth Hassan studied under a doctor at Nishapur, where he met the grand vizier of Malik-Shah. Later he endeavoured to usurp the vizier's place in the court, but failed, and was compelled to leave Persia. In 1078 he went to Egypt, where his great abilities earned him a welcome at Cairo. Here, too, his efforts towards the advancement of his own interests caused his withdrawal from that country. At Kuhistan, after varied experiences, he founded the Ismailite sect. He captured by a ruse the fortress of Alamut in Persia and settled there as chief of the society afterwards called the As. The doctrines of the As. were those of the Ismailites, with the additional custom of the secret removal of all its enemies. At the head was the Sheikh al Jabel, who was assisted by 3 grand priors. Beneath these were the semi-initiated members, and last the actual agents of assassination, who were called *fedais*, meaning devoted ones. They worked in absolute ignorance of the objects and rites of the society, and from them was exacted the most implicit obedience. The chief used occasionally to allow them every sensual indulgence, having previously drugged them with hashish. In return for such experiences they were ready to obey his slightest wish, valuing their lives as nothing. One of the first victims was Hassan's former friend, Nizam-al-Mulk, followed shortly by the murder of the Shah Malik. Shah Malik's successor made war against the As., but to no purpose. It is said that no precautionary measures ever seemed to avail against the machinations of the society. In N. Syria fragments are still believed to exist of the society. In 1255 a massacre of 12,000 of the As. by order

of the Tartar khan, and a subsequent ravaging of their country by Bibars, the Mameluke sultan of Egypt, completely destroyed their power.

The application of the word assassination is now generally limited to the taking of the life of a public personage for the motive purely of destroying his life. By the ancients it was sometimes applauded. During the sixteenth and seventeenth centuries political assassination became prominent. During the reign of Elizabeth many desperate attempts were made to assassinate her. At this time political enthusiasts resorted to the most extreme methods of gaining their ends, and assassination, the very height of violence, was frequently and successfully perpetrated by these fanatics. Among the most famous victims of assassination were Julius Caesar, 44 B.C.; Thomas à Becket, A.D. 1170; David Rizzio, 1566; Lord Darnley, 1567; William of Orange, 1584; Wallenstein, 1634; Marat, 1793; Paul, tsar of Russia, 1801. Three presidents of the U.S.A. have been assassinated: Abraham Lincoln in 1865, James A. Garfield in 1881, and William McKinley in 1901. Ex-President Roosevelt, while campaigning for the Presidency again on the Bullmoose ticket, was shot in 1912, but escaped serious injury. An assassination plot in 1696 was organised for the contemplated murder of William III. by the Jacobites. It was their intention to kill the king on his return from a hunting expedition. One of the plotters communicated with the king, the hunt was postponed, and many arrests were made. Other assassinations were those of Carnot, Fr. president, 1894; Humbert I., king of Italy, 1900; Carlos I., king of Portugal, and his elder son, the Crown Prince, 1908; Nicholas II., tsar of Russia, his wife and son, 1918; Paul Doumer, Fr. president, 1932; F.-M. Sir Henry Wilson, 1922; Alexander I., king of Yugoslavia, and M. Barthou, Fr. foreign minister (at Marseilles), 1934. Of unsuccessful attempts at assassination there are examples without number, and the causes which have actuated them are chiefly political distortion or personal animosity. Among the bodies which organise and carry out their fell work are anarchists, nihilists, and similar fanatical organisations. There is not space enough here to recount a list of attempted assassinations, but among the most important during recent years are those committed upon Alfonso XI. of Spain, 1878 and 1879; Amadeus of Spain, 1872; Bismarck, 1866 and 1874; Francis Joseph of Austria, 1853; George III. of England, 1786 and 1800; George IV., while regent, 1817; Humbert I. of Italy, 1878; Isabella II. of Spain, 1847, 1852, 1856; Louis Philippe—no less than 6 attempts during 1835-46; Lord Lytton, 1878; Napoleon I., 1800; Napoleon III., 1855 (twice); Queen Victoria, 1840, 1842 (May and July), 1849, and 1882; William I. of Germany, 1861, 1875, 1878; Theodore Roosevelt, 1912; Mussolini, 1925, and thrice in 1926; Franklin D. Roosevelt, 1933; Venizelos, 1933; Abdul Aziz ibn Sa'ud, 1935; Hitler, 1944.

**Assault.** An A. has been defined as 'an attempt or offer with force and violence to do a corporal hurt to another.' Thus, to present a gun at a person within the distance to which it will carry, to throw a stone or other missile at him, to draw a sword and wave it, or to shake one's fist at a person within striking distance, to attempt to kiss a woman, to incite a dog to attack a person, are all forms of common A. But no words, however insolent and provoking, unaccompanied by an act of violence, amount to an A. A term much used in connection with A. is that of *battery*, and so close is the connection that the word A. is often used in the sense of battery. A battery consists of any kind of corporal injury, however small, designedly done to another by an actual contact with his person. A person assaulted is entitled to retaliate if the retaliation be not in the nature of revenge, but undertaken merely in self-defence and with the object of ending the A. The Scots law in particular is insistent on the discovery of which person struck the first blow in a breach of the peace, and goes slightly further than the Eng. law in excusing retaliation if it does not exceed a just measure of resentment. A person assaulted has two remedies: in the criminal courts, or in the civil court for damages, or both. But if a cause is brought for damages, the defendant, if he has been acquitted by the magistrates in the court of summary jurisdiction, may, if the A. is an ordinary one, obtain a certificate from the magistrate protecting him from all further proceedings. The civil action to which a person who commits an A. and battery is liable is an action of trespass. Strictly the person assaulted should vindicate the public wrong by prosecuting his assailant before pursuing his civil remedy. As. are divided for the purposes of criminal proceedings into common As. and aggravated As. The former is a misdemeanour, and is punishable in the police courts by a fine not exceeding £5 and costs, or, in default, 2 months' imprisonment, or if the case goes to the assizes as much as 1 year's imprisonment may be awarded. Aggravated As. have been defined by a number of statutes and include: indecent As. on women; As. on children; As. on the police and other public officials, including the clergy, in the execution of their duty; As. causing actual bodily harm. These aggravated As. are often classed as felonies, and are punishable with terms of penal servitude. The principals and spectators at a prize-fight are guilty of and are aiders and abettors to an A. The Scots law with regard to A. is similar to that of England, but there is no div., as in England, into 'A.' and 'A. and battery.'

**Assaye**, a vil. of Hyderabad in S. India. It is celebrated as the scene of a battle between the combined Mahratta forces and the Brit. under Wellesley, afterwards duke of Wellington, in 1803. It resulted in a complete victory for the Brit.

**Assaying**, a chemical process the object of which is the determination of the

amounts of certain metals in an ore or alloy. The methods used fall into 2 classes, dry and wet. In a dry assay the ore is reduced by fusion with suitable fluxes, so that the metal is recovered in a pure state. Wet methods are those in which by the action of certain reagents a solution of a salt of the metal is first obtained. The salt may be precipitated and weighed, or the strength of the solution may be determined by observation of the amount required to bring about a certain reaction with a standard solution of known strength. The composition of the salt being known by analysis, a simple calculation will determine the amount of the metal present.

The results of A. processes are dependent for their accuracy on the perfection of the balance used to estimate the different weights of the metals, which should be so constructed as to reveal the most minute differences in weight.

Before proceeding with an assay, it is necessary to obtain a true sample of the material; that is to say, a sample which is likely to contain the same proportions of its constituents as exist in the whole bulk of the material. There are various devices for accomplishing this, the usual method being the div. of a large supply of material into 2 unequal parts, the smaller part being subdivided and so on until a sample of convenient size is obtained. In the case of alloys in a solid state, holes are drilled right through the metal in different places, and the drillings taken for testing.

It is important to determine the amount of moisture in an ore. The simplest method is to heat a sample in an air-oven to a temp. of less than 100° C., when the loss of weight when the mass is quite dry indicates the weight of water in the sample.

The principle upon which the A. of gold and silver by cupellation depends is, that all metals with which those precious metals are usually alloyed are convertible into oxides by exposure to atmospheric air at a high temp., whereas the precious metals themselves remain unacted upon.

The general methods of A. as applied to particular ores, etc., are seen in the following examples:

**Lead.**—The dry assay of galena, or lead sulphide, is carried out by mixing the ore with a flux consisting of sodium carbonate and borax. The mixture is heated in a clay crucible at a red heat for about 20 min. and the fused material poured out. The lead button generally contains impurities, such as silver, antimony, and copper, so that its weight gives too high a percentage. The percentage of lead can also be gravimetrically determined by the formation of the sulphate. The ore is first dissolved in nitric acid, to which sulphuric acid is afterwards added. The excess of acid is removed by evaporation, and a precipitate of lead sulphate remains. This is washed with water to remove the iron and copper salts, and the insoluble matter is treated with dilute sulphuric acid. After filtering, the solid portion is treated with

hot alkaline ammonium acetate to dissolve the lead sulphate. After again filtering, the filtrate is treated with alcohol and sulphuric acid to re-precipitate the lead sulphate, which is then filtered, again washed with strong alcohol, and weighed. When, as is sometimes the case, the carbonate or white lead ore is found in considerable quantities, the process is similar, but a different flux is used.

**Copper.**—The percentage of metallic copper in an ore may be determined by electrolysis. The ore is treated with nitric and sulphuric acids until all the copper salts are dissolved, when the solution is freely diluted and submitted to electrolysis in a glass vessel with platinum electrodes, the copper being deposited on the negative electrode. The process is somewhat lengthy, but gives fairly accurate results. The potassium cyanide wet method depends on the fact that when potassium cyanide is added to a copper salt which has been rendered blue by the addition of ammonia, the colour gradually disappears. The ore is treated with nitric and sulphuric acids and then heated until the nitric acid is evaporated. The pure copper may be obtained from the solution by placing a small piece of aluminium foil in the solution. The copper is soon precipitated and sulphuric acid is added to dissolve the aluminium. The solid portion is washed and then treated with nitric acid, which dissolves the copper. Ammonia is added to the filtrate until it is just blue. The strength may then be estimated by adding the standard solution until the blue colour vanishes.

**Zinc.**—Dry methods are not used, owing to the difficulty in separating the pure zinc from the other metals found in the ores. The chief volumetric method depends on the reaction between zinc chloride and potassium ferrocyanide, zinc ferrocyanide and potassium chloride being formed. The ore is treated with a mixture of potassium nitrate and nitric acid, and a strong solution of potassium chlorate in nitric acid is afterwards added and the mass evaporated to dryness, Sodium hydrate and sodium carbonate are added and the mixture is filtered, after which the filtrate is treated with excess of hydrochloric acid. Any copper present is precipitated by passing sulphuretted hydrogen into the solution, after which the standard solution of potassium ferrocyanide is added. The end of the reaction is determined by testing a small drop of the solution with uranium nitrate. The appearance of a brown tint announces the presence of potassium ferrocyanide in excess.

**Silver.**—In what is called the scorification assay, the ore is mixed with an excess of lead and heated in a scorifier or clay dish. The silver compounds are decomposed, the silver forming an alloy with the lead, and part of the lead oxidising and combining with the other constituents of the ore. The metallic button produced therefore contains a small part of the lead used and all the silver. This alloy is then cupelled.

Cupels are small vessels moulded out of bone ash, which has the property of absorbing molten litharge or lead oxide, whilst the metallic portion is unaffected. The temperature used is just below the melting point of silver until just before the process is complete, when it is suddenly raised. The result is that the lead is oxidised and thus separated from the silver. The assays are slowly cooled so as to avoid 'splitting' of the silver button.

**Gold.** when the alloy consists of copper, is assayed by the same method as is used for silver, and any silver present is removed by the action of strong nitric acid, the metal being previously rolled into a thin plate, so that every part of it may be reached by the acid. When the alloy consists of silver the process is called parting. Generally, however, both processes have to be resorted to. Amalgamation with mercury is also resorted to when gold has to be separated from sand, gravel, &c.

**Iron.**—Dry methods are almost obsolete, and wet methods are all based on the readiness with which ferrous salts can be oxidised to ferric salts, or ferric compounds reduced to the ferrous condition. A standard method is the addition of potassium dichromate to an acid solution containing iron in a ferrous state. The ferrous salt is oxidised and the colour changes to green owing to the formation of a chromium salt. The solution must be continually tested by adding a drop to a little freshly prepared solution of potassium ferrocyanide on a white tile. When no blue colour is produced, the ferrous salt has been completely oxidised. The amount of the standard solution of potassium dichromate used determines the strength of the solution of the ferrous salt.

**Assche, or Asche,** a small tn. in Brabant, Belgium. It is situated 9 m. N.W. of Brussels.

**Assagal, or Assagal,** a weapon for throwing, usually a light spear made of wood and tipped with iron. It is used by all the Bantu peoples of Africa. There are the long and short A.

**Assemani, Giuseppe Simone** (1687–1768), a member of a celebrated family of Syrian orientalisks. When young he attended the Maronite College in Rome, whence he was transferred to the Vatican Library, and afterwards made archbishop in *parlibus* of Tyre. The pope sent him on an expedition to Egypt and Syria in quest of valuable MSS. His successful discovery of 150 of great value resulted in a second and even more successful journey. He ed. and pub. the most valuable MSS. of the Vatican. His 2 great works are the *Bibliotheca Orientalis Clementino-Vaticana rec. manuscr. coad. Syr., Arab., Pers., Turc., Hebr., Samarit., Armen., Æthiop., Græc., Ægypt., Iber., et Malab., jussu et munif. Clem. XI., and Ephraemi Syri opera omnia quæ extant Gr., Syr., et Lat.*

**Assemani, Simone** (1752–1820), grand-nephew of Giuseppe Simone A. b. in Tripoli. Prof. of oriental languages in Padua, and author of sev. works in It. and in Lat. on Arabian literature

and hist. He is best known by his masterly detection of the literary imposture of the Maltese, Vella, which claimed to be a hist. of the Saracens in Syria.

**Assemani, Stefano Evodio**, was the nephew of Giuseppe A., whom he succeeded as librarian of the Vatican. He was also bishop of Apamea, and amongst his works the 2 most important are: *Bibliotheca Mediceo-Laurentiana et Palatina Codicum MSS. Orientalium Catalogus*, with notes by Gori, 1742; and *Acta Sanctorum Martyrum Orientalium et Occidentalium*, 1748.

**Assembly, Church**, see CHURCH ASSEMBLY.

**Assembly, General, of Scotland**, see GENERAL ASSEMBLY.

**Assembly, National**, see NATIONAL ASSEMBLY.

**Assembly of Divines**, see WESTMINSTER ASSEMBLY OF DIVINES.

**Assen**, the cap. of the prov. of Drenthe, Holland. Peat-cutting is the chief industry. Pop. 11,329.

**Assent, Royal**. When a Bill has passed through both Houses of Parliament in the same session it does not become an Act, or the law of the land, until the sovereign has signified his or her consent, such consent being known as the R. A. The Parliament Act, 1911, provides that where a Bill has passed the Commons twice in 3 successive sessions, such a Bill may be presented direct to the king for his assent even if the Lords refuse to agree to its passage. The R. A. is sometimes given by the sovereign in persons but more often by lords commissioner, representing him, the power to do this being conferred by 33 Henry VIII. c. 21. The commissioners are usually 3 or 4 of the great officers of the state, and they hold letters patent under the great seal, signed by the king's hand. They or the sovereign signify the R. A. in the House of Lords, but the Commons are also present at the bar, to which they are summoned by the black rod, and to which they repair headed by the Speaker, the ministers, and the officers of the House. The assent is given in Norman-Fr. in the following picturesque fashion. After the title of the Bill is read by the clerk of the Crown, the clerk of the Parliament says 'Le Roy (or, La Reyne) le veult.' An expression of thanks for the 'benevolence' of 'ses bons sujets' is coupled to the assent to a money Bill, and there is yet another formula for assenting to a private Bill. Should the king refuse his assent to a Bill, the form of announcement is, 'Le Roy s'aviserà' (the king will consider it). But as the sovereign can now act only on the advice of his ministers, i.e. the Cabinet, this contingency never arises. The last instance in which the R. A. was refused was by Queen Anne in 1707, when she refused her assent to a Scotch militia Bill, but in former times the refusal of the R. A. was a common enough occurrence. Queen Elizabeth once at the end of a session refused to assent to 48 Bills out of a total of 91 presented to her. In 1853,

says Prof. Lowell, Queen Victoria was nearly advised by ministers to veto a private Bill obtained by the Fimleco Company because the House of Lords had not permitted the Board of Trade to appear and oppose something which it ought to have opposed before the Private Bill Committee. Unless it is stated to the contrary in the body of a Bill, a Bill becomes the law of the land and its operation commences from the day it has received the R.A. A bill to abolish the use of Fr. in all proceedings in Parliament and courts of justice was passed by the House of Lords in 1706 but was dropped in the House of Commons, so that Fr. is still used for the R. A., although it was enacted in 1731 that all proceedings in courts of justice should be in Eng.

**Asser**, properly **Ashi** (353-426), a Jewish doctor b. in Babylon. He was president of the academy of Sora, or Euphrates. He collected all the Jewish laws, doctrine, and tradition into the Talmud of Babylon, which is ranked above that of Jerusalem by the Gks.

**Asser**, or **Asserius Menevensis**, a learned monk of St. David's, b. in Pembrokeshire. King Alfred made him his preceptor and companion, and promoted him to bishop of Sherborne. *He d.* in 910. In 1572 his life of Alfred, *De rebus gestis Alfredi Magni*, was pub. by Archbishop Parker.

**Assessment** is the fixing by the discretion of the authorised assessor of the value of a property or income for the purpose of taxation or judicial award. See articles on COSTS; DAMAGES; RATES AND RATING; TAXATION.

**Assessor**. The word is derived from the Lat. *adessor*, one who sits beside another, and signified one who was learned in the law and sat by a magistrate or other functionary, such as a governor of a prov., to aid him in the discharge of the judicial duties of his office. In modern times the word has been applied in the reverse sense to one who, having a special technical knowledge, assists a judge to arrive at a decision, though having, of course, no part in the judgment. The Judicature Act, 1873, provided for their employment in all High Court cases, and the Appellate Jurisdiction Act, 1876, empowered the Judicial Committee of the Privy Council to obtain the help of the archbishops and bishops in eccles. causes. In maritime causes particularly **As.** are frequently employed, such **As.** generally being Trinity Brothens. The power to employ **As.** in hearing appeals from the Admiralty Court was conferred on the House of Lords by the Supreme Court of Judicature Act, 1891, and under the Patents Act, 1883, either party in an action to demand that the case be heard with an **A.** The Clergy Discipline Acts require that the bishop inquiring into the case should be assisted by three **As.**, one of whom must be a barrister and another being generally his chancellor. Apart from eccles. and maritime causes, the help of judicial **As.** is not often resorted to, their functions having long since been performed by expert witnesses.

**Assets**, in ordinary commercial parlance, implies any property or stock-in-trade of a merchant or company, and the term in this sense is used generally in relation to bankruptcy and insolvency. The more strict and legal application of the term (which is derived from the Norman-Fr. *assets*, meaning 'enough') is to the real and personal property of a deceased person, which, either in the hands of his heir, devisee, executor, or administrator, is chargeable with the payment of his debts and legacies. Strictly speaking, therefore, the term does not apply to an intestate person's estate or to the estate of a person who dies with no debts to be paid. A. are either *personal* or *real*. The former comprehend goods, chattels, and debts, whilst the latter include real estate (i.e. landed property), whether it descends or is devised to the heir-at-law. Both classes, by the operation of the Land Transfer Act, 1897, now devolve on the executor or administrator in the first place. A. are also divided into *legal* and *equitable* A., a distinction derived from the nature of the claim of the creditors on the heir or administrators of the estate. 'Specialty' creditors, i.e. those whose debts arose from a sealed instrument or bond, were formerly entitled to payment before those whose debts were in the nature of a simple contract, but this privilege has been abolished, and both classes of creditors now rank *pari passu*. The first charge upon a deceased's estate is the expenses of the funeral and the expenses involved in administering the estate. The next charges, if they are legal A., are those which have statutory priority, such as unpaid taxes, rates, judgments of the courts, etc. Next come ordinary creditors, and finally voluntary obligations. In equitable A., however, the executor must pay whoever first obtains a judgment for his debt: he cannot plead that he must keep back any part of the A. to meet other creditors' demands. When all the A. have been expended to meet the demands of various creditors and there are still creditors after the estate is exhausted, the administrator is entitled to protect himself by the plea of *plene administravit*, i.e. that he has fully administered the estate. When this plea is put forward the creditor is awarded a judgment of A. *in futuro*, meaning that he shall be paid out of any A. that may accrue to the defendant. In Scotland, although the word is used in the general sense of property, there is no legal term A. For administration of a bankrupt's A. see **BANKRUPTCY**.

**Assheton, William** (1641-1711), a divine, was b. in Lancashire. He was a voluminous if prejudiced and superstitious writer, as is shown in his work, *The Possibility of Apparitions*. His works include *Toleration Disapproved*, *Danger of Hypocritism*, *The Certainty and Eternity of Hell Torments*. His scheme of insurance for the clergy may be said to be the forerunner of present-day life insurance methods.

**Ashur**, the name of the earliest known

cap. of Assyria. Its site was that of Kalat Sherkat, on the rt. bk. of the Tigris, some 60 m. S. of Mosul. See also **ASSUR**.

**Assideans** were zealous defenders of the unity of the Deity and the belief of their ancestors, who opposed Antiochus Epiphanes (175-164 B.C.) and his successors when they endeavoured to put aside the Jewish religion and to introduce idolatry. The leader of these A. or Chasidim was Mattathias, who killed the commander of the tyrants at the idolatrous altar in Modeim, near Joppa. Antiochus, after an unsuccessful attempt to plunder a temple in Elymais, d. insane. The name Chasidim was given by later Jews to those persons who devoted their lives entirely to religious exercises and bodily chastisements, to expiate their own sins, or those of others, or to hasten the coming of the Messiah. They studied the Cabbalah (q.v.), fasted, and by mortifying the flesh thought to free the spirit from the body, and so to enter into communion with God and angels. About the middle of the eighteenth century a new sect of Chasidim arose, who held the belief that communion of man with God was effected by contemplation and prayer. This sect increased in number, some were considered representatives of God and their works were regarded as oracles.

**Assiento**, or **Asiento**, from the Sp., meaning contract. It is specifically used for a contract or convention between the king of Spain and other powers for supplying slaves for the Sp. dominions in America. A treaty of a like nature was entered into by Charles V. with the Flemings, which compact was the first of its kind. Similar agreements were concluded with the Genoese, Fr. Guinea Company, and England. Out of the disagreement over the A. between England and Spain concerning certain privileges granted to the South Sea Company arose the war of 1739. In 1748 4 years still were due to lapse, but at a cost of £100,000 the Brit. abandoned the A.

**Assignats** and **Mandats**. A. were bonds issued by the Constituent Assembly during the Fr. Revolution on the security of the confiscated landed property of the clergy. These bonds were called A., as they represented land assigned to the holder of these bonds. The first issue of these bonds amounted to 400 million francs (£16,000,000), and were generally in notes of 100 francs (£4) each, though many of them were for lower sums. The object in issuing A. was not only to obtain the full value of the confiscated lands, but also to supply the deficiency of coin in circulation. Shortly after the first issue another 800 millions in addition were issued, but without the liability to pay interest. The last of these 2 issues was made in Sept. 1790. In the beginning of 1791, the Legislative Assembly sequestered for the benefit of the state the property of all the wealthy *émigrés*, and in due course the Crown estates. On these more A. were issued, and by Sept. 1792 the total amount

issued was by a fresh issue of 200 millions brought up to 2700 millions. Towards the end of this year, the double effects of the general insecurity of property and person, and of the depreciation of A. caused by their over-issue, caused a general rise in prices, with its natural concomitant, distress and pillage of shops. To counteract this distress the most extreme measures were taken by Convention, and laws fixing a maximum price to bread and other necessities of life were enacted. In Aug. 1793 there were in circulation 3776 millions of A.; but by a forced loan of 1000 millions, and by the collection of a year's taxes, this amount was reduced to less than two-thirds. Later the wants of the Gov. led to a fresh issue of A. Eventually the enormous sum of 45,500 million francs in face value was in circulation, and the value of A. sank almost to nil, and early in 1796 a louis d'or (24 francs) was considered worth 7200 francs in A. Under the Directory recourse was had to a new kind of paper-money, the mandat. These M. were to enable any person who was willing to pay the estimated value of any of the national lands to enter into possession. They furnished, therefore, a somewhat better security than the A., as these could only be offered in payment at sales by auction. The estimate of the value of the lands was that of 1790, and in many cases this had considerably depreciated by 1795. The mandat of 100 francs at its first issue was worth only 16 francs in silver, and soon fell to a seventieth of its nominal value. The Gov. were soon forced to abandon the M. and declare that they should be received only in payment of taxes and of land. The last issue of paper-money was in 1797, and since then to the outbreak of the First World War, 1914, the legal currency of France was purely metallic.

**Assignment, see ASSIGNMENT.**

**Assignee in Bankruptcy,** a person officially appointed on behalf of the creditors to manage a bankrupt's estate and now termed a *trustee*. See BANKRUPTCY.

**Assignees, see ASSIGNS.**

**Assignment,** in Eng. law, is the name given to a deed or an instrument of transfer, the operative words of which are to 'assign, transfer, and set over,' and which transfers both real and personal property. In Scots law the word *assignment* is used in conveyancing, and corresponds to the Eng. law term A., but in some instances, where statutes employing the phraseology of the Eng. law have been extended to Scotland, the word A. has necessarily obtained a partially technical use. Thus property in copyright, patents, registered vessels, all of which are transferable, are in Scots law also referred to as being assignable. The prin. interests in land to be assigned are estates for life or for any definite period of uncertain duration, and a statute of Charles II. (Statute of Frauds and Perjuries) requires such A. to be in writing. An A. differs from a lease in being a

transfer of the entire interest of the lessor; whereas a lease is an estate for years taken out of a greater estate, creates the relation of landlord and tenant, and reserves to the lessor a reversion. In all under-leases, therefore, it is necessary that part of the original term should remain in the lessor, a day being sufficient. With regard to personal property, A. of goods and chattels in possession is made by bill of sale (q.v.). According to the Eng. common law a chose in action (q.v.) is not assignable. Common examples of a chose in action are the right to sue for a debt, a legacy, damages, etc., and the idea underlying the prohibition to assign these choses in action was to discourage litigation. The rigour of such a position of things was mitigated by the old equity courts, which, on grounds of expediency, sanctioned the transfer of such property, and even in the courts of common law the anct. principle was often evaded. Since the Judicature Act, 1873, every legal chose in action is assignable provided that the debtor be served with a notice of such A. In general it may be said that any form of property is now assignable with perfect freedom, if we except a few cases which are considered contrary to public policy, such as the A. of pensions and the salaries of civil servants. Mortgages can be, and frequently are, assigned, and bills of exchange (q.v.) are assignable on indorsement.

It follows from the definition of assignment as the conveying of the right to a thing and not the thing itself, that in Scots law, in the case of movable property, A. can only take place when that property is in the hands of a third party. To make the transaction complete, formal notice must be given the third party, and until such an intimation has been made the cedent's creditors may attach the property in the hands of the holder. This intimation is an important part of the transfer, for though as between the parties mere knowledge of the transaction is sufficient, in the case of a competition for preference in payment the assignment first intimated will have preference over others which may be prior in date, but of which intimation of assignment has been received later.

A. of property is void if it be with intent to defeat or delay creditors, unless the transfer is made for valuable consideration and the assignee has no reasonable grounds for suspecting fraud.

**Assigns in Eng. law and Assignees in Scots law** is the name given to the parties in whose favour a deed of assignment or assignment is made or property assigned.

**Assiniboia,** a name previously applied to two dists. of Canada, but now not held by either. The derivation of the word is from the Ojibway *assinin*, meaning stone, and the termination meaning to cook. The first dist. was formed in 1835 by the Hudson's Bay Company, and ceased to exist in 1870 on the transference of Rupert's Land to Canada. The second region was created by an Act of Parliament in 1875. By the Dominion Act of 1905 it was united to the former.

and now forms part of the prov. of Saskatchewan.

**Assiniboine**, a riv. of Brit. N. America. It rises in 51° 40' N. lat., and 105° E. long. It joins the Red R. at Winnipeg. Its course measures about 400 m., and its tribs. are the Little Souris, Qu'appelle, Rapid R., White Sand R., and Beaver Creek. A tribe of Indians takes its name from the riv. Steam communication exists between Winnipeg and Fort Ellice, about 700 m. distant.

**Assinie**, seaport at mouth of A. R. in the Fr. colony of the Ivory Coast. Seized first in seventeenth century by a Fr. trading company. The Fr. occupied it again in 1840 as an outpost but abandoned it to a commercial firm of La Rochelle. Reoccupied continuously since 1882. Exports groundnuts. Pop. 700.

from the Lat. *via* the Norm.-Fr. It is derived from the O.F. *assis*, and comes ultimately from the Lat. *assideo*, to sit by. It is possible that the word A., where it signifies an ordinance, a decree, or an assessment, and which is derived from another Lat. word, *assido*, meaning to assess, fix, or ordain, may in anct. times have been confused with the former word. In the latter sense the word was used for sev. ordinances, chief among which are those known as A. of Bread and Ale, the A. of Clarendon, 1166, and the A. of Northampton, 1176. By the first the price of bread, ale, fuel, and other necessities of life was fixed. The A. of Clarendon was an important ordinance of Henry II. reforming the administration of justice; it contained the beginning of the system of trial by jury. The A. of

ASSISI: THE UPPER AND LOWER CHURCHES OF ST. FRANCIS

E.N.A.

**Assisi**, a tn. of Umbria, Italy, in the prov. of Perugia. The tn. commands a splendid view of the valleys of the Tiber and the Topino, as it is situated on a mt. 1345 ft. above sea-level. The tn. owes a great deal of its fame to being the bp. of St. Francis, who was b. 1182 and d. 1226. Directly after his canonisation the Franciscan monastery was begun, and completed in 1253. The building is a magnificent example of Gothic architecture. In 1818 the sarcophagus containing his remains was discovered, and a crypt was consequently added. In the lower church are decorations by Cimabue and Giotto. A feature of the tn. is the castle of medieval style built by Cardinal Albornoz in 1367. It is 1655 ft. up and was added to by Popes Pius II. and Paul III. To the S.W. of the tn. is a large church where St. Francis is said to have died, and which contains his original oratory. The tn. is famous as a pilgrimage resort and for its influence in the hist. of It. art. Metastasio was b. here in 1698. Pop. 20,000.

**Assiut**, see ASYUT.

**Assize**. This word, like so many other legal terms, came into the Eng. language

Northampton still further removed administrative machinery from the control of the barons. The As. of Jerusalem were a code of feudal laws formed in 1099 for the new Christian kingdom of Jerusalem founded by the Crusaders.

The most common connotation of the term A., and that in which it is almost exclusively used at the present day, is that which denoted the session of High Court judges held periodically in each of the cos. of England and Wales. Their origin is to be found in articles 22 and 23 of Magna Charta, which provided that judges should visit each co. to take As. of *novel disseisin* and *mort d'ancestor* (abolished in 1835), i.e. to settle disputes about the possession of land. Prior to this, by the common law, the administration of justice was confined to the judges sitting in term at Westminster and to justices in eyre (i.e. itinerant judges), whose circuits sometimes took 7 years to complete. The Statute of Westminster II., passed in the thirteenth year of Edward I., enacted that the justices should be 2 sworn judges, and that they should hold court in each shire not more than thrice a year. Since the passing of

1 William IV., c. 70, these courts have been held generally twice, but sometimes thrice, a year on a regular system, the country being divided for this purpose into *circuits* (q.v.). London and Middlesex do not come within the circuit system, the administration of criminal justice being at the Central Criminal Court (q.v.). Judges in the A. courts are as fully qualified to deal with all questions of law and fact as are those of the High Court, and in practice are always judges of that court. Their powers are now derived from 4 authorities: firstly, a commission of *oyer and terminer* (q.v.); secondly, a commission of *gaol delivery* (q.v.); and, fourthly, a commission of *nisi prius* (q.v.). The Scottish courts of justiciary are circuit courts somewhat similar in their function to the A. courts of England, but in civil causes they are practically limited to hearing appeals from the small debt courts. Only occasionally is a civil trial by jury transferred from the court of session to the court of justiciary. There are 3 circuits, N., S., and W. (the court of session being at Edinburgh in the E. of Scotland), in which courts are held twice a year, but owing to pressure of work, Glasgow, Perth, Dundee, and Aberdeen have additional courts.

**Assmannshausen**, a vil. in the dist. of Wiesbaden, on the Rhine, 2 m. from Rüdesheim. It is celebrated for its wine. Pop. 1500.

**Associated Counties.** In 1642 Essex, Cambridge, Norfolk, Suffolk, Hertford, and later Lincoln and Huntingdon, formed a league to defend their ters. from destruction during the Civil war. Their troops were commanded by Lord Grey of Wark and later by Cromwell.

**Associated Press of America.** This is an Amer. body, which claims to be the largest co-operative news organisation in the world, and in support of this claim points to the fact that it represents 1200 daily and Sunday newspapers. It works with over a score of other news agencies abroad and provides its members with 'spot' news, objectively presented. Its rival is the United Press of America.

**Associates**, the term applied to clerks of the Crown office, who were once 'associated' with the judges of the commission of assize. They are officials of the King's Bench Div. of the High Court, and must be barristers or solicitors. Their duties include keeping the records of the court; the preparation of the cause lists, attendance on the judge in court, and the entering up and delivering to the right quarter the verdict and record of the case.

**Association.** The, a league, the full name of which was 'The National Association for King William,' formed in 1696 to protect the king against polish plots, as a result of the recent assassination plot. It enjoyed considerable popularity.

**Association Football.** see FOOTBALL.

**Association of Ideas**, an important term in philosophy and psychology first used by the Eng. philosopher Locke, but given by him a very limited reference,

and used rather to connote mental idiosyncrasy than as a term explanatory of the operations of thought generally. The office which A. performs is to connect and arrange ideas, to regulate the succession of the thoughts. When one thought is suggested by another, or when a train of past images is summoned by something present, whether spontaneously or by an exertion of the memory, the process by which this is made is called A. Thus by an A. of I. 'lightning,' either actual or the mere word, suggests 'thunder,' and 'black' suggests 'white,' 'funeral,' or 'negro.' David Hume, the Scottish philosopher, was the first modern writer who traced the influences of our As. to certain principles, which he denominated 'resemblance, contiguity in time or place, and cause or effect,' but Aristotle in his treatise on memory had enumerated 3 principles of A., viz. similarity, coadjacency, and contrariety. This last category, contrariety or contrast, is now generally abandoned, for on reflection it will be seen that all associated contraries can just as well be classed under contiguities. In the same way causation is merely another case of contiguity, and most modern writers assign A. of 1. to 2 great principles: *likeness* and *proximity* (or, more technically, similarity and contiguity). Two examples of A. arising from contiguity have been given above. In the first case the A. arises purely from contiguity (of time), for our brain has recorded the fact that immediately after most flashes of lightning there has been thunder. As for the second example, it is obvious that although 'white' is the contrary of 'black,' it is also contiguous (in time and place) to it, for we cannot think of 'white' (a relative term) without at the same time thinking of the 'non-white' surroundings, i.e. black. The law of similarity may be defined as *present* impressions which tend to revive a memory of *previous* like impressions. If the mind were only capable of working on the principle of contiguity we should recall nothing but that in which some connection was already formed. There may be large classes of our As. which are not referable to any of the above principles, e.g. the terms of art and the words by which we designate moral and intellectual qualities and operations; in short, the whole vocabulary of language, in which there is next to no connection, either in the way of resemblance, contiguity, cause, effect, or contrast, with the ideas or objects represented, although none of them ever fails to summon up the images of the things for which they stand. But, according to Spencer, anomalies like this, when reducible to certain limits, establish rather than invalidate the laws to which they form an exception. While thought is intensely directed to a particular subject, the As. act in subordination to that which is for the time 'the ruling idea of the mind'; when this mental intensity subsides, the attention ceases to concentrate the faculties of thought and the mind relapses into its ordinary mood in

the absence of excitement. Hence the attention which fixes the thoughts controls the As.; the relaxation of attention which allows the thoughts to wander grants the same liberty to the As. The associationist school is the name given to those psychologists who endeavour to explain all mental processes by the theories of A. of I. This school is almost entirely Eng., but it includes the Fr. thinker Condillac. Hobbes, Hartley, and Hume may be said to be the founders of the school, and notable representatives of it in more recent times are the two Mills, Herbert Spencer, and Prof. Bain. Diversity of opinion exists among the associationists, some, like Hartley, emphasising the predominance of contiguity, whilst others, who number among them Herbert Spencer, insist on the importance of similarity. This latter section is still further divided by those who would make a contrast a distinct principle. In recent years psycho-analysis has made great use of the principle of A. of I. in securing that catharsis which is the basis of mental therapy. From the psycho-analysts the police have adopted the idea as an aid to the discovery of crime by the interrogation of suspects, of the 'third degree' as applied in the U.S.A. See articles on the respective writers above mentioned, and on **PSYCHOLOGY**.

**Assoilzie** (O.F. *assoiler*, and Lat. *absolvere*, to absolve), a term in Scots law meaning to absolve from a claim, to acquit, to pronounce not guilty.

**Assonance** (Lat. *assonare*, to respond to), a form of rhyme not strictly correct. In the final words it is sufficient to have similar-sounding vowels irrespective of the consonants connected with them. It is a form that is popular in much of our rustic verse. In foreign literatures A. is studied and cultivated to an artistic degree. It appears to have played an important part in the evolution of rhyme. A preference for assonant rhyming is found among the Romance languages, while in the Teutonic the reverse is the case. One reason, of course, is that the harsher and more discordant consonants of the Teutonic tongues have a more distorting effect upon their vowels. In Sp. literature A. is cultivated and recognised as the most popular form of rhyme. Its use in prose serves to ornament it and to point to skill in the stylist, but often the occurrence is due to coincidence. Some poets of to-day make extensive and effective use of it, but its use is not generally admitted to be justified in 'classical' Eng. literature.

**Assos**, or **Assus**, a tn. on the gulf of Adremyttia (Edremit), Mysia. It is in ruins, and expeditions for the purpose of excavation have unearthed a bath, a theatre, a senate house, and 7 Christian churches. Its site is now occupied by the Turkish vil. Behram.

**Assuan**, see **ASWÂN**.

**Assumpsit** (past tense of Lat. *assumo*, barbarously signifying 'I undertake'), an old form of action under the common law so called because the defendant was said

to have taken upon himself (*super se A.*) to pay the plaintiff so much money. It was used to recover damages for breach of a simple contract, i.e. a contract not made under seal, but in form the action was similar to an action for trespass. The action could not be sustained unless the promise to pay had been expressly made, either by an actual written instrument, such as a promissory note, or implied, as when a householder receives goods delivered by a tradesman, or an innkeeper undertakes, by his action of receiving a traveller, the responsibility for the security of the goods of his guest. Like so many other common law forms of action, the action for A. has been superseded by such statutes as the Common Law Procedure and the Judicature Acts.

**Assumption, Feast of**, a festival of the Christian Church celebrated on Aug. 15 to commemorate the ascent into heaven of the mother of Christ. Its authority is taken from apocryphal sources. The festival was first instituted by the Emperor Maurice in A.D. 582.

**Assumption, Paraguay**, see **ASUNCIÓN**.

**Assur**, a Heb. name for the dominion of Assyria. It is mentioned in the O.T.

**Assur**, the mythical founder of Assyria, and probably identical with the Asshur of Gen. x. 22, son of Shem. Gave his name to the country of Assyria and to its cap. A. was above all a god of war, and his symbol—the figure of a god in a horned cap, in the act of shooting an arrow from the bow, enclosed in a circle—was the ensign under which the Assyrians marched to battle. His name is frequently associated with that of the goddess Ishtar.

**Assurance**. This term is often applied specially to life as distinct from fire and other clauses of insurance, but A. and insurance are practically identical. The term is also frequently applied to grants or conveyances of interests in land. See **INSURANCE**.

**Assur-bani-pal**, king of Assyria. He succeeded Esar-haddon in 669 B.C. The chief events of his reign were the suppression of an insurrection in Egypt, the defeat of Te-umman, king of the Elamites, and the conquest of Babylonia, of which the king, Sarnas-sum-yukin, brother of A., had revolted against the Assyrian overlordship. In spite of these successes, the reign saw the beginning of the decline of Assyrian power.

**Assynt, Loch**, a fresh-water lake of S.W. Sutherland. It is 215 ft. above sea-level. Its length is 6 m., and its breadth 2 m.

**Assyria**: in Assyrian inscriptions **Assur**; in the Persian, **Athura**; in the Median, **Assura**. It was the northernmost country that occupied the great Mesopotamian plain. Its boundaries were, on the N. the Niphates Mts. of Armenia, on the S. Susiana and Babylonia, on the E. Media, and on the W. the Tigris or, more accurately, the watershed of the Euphrates. Its length was about 280 m. from N. to S. and its breadth 150 from E. to W. It is interrupted by mt. masses on the N. and E., and drained by the Tigris and its affluents. The most fertile part of

the country, Adiabene, lay between the Zab Rs. The anct. cap., Ninus (Nineveh), founded by the king of the same name, was, according to Strabo, situated on the Tigris and in the Aturian plains. Conjecture identifies its ruins with those on the Tigris opposite Mosul. A's political importance was due to its position between the Semitic tribes and Iran. It attained a high standard of civilisation, proof of which exists in the testimony of old writers and in the existence of the ruins of huge cities, of irrigation contrivances and canal routes. Modern excavations have yielded, too, many relics of great value in art, and show the lofty intelligence possessed by the Assyrian peoples. Nineveh is the centre around which many of the ruins are grouped, while farther S. a continuous line of ruins extends along the Tigris from Tekrit to Bagdad. The magnificent country was reduced to its present barrenness under Moslem rule. Among anct. authorities there is much divergence of opinion respecting the actual hist. of the Assyrian empire. Ignoring the less trustworthy authorities, we find in the Bible (Gen. x. 11) information that Nineveh was founded from Babylonia. In fact both Babylonia and A. had so many characteristics in common and were moreover so closely connected one with the other, that to read of the rise of one is but to learn of the fall of the other. Recent excavations have borne out the fact of Nineveh's situation in Babylonia. From inscriptions on bricks from the old cap., Assur, has been gained the information that the original rulers of the land were called Patesi, and the city itself bore the name of Pal-bi-ki. No further information is available till the year 738 B.C., when their king, Pul, or Tiglath-pileser III., invaded Palestine and was paid money to evacuate by Menahem, king of Israel. During the same reign Ahaz (Jehoahaz) became a vassal of the court of A., while those tribes beyond the Jordan were carried off as captives in 734 B.C. Sargon, 'the Tartar,' who had deposed his master Shalmaneser, captured Samaria in 722 B.C. In Isaiah mention is made of the siege and capture of Jerusalem by Sargon and also the siege of Ashdod (712-711 B.C.). The latter event has no connection with the siege in 701 by Sennacherib. The next record is that of Esar-haddon, son of Sennacherib. Esar may be given first place in the rank of the most powerful of the Assyrian rulers. He extended his dominions to the Mediterranean and acquired Egypt by conquest. In the book of Judith, the record of Holofernes' expedition is too much involved in obscurity to warrant much reliance being placed upon it.

From this time the empire seems to decay, and its decline had assumed such a stage that a union of Nabopolassar of Babylon and Cyaxares of Media was formed for the destruction of the country. The resulting war was protracted by an invasion of the Scythians, who prevented by counter-attraction any harm from Cyaxares. Eventually, however, Nineveh was captured and destroyed about the

year 605 B.C. In alliance with Media, an Assyrian rebellion met with signal failure in the time of Darius Hystaspes. The cap. had quite ceased to be during the reign of Herodotus. The actual ruins of the city were noticed by Xenophon, who testifies to the height of the ruined walls (150 ft.). (See also under NINEVEH.) A minor tn. seems to have flourished during the reign of Claudius on the old site. In Tacitus the last mention is made of the tn. A hist. of the city by Ctesias, largely the product of an imagination soaring above the facts at his disposal, is based upon partial Gk. and Persian myth. At the time his work was received with some credit, but recent investigations have proved the error of his statements. In 600 B.C. A. became a Median prov. and subsequently, together with Babylonia, it formed one of the principalities of the Persian empire. In 331 B.C. Alexander defeated Darius Codomannus at Gaugamela. In A. Twenty years later A. became part of the kingdom of the Seleucids, whose cap. Seleucia was situated on the R. Tigris. Under the Parthian kings the cap. was transferred to Ctesiphon, and was at times in possession of the Romans. The successors of Mohammed destroyed the Persian kingdom of the Sassanids, and A. now came under the rule of the caliphs. Their cap. was Bagdad during the years A.D. 762-1258. From 1638 it has been governed by Turks, after being captured by them from the Persians.

Before the Assyrian monarchy began its fascinating hist., that of Babylonia had already approached its end. In early times the governors of Assur were those appointed by Babylonian monarchs. In the seventeenth or sixteenth century B.C. they had acquired sufficient power to establish their independence at Assur. Guerrilla warfare on the border was for some considerable time maintained, with an occasional peace, produced by alliances of marriage. Of the actual kings of A., apart from the governor appointed by Babylonian rulers, Bet Kapkapi was the first. The ter. along the Tigris was in his possession, although under the rule of his successors its extent varied with their constantly changing success. The actual beginning of its powerful position dates from the reign of Rimmon-nirari I. in 1320 B.C. Calah was founded by Shalmaneser I., his son, and his grandson, Tiglath-Adar I., rose so high that an invasion of Chaldaea resulted in the capture of Babylonia in 1280. The first Assyrian empire was founded by Tiglath-pileser I., his descendant, about 1140. Success favoured his reign, and it is at this point that A. rose to the height of its early power. Throughout W. Asia, from Elam to the Mediterranean, from Armenia to the Persian Gulf, its dominion extended. Sippara and Upija were annexed, and Chaldaea was made a trib. state. Westwards his energies led to the possession of Cilicia, involving the capture of Carchemish and the vassalage of the Arvad people, with the ownership of the cities of N. Phoenicia. From this

point of eminence, however, a decline set in. The succession of Assur-bel-Kala, his son, with an administration as weak and futile as his father's was strong and irrepressible, saw a decay as rapid as its rise had been. So great had been the fall that we find the once all-powerful Assyrian empire bowing in homage to the Armenian monarch. This low condition was not permitted long to continue. A new dynasty, founded by Assur-dân II. in 930 B.C., once again caused the fallen empire to raise itself above the horizon. A succession of wars, cruelly carried out, under Rimmon-nirari II. and Assurnatsir-pal, again led to the recovery of the old supremacy of A. Besides the restoration of all the former provs. further annexations were made in N.E. Armenia and Kurdistan. The cap. was removed during the middle empire from Assur to

general revolt of the provs. Sargon, Tiglath's second successor, ascended the throne with one object nearest his heart. That was the conquest of the Babylonian kingdom. After a bloody succession of affrays he accomplished his desire. The successful invader then built a splendid palace for himself of extraordinary grandeur at Dûr Sharrukin. Explorations of it have resulted in the discovery of some beautiful sculptures, which form to-day one of the most valuable acquisitions of the Louvre. In 675 the Assyrians embarked upon one of the most important campaigns connected with their hist. It resulted in the subjugation of the Egyptian ter. With this event the whole of the anct. world came under one rule, and it is not surprising that the idea of a universal empire for the whole world was now born. The statue of the king

British Museum

## AN ASSYRIAN HUNT

A bas-relief from a slab found at Nineveh.

Calah, and gorgeous buildings were constructed by the kings. Assurnatsir-pal has been found to have been the most outrageously cruel of a line of kings remarkable for their cruelty. Utter ruthlessness and disregard for human suffering seem to have been characteristic of Assyrian rule. An Assyrian code found by the Ger. Oriental Society, which in 1910-16 excavated the site of Assur, is far more harsh than the Babylonian code of Hammurabi. By the time of Shalmaneser II. the dominance of A. had spread throughout the whole of W. Asia, and it was during this reign that a series of synchronisms was created between Assyrian and Heb. annals. Still further additions were made to the ter. under his son, Samas Rimmon II. (823-810 B.C.), and now for the first time the Assyrians met the approaching Aryan tribes. Strangely enough, the turning point of Assyrian power coincides with a solar eclipse, records of which are found in the Assyrian eponymous canon. A spirit of revolt became manifest, and a new method of gov. proved the saviour of the country under Tiglath-pileser III. The revolution, however, was still dormant, and showed itself again shortly after in a

Esar-haddon was carved in the rocks at Baal-Rasi, and an inscription was engraved recording the event. In 669 B.C. Esar-haddon d. during a second Egyptian campaign. Of his abilities as a ruler, it is sufficient to say that no Assyrian king had exhibited such a high standard of administrative talent together with military genius. His son, Assurbani-pal, during his reign continued the campaign and embarked upon fresh ones with a success that is almost monotonous. With all his military exertions he had time to devote to the patronage of arts and letters. Indeed, with his reign the culminating point of Assyrian power is reached. A severe blow was now aimed at the empire. His brother had been installed viceroy during the absence of the army in other lands. He took advantage of the moment to organize a gigantic revolt. The Elamites, Arabs, and Egyptians joined forces, and for 5 years the revolution raged. At the end of that time the Assyrians had conquered the revolutionists and destroyed the allies. But the effort had been more than ordinarily weakening in its effect. So vast an achievement could have only one consequence, gigantic though the military

resources of A. were. Everywhere the foundations of Assyrian rule were shattered. The viceroy of Babylonia declared himself king, and his successor Nabopolassar, whose son was Nebuchadnezzar, in the face of all authority avowed his independence. The last Assyrian king of note was Esar-haddon II. Inscriptions testify to the invasion during his reign of a formidable army composed of the united forces of Aryan and Turanian tribes, Medes, Gimmerians, and Armenians. A period of anarchy followed the death of Assur-bani-pal, and A. now became a prov. of Media, after the destruction of Nineveh.

The religion of A. was simpler than that of Babylonia, though of course it originated from the Babylonian. In character it was polytheistic, yet without the innumerable deities of the pantheistic creed. Every object and phenomenon in nature was believed to be animated by a spirit. Assur (*q.v.*), the national god, was regarded as the spiritual founder of the race. Ignoring the lesser deities, the gods of A. may be divided into 2 prin. triads. First is the 'nature' triad. A description of this group is contained in the 'Chaldean creation tablet,' and comprising *Anu*, the father of all the gods, who was regarded as the progenitor, termed 'the heaven'; *Bel*, called 'the lord of the world,' who was the ruler of the earth; and *Ea*, who was one of the most prominent of the Assyrian gods. He was termed 'lord of the sea,' and was the lord of wisdom and knowledge. Next is the celestial triad, containing the 'moon god,' *Sin*; he was called the 'lord of laws'; the god of the sun, *Shamas*, whose appellations include 'the judge of heaven and hell,' 'the lord of light.' The morning and evening hymns to him constitute the most perfect specimens of Assyrian sacred literature. *Adad*, synonymous with *Ramman*, was the god of storm and thunder. *Ishar*, the goddess of the crescent moon and 'queen of the stars,' was the third member of this triad. She is given many and varied attributes, including those of 'queen of war' and 'archeress of the gods.' The most important of the lesser deities was Marduk or Merodach, the son of *Ea*. The importance of his position as mediator between the immortals and men necessitated a great amount of invocation. Next were *Nabu*, son of Marduk, the scribe and messenger of the gods, in whose hands were the Tablets of Fate, and his consort, *Tashmetu*. All the collections of MSS. and other embodiments of learning were dedicated to him. Some of the terms applied to him were 'the wise god,' 'the enlarger of the mind.' Two statues were found at Nimrud (Calah), now in the Brit. Museum. *Nergal* (*q.v.*), a solar deity, was god of war and hunting, and king of the lower regions. The title of 'the great devourer' was assigned to him as, in addition to being god of war, he was god also of death or destruction. *Nusku*, the new moon, was a light and fire god associated with *Sin*, and appears sometimes as the latter's son. The actual rites performed in the worship of these

gods resemble those of Babylonia, from which, indeed, they are taken. Among them were morning and evening sacrifice, and the offering of bread, wine, and milk.

It is now recognised that the Assyrians were a branch of the Semitic peoples. Hence they belonged to the same race as the Syrians, Phœnicians, Jews, and modern Arabians. Semitism was first estab. in Chaldæa some time before the twenty-first century B.C. The pressure of invaders from the E. drove the Semites from Chaldæa, where they had been the dominant race. From here they went to the S. countries of Asia Minor, Carthage, Sicily, Spain, and W. Africa. From their traditions clues to a close connection with Ethiopia, Arabia, and the cities of the Euphrates have been discovered. Their language, it is apparent, is related to the N. branch of the Semitic. In certain points it comes near the Arabic.

One of the most important discoveries arising from the explorations that have been organised was that of an extensive library. This was unearthed in the palace of Assur-bani-pal at Nineveh, and it contains thousands of tablets. Numbers of them repose in the Brit. Museum. The name of Assur-bani-pal is inscribed upon most of them, though it is probable that, directly, the presence of such a fine collection is due to the foresight of Esar-haddon. References to old copies have led to the truth that these tablets bear inscriptions taken from former and older specimens, and duplicate copies have been discovered in Babylonia. It is apparent that the object of the library was to act as a preventive to the custom of sending their youth to be educated at Babylonia, where a risk was certain of their imbibing prejudices and assimilating dangerous political ideas. Tablets containing learning on the subjects of old languages such as the Akkadian and Sumerian, text-books on mathematics, tables of square and cube roots, lists of birds, plants, and animals, and geographical works point to the educative influence for which the collection was intended. But in richer and far more numerous quantities were the tablets of poetic and mythological literature. Among these discoveries was that, in 1872, of a number of poetic legends relating to the career of the great Chaldean hero Gilzdhubar. The eleventh tablet of this series contains an account of the deluge, and striking similarities to the Heb. version occur. Here the flood is ordained as a punishment for evil-doing, while the name of the builder of the ark is Samas-Napisti (interpreted 'the living sun'). The mt. of Nizir is the landing-place, while the duration of the rain is 7 days. The differences which occur point to the fact that the different versions were taken from one older and common legend and coloured with local facts and landmarks. The resemblance to Genesis which is borne by later-discovered legends describing the phases of creation is extraordinary, while the

psalms and hymns possess exquisite beauty of diction.

How much the general reader owes to the work of those engaged in excavation it is difficult to say adequately. Much has been done, and among the most remarkable monuments now in London at the Brit. Museum are 2 winged human-headed lions rising to a height of 12 ft., winged human-headed bulls quite as ponderous, winged sphinxes, and the famous black marble obelisk. The subjects of inscription on the last-named include a victory, a prisoner acknowledging submission to a king, and foreign people paying homage, while the animals portrayed include the Bactrian camel, elephant, lion, and rhinoceros. The work in bas-relief is of a quality unexcelled in oriental art. It is characterised by a spirit of accuracy, grace, and artistic touch difficult to realise as work of such an age. The Assyrian kings being great fighters and hunters, the favourite themes of the sculptor are the marching of an army, an attack, a pursuit, a siege, the fording of rivers, lion-hunting, and the counting by secretaries of the heads of game taken in a hunt, or the estimating of prisoners of war. In the ruins of Assur-bani-pal's great palace at Nineveh, a series of such sculptured bas-reliefs has been found, and is now to be seen in the Brit. Museum, illustrating the hunting prowess of the great king. Quaint concessions are sometimes made. An instance is the drawing of 5 legs to a bull in order that from every point of view 4 may be seen, and similarly in order to dispel confusion arising from the portrayal of a ladder placed against a wall, it is turned to face the observer. There is little to be gathered, however, about private life from the work. The principle of the arch, the use of the level, and the construction of aqueducts and drains were accomplishments all known to the Assyrians, while their ornaments exhibit skill in the working of metal. Assyrian architects possessed a great advantage over the Babylonian, in that marble was procurable in large quantities, whereas the Babylonians had to rely solely on brick. Sennacherib, early in the seventh century B.C., built a wonderful palace at Nineveh, and left inscriptions describing the progress of the work. His palace, and that of Assur-bani-pal, have both been excavated, but little of the actual city of Nineveh has been explored. The palace of Sargon II. at Kirsabad (Dür Sharrukin) is another splendid example of Assyrian architecture. Excavations have also been carried on at Assur and at Nimrud, or Calah, but the sites of other Assyrian cities are as yet hardly touched.

**Ast.** Georg Anton Friedrich (1778–1841), a great Ger. scholar and teacher, was b. at Gotha and d. at Munich. He went to the univ. of Jena in 1798, where he studied philosophy and philology. In 1802 he became an academical lecturer at Jena; and in 1805 was appointed prof. of anc. literature in the univ. of Landshut, which institution was transferred to Munich in 1812. He wrote many philosophical and philological works, and during the latter part of his life gave most of his time to the study of Plato. His *Platons Leben und Schriften* is an excellent work. In 1809 he began to edit separate dialogues of Plato; and from 1819 to 1832, he pub. a complete ed., with a Lat. translation and a commentary. His *Lexicon Platonium* was pub. 1834–39.

**Astacus**, a genus of decapod crustaceans. *A. serratus* is an Australian crayfish; *A. gammarus* (or *Lomarus vulgaris*) is the lobster (q.v.). An astacian is a member of the family, and an astacite is a fossil crayfish.

**Astarte**, see ASTORETH.

**Astatic Couple**, 2 magnetised needles mounted one above the other, and parallel, but with the poles reversed. If the strength of the 2 magnets is nearly identical, the couple will show little tendency to set N. and S., but will still be sensitive to an electric field. Hence A. Cs. are used in astatic galvanometers.

**Astell**, Mary (1668–1731), Eng. authoress, b. at Newcastle-on-Tyne. Her uncle educated her in Lat., Fr., logic, mathematics, and natural philosophy. She finished her studies in London, and pub. in 1691 *A Serious Proposal to the Ladies, wherein a Method is offered for the Improvement of their Minds*. It advocates the establishment of a kind of Protestant nunnery. Her other prin. work was *The Christian Religion as Professed by a Daughter of the Church of England*.

**Aster**, a large genus of Compositæ universally grown. The China A. is a species of the allied genus *Callistephus* and not the A., though it is sometimes called *A. chinensis*; it grows in China and Japan, and is properly known as *C. hortensis*.

**Asterabad**, see ASTRABAD.

**Asteria**, or Star-stone, the name applied to a stone which, when cut in the form of a dome, shows a star of 6 rays. Especially used of an imperfect variety of sapphire, which is bluish-grey in colour and is milky or opalescent. Asterism is the name given to the optical phenomenon of a star-shaped figure which is exhibited by some crystals. Asteriated sapphire gives rise to this phenomenon

by reflected light, and some forms of mica by transmitted light. Asterism is also the name of any group of stars smaller than a constellation.

**Asteria** or **Asterie**, in Gk. mythology, the daughter of the Titan Coeus and Phoebe, sister of Leto, mother of Hecate. To escape the embrace of Zeus, she took the form of a quail (*ortyx*), and threw herself into the sea, where she was changed into the is. A. or Ortygia, afterwards called Delos.

**Asterias** (Gk. *ἀστέρ*, star) is the name of a genus of starfishes, of family Asteriidae and phylum Echinodermata. *A. rubens*, the 5-rayed starfish, is common to the North Sea, *A. glacialis* to other European seas. Starfishes are found throughout the world.

**Asteroids** is the name given by Sir William Herschel in 1802 to what should more properly be termed, as they are sometimes planetoids. These planetoids, now usually known as minor planets, are, as this latter name indicates, a numerous group of very small planets not visible to the naked eye, situated in the solar system between Mars and Jupiter. The discovery of Uranus by Herschel in 1781, which first broke through the old opinion that the number of planets was complete, and the gap between Mars and Jupiter which Bode's law (*q.v.*) indicated should be filled by some planet, gave an impetus to the search for a new planet, which resulted in the discovery by Piazzi at Palermo on Jan. 1, 1801, of the first and largest of the A., Ceres. On Mar. 28 of the next year Olbers at Bremen discovered Pallas; on Sept. 1, 1804, Harding of Göttingen found Juno; and on Mar. 29, 1807, Olbers found the fourth planetoid, Vesta. It was not till Dec. 8, 1845, that Hencke at Briesen discovered Astræa, and he added a sixth to the list in Hebe, found on July 1, 1847. Since that date no year has passed without the addition of some A. to the list, and at the present time over a thousand are known, and apparently there is no limit to their numbers.

The introduction of the photographic method by Dr. Max Wolf in 1891, now exclusively used for detecting these bodies, has enormously accelerated their discovery: *e.g.* in 1908 117 were found. The photographic plate is fixed to a telescope worked by a mechanism which follows the apparent motion of the 'fixed stars.' It follows that if the plate be long exposed, any heavenly body with a proper motion will be detected owing to the fact that its image on the plate will be a short streak instead of a round disk. The 4 largest As. are Ceres, Pallas, Vesta, and Juno, whose diameters are respectively 480, 306, 241 and 121 m.: the diameters of the majority of the As. are considerably less than 50 m. and Shapley and Nicholson have detected and measured one whose diameter is 3 m.: this is, therefore, the smallest planet whose dimensions have been ascertained.

The total mass of all the A. probably does not exceed one-thousandth of the mass of the Earth and in any case must

be less than that of Mars, for otherwise noticeable perturbations of Mars in its orbit would be detected. There appears to be no lower limit to the size of the A., a fact which indicates that they are meteoric rather than planetary bodies. This is supported by the fact that their orbits are often very eccentric, *e.g.* that of Pallas is inclined at 35° to the ecliptic.

Most of the A. are fainter than the tenth magnitude, and it is surmised that they are irregular masses of rock, and no A. appears to possess an atmosphere.

Eros makes the nearest approach to the sun, and is of great importance for determining the solar parallax.

After the discovery of the larger A. it was suggested that they had their origins in the breaking up of a larger planet. A later suggestion was that the A. were originally distributed in a ring round the sun (*cf.* Saturn's rings), and that perturbations by the planet Jupiter broke up the ring, giving rise to the present A., but it is not possible to state whether either theory is correct.

**Asthenopia**, weakness of the muscle of the eye or of visual power, due to overuse, anaemia, or errors of refraction.

**Asthma**, a paroxysmal affection of the bronchial tubes characterised by cough, laboured breathing, and a feeling of suffocation. There is little known about the cause of the disease; but in 50 per cent of all cases it is a hereditary affection, and is therefore probably due to a constitutional peculiarity, such as a singular sensibility of the local muscular fibres to spasmodic contraction. The immediate cause of a paroxysm may be the inhalation of an irritant, such as chemical vapours, smoke, fog, dust, and emanations from plants or animals; gastric or intestinal disturbances; emotional excitement or increased blood-pressure; or the presence of some chemical substance or toxin acting on the respiratory centre.

The paroxysm usually comes on at night and at a particular time. The patient has a feeling of suffocation, sits up in bed and grasps the knees, or bends down with the palms on the bed so as to raise the shoulders; if able, he may rush to an open window, or take up an attitude on a chair which his experience has shown him is conducive to easier breathing. The face is pale and anxious, and the eyelids, lips and fingertips livid, owing to insufficient oxygenation. The breathing becomes whistling and slow, and the chest may become distended, owing to inability to expel the air. The length of the attack varies in different individuals, and the subsidence of the paroxysm is usually abrupt and somewhat unexpected.

To bring relief during the paroxysm it is necessary to remove the cause, if possible. An overloaded stomach should be treated with an emetic, and sometimes relief is obtained by administering a calomel purge followed by an enema. The breathing should be eased by free ventilation and the adoption of a suitable posture, the choice of which is best left to the patient. A whiff of chloroform

or amyl nitrite, a cup of hot, strong coffee, a dose of hot alcohol strong enough to induce a mild intoxication, the inhalation of fumes of nitre-paper, tobacco smoke, cigarettes made of stramonium, belladonna, or lobelia, or burning pastilles of the same, may produce relief in different cases. Each patient usually has some pet remedy which he has found efficacious, and it is the wisest plan to follow his wishes.

Few systems of permanent treatment seem of any avail. If the purse permits, it is generally possible to find a climate where particular individuals are free from attacks, but no general rule can be given. On the assumption that it is a nervous affection, some physicians have advocated a system of breathing drill, which consists of a slow, deep inspiration and an expiration aided by compressing the chest with the hands so as to expel all the air. In recent years psychiatric treatment has effected remarkable cures.

**Asti**, a tn. of Piedmont, in the gov. of Alexandria, Italy. It is situated on the l. b. of the Tanaro. It is an episcopal see. A feature of the city is a large Gothic cathedral. The trade in silk and woollen fabrics, hats, leather, and agric. produce is extensive. Around the tn. is a wall much dilapidated. Its wine, vino d'A., enjoys a reputation for its excellence. The hist. of the tn. goes back to 400 B.C., when it was famous for its pottery. Pop. 49,000.

**Astigmatism**, that condition of the eye in which rays of light from an object are not brought to a focus at one point. It is usually due to inequality of curvature of the meridians of the cornea. This may be caused by imperfections in the lens, unequal contraction of the muscles, or a defect in the curvature of the retina. The condition is treated by the use of cylindrical glasses with the axes arranged as determined by an oculist's test.

**Astley, Sir Jacob, Baron (1579-1652)**, a Royalist commander in the Eng. Civil war. He took part in the Thirty Years war, winning considerable distinction. He was famous for his characteristic dictum delivered as a prayer usually before battle, 'O Lord, Thou knowest how busy I must be this day. If I forget Thee, do not forget me. March on, boys!' An example of his scrupulous honesty was his refusal to take part in the second Civil war lest he should break parole.

**Astley, John (d. 1595)**, was appointed master of the jewel house on Elizabeth's accession. He was a friend of Roger Ascham, and the author of the *Art of Riding*, etc.

**Astley, Philip (1742-1814)**, b. at Newcastle-under-Lyme, England, and d. in Paris. He was well known as a horse-tamer. He began life as a cabinet-maker, but soon joined a regiment of light horse in Holland. He finally settled in London, and developed a prosperous business as circus-proprietor. The establishment was known as 'Astley's'. Dickens mentions it in *The Old Curiosity Shop*.

**Astley Bridge**, a tn. of Lancashire,

3 m. N. of Bolton, with cotton-spinning and bleaching industries. Pop. 4800.

**Astolfi**, see **AISTRUP**.

**Astolpho** is the name of an Eng. prince, one of the most famous paladins in Ariosto's poem. He was changed into myrtle by the magic of Alcina, but delivered by the fairy Melissa. Another fairy gave him a horn which caused all who heard it to flee; armed with this, he accomplished prodigious exploits.

**Astolphus, King of the Longobards (A.D. 750-746)**. He aimed at driving the Gks. from Italy; he took Ravenna, expelled the exarch, and conquered the Pentapolis, a part of the present March of Ancona. In 752 he fought against Rome, but Pope Stephen II. arranged a truce with him. A. broke the truce, but Pope Stephen was assisted by Pepin, king of the Franks, who defeated A., concluded a treaty with him, and returned to France. In 755 A. again marched against Rome, but, besieged in Pavia by Pepin, he made peace, and gave up the exarchate, which was bestowed by Pepin on the see of St. Peter.

**Aston, Sir Arthur (d. 1649)**, Royalist general. He helped to put down the Scottish rebellion. During the Civil war he fought at Edgehill and defended Reading.

**Aston, Francis William (1877-1945)**, Brit. chemist and physicist; educated at Malvern and Birmingham Univ. Worked for a few years as a research chemist in a brewery. In 1910 he went to Cambridge to work under Prof. Sir J. J. Thomson and during the First World War he was Thomson's assistant on the analysis of positive rays and neon research. In 1913 he achieved the first artificial separation of isotopes. His interest was now aroused in considering how to determine accurately the masses of atoms constituting the positive rays. But this stage in his strictly scientific work was suspended during the war period, when he worked at Farnborough on chemical problems relating to dopes for aeroplane fabrics. But discussions of the existence of isotopes satisfied him that further analysis of positive rays was the only sound method of research, and it was then that he conceived the idea of his focusing method on which foundation his subsequent success was built in measuring atomic masses and determining the prin. isotopes of all the permanent gases and the other elements which can be introduced into a gaseous discharge. These results induced chemists everywhere to reconsider the fundamental determinations of atomic weights and honours soon followed: Mackenzie Davidson medal of the Röntgen Society, 1920; Hughes medal, Royal Society, 1922; Nobel prize for chem., 1922; Paterno medal, Rome, 1923. Later he constructed a new mass-spectrograph, in which the focusing of the rays was nearly perfect. Final measurements of the desired accuracy were announced in 1927. A.'s curve of deviation from the whole number rule immediately became the basis for all speculation on the structure of the atomic nucleus. In 1935 A.

described researches by himself and other physicists which led to the discovery of 'heavy water,' a constituent in the production of the atomic bomb. In 1938 he was awarded the Royal Medal of the Royal Society for his discovery of the isotopes of non-radioactive elements. Publications include *Isotopes* (1922) and numerous papers contributed to scientific magazines.

**Aston Manor**, a municipal and parl. bor. of Warwickshire, England. Its manufs. include motor accessories, paper, and beer. It was incorporated in 1903, but the charter was annulled in 1911, when it became incorporated in the city of Birmingham. Pop. 35,600.

**Astor, John Jacob** (1763-1848), an Amer. merchant, b. near Heidelberg, Germany. During his early years he assisted his father, who was a butcher, following this vocation by piano and flute making. He emigrated to America in 1783 and settled in New York. Acting on the advice of a fur trader, he embarked on the same trade. He gradually enlarged his business, and amassed an enormous fortune. In 1811 he founded a settlement at the mouth of the Columbia R., for the purpose of establishing a central depot. It was seized by the Eng. in 1813, an event which forms the theme of Washington Irving's *Astoria*. The A. library was given by him, and forms to-day part of the New York library.

**Astor, John Jacob** (1864-1912), an Amer. capitalist, soldier, and inventor, the fourth of the name, b. at Rhinebeck, New York. He served on Gen. Morton's staff (1894-96); in the Sp.-Amer. war during the Santiago campaign (1898). He lost his life in the *Titanic* disaster of 1912. He pub. *A Journey in Other Worlds: A Roman of the Future*, 1894.

**Astor, Nancy Witcher, Viscountess** (b. 1879), wife of Viscount A. of Cliveden, whom she married in 1906. Her first husband was Robert Gould Shaw, to whom she was married in 1897 and whom she divorced in 1903. Daughter of Chiswell Dabney Langhorne of Virginia, she was born at Mirador in that state. She was the first woman to sit as a member of the Imperial House of Commons (though not the first to be elected, that honour falling to the late Countess Markievicz, a Sinn Féiner who never appeared at Westminster), being returned for Plymouth in 1919 and at every general election since that time. Has always manifested a keen interest in temperance movements. Assisted Margaret McMillan in founding the Rachel McMillan Training College. Pub. *My Two Countries* in 1923.

**Astor, Waldorf, Viscount** (of Cliveden) (b. 1879), eldest son of William Waldorf, first Lord A. M.P. for Plymouth 1910-19. Has held many subordinate ministerial posts, and did useful work as chairman of the Parl. Committee on the Prevalence of Consumption, one outcome of which was the establishment of sanatoria under the Insurance Acts. On his succeeding his father as Viscount A., his wife, Nancy Langhorne, was returned for

Plymouth. Controlled the Sunday newspaper, the *Observer*.

**Astor, William Backhouse** (1792-1875), eldest son of John Jacob, the merchant, the greater part of whose fortune he inherited and increased by real property investments. The building for the A. library, to which he gave over half a million dol., was erected under his direction. Sometimes known as the 'Landlord of New York.'

**Astor, William Waldorf, Viscount** (1848-1919), a Brit.-Amer. capitalist, b. in New York. Assumed management of the A. estates in 1871. Elected to the New York Assembly in 1877, and to the Senate in 1879. From 1882 to 1885 he was a minister to Italy, and he wrote 2 romances, *Valentino* and *Sforza*. In 1890 he succeeded to an estate valued at 200,000,000 dol. In 1893 he bought the *Pall Mall Gazette*, and founded the *Pall Mall Magazine*. In 1899 he became a Brit. subject. Subscribed large sums to various war funds. Gave £20,000 to Oxford Univ. Created a peer in 1916, and viscount in 1917.

**Astoreth**, or **Astarte**, the Gk. and Rom. name for the Phœnician Venus, whose cult is synonymous with that of Astarte, the abomination of the Sidonians (2 Kings xxiii. 13), of the Gk. Aphrodite, and of the Assyrian Ishtar. She appears to have been considered as the goddess of fertility and fruitfulness, and is typified in the form of a cow. The moon was also identified with her. The worship of A. was full of licentiousness, and is regarded in the O.T. as a type of wickedness. Her chief temples were at Erech, Nineveh, and Arbela.

**Astorga** a city of N.W. Spain, in the prov. of Leon. The Rom. name for the tn. was Asturica Augusta. Pop. 5,000.

**Astorga, Emanuele d'**, **Baron** (1680-c. 1756), an amateur singer, harpsichordist, and composer of high artistic merit. Pupil of Alessandro Scarlatti. His patron, duke of Parma, wrongly suspected an intrigue with his daughter and A. was sent to the court of Leopold, at Vienna. His masterpiece is a *Stabat Mater*, which is still famous. Composed (especially) chamber cantatas (*Cantate da Camera*).

**Astoria**, a tn. in Clatsop co., Oregon, U.S.A., at the mouth of the Columbia R. It is the oldest Amer. settlement in the Columbia valley, and takes its name from its founder, John J. Astor. Salmon tinning and lumbering are the prin. industries. Was seized by Brit. in 1813, but restored 2 years later. Pop. 10,300.

**Astrabad**, or **Asterabad**, a walled tn. in the prov. of the same name in the N. of Persia. It is situated at the foot of the Elburz Mts., and is 25 m. S.E. of the Caspian Sea. For long it was the residence of the shah's ancestors, the Kaja princes. Has a large trade in carpets. Pop. 31,000.

**Astræa**, the star-maiden in Gk. legend. A daughter of Zeus and Themis. She was the last of the goddesses to leave the earth, which she did on the advent of the Bronze Age. She is immortalised among the signs of the zodiac as Virgo.

**Astragal** (from the Gk. ἀστράγαλος), a moulding used in architecture, and usually applied to the upper end of the shaft of a column, and to its base. It is also used in the entablatures of the Rom. Doric, the Ionic, Corinthian, and Composite orders. The use of the A. is to bind the parts of columns and entablatures together, both at the top of the shaft, where the capital commences, and at the bottom where the base terminates. In Grecian architecture an example is found in the base of the Ionic temple of Minerva Polias at Priene.

**Astragalus**, a genus of plants of the order Fabaceæ. The Eng. name is milk-vetch. The best-known Brit. species is *A. hypoglottis*, the purple mt. milk-vetch, which is found at sea-level. *A. verus* and *A. gummifer* produce gum tragacanth.

**Astrakhan**, the name of a region and its cap. in the R.S.F.S.R. The pop. of the region is about 1,500,000. Its area is 91,327 sq. m. The country, watered by the Volga, consists to a large extent of brackish lagoons and steppes. The climate is hot and dry, there being practically no rainfall all summer. The yearly rainfall is 6 in., and the temp. reaches 58.9°, while the Jan. temp. is 19.0°. The chief occupation of the people is fishing; herrings, sturgeon, and caviare are exported in great quantities. Salt is extracted from the marshes of the steppes, and is one of the chief industries. A., the cap., pop. (1939) 254,000, is situated on the l. b. of the Volga. While formerly it was the only trading centre with the country beyond the Caspian, the overland routes of Orenburg and Tiflis have destroyed to some extent its monopoly, but it remains the chief centre of the fishing industry. The increase, however, in petroleum exports improved its commerce. The great markets and bazaars of A. were, before the Second World War, among the most crowded trading spots in the world. It is a picturesque city, in which mingle E. and W. On its canal are barges laden with all manner of merchandise. The city gives its name to the fur which is procured from the young Persian lamb. A. is connected by rail with Moscow (via Saratov) and with the important salt works at Lake Elton and Lake Baskunchak. Considerable quantities of oil are shipped across the Caspian to A., and thence up the Volga to the various refining centres.

**Astral Spirits**, the animating principles of the heavenly bodies according to anct. E. belief. The doctrine of the existence of such spirits was accepted by a great number of the Jews, Gks. and Roms., though such beliefs were among these peoples always looked upon with suspicion by the authorities. In mediæval times these doctrines became very widely spread. A.S. were then conceived as fallen angels, or, at least, powers who had less kinship with heaven than with hell. These spirits were intimately concerned with the affairs of mortals, and could be bound by magic to their service.

**Astringents**, remedies which cause contraction of muscular fibre and condensation of the tissues, mostly by coagulating albumin. They are used to check hæmorrhage externally or internally, and diarrhœa. The most important are tannic acid and gallic acid, the mineral acids and most metallic salts.

**Astrocrinus** (Gk. ἀστὴρ, star, κρῖνος, hair), a fossil genus of blastoid echinoderms, of family Astrocrinidæ and order Irregularæ. They are found in the carboniferous limestone of Yorkshire and Scotland.

**Astrolabe** (Gk. ἀστὴρ star, and λαβεῖν, to take), an instrument used by astrologers for taking the altitude of the heavenly bodies. As. were not only used by astrologers, but also in portable form by travellers for astronomical and topographical calculations. Chaucer in 1391 wrote a prose treatise on the A., for the use of his son. There was also another species of A. for marine calculations of the lat. Columbus used such an instrument on his voyage of discovery. See R. T. Gunther, *The Astrolabes of the World*, 1932.

**Astrolabe Bay**, a large bay on the N.E. coast of New Guinea.

**Astrology**, a science concerned with the heavenly bodies; in modern times the science is confined to the art of divination from the position of celestial bodies, but in anct. times it embraced also what is now called astronomy. Formerly the 2 depts. of the subject were distinguished thus: (1) Natural A., consisting in the calculation of the movements of the heavenly bodies. (2) Judicial A., consisting in the study of the supposed influence of the stars, etc., on human life and destiny. A., therefore, was a curious mixture of science and quackery, or rather, A. was the pseudo-science out of which the science astronomy evolved. A curious parallel is seen in the research of the mediæval alchemists, out of whose pseudo-chem. true chem. evolved. A. reached its zenith among the Babylonians—so much so that subsequently Chaldean became a synonym for astrologer. Babylonian life was in early times nomadic, and the environment was vast stretches of desert. The people had thus an unobstructed view of the heavens. From the elementary observation that the sun sustains life throughout the world developed the belief that the other heavenly bodies, too, governed nature, and were the abode of the divine element. Just as A. was being superseded by astronomy in Babylon, its influence spread westward and began to colour the thought of the Hebs., Gks., and the Roms. Thus in the N.T. we read that wise men of the E., i.e. Chaldeans, followed the star that proclaimed the advent of Jesus. Among the Gks. judicial A. never had a very firm footing, but among the Roms. it found a superstition that readily sympathised with it. The mathematici, or Chaldean astrologers, were always a source of annoyance to the authorities, and in Tacitus we read that though they were expelled from Rome repeatedly, they always returned. The nucleus round

which the science of A. grew was the belief that the divine energy was manifested in the movements of the sun and the planets. The correct interpretation of the position of these was a key to the will of heaven. Gradually the system was enlarged. The relative position of the planets and their position relative to the fixed stars and constellations gave more information. As the field of observation widened, the amount of information to be derived from the observation thereof widened with it, until it embraced every experience of human life. This information was augmented by the theory of repeated omens, e.g. the postulation that if a certain event happened while a certain planet occupied a certain position, the recurrences of that position of the planet would also foreshadow a recurrence of the event. The reaches of astrological information were also extended by the association of ideas. The divers planets were associated with various passions and things, and the position of the planets would therefore denote a state of the passions, etc., with which they were associated. To take a concrete example, Mars is associated with war and strife, and Venus with love; the juxtaposition of the 2 planets might therefore indicate some calamity arising out of some union. Moreover, these planets were associated with the various parts of the human body, hence medicine became a department of A. Thus Mars, as being the tempestuous planet, became associated with the bile. Again, not only the position of the planet was important, but which particular sign of the zodiac it occupied, or, in other words, which house of heaven. The days of the week were assigned to the various planets, etc.—Sunday to the sun, Monday to the moon, Tuesday to Mars, Wednesday to Mercury, Thursday to Jupiter, Friday to Venus, Saturday to Saturn. (These relations are more immediately apparent from the Fr. names of the days of the week.) In the Middle Ages the astrologer was considered by many people of learning and dignity, as well as by the uneducated as being almost omniscient. The astrologer could foretell the destiny of the individual by calculating which star was in the ascendant at the time of his birth. The ascendant was that sign of the zodiac which was nearest the E. horizon at the time of the event, and that star was most important which rose at that precise moment, i.e. was in the ascendant. Limitless information could thus be derived from these details regarding the character, physique, and destiny of the individual. The art of A. has not yet died out, though for long it has been in ill repute. In recent years, as with other occult sciences, attempts have been made to revive it on scientific principles. However, whether A. will do further services to mankind in the future, time alone can decide, but its services to mankind in the past are undeniable, despite the bad reputation the art has earned in modern times, for it was out of A. that the great science of astronomy evolved.

**Astronomer Royal**, the head of Greenwich Observatory, appointed by the Prime Minister under the royal sign-manual. The office was estab. in 1675, and from 1933 to 1936 was held by Sir Frank Dyson (d. 1939), formerly A. R. for Scotland and director of the Edinburgh Royal Observatory. The present A. R. at Greenwich is Sir Howard Spencer Jones (author of *General Astronomy*, 1922).

**Astronomy** (Gk. *ἀστρον*, a star, *νόμος*, law) is the science which treats of the heavenly bodies and all phenomena therewith connected. Such phenomena include their movement in the sky, eclipses arising therefrom, their influence on the earth and on each other, and changes in their composition. A. is the oldest, most exact, and most widely embracing of all the sciences, and, as the great Laplace truly said, presents the longest chain of discoveries. A. rising in the mists of antiquity, attained to the position of an exact science under the Gks., but during their time, and for many centuries after, it was closely allied to, if not almost overlaid by, the pseudo-science of astrology. However, with the revival of learning in the sixteenth century and the crowding discoveries which resulted from the invention of the telescope at the beginning of the seventeenth, A. was able to slough its astrological covering even as chem. arose from alchemy. A. in modern times has been generally divided into 3 main divs., known as (1) practical, (2) theoretical, and (3) physical. The first deals with the observation of the celestial objects, and necessarily therefore concerns itself with the instruments and observatories used in this work. The second, or theoretical A., is practically a branch of higher mathematics, and is the application of the fundamental laws of gravitation to the observations of the practical branch. The third branch of the science, the physical, trenches on the domain of chem., and is the application of the other, and by comparison, terrestrial, sciences to the heavenly bodies. This branch of the subject is the most recent in date, but of great and increasing importance, and serving to weld into one harmonious whole all the sciences. Each of these 3 main divs. has its sub-divs. according to the nature of the celestial object observed, or the instrument used. The known heavenly bodies are the sun, the moon, the planets, the satellites (or moons) of the planets, the asteroids (small planets), meteors (shooting stars), and comets, all of which belong to what is known as the solar system, and the bodies immeasurably more remote, the stars and nebulae. The 4 chief instruments used in observations are: (1) Fixed telescopes, graduated for ascertaining the position of the heavenly bodies on the celestial sphere; (2) equatorially mounted and movable telescopes, capable of following the movements of the heavenly objects; (3) the spectroscopic, for ascertaining the physical composition of the body observed; and (4) the photographic camera, for securing a permanent and trustworthy record of celestial objects too faint to be

perceived by even the optically assisted human eye. These sub-divs. have their special names and their practical, theoretical, and physical sides. What is known as solar physics is the study of the sun's physical condition; the mapping of the moon's surface is known as selenography; and the name sidereal A. attaches to the special study of nebulae and the so-called fixed stars.

From the foregoing paragraph it will be seen how vast is the subject we have to deal with. It is impossible in this article to give more than an outline of the science, and, in the main, a chronological record of discoveries. For details the reader is referred to the articles on the different categories of heavenly bodies, the instruments used, and the names of constellations and astronomers. The prin. articles are as follow: ALTITUDE; ASCENSION, RIGHT; ASTEROIDS; AZIMUTH; IRABE; COMET; CONSTELLATION (*see also under various names*); COPERNICUS; DAY; EARTH; ECLIPSE; ECLIPTIC; EQUINOXES; GALAXY; GALILEO; GRAVITATION; HERSCHEL; HIPPARCHUS; HORIZON; KEPLER; LAPLACE; LATITUDE AND LONGITUDE; LIGHT; MERIDIAN; METEORS; MOON; NEBULÆ; NEWTON; OBSERVATORY; OCCULTATION; OPTICS; ORBIT; PARALLAX; PERTURBATIONS; PHASES; PHOTOGRAPHY; PLANETS (*see also under various names*); POLES; PRECESSION; PTOLEMY; REFLECTION; SATELLITES; SEASONS; SEXTANT; SOLAR SYSTEM; SOLSTICE; SPECTRUM AND SPECTROSCOPE; STARS; SUN; TELESCOPES; TIDES; TRANSIT INSTRUMENT; YEAR; ZODIAC.

Before turning to the hist. of A. it will be well to take a brief glance at the position of the earth in the solar system, and of that system in the universe. In the course of the last 20 years our knowledge of the universe has been increased enormously, especially with regard to the origin of the stars, their composition, their histories, their sizes, and their temps. The science of astrophysics has brought about this enlightenment, and an attempt is made, in what follows, to describe the results of the recent progress, made possible only by new methods of attack and by great improvements in the design and technique of astronomical instruments. The centre of research has shifted from the solar system, but we must briefly remark on that system, and refer the reader for further details to the articles on PLANETS, COMET, and METEOR. The solar system is supposed to have had its origin in the approach of another sun to our present sun: the gravitational attraction between 2 such bodies would be enormous, and just as our small satellite, the moon, causes tidal waves in our oceans, so the approaching sun caused great tidal waves in our sun, and streams of matter were ejected from it. This matter rotated round its parent and in the course of time condensations took place which served as nuclei for the building up of the planets, which continued, and now continue, to rotate round the sun at different distances from it. Kepler and

Newton (*qq.v.*) studied their orbits and pronounced the laws which govern their motion.

There are 8 major planets, and more than a thousand known minor planets or asteroids (*qq.v.*). The solar system consists of the central star or the sun, with the planets and their attendant satellites, and, in addition to these, there are meteors and comets. Named in the order of their distances from the sun, the major planets are Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, and Neptune; the asteroids lie between Mars and Jupiter. The Gks. gave them the name wanderers (Gk. *πλανῆς*, a wanderer). All the planets shine by the light they reflect from the sun, and they describe approximately circular orbits about it. The orbits are really elliptical, and the sun is in one focus of the ellipsis. They rotate in the same direction round the sun, and their orbits lie in approximately the same plane. The period of rotation varies in the year of the planet, Mercury's being only 88 days, as compared with our 365½ days. In addition to this rotation, the planets turn on their axes, and it is this which causes our seasons.

The mean distance of the Earth from the sun is 93,000,000 miles; Mercury is about 37,000,000 miles from the sun, while the furthest planet, Neptune, is about 280,000,000 miles from its parent. Conditions such as temp. and the nature of the atmosphere of the planets depend on their dists. as well as on their positions with respect to the sun; there is only a possibility of life such as we know it on the planet Mars, the remaining planets are either too hot or too cold or devoid of an atmosphere capable of supporting life.

The Earth is approximately a sphere, nearly 8000 m. in diameter, the sun is more than a million times as large. It is our nearest star, and yet it is exceedingly small by comparison with the giant stars known to us. The giant known as Betelgeuse, the bright red star in the constellation of Orion, is so great that if it replaced our sun, it would more than fill the whole of the space between the Earth and the sun. Some idea of its magnitude may be gathered from the fact that if a bullet could travel with undiminished speed round the Equator of Betelgeuse, it would take nearly 60 years to return to its starting point. Its apparent size is small because it is so far away from the Earth, namely 600 light-years away. Light travels at a speed of 186,000 m. per sec., and takes rather more than 8 min. to travel from the sun to us; by one light-year we mean the distance that light would travel in 1 year, i.e. nearly 6 billion miles. When we look at Betelgeuse we see it as it was 600 years ago: we are, as it were, looking back into the past, but it is less irksome to think of the distances of the stars in terms of light-years! There are at least 3000 million stars, and, with the exception of the sun, which is about 8 light-mn. away, the nearest one is Proxima Centauri, 4·1 light-years away, while we know of globular

clusters of stars which are 220,000 light-years away from the Earth.

Modern A. has realised that what the ancients called the fixed stars are not fixed, but most with velocities much greater than that of our sun; though the constellation of Orion appears to the naked eye to be in the same position it occupied 1000 years ago, the stars are really moving quickly, and it is merely because they are so very far away from us that they appear to be fixed. In addition to the stars, there are nebular regions in the stellar universe, e.g. the Milky Way (on which see NEBULA); it is sufficient to point out here that the present view is that the evolution of the star begins in some nebula and the star that condenses from the nebula is a diffuse mass of gas of low density and comparatively low surface temperature (3000° C.). According to the classification of the Harvard Observatory, the star is now a red giant of type M, e.g. Betelgeuse. The evolution of the star through the successive stages known as M, K, G, F, A, B and characterised by typical differences of spectra, is accompanied by increase of temp. and a contraction of mass, so that when type B is reached, e.g. Sirius, the surface temperature is about 20,000° C. and the density still somewhat less than that of water. The giant has now entered dwarfdom, and it begins to cool as it contracts further, and it goes through the same spectral stages in the reverse order, though it is now called a dwarf, because it is much smaller than the giant which emits the corresponding type of spectrum. Our sun is a dwarf star of type G, with a surface temperature of 6000° C. It has still to pass through the K and M stages before its life as a star is completed. The density of a dwarf increases with its age, and there are stars so dense that a tiny portion of no more than the bulk of a match-box weighs as much as a ton. The evolution of the stars is a slow process, and we cannot accept anything less than 1000 million years for the age of the sun. About three-quarters of the stars are dwarfs, and one quarter are giants, progressing towards their maximum temperature. This surface temperature is very small by comparison with that of the star's interior temperature, which is about 40,000,000° C.

**Binary stars and pulsating stars.** Many stars which appear single to the naked eye are found to be double stars when examined in a telescope or by the spectroscopic. These stars are known as binaries, and consist of 2 stars revolving in orbits about their common centre of gravity. Much of our recent knowledge of the stellar universe is due to the pulsating stars known as Cepheid variables. Although Michelson in 1920 constructed his telescopic interferometer, and by means of it measured the diameter of Betelgeuse, few stars appear large enough to the terrestrial observer to be measured in this way. The star  $\delta$  Cephei is a prototype of stars that occur in all parts of the universe, known as Cepheid

variables. They are globes which swell and contract in a period of  $5\frac{1}{2}$  days, and their pulsations are made known by the corresponding changes in their luminosities. Now, as Eddington points out, the note of a tuning-fork is characteristic of the fork, and in a similar way the period  $5\frac{1}{2}$  days is characteristic of stars of identical structure and luminosities. The Cepheid variables therefore serve to measure the distances of various parts of the stellar universe, by comparing the apparent luminosity of any Cepheid star with that of a near star of the same type whose distance can be measured by finding its parallax (q.v.). The realisation of this fact has enabled astronomers to 'measure up' the universe in no uncertain manner.

We have had, so to speak, a bird's-eye view of the solar system, and have the universe in perspective. We are now in a position to appreciate the hist. of astronomical discovery, which, as has been indicated, is also largely the hist. of the invention of the instruments used and the progress of mathematics. We cannot here make more than a passing allusion to the influence of the discoveries of the astronomer on the mind of man and their reaction on philosopher, theologian, geologist, physicist, and chemist, and must content ourselves by observing that their effect has been profound.

A. is, as we have said, the most ancient of the sciences. Nations who are known to have cultivated it before the Christian era are the Chinese, Hindus, Chaldeans, Egyptians, and Gks. The Chinese made it a matter of politics, the next three of religion, and all, except the Gks., applied it to astrology. With the Gks. A. was treated merely as any other science, and for this reason, perhaps, it made a more rapid advance with them than among their contemporaries. Which nation was the first to study A. will perhaps never be finally determined: all we can say is, that wherever a people emerged from savagery, traces can be found of astronomical observations. For each of the above-mentioned nations the claim is made for the honour of being the first to study the science. The Chinese annals go back as far as 2857 B.C., but of astronomical phenomena they record hardly anything except the eclipses of the sun and the appearance of comets. The fact of the motions of the planets was known to the Chinese, as was also the Metonic cycle, but not the precession of the equinoxes till about A.D. 400, or about 550 years after its discovery by the Gk. astronomer Hipparchus. A record of the conjunction of 5 planets shows that observations were made by the Chinese at about 2500 B.C. The burning by order of the Emperor Tsin-Chi-Hong-Ti (221 B.C.) of all scientific books may have destroyed evidence of still further astronomical observations. Neither the Hindus nor the Egyptians contributed to A. anything of outstanding importance, but from the accuracy with which the Great Pyramid of Cheops faces the cardinal points it is clear that the Egyptians possessed, even

at the most remote period no little astronomical knowledge. But it is probable that the Chaldeans were the nation which, next to the Gks., made the most extensive study of the heavens. Certain it is that they had the Metonic cycle, and it is thought that Meton, the Gk. astronomer of the fifth century B.C., who gives his name to this period, may have obtained the cycle from them. They had quite early in their hist. measured the celestial sphere and portioned out and named the sections (signs) of the belt of the heavens through which the sun, moon, and planets apparently move, a belt known as the zodiac. Though their observations never attained to the accuracy of the Gks., being, in fact, of the roughest kind (the time of eclipses, for instance, being given only in hrs., and the part of the diameter eclipsed only within a quarter), they were, nevertheless, the earliest trustworthy observations, and in the hands of Hailey, an Eng. astronomer, led to the discovery of the acceleration of the moon's mean motion. Besides Meton's, these Babylonian astronomers also discovered other cycles, among them being the Saros, i.e. the period of 18 years 7 months after the effluxion of which eclipses of sun and moon will again occur at the same intervals. It is not certain when the Saros was discovered, but it is probable that it was some centuries before the Christian era, and the earliest eclipse (excluding doubtful Chinese accounts) as one referred to on a Babylonian tablet as having occurred in 1062 B.C. Simplicius, a commentator on Aristotle, tells us that Alexander the Great found records in Babylon containing observations of eclipses for nearly 2000 years prior to the conquest of that city by him. These he transmitted to his former tutor Aristotle, but Ptolemy, the great astronomer of the Alexandrian school, mentions only a few of them, and none prior to 720. But undoubtedly among the Chaldeans A. was gathering a definite shape, and among the instruments they used we find the use of the clepsydra (water clock) as a clock, and of the gnomon as measuring solstices.

To the Gks., who took the lead in the ant. world in so many other matters, must go the honour of raising A. to the dignity of an exact science. From Thales (640 B.C.) to Hipparchus (190-120 B.C.) was built up a wonderful body of exact astronomical knowledge which for 15 centuries was not appreciably added to. Thales, who founded the Ionian or physical school of philosophy, and one of the Seven Wise Men, predicted the eclipse of the sun which happened in 584 B.C. in the reign of Alyattes. He may be said to be the founder of Gk. A., but for many reasons we shall reserve for Hipparchus the title of Father of A. It is probable that Thales in predicting the solar eclipse did so by means of the Chaldean Saros (mentioned above). He also held, and is the first of whom we have record of so holding, that the earth was a sphere, that the stars were fiery bodies, and he also taught his countrymen how

to steer their vessels by means of the Little Bear, an asterism nearer the Pole star than the Great Bear, which the Gks. had hitherto been satisfied with as an indication of the N. Anaximander, his successor, is credited with asserting that the earth rotated on its axis, and that moonlight was but reflected sunlight. Pythagoras (500 B.C.) promulgated the idea, which was not generally accepted till many centuries afterwards, that the earth and other planets circulated round the sun. He also was probably the first to teach that the evening and morning star were the same planet. Meton (432 B.C.), already mentioned, introduced the cycle bearing his name, which Calippus, 100 years later, improved. Eudoxus of Cnidos (370 B.C.), according to Pliny, brought the year of 365½ days into Greece, and wrote some astronomical works. Aristotle (384-322 B.C.), perhaps the greatest all-round scientist among the ancients, wrote on A., but his works were lost. We know, however, that he gave a correct interpretation of the phases of the moon. The fourth century B.C. saw the foundation at Alexandria of the school of that name. The Alexandrian astronomers were encouraged in their task by the Ptolemaic dynasty. Their work was characterised not so much by new theories of discoveries, as by a long series of painstaking, connected, and accurate observations. They no doubt owed much to Euclid of Alexandria (300 B.C.), who did so much to advance the trigonometrical science by which astronomical calculations are made. Among the more distinguished representatives of this school were Timochares and Aristyllus (c. 300 B.C.), who made observations which enabled Hipparchus to discover the precession of the equinoxes. Eratosthenes, who was librarian at Alexandria (276-196 B.C.), attempted to ascertain the size of the earth—and roughly succeeded—by means of measuring an arc of the meridian between Alexandria and Syene in Lower Egypt. He made other useful observations, such as the determination of the value of the obliquity of the ecliptic, a value adopted by his 2 great successors, Hipparchus and Ptolemy.

Hipparchus was not merely the greatest of the Gk. astronomers, but one of the greatest of all astronomers. He was b. at Nicæa in Bithynia, either in 190 B.C. or in 180 B.C., lived at Rhodes, and d. 120 B.C. In his youth he wrote a commentary on a poetical description of the stars by Aratus, and this is the only direct knowledge we have of him. To his great successor and only rival in fame among the ancients, Ptolemy, we are indebted for what we know of his discoveries. As said above, he discovered the precession of the equinoxes by a comparison of his own observations with those of Timochares and Aristyllus. He was a great mathematician, and it was he who first employed processes analogous to those of plane and spherical trigonometry, for which he constructed a table of chords. He determined the mean motion of the sun and of its apogee, the inequality of

the sun's motion, and the length of the year to greater exactness than his predecessors. He found the mean motion of the moon, of her nodes, and of her apogee; her parallax, eccentricity, the equation of her centre, and the inclination of her orbit. His observations also led him to suspect another inequality in the moon's motion. This was the 'evection' afterwards discovered by Ptolemy. He made one of the first steps towards the correct representation of astronomical phenomena, by supposing the sun to move round the earth in a circle, the earth not being at the centre. He was, of course, incorrect as to which body moved round the other, but he was reaching forward to the correct description of celestial motion, i.e. the ellipse. He made a catalogue of 1081 stars, giving their lat. and long. We can judge of the value of his work by the statement which has been made that had Hipparchus possessed the pendulum and the telescope, 50 years might have enabled his successors to place A. in the state in which it stood at the birth of Newton (1642). Considering his means, his observations are perhaps unequalled, and he well earns the title of Father of A. After the death of Hipparchus there is no astronomer of eminence till Ptolemy. Probably there were many real observers, but the loss of even their names, and the silence of Ptolemy himself, makes it clear that no discovery of any importance was made. It is not a little remarkable that Rom. civilisation, which was at its height in the period between Hipparchus and Ptolemy, should have produced, neither then nor at any time, any astronomers of more than mediocre quality. One must, however, mention the name of Sosigenes of Alexandria, who advised and assisted Julius Caesar to reform the calendar, the calendar which, after being slightly revised by Pope Gregory XIII., is in use to-day.

We now come to the second great name among ant. astronomers, Ptolemy, who fl. in Alexandria towards the middle of the second century of our era. Next to Hipparchus he was probably the greatest of the ant. astronomers, and with his death the epoch of ant. A. terminates. Just as Aristotle in natural science and philosophy dominated learning during the Middle Ages, so Ptolemy in A., and incidentally, we may say, in geography, held supreme sway over scientific men from his own time down to the sixteenth century. Finally, although he did not originate it, he was the chief exponent of and gave his name to the system of planetary motions known for centuries as the Ptolemaic system. His chief title to fame is that he corrected and improved on the work of his predecessors, particularly Hipparchus, but he made sev. original discoveries of very great importance. A voluminous writer on many subjects, his astronomical work, the *Almagest* (q.v.), summed up practically all the astronomical knowledge of the ants. and it is, in fact, practically our chief source of information on this subject. The prin. discovery of Ptolemy is

that of the 'evection' of the moon, an inequality such as would be caused by an alternate increase and diminution of the eccentricity of the moon's orbit. He also discovered the refraction, and made some tolerably correct experiments to determine its law, explaining the apparent enlargement of the disks of the sun and moon when near the horizon. The projection of the sphere of Hipparchus he extended, and, in fact, entered into the investigation of every point which Hipparchus had touched, verifying or altering. He attempted to account for the motions of the planets by supposing them to move uniformly in circles, the centres of which circles themselves moved uniformly round the earth. The whole Ptolemaic system is now on the scientific scrap-heap, but for his painstaking work as an observer and as the historian of A. the name of Ptolemy will always be honourably remembered.

With Ptolemy the originality of the Gk. school ends, as indeed does all of ant. astronomical science. With the rise of Christianity and the descent of the northern barbarians on the shores of the Mediterranean, civilisation suffered an eclipse. A dense pall of scientific ignorance hung over Europe, and in such congenial environment the bastard sciences of alchemy and astrology flourished. But in its darkest hour science has never lacked devotees, though for a while it may harbour in strange households. The sacred torch of scientific truth was kept alight by the Arabs—an Asiatic and non-Christian people. It is no part of our duty here to animadvert on the dislike, to put it mildly, of A. evinced by the more fanatical of the Christians from the time of Hypatia (end of fourth century A.D.) to that of Galileo (seventeenth century). We mention these 2 cases in passing because the first-named lived in the period immediately succeeding Ptolemy, and is, moreover, worthy of mention as being the first woman astronomer and mathematician on record. With Galileo the Dark Ages ceased and practical modern A. commenced. But of him we will speak later.

The E. and Cordova caliphs were for the most part generous patrons of learning. By their encouragement of original scientific research and of translation into Arabic of the works of the old Gk. authors, and by, in some cases, actual personal labour in this field of knowledge, the caliphs have earned an honourable position among enlightened princes. The line of Arabic astronomers may be said to have begun in the reign of Al-Mansur, the caliph who built Bagdad, in the year A.D. 762. In his reign were begun translations of the Gk. writers, and with nearly the same instruments, and the same theory, as Ptolemy, commenced a period of 4 centuries of astronomical observation. In the reigns of the great caliph Harun al-Rashid and his son Al-Mamun, both of whom were students of the science, great encouragement was given to A. The most illustrious of this school was Albategnius, or Al-Battani

(A.D. 880), and he is, beyond all doubt, the only distinguished observer of whom we know anything between Hipparchus and Tycho Brahé. He discovered the motion of the solar apogee, corrected the value of the precession, the solar eccentricity, and the obliquity of the ecliptics. He pub. tables, was the first to use sines (instead of chords) and versed sines, and found the length of the year more accurately. The influence of the Arabian school spread to Persia, Turkestan, China, and Spain as Islam advanced on its conquering mission in these countries. In Persia in the eleventh century flourished the famous astronomer-poet, Omar Khayyám. He suggested a reformation of the calendar, which, though not adopted, was, it has been asserted, more accurate than that of Pope Gregory XIII. Ulug Beg (1433), a prince at Samarcand, pub. the most correct catalogue of stars known till his day, but, on the whole, though assiduous observers and great mathematicians, there was little constructive work in the Arabian school.

The names of 4 great men will be for ever associated with the beginnings of modern A.: Copernicus and Tycho Brahé (sixteenth century), Kepler and Galileo (seventeenth century). The achievements of these 4 men stand up like peaks, and dwarf all the efforts of their immediate predecessors. With these predecessors we have not space to deal, so must content ourselves with remarking that with the Renaissance, A. was reintroduced into Europe. The Gk. writers were trans. direct, but more often than not their writings filtered through translations from the Arabic. The first translation of the *Almagest* of Ptolemy was made under the auspices of the Emperor Frederic II., about A.D. 1230, and many original Arabic works on mathematics were trans., the latter introducing into Europe algebra and the decimal fractions.

Nicolas Copernicus, sometimes called the founder of modern A., was b. on Feb. 19, 1473, at Thorn in W. Prussia. In his almost posthumously pub. book, *De Revolutionibus* (it appeared a few hrs. before his death), Copernicus laid down 2 propositions. With the anc. Gks. of the Pythagorean school he asserted that the diurnal movement of the stars, etc., was apparent only, and resulted from the rotation of the earth about its axis in the opposite direction. He also held that the earth was one of the planets, and, like them, revolved round the sun. These, of course, are to-day the commonplaces of A., but in his time practically every scientific man believed that the earth was the hub of the universe. Copernicus was in error in describing the motion of the planets as circular, instead, as Kepler later found to be the case, elliptical, and his book is a curious mixture of his own original and sagacious notions and of the old philosophy, such as that the planets moved in crystal spheres. His system, to which his name is attached, did not at first make great headway. It encountered the odium *theologicum* of his immediate suc-

cessors, and it needed the thought of Kepler and the application of the newly invented telescope to A. by Galileo, added to, still later, the discovery of the laws of gravitation by Sir Isaac Newton, to establish finally the Copernican system. What perhaps hindered the general acceptance of the Copernican system more than theological dislike or the inertia of the human mind was the fact that the second of our quartet of giants, Tycho Brahé (1546-1601), the greatest practical astronomer of his time, constructed yet another planetary system, a blend of the Ptolemaic and Copernican, which held together against the weak and ineffective criticisms of the Copernicans better than the Ptolemaic system. The system of Tycho consists in supposing (1) that the stars all move round the earth as in the Ptolemaic system; (2) that all the planets, except the earth, move round the sun, as in the Copernican system; and (3) that the sun, and the imaginary orbits in which the planets are moving, are carried round the earth. From his observation of comets he pointed out that the *spheres* of the planets could not be solid, since they were cut in all directions by the orbits of comets. And Tycho was the first to prove that comets had such a parallax as precluded their being atmospheric or even sublunary bodies. By his demolition of the crystal planetary spheres he dealt a severe blow, the first decisive blow, to received notions, and at the same time that he damaged the Ptolemaic structure he weakened the Copernicans' arguments, for the Copernicans of that time, having no inkling of the law of gravitation, had adopted the anc. idea of crystal spheres, in which the planets were embedded, revolving round the sun. Tycho has been reproached for not adopting the more simple Copernican system, but it must be remembered that the Tychoenic system explained all appearances as well as that of Copernicus, and, in fact, while it seized by far the greater proportion of the advantages of the latter, it was not open to the most material objections. We must also bear in mind that Tycho was the last great astronomer without the help of the telescope, and that the other confirmatory sciences were in his day most crude. The most stupid general can win a battle if his opponent be more stupid, and of all the inconclusive arguments of that day, the reply of the Copernicans to Tycho was the most inconclusive. The Copernican system appears a premature birth; the infant long remained sickly and would certainly have died if it had not fallen under better management than that of its own parents.

But this aberration apart, the work of Tycho Brahé was of a most solid and accurate nature, and furnished the means by which the Ptolemaic and Tychoenic systems were finally destroyed. He made a catalogue of the fixed stars, more accurate than any which preceded, and he greatly improved and extended the instruments in use as well as all methods of observation. The celebrated Kepler, who

helped to demolish Tycho's system, was for the last 2 years of Tycho's life his colleague in his work. It was with Tycho's accurate observations to work upon, and following Tycho's much-needed advice to apply himself to the deduction of causes from phenomena, that Kepler made his marvellous discoveries.

Unlike his master, Kepler (1571-1630) was a Copernican. In addition to A., he studied and made some discoveries in optics and physics, but it is chiefly as a mathematician that Kepler excelled. Too much importance cannot be attached to his 3 laws of planetary motions, laws which, though not proved till Newton's *Principia* appeared many years later, laid securely the foundations of modern A. Like all great things, Kepler's laws are in essence marvellously simple, and, like simple fundamentals, are beautiful. As the geometrician derives pleasure from the contemplation of, say, Euclid's 47th proposition (Book 1), 'Theorem of Pythagoras,' so the astronomer feels a pleasurable emotion by allowing his mind to dwell on Kepler's third law. The first 2 laws were announced in Kepler's work, *The Motions of Mars*, pub. in 1609, and the third in his *Harmonice Mundi*, 1619. The laws are as follows: (1) *The planets move in ellipses, having the sun in a focus.* (2) *The imaginary straight line joining a planet to the sun (radius vector) sweeps out equal areas in equal times.* (3) *The square of the time of revolution of any planet about the sun is proportional to the cube of its mean distance from the sun.*

In the hands of Galileo Galilei (1564-1642), or, as he is more generally known by his Christian name alone, Galileo, the telescope settled the problem of the planetary system. Galileo, a great astronomer, was nevertheless more than an astronomer, and may be said to have invented the science of dynamics. Quite early in life (1581) he discovered the isochronisms of the pendulum, an invaluable principle which led to the more accurate construction of clocks. In 1609 Galileo made a telescope from a general description of a magnifying instrument made by one Jansen in Holland. He was indubitably the first to apply the telescope to A., and on the very first time that he used it he discovered 3 of the satellites of Jupiter (Jan. 7, 1610). A few nights later he discovered a fourth moon to Jupiter. In the same year he saw spots on the moon (mts., etc.), resolved the Milky Way into stars, discovered the rings of Saturn and the phases of Venus. The following year he observed sun-spots, and from them concluded that the sun rotated on its axis. None of these observations required a great amount of skill, and all the phenomena mentioned may be easily observed by any amateur with a small telescope, but they served to bring down with a run the fast-crumbling fabric of the Ptolemaic system. For it was an obvious analogy to make, that if the sun rotated on its axis, why not the earth? If Jupiter could carry his 4 moons along

with him round the sun, why could not the earth carry its moon? And, moreover, the resemblance between the phases of Venus and the moon was yet one more argument in favour of the Copernican theory. For further details of the life and discovery of this most interesting man the reader is referred to the article GALILEO. Therein he will find food for reflection on the age-long struggle between science and sacerdotalism.

It will not be necessary to emphasise the profound change that came over A. with the introduction of the telescope. Even with the small light-grasping power of the primitive instrument of Galileo the whole face of the heavens was altered and it was only a matter of time until the continued improvement of this wonderful instrument should, as it were, induce the universe to yield up more and more of its secrets. But for a long while the telescope was a small instrument and suffered from the defect of being chromatic. This defect was remedied by Dollond, an Eng. optician, in 1758, but till his day the largest *refracting* telescope did not have an object glass of a greater diameter than 3½ in., a size which scores of astronomical amateurs possess to-day. The search for a form of telescope that would obviate the drawbacks of chromatic light led to the invention of the reflecting telescope; the Gregorian by Gregory in 1663, and the Newtonian by Sir Isaac Newton in 1669. As the mirror of the reflecting telescope offered less difficulty in construction, and was consequently cheaper, for a long time much more progress was made with the reflector than with the refractor. In 1723 Hadley had made a reflector with a mirror of 5½ in., but it was Sir William Herschel (1738-1822) who made telescopes with mirrors ranging from 6 in. to 4 ft. The largest reflector yet made was that constructed by Lord Rosse, who in 1848 constructed one of 6 ft. diameter and with a focal length of 53 ft. The 2 largest refracting telescopes are both in America. That of the Lick Observatory has a 36-in. aperture, and that of the Yerkes Observatory one of 40 in. The progressive increase in the size of the telescope has enabled the surface of the sun, moon, and planets to be surveyed in a more and more detailed manner. It enabled Cassini in 1631 to observe for the first time the transit of Mercury over the sun's disk, and to measure the diameter of Mercury. Eight years later Horrocks and Crabtree first observed a transit of Venus over the disk of the sun, and the former ascertained the diameter of that planet. The telescope enabled Cassini in 1665 to determine the time of the rotation of Jupiter, and in the following year he determined the rotation of Mars and made a first approximation to that of Venus. In 1675 Roemer discovered the velocity of light from observations of Jupiter's satellites (a discovery since confirmed by other means in the physical laboratory), and the same year saw the founding of the world-famous Greenwich Observatory, with Flamsteed

as first astronomer royal. The first transit telescope was used by Römer in 1689, 2 years after the publication of Newton's *Principia*. In this epoch-making work Newton provided the mathematical proof of Kepler's laws and laid down the law of gravitation. It is, of course, too technical a matter to enter into here. 1705 was the year in which Halley first predicted the return of the comet to which his name has been given, and it duly turned up again in 1758, the year predicted. Flamsteed's great work, *Historia Cœlestis*, issued in 1725, made a great step forward in sidereal A., giving a catalogue of the stars such as had never before been pub. Sir William Herschel is, however, generally spoken of as the founder of sidereal A., his motto being 'Whatever shines should be observed.' With his giant reflecting telescopes he undertook a complete survey of the stars in the N. hemisphere, in the course of which he found the planet Uranus, 1781. The story of the observation of the stars in the S. hemisphere is bound up with that of his son, Sir John Herschel, and his son's forerunner, Lacaille. The latter, a Fr. astronomer, went to the Cape of Good Hope in 1751, and he remained there 4 years. He observed nearly 10,000 stars and formed 14 new constellations. Sir John Herschel, carrying on the work of Lacaille, did for the S. hemisphere what his father had done for the N., and pub. in 1847 a complete survey of the S. heavens. The first few minor planets (asteroids) were discovered in the first decade of the nineteenth century, and the planet Neptune in 1846.

By the middle of the nineteenth century the position of A. stood thus. The whole surface of the sky had been carefully surveyed, and catalogues prepared giving thousands of stars and scores of nebulae. The solar system was known as we now know it except for the discovery of a few small satellites and additions to the swarm of minor planets. The motions of all heavenly bodies were referable to the laws of gravitation, enunciated by Kepler and elaborated by Newton and Laplace. Large and accurate telescopes were in existence for examining the surface of sun, moon, and planets, and many of their features had been recorded. Observational A. was beginning to yield fewer results. How great a progress had been made in telescope construction may be judged from the statement of the former astronomer royal (Sir Frank Dyson's *Astronomy*) that the moon could be seen through modern telescopes as it would appear to the naked eye at a distance of 200 m. At this distance a circle a mile and a half in diameter would appear as large as the whole moon does to the naked eye at its distance of 240,000 m., so that towns, lakes, etc., if they existed on the moon could be distinguished. What, then, would be the line of advance for the latter-day astronomer? The answer is that he turned his attention to the sidereal universe and to an examination

of the composition of the heavenly bodies.

The dictum of the biologist, 'Want creates organ,' applies here. The need for instruments to aid man in his self-appointed task of plumbing the universe resulted in the application of the spectroscopic and the photographic camera to astronomical uses. The chemist came to the aid of A. with his sensitive photographic plates and knowledge of the spectra of earthly elements, and the astronomer repaid his brother scientist by his discovery of new elements in the sun: elements unknown to mundane chem. For a more detailed account of celestial and terrestrial spectroscopy the reader is referred to article SPECTRUM AND SPECTROSCOPE: it will suffice here to explain the principle of the spectrum. Light is capable of being split up into component parts in the same way as sound. If we hear a band playing, our ears are able to distinguish the notes of the trumpet, horn, bassoon, violin, double bass, clarinet, and so forth, though all these instruments are being played simultaneously. In like manner, a beam of light if passed through a glass prism will be split up into a band of multi-coloured light, ranging from violet at one end to red at the other, the colours shading into each other by insensible gradations. These colours correspond to the length of the vibrations of the light waves and the time of vibration, and as these different vibrations are produced by the light emitted by the various chemical elements in a state of combustion, we are enabled by this means to tell roughly the composition of the luminous body. If we still further expand the band of light by passing it through one or two more prisms, we find on careful examination that it is generally crossed by a number of bright or dark lines. Each of these lines stands for an element in combustion, and the lines produced by that element are always in the same position on the spectrum. Thus the spectrum of common salt shows 2 bright yellow lines, and no matter in what part of the universe (sun, earth, or stars), common salt, if in a state of combustion sufficient to produce light, will always show these 2 bright yellow lines in the same position, or, what amounts to the same thing, 2 dark bands in the same position. The discovery of this fact by Fraunhofer and the development of this discovery by Kirchhoff laid the basis of solar and stellar chemistry. By this means we can tell the physical construction of every luminous body in the universe, whether it be sun, star, comet, nebula, or meteor. And as the spectrum is susceptible of being photographed, and as the photographic plate can record the ultra-violet light not visible to the human eye, great accuracy can be observed in these observations.

Another remarkable result is obtained from spectrum analysis: We have seen how the lines on the spectrum show the composition of the body emitting light, but another feature of the spectroscopic of equal, if not surpassing, importance

to the astronomer is that known as Doppler's principle. This principle enables the motion and direction of the light-emitting body to be measured. According to the number of light vibrations per sec. the position of a line in the spectrum is determined. If the light-giving object approaches the spectro-scope, or vice versa, more than the usual number of vibrations will reach the observer in each sec. On the other hand, if either the source of light or the spectro-scope recedes from the other, the number of vibrations will be less than the normal. This departure from normality is shown by a shifting of the lines (not in relation to each other, but of the whole lot) on the band of chromatic light: on approach the lines shifting towards the violet end; when receding towards the red end. Sir William Huggins was quick to see how this principle could be utilised in A., and was the first so to apply it. This principle has enabled us to tell whether stars are approaching or receding from the sun; at what rate they are doing so; the rotation of the sun on its axis, and the rotation of Saturn's rings. And as the spectrum can be photographed a permanent and accurate record can be made, and, as above mentioned, part of the spectrum invisible to the human eye can be recorded on the photographic plate.

Astrophysics, armed with the spectro-scope, made great strides during the latter part of the last century, when it was discovered how to analyse spectra. Since 1895 atomic physics has produced epoch-making results, and as one of the most striking advances, made in 1913, was the interpretation of the spectra of the element it may be imagined that astrophysics, too, received a new interpretation and the present century may be called the golden age of physics and A., for a knowledge of the atom is invaluable in interpreting the physics of the stars. As in physics, so in A., the recent progress has been due to a large number of learned astronomers, and for details of the hist. of A. during the present century the works mentioned in the following brief bibliography should be read. Mention must be made of the Californian observatories, which are modern observatories, containing the finest instruments in the world, and, in particular, the Mt. Wilson Observatory, which contains Michelson's famous telescopic interferometer, with which he first measured (in 1920) the angular diameter of a star, and of the 200-inch telescope being set up on Mt. Palomar, which, with its reflector, will weigh 1,000,000 lb. and be able to photograph light sources 1,000,000,000 light-years distant, and also of Eddington, the Eng. astronomer, whose work on *Stars and Atoms* has estab. him as not merely one of the greatest of Eng. astronomers, but one of the greatest of all astronomers.

See Sir H. Spencer Jones, *General Astronomy*, 1923; H. Macpherson, *Modern Astronomy*, 1926, and *Makers of Astronomy*, 1933; Sir A. Eddington, *Stars*

and *Atoms*, 1927; Hutchinson, *Splendour of the Heavens* (admirable photographs from the best observatories in the world), 1930; Sir J. Jeans, *The Mysterious Universe*, 1931; E. A. Milne, *The White Dwarf Stars*, 1932; J. Stokely, *Stars and Telescopes*, 1936; Sir F. Dyson and R. Woolley, *Eclipses of the Sun and Moon*, 1937; R. Waterfield, *A Hundred Years of Astronomy*, 1938 (useful to the astronomer and intelligible to the general reader); P. W. Merrill, *The Nature of the Variable Stars*, 1938; W. T. Skilling and R. S. Richardson, *Astronomy*, 1939; E. A. Beel, *A Text-book of Elementary Astronomy*, 1945; and J. B. Sidgwick, *The Heavens Above: a Rationale of Astronomy*, 1948.

**Astrophel** (Gk., star-lover): 1. The title under which Sir Philip Sidney wrote his sonnet sequence to Stella, or Penelope Devereux. The poems, written 1575-83, appeared in 1591. 2. The name of an elegy by Edmund Spenser on the death of Sidney.

**Astrophysics**, that branch of astronomy which relates to the physical components of the stars and their atmospheres. The spectro-scope and the photographic camera greatly advanced its study. See **ASTRONOMY**; **SPECTRUM** and **SPECTROSCOPE**.

**Astruc, Jean** (1684-1766), a Fr. physician and Bible critic, was b. at Sauve in Languedoc. In 1731 he became regius prof. of medicine at Paris, and his fame as a lecturer spread throughout Europe. Of his numerous medical works his most famous deal with sexual disorders and kindred subjects, e.g. *De morbis veneris libri sex* (1736). Besides being a physician, he was also a philosopher and wrote on the dual sources of the book of Genesis.

**Astura**, a vil. on a peninsula, once an is., on the coast of Latium, Italy, and near Antium. It is at the mouth of the Astura R., 39 m. S.E. of Rome. Remains of Rom. villas are excavated on the spot, and valuable traces of anct. civilisation have been revealed. Cicero had a villa at A., to which he retreated after the blow of his daughter's death. Augustus and Tiberius both frequented it, and, according to Suetonius, both here contracted their fatal illnesses. On the site of the villa there is now a lofty tower.

**Asturias**, an anct. prov. of N. Spain. The country is very rich in mines. The inhab. are insular, and having kept free from contact with other peoples, are the purest representatives of the Sp. race. The eldest son of the king of Spain was called Prince of the Asturias, a phrase coined on the analogy of the Eng. Prince of Wales.

**'Asturias'** The. The name of a Brit. hospital ship which the Gers. attempted to torpedo off Havre on Feb. 2, 1915. The A. plainly showed the Red Cross, and all other externals of its character. Later the Gers. issued an 'apology' to appease hostile judgment of neutrals. The Brit. Admiralty retaliated on Mar. 8 by announcing that they would not extend the honourable treatment which they had accorded to the crew of the

*Emden* to the officers and men rescued from *U-boat 8*, the delinquent boat.

**Astyages**, grandfather of Cyrus. According to Xenophon, A. and Cyrus lived amicably together, but another version of the story relates that A., fearing his grandson, exposed him, and he in turn dethroned his grandfather.

**Astyanax**, the young son of Hector and Andromache, and sometimes called Scamandrius. At the sack of Troy he was cast from the ramparts, that he might never restore his grandfather's kingdom.

**Astylar** (ἀ-, without, στύλος, pillar), an architectural term signifying without columns. Thus A. It. buildings are in contradistinction from those buildings which are decorated with columns. The A. class of design was introduced into England by Barry in the Travellers' club-house and Reform club-house, London.

has almost entirely ceased since the construction of the railway to Port Sudan. The granite quarries from which the anc. Egyptian builders and sculptors drew their supplies are situated in the hills to the S. An unfinished obelisk 137 ft. long and 14 ft. thick is there. Blocks were detached by boring holes, driving wedges into them, and then waiting the wedges. On the is. of Elephantine is an anc. Nilometer, and the A. Museum, containing objects found in Lower Nubia. The rock tombs of Elephantine of the princes and grandees are to be found in the hill on the opposite side of the riv. The ruined Coptic monastery of St. Simeon is also in the neighbourhood. During the Mahdia (1884-1898). A. was strongly garrisoned by Egyptian and Brit. troops, but since a defeat of the khalifa the fixing of the Egyptian frontier farther S. lessened its

THE DAM AT ASWÂN

**Asunción**, or **Assumption**, cap. of the republic of Paraguay, S. America. The city takes its name from the feast of the Assumption in 1537, which was the date of its foundation. The port (which is 950 m. from the sea) has communication with Buenos Aires by steamers. There is a Brit.-owned railway (the Paraguay Central railway) from A. to Encarnación, on the Rio Alto Paraná. There is a wireless station. The climate is hot, but is not unhealthy. The city was once the seat of the Sp. gov. of the region, and has a college, library, and many fine churches. The seat of the Paraguayan Rom. Catholic archbishopric is at A. A. has been the scene of many struggles. The Jesuits and the Church here came into serious conflict. Francia made himself despot of the city. A., too, was the centre of a war with Brazil. Pop. (1941) 178,000.

**Aswân** (or **Assuan**), a tn. of Upper Egypt, on the Nile. It is the cap. of the most southerly prov. of Egypt, bearing the same name. It is popular as a health resort and tourist centre. Some remains of the anc. city still exist in the form of granite columns and portions of the ruins of a temple. The once considerable trade in the products of the Sudan and Abyssinia

military advantages. At A. is situate one of the greatest dams on the Nile. Pop. 22,000.

**Asylum**, see **INSANITY**.

**Asylum**, **Right of**, a right, once familiar to students of international law, but now virtually obsolete in Europe, which makes an ambas.'s house a sanctuary or 'city of refuge,' whether for himself and his household or for refugee criminals. As regards the last named, the claim has long been generally abandoned in practice, and to-day an ambas.'s house is no longer accurately described as part of the ter. of his own country. A criminal who takes refuge there can now be surrendered without formal extradition process, though whether an embassy can be entered without the ambas.'s permission is open to doubt. Entry and search are probably justifiable in those extreme cases which justify the arrest of the ambas. himself. The right was exercised in Greece in 1862 and in Spain in 1875, but not elsewhere in Europe in recent years, though it has not entirely disappeared in S. America.

In another sense the R. of A. means that a neutral, consistently with his continuing friendship with both belligerents,

is allowed to receive their troops or vessels within his ter. In circumstances which ensure that the use of his hospitality will not be aggressive in its results. Such reception is properly conditioned, in the case of land forces, upon an agreement by the fugitives, to undergo disarmament in crossing the frontier, and internment within the neutral ter. as long as hostilities last.

**Asymptote** (a privative, *συν*, together, and *πτω*, to fall), a mathematical term used to denote a line which approaches nearer and nearer to another, but only coincides with it at infinity. Familiar examples of the A. curve are those obtained from the graph of the tangent and also from the hyperbola.

**Asyndeton**, is a figure of rhetoric which omits the connectives for the sake of emphasis, and in order to bring out the climax. The stock example of A. is Caesar's famous message, 'Veni, vidi, vici'—'I came, I saw, I conquered.'

**Asyút** (Assiut) or Siut, cap. tn. of prov. of same name, Upper Egypt, near W. bank of R. Nile, 248 m. S. of Cairo. Area of prov., 812 sq. m. It is the residence of the governor, and is the largest tn. and the most important commercial centre in Upper Egypt. The handicrafts for which it was formerly noted (pottery, inlaid wood, ivory carvings, leather and woven goods, and tulle shawls) are being rapidly ousted by European factory-made goods. There is an Egyptian museum belonging to a wealthy resident. The Mohammedan A. Institute was founded in 1915. Near by are the rock tombs of anct. A. It is the chief seat of the Amer. Presbyterian Mission. One of the Nile dams has been constructed here. Pop. (prov.) 1,204,000, (tn.) 60,000.

**Asystaton**, the characteristic sophism of the liar.

**Atabapo**, riv. of Venezuela, joining the Orinoco at San Fernando de A. after a course of 140 m. It forms part of the boundary between Colombia and Venezuela.

**Atacama**, a prov. in N. Chile, area 31,400 sq. m. There are some of the world's most valuable silver and copper mines in the prov. Salt is exported in large quantities. The A. desert is a vast stretch of barren country extending over the provs. of A., Los Andes, etc. It is volcanic in character, but is one of the richest ters. of the globe, having quantities of silver, copper, lead, nickel, borax, iron, salt, etc. Pop. 80,000.

**Atacamite**, a rare mineral originally found in the desert of Atacama, in S. America, and also occurring in Saxony and on the slopes of Vesuvius and Etna. It is a copper oxychloride,  $\text{CuCl}_2 \cdot 3\text{Cu}(\text{OH})_2$ , crystallises in the orthorhombic system, is usually green in colour, has a hardness of 3, a sp. gr. of 3.7, and is worked as a copper ore.

**Atahualpa**, son of Huayna Capac of Peru and 'last of the Incas.' He was deprived of the throne of Peru by the illegitimacy of his birth, as he was of the blood of the Incas only on his father's side, his mother being a captive princess of

Quito. His father therefore was obliged to leave his throne to his legitimate son Huascar, but to his favourite son A. he left the newly conquered kingdom of Quito. A quarrel sprang up between the 2 brothers, and A. was victorious, but at the moment of his victory Pizarro, the Sp. pioneer, landed in Peru. On Nov. 15, 1532, he requested A., now Inca, to pay him a friendly state visit, but took him prisoner by a horrible massacre of his bodyguard. Treachery was followed by treachery, and after A. finally professed himself Christian, he was strangled in 1533.

**Atakpame**, a gov. and mission station in the interior of Togoland, in W. Africa, having a large trade in rubber. It is connected by rail with Comé. Pop. about 8000.

**Atala**, one of the most beautiful and famous mosques of India. It is situated in Jaunpur, in the Benares div. of the United Provs. The mosque is known as the A. Masjid or Mesjid (i.e. Great), and was built in the year 1408 by Ibrahim. Its cloisters and façade are magnificent specimens of Indian architecture.

**Atalanta**, an Arcadian huntress, and daughter of Iasus and Clymene. Her father, desiring a son, had exposed her in infancy, but she was nourished by a she-wolf. She became the devotee of Artemis, goddess of maidenhood and the chase. She took part in the hunting of the Calydonian boar, and her father once more recognised her as his daughter. She was urged to give her hand in marriage, but being warned against marriage, and knowing she was without peer in swiftness of foot, she compelled all suitors to contend with her in the foot-race. He who lost must die; he who won would be her lord. Milanion conquered her by a ruse. Aphrodite gave him 3 golden apples, which he let fall during the race, and A., overcome with their beauty, stooped to pick them up. She thus surrendered herself to Milanion.

**Ataman**, see HETMAN.

**Ata-Melik**, whose complete name was Ala-eddin-ata-Melik al-Jowaini (c. 1227-1282), was b. at Jowain, near Nishapur, Khorasan. He became the confidant of Mangu Khan, and afterwards of Hulagu, by whom he was made prefect of Bagdad 1258. He was accused of peculation, and put into prison by Abaka Khan, the successor of Hulagu. He was, however, released by Sultan Ahmed, the successor of Abaka Khan. Ahmed was soon afterwards defeated by Argun, the son of Abaka Khan, and this news no doubt brought about the death of A. He was the author of *Jehankushais* (The Conquest of the World), a hist. of the Moguls, and a MS., said to contain the greater part of it, is in the Royal Library at Paris (Quatremère, *Mines de l'Orient*, vol. 1., p. 220).

**Atanjauia**, see JAUJA.

**Ataroth**, a tn. E. of the Jordan, rebuilt by the tribe of Gad (Num. xxxii.) and taken from the men of Gad by Moab, king of Moab. Generally identified with the ruins of Attârus, on the W. slope

of Jebel Attarus, 7 m. N.W. of Dhibân. Also the name of a tn. on the border of Ephraim, not far from Jericho, but unidentified.

**Atatürk Mustapha Kemal** (1880-1938), first president of the Turkish Republic and maker of modern Turkey; *b.* at Salonika. His father, who was first a custom-house officer and afterwards a timber merchant, *d.* when A. was a child. But he was given a very good education by his Albanian mother, and entered the Military College at Monastir, afterwards passing into Pancaldi, the chief military college of Turkey, where he evinced a taste for mathematics. In 1904 he became a captain. Detected in political activity, he was imprisoned, and, on liberation, was sent to Syria, where he fought the Druses and founded, among subaltern officers, a Liberty Society, which was subsequently taken over by the Committee of Union and Progress. He was politically active also in Egypt, on his way home again; and again at Salonika, where he enjoyed the protection of Cemil Bey. He returned to his old post at Jaffa, and was not heard of at Salonika for 3 years. But he then became active once more in connection with the Young Turk movement and, at the time of the revolution in 1908, was a junior major in the gendarmerie. He also saw service against the Albanian rebels in 1909-10, and when the war with Italy broke out he served in Tripoli as a member of Enver Bey's staff. Although he quarrelled with Enver, he was appointed military attaché at Sofia in 1913. Opposed to Turkey's entry into the First World War, his ability was exploited by the Gers., who gave him the command of a new div. in the Fifth Army which was concentrated for the defence of the Dardanelles, and he stopped the advance of the Allies in Gallipoli. In 1916 he went to the Caucasus in command of the Turkish Second Army, but was removed by Enver for mismanagement, for which, it is said, he was not responsible. Next commanded in Mesopotamia, but disagreed with Falkenhayn, and in consequence was sent to Aleppo; but he was recalled to activity when the Ger. plans regarding Palestine failed, and was about to assume an important command when Turkey sued for peace. At the time he was strongly criticising, in official reports, Ger. interference in Turkey's Arab policy and Enver Bey's subservience to Potsdam. In May 1919, just after the Gks. had landed at Smyrna, he was appointed inspector-general of the forces in E. Anatolia, it being supposed by Damad Pasha, who had sent him there, that he would suppress the incipient Nationalist movement. But though A. may have been opposed to the Committee of Union and Progress, he was a patriot. He started a movement which rapidly spread among the Anatolian soldiery and led to a conference at Sivas at which A. and his *compères* drew up their 'National Pact.' For this he was outlawed, but his attitude towards the ill-starred

treaty of Sèvres quickly marked him out at the spear-point of Turkish resistance to Greece and the aspiration of Venizelos towards a greater Greece at the expense of Asiatic Turkey. After the invading Gks. had everywhere been repulsed, he consented to an armistice at Mudania (Oct. 11, 1922). The sultan fleeing from Constantinople in Nov., A. was left the only power in Turkey; and on July 24, 1923, at Lausanne, he made peace with the Allies. On Oct. 29 the Republic was declared, with A. as president. In Mar. 1924 the Popular party, which he led and which had a majority in the Assembly, passed a law abolishing the caliphate and ordering the exile of all members of the House of Osman. A. then turned to the secularisation of Turkey and to the complete destruction of his political opponents. He governed as a dictator, combining the offices of president of the Republic, of the Council of Ministers, of the Grand National Assembly, and leader of the Popular party. Following the Kurdish rebellion, which had been fomented by religious leaders, he closed all Moslem religious houses, and not only prohibited any distinctive dress of the orders of the dervishes, but imposed European head-dresses and raiment on Turkish subjects, as being the 'ordinary clothes in use among the civilised nations of the world' (1925). About the same time the Assembly abolished various traditional restrictions on female education and abolished polygamy. There was a plot against his life at this period, but it was discovered and many political opponents were executed or banished. A. was now the undisputed master of Anatolia, and this fact was emphasised at the election of 1925, when his party won all 300 seats. From that time he and his ministers proceeded from one reform to another. He instituted a civil code on the Swiss model for the Moslem Sacred Law and in Apr. 1928 secured a modification in the constitution by which Islam ceased to be the State religion. In 1934 he abolished the old titles of pasha, bey and effendi. In the same year the franchise was given to women, nearly a score of whom were elected to the Assembly in 1935. At the same time the Assembly ordered the use of surnames, the lack of which in Moslem countries was always a source of confusion. He himself was given the surname of Atatürk, or Chief Turk, by a special law passed by the Assembly. During his dictatorship there were numerous other beneficial reforms—notably in public health, education, and agriculture. In the sphere of foreign policy A. was no less successful. Anglo-Turkish relations became markedly better—thus paving the way for the pact of 1939; a Turco-Greek entente was initiated in 1930; Turkey became a member of the League of Nations in 1932; and, in 1934, a Balkan pact was made for the mutual respect of the boundaries of the signatories. In 1936 Turkey won a diplomatic triumph at Montreux, when it regained sovereignty

over the Dardanelles and Bosphorus from the powers which had signed the Straits Convention of 1923. A. was the first to insist that the New Turkey must renounce all claims to influence outside her racial frontiers. Determined to remain the master in Turkey, he boldly abdicated all claims outside it. From the very first months of 1919 he felt that that was the only way to salvation for a really independent Turkey. This appears to have been his attitude in his policy towards the Senussi in 1919, when he renounced any intention of renewing Turkish domination over the Arabs, a domination which he regarded as one of the causes of Turkish decline. But suspicion of Gks. and Armenians, who in the old Turkey used to have the monopoly of commercial life, explains, if it does not excuse, the fact that his policy blindly ignored all considerations of social economy. He believed that it was enough to expel the foreigners from their posts to have all the gains going into Turkish pockets; but he overlooked the fact that the mercantile genius of the Gks. and the Armenians, and of all the Levantines of European origin, had been created by centuries of tradition and work. But, on the other hand, it is not to be forgotten that the expulsion from Anatolia of all the rich Hellenic colonies that, for long centuries, had kept in W. Asia the monopoly of trade, navigation, and industry, was conceived by Venizelos under the form of a project for the exchange of pops. A million and a half Asiatic Gks., previously rich and contented, were thrown back on the coast of Greece as social pariahs. Turkey lost by the exchange, as she lost by all her xenophobia, but it was impossible to expect that A. and his Gov. would renounce this unique chance of changing their country into a homogeneous Turkish state, containing fewer extraneous elements than any other nation in Asia and probably also in Europe. Combining ruthless vigour and fiery ambition with a bold intellectual radicalism, utterly unaffected by historical tradition or religious sentiment, he lived a hard and intemperate life. He married in 1923, but divorced his wife because he thought that she was endeavouring to influence his political decisions. He d. of cirrhosis of the liver.

**Ataulphus**, or **Ataulf** the 'Father-wolf' (derived from *atta*, father, and *wulfs*, wolf, a name now corrupted into Adolf), king of the Goths and brother-in-law of Alaric. He had a successful military career, and conceived the brilliant idea of blending the Rom. and the Gothic races, that Rom. civilisation might moderate the barbaric hardness of the Goths.

**.Atavism** (Lat. *atavus*, a great-great-grandfather), a biological term used to denote a reversion to some remote ancestral type. It is a species of heredity common to animal and plant life. Thus coloured blood may come out after its apparent disappearance for many generations, or some old family characteristic

may make a sudden reappearance. Pure breeds may occasionally breed a common type or in horticulture cultivated species may revert to the common type.

**Athara**, the most N. trib. of the Nile. The A. was the theatre of a battle fought between a Mahdist army under Mahmud and a Brit. army under Lord Kitchener. The battle resulted in the capture of Mahmud and the rout of the Mahdists. This victory was followed by the decisive battle of Omdurman.

**Atchafalaya**, a name applied to an outlet of the Red R., 220 m. long, and according to derivation signifying Lost River. The origin of the name is the fact that it was supposed to have been the original bed of the Red R. The A. receives also in time of flood the waters of the Mississippi. Its course is southward, and passing through Chetimaches Lake it throws its waters into Atchafalaya Bay.

**Atchin**, or **Atoheen** or **Achin**, a Dutch prov. in the N.W. of the is. of Sumatra, with an area of about 21,300 sq. m. The is. has a backbone of mt. ranges from which numerous small rvs. descend to the coast on either side. The inhab. of A. are distinct from the other inhab. of the is., and hold themselves aloof. They have an admixture of Arab and Hindu blood. In their religion they are Muslims and retain the Moslem robe and turban characteristic of the Arabs. They are more industrious and intelligent than the neighbouring peoples, but they are very treacherous and unreliable. The social organisation of the Atchinese is communal. The ter. was rich in gold and attracted merchants from the sixteenth century, but the Atchinese persistently opposed the establishment of commercial relationship with European countries. Much fighting preluded the Dutch establishment in A. in the year 1875. Pop. 1,000,000.

**Atchison**, a city of A. co., Kansas, U.S.A., situated on the l. b. of the Missouri, and named after the leader of the pro-slavery party. The city is an important railway centre. Pop. 13,000.

**Atchison, Topeka, and Santa-Fe Railway**, U.S.A. A railway system extending through Missouri, Arkansas, Texas, Kansas, Colorado, New Mexico, Oklahoma, and Arizona. The system has now a total mileage of 10,445.

**Ate**, daughter of Eris (Strife) and Zeus, a Gk. goddess who represents the infatuation that leads men to ruin. In tragedy her mission is more moral, and instead of being the goddess of destruction she is the personification of retribution.

**Atef Crown**, a form of head-dress worn by Egyptian deities, consisting of a tall white cap, with a plume on each side, and bearing the solar disk and uræus in front.

**Ateles** (Gk. *ἀτέλης*, imperfect), a genus of S. American primates known as spider-monkeys. They belong to the family Cebidae. The thumb is absent (hence their name), the limbs long and very flexible, the tail long and much used in climbing. *A. paniscus*, the coaita,

inhabits Brazil; *A. belzebuth*, the marimonda, Guiana.

**Atellanae Fabulae** were an old Oscan type of drama introduced into ant. Rome. These dramas were improvised burlesques from low life. Certain stock characters appeared, e.g. Maccus the fool, Pappus the father, and Dossennus the humpback. They were the only type of play in which a Rom. citizen could act without losing caste as such. The A. F. lingered after many revivals till far into the empire.

**A tempo** (It., in time), a musical term used to indicate a reversion to the time at the beginning of a movement, when that time has been altered, e.g. *ad libitum*, *a piacere*, or for a longer time, e.g. *più lento*, *più allegro*, etc.

**Ateshgah** (place of fire), a place about 1 sq. m. in area, from the soil of which issues natural gas. It is a place of worship among the Guebres or Persian fire-worshippers.

**Atessa**, a small, finely situated tn. near Chieti in the S. of Italy. It has a fine collegiate church and other public buildings of note. Pop., tn. and dist., 10,000.

**Atfah**, the ant. Aphroditopolis, is an Egyptian tn. situated on the r. b. of the Nile, in the gov. of Ghizeh. Pop. about 3000.

**Ath**, a tn. on the Dender in the prov. of Hainaut, Belgium. It was once a fortified stronghold. A battle was fought here in Nov. 1918. Pop. 10,000.

**Athabasca**: 1. Before 1905 a great dist. in Canada was known as Athabasca. It covered an area of 251,000 sq. m. and was situated in the N.W. Ters. In 1905 parts of it were given to Saskatchewan and Alberta and in 1912 the rest became part of Manitoba. 2. A riv. and affluent of the Mackenzie (also named the Elk or Reindeer R.), and likewise a lake in the prov. of Alberta, Canada. The word A. means grassy carpet, a name applied to the riv. owing to the abundant herbage produced at the delta. The source of the riv. is a small lake at the base of Mt. Brown in the Rocky Mts., called the Committee's Punch-bowl. The A. flows from the mts. in a N.-eastward direction, receiving many affluents and the drainage of the Lesser Slave Lake. An interesting feature of the riv. is the point where it takes the 'Great Rapids,' a long slope where the water flows steadily and without cascades. After a course of 550 m. the A. enters Lake A. The lake is shaped like a great bow with the horns pointing southward. The main affluent of the A. lake is called the Great Slave R., and is formed by the union of the A. and Peace Rs. The Great Slave R. in turn flows into the Great Slave Lake, and takes the name of the Mackenzie R. The A. (lake and riv.) are thus part of a great system which drains and waters a vast tract of Canada. The A.-Mackenzie, whose united length is 2700 m., together with the recipient lakes, provides most valuable transportation facilities.

**Athalaric** (516-534), a king of the Ostrogoths, and grandson of Theodoric. He ascended his grandfather's throne in

the year 526, but being only 10 years of age, his mother, Amalasuntha, became queen-regent. During his minority he contracted vicious habits which undermined his constitution and caused his premature death.

**Athallah**, daughter of Ahab, king of Israel, and Jezebel, and wife of Jehoram, king of Judah. She inherited her mother's evil instincts, and under her influence the cult of Baal spread in Judah. On the death of her son Ahaziah, after a massacre of all her grandchildren except Joash, who managed to escape, she reigned in Israel for 6 years. Joash deposed her, and she was struck down as she witnessed her grandson's return to the throne.

**Athalie**, the title of the last tragedy of Racine, written by him in 1691 by the wish of Madame de Maintenon, who desired, for use in her girls' school at St. Cyr, a play in which sexual love was not mentioned. The drama is founded upon 2 Kings and 2 Chron., and is remarkable for religious fervour and emotional force.

**Athamas**, son of Æolus, king of Thebes, married Nephele, and by her had Phryxus and Helle. He forsook Nephele for Ino, and by her had Learchus and Melicerta. Ino persecuted the children of Nephele, and Ino in revenge visited A. with madness, whereby he slew his son Learchus.

**Athamelik**, surnamed Ala Eddin, was a famous Persian statesman and historian of the eighteenth century. He was twice governor of Bagdad, which he much improved during his term of office, building new mosques and canals.

**Athanagild**, a captain of the Sp. Goths who d. at Toledo in A.D. 547. With the help of a Rom. force sent from Gaul by the Emperor Justinian, he defeated and killed King Agila near Seville in 534. A. then became king of the Goths in Spain, and endeavoured to drive his Rom. allies out of Spain. He was unsuccessful, but reigned 14 years over that part of the country occupied by the Visigoths. Brunehaut, one of his two daughters, married Sigbert, king of Metz.

**Atharic**, a prince of the Visigoths bearing the title of judge. He engaged in a long unsuccessful campaign with the Emperor Valens, and peace was ratified in 369. In 376 he was defeated by the Huns who had advanced into the confines of Europe. In 381 he took refuge with the Emperor Theodosius at his court in Constantinople, but d. shortly after his arrival.

**Athanasian Creed**, see **ATHANASIU** and **CREED**.

**Athanasiu** (c. A.D. 296-373) was b. in Alexandria. His life is distinguished by his steady and notable resistance to the doctrines of Arius. He distinguished himself at the Council of Nicea (325), and in the year following that council he was made patriarch of Alexandria and primate of Egypt. Arius, who had been banished after the Council of Nicea, was, chiefly owing to the fact that the favourite sister of the Emperor Constantine had leanings towards Arianism, restored to favour.

A. was ordered—entreated perhaps would be the better phrase—to restore Arius to Christian communion, but he refused. For this and other acts which concerned his treatment of 6 of the Arian bishops, and particularly the Bishop Arsenius, he was tried and condemned at Tyre. He flung himself on the justice of Constantine, but was banished for a little over 2 years to Treves, whence he was restored by the younger Constantine on his accession (338). At a synod which was held at Antioch it was decided that a bishop deposed by one synod could only be restored by an equal synod, and this decision was immediately applied to A., who was again driven into exile. Part of this exile was spent in Rome, where he quickly gained the sympathies of the W. Church, and his innocence was upheld by the It. bishops in council. At a synod convened at Sardica, and at which met representatives of the E. and W., his cause aroused the deepest and angriest feelings, and the beginnings of a separation between E. and W. Churches are obvious for the first time. Constans, emperor of the W., by a threat of a religious war unless A. was immediately restored, brought about his restoration by Constantius in 349. Two years after, however, he was deprived of his protector (Constans) by his assassination in 351. By councils which were held at Arles (353) and Milan (355) his condemnation was brought about with great difficulty. In 356 he was expelled from Alexandria, which was given up to the plunder of the imperial army, while A. sought refuge in the deserts of Upper Egypt amongst men who regarded him with the greatest respect and refused to betray him. For 6 years he remained in exile. In 362, during the empire of Julian, A. returned, but was soon in exile again. Julian hated him, and, in his own words, desired his death, giving as his reason: 'The contempt that is shown for all the gods fills me with grief and indignation.' A. eluded capture, and again took refuge in the monasteries of the Upper Nile. He returned in 363 during the empire of Jovian, and save for a short break under Valens remained to carry out his work in Egypt until 373. His death was the signal for the outbreak of religious persecution. He had been primate of Egypt for 43 years, and had been in exile 4 times. He was the leader of the Church during one of its most dangerous periods, and showed by his zeal, his fervour, and his firmness an example which was not without imitation during his own age. As a writer and an orator he had superiors amongst his contemporaries, but as a leader of men and of the Church he was without equal. The creed which embodies his doctrines and beliefs was not heard of until some centuries after his death.

**Athanasius:** 1. Bishop of Perrha. Serious accusations were brought against him by his colleagues, and A. refused to appear when summoned. He was deposed and again c. 450, when an attempt was made to re-examine the evidence, he

refused to appear on the ground that the jury was predisposed to condemn him. 2. Bishop of Ancyra (A.D. 360-69) through the influence of the Arian Acacius, but throughout his career he was rigidly orthodox, and St. Basil commended him as the bulwark of orthodoxy.

**Athapasean**, a linguistic family of N. Amer. Indians, inhabiting Canada, California, and the Rio Grande dist., and formerly known as the Chippewayan. It may be divided into 3 main branches: the N., about 8595 strong, in Alaska and Canada; the Pacific, about 895 strong, in Washington, Oregon, and California; and the S., about 23,400 strong, in Oklahoma, Arizona, New Mexico, and Colorado.

**Atheism**, disbelief in the existence of a God. A. should be carefully distinguished from scepticism, with which in the popular mind it is very often confounded. One sect is very apt to charge an opponent sect with A. merely because the doctrines of that sect are not understood. Thus Xenophanes, who rejected the gods of the popular Gk. religion, incurred the charge of A., though his attitude was almost monotheistic. Socrates, too, was charged with A. because he did not believe in the gods that the city worshipped. Even the early Christians were called atheists by the Romans, because the absence of images and the other familiar appurtenances of worship was to the material Rom. mind incomprehensible. Philosophic A. fails to find evidence of a god manifest in the universe. In Greece positive atheists were the followers of Democritus, Leucippus, and the materialistic schools. In Rome there were very many sceptics, but very few atheists. Lucretius was unique, standing apart from his age and from his race. His book *De Rerum Natura* (On the Nature of Things) is one of the most fervent denials of the divine ever penned. 'Gods' there are, but these 'gods' are not immortal, according to Lucretius, but only beings, endowed with a happier and longer life than ordinary mortals. Lucretius had no followers at Rome, and his book was ignored for many generations. In recent times Europe has produced not a few eminent atheists, e.g. von Holbach, and Gustave Flourens. Modern A. falls into three classes: (1) *Dogmatic A.* which positively asserts there is no God. (2) *Sceptical*, which maintains that the finite mind of man is incapable of asserting whether there is or is not. (3) *Critical*, which holds that the evidence for Theism is inadequate. Plato first asserted that no one after adopting in his youth the doctrines of A. persisted in such doctrines in old age—a theory that has frequently been reasserted. In India the disbelief in the existence of God is common from very early times. Notably atheistic are the Sankhya system and the more modern Jainism. A. as a system did not have many adherents among the Jews. The Jewish mind was not prone to analyze religious beliefs. Still there are traces of it, e.g. Jer. v. 12, 'They denied the Lord and said, He is not';

and Psalm x. 4, 'The wicked in the haughtiness of his countenance says, He will not require, all his thoughts are, There is no God.'

**Atheling**, an A.-S. title of nobility used by the descendants of the first invaders, but by and by this title of honour was used only by the members of the royal family, i.e. kings and the brothers and sons of kings.

**Athelney**, a marsh at the junction of the Tone and Parret, formerly an is., in Somerset, England. Here Alfred fled (A.D. 878) when oppressed by the Dan. invaders. On regaining his throne he founded a Benedictine monastery on the is. in commemoration of his retreat, and portions of it have been excavated. A ring was found bearing Alfred's name, and is now preserved in the Ashmolean Museum, Oxford.

**Athelstan** (c. 895-940), son of King Edward the Elder, and grandson of Alfred the Great. He succeeded to the throne in 924, not without opposition. He annexed the kingdom of Northumbria, and then made tributary to himself the kings of Wales, Cumbria, Scotland. His title thenceforth was king of Britain. These dependent kings then conspired against him, but the battle of Brunanburgh, a signal victory for A., put an end to the opposition. A. was the first king to unite England and to establish a connection with Europe by uniting the female side of his line with European princes.

**Athena**, a Gk. goddess, according to a quaint legend born from the head of Zeus, who, fearing that the child about to be born would surpass himself, had previously swallowed her mother, Metis (counsel). This myth symbolises the intellectual character of the deity. Her distinguishing attribute is the regis (a shield or cloak), bearing the gorgon's head. Other characteristic symbols are the owl, the serpent, and the olive branch. In Gk. poetry her name is qualified with the fixed epithet *glaukopis*, translated 'grey-eyed,' but possibly really signifying 'owl-eyed'—just as the fixed epithet of Hera is 'ox-eyed.' These 2 epithets may be a survival of totemism. A. was patroness of many arts and divine protectress of many human experiences. She was protectress of Athens, goddess of wisdom, of war, of agriculture, and of the various crafts that belong to women. The story of how she became patroness—deity of Athens is one of the most famous of Gk. legends. Poseidon and A. contested for the honour, and each brought forth a gift-symbol. Poseidon struck the ground and a horse arose, symbolical of war, but A. produced an olive branch, symbolical of peace and prosperity. The latter was adjudged the better gift, and A. became patron-goddess. At Athens to A. in this character was dedicated the Parthenon, the most magnificent example of Gk. architecture, and 2 magnificent and colossal statues by Phidias (one in gold and ivory, and the other in bronze) represented her in all her beauty, dignity, and power. As the goddess of wisdom

she, along with Apollo, with whom she was associated, is one of the most characteristic of Gk. deities. Literature and fine art were under her protection, and it is in literature and fine art that the glory of Greece chiefly lies. In a sterner aspect she was associated with war, but war in which she is concerned is war waged on the side of justice. Hence she is associated with victory and worshipped as its personification (Athena Nike). Anct. art very often represents her contending with the giants. But the milder side of her character is revealed in her association with women's work—chiefly weaving. A., like Diana, remained a virgin and protected the virginity of women. In art she was usually represented in full armour, bearing helmet, spear, shield, and regis. Her chief festival was the Panathenæic games.

**Athenæum**: 1. A temple of Athena used as a seat of learning at Athens. 2. A similar institution at Rome, built by Hadrian A.D. 135 for philosophy, rhetoric, law, etc. The name thus began to be applied to colleges in general, e.g. at Constantinople and at present at Marseilles.

**Athenæum**, formerly a high-class literary journal, pub. weekly. After an existence of nearly a century, it was incorporated, in 1921, in the *Nation*, a weekly (q.r.), later called the *Nation and A.* The A. was started by James Silk Buckingham in 1828, but in his hands the paper was not successful. From 1828 to 1832 Charles Wentworth Dilke was one of the proprietors. Others were Hood, Allan Cunningham, and John Hamilton Reynolds. Two years after the paper was started it passed under the sole control of Charles Wentworth Dilke. In 1831 Dilke reduced the price from 8d. to 4d., and in spite of the duty and the cost of the paper, it flourished. Other writers were Hogg, the Ettrick Shepherd, Leigh Hunt, and William Roscoe. Dilke was not only an innovator in the price of the paper, he also tried to make a revolution in journalistic principles. He asked no favour of any publisher, and refused to allow his criticisms to be biased in any direction. In 1846 Dilke resigned the editorship of the A. and went to the rescue of the *Daily News*. The paper was amalgamated in 1931 with the *New Statesman*.

**Athenæum Club**, a famous institution in Pall Mall, founded in 1824 'for the association of individuals known for their literary or scientific attainments, artists of eminence in any class of the Fine Arts, noblemen and gentlemen distinguished as liberal patrons of Science, Literature, and the Arts.' Membership is attained by ballot-vote or the vote of the committee (restricted to 9 new members each year). The club consists of 1200 members, who pay a yearly subscription of 15 guineas, with an entrance fee of 30 guineas. Attached to the club is the finest library in any club. Ten per cent black balls excludes from membership.

**Athenæus**, an erudite Gk. grammarian,

b. at Naucratis in Egypt, *fl.* c. A.D. 200. He studied in Alexandria and Rome. He wrote a miscellany called the *Banquet of the Learned* in the form of conversations of learned guests at a prolonged feast. The book is crammed full of valuable information concerning Gk. letters and science, and is one of the best sources for fragments of lost comedies, etc. The *editio princeps* is the Aldine, pub. 1524. Others: by Casaubon (1597), Lindorf (1827), Meineke (1859), Kaibel (1887). See also K. Mengis, *Die Schriftstellerische Technik im Sophistenmal des Athenæus* (Paderborn), 1920. There is an Eng. translation by Yonge in Bohn's Classical Library; and by Charles Burton Gulick in the Loeb Classical Library, *Athenæus: The Deipnosophists*, 7 vols., 1927-38.

**Athenæus**, a Gk. writer, probably contemporary with Archimedes. A work by him on engines of war (*Περὶ Μηχανημάτων*) is extant, and printed in the collection of Thévenot. This work is addressed to M. Marcellus, supposed to be the conqueror of Syracuse.

**Athenæus of Attalia**, a physician who *fl.* in Rome about the middle of the first century of our era, and estab. the Pneumatic school in medicine. A few fragments of his writings are preserved by Oribasius and Aetius, and allusions are made to his opinions in the writings of Galen. The theory, which originated with A., and was adopted by sev. other distinguished physicians (Aretæus), derived its name from the *pneuma*, or spirit, a notion of which these physicians made frequent use in their explanations of life and disease. This *pneuma* formed an important principle in the physical science of the Stoic philosophers, from whom the Pneumatic physicians seemed to have derived it. The very scanty remains of the Pneumatic doctrine do not enable us to judge whether its spirit resembled the *vital principle* of some modern physiologists; nor can we appreciate in what manner the Pneumatics conceived the efficacy of this spirit as connected with those principles which they admitted in common with other ant. schools, the elementary qualities, heat and cold, which they called active principles, and dryness and moisture, which they termed passive principles. (Leclerc and Sprengel's *Histories of Medicine*.)

**Athenagoras**, a Gk. Christian apologist, who *fl.* in the second century A.D., b. at Athens, and taught there and at Alexandria. Best known by his *Legatio pro Christianis*, addressed to the Emperor Marcus Aurelius, in which he defended the Christians. He also wrote a treatise on the resurrection of the body. Works trans. by Humphreys, 1714.

**Athenals**, see EUDOCIA.

**Athenion**, a Sicilian slave, but by birth a Cilician, who lived in the latter part of the second century B.C. He was the overseer to 2 wealthy brothers, and on the insurrection of the slaves in Sicily (known as the second Servile war, 102 B.C.) he gained over the slaves under his charge. Other slaves flocked to his

standard, and he soon had 10,000 followers. He assumed the title and state of a king, and told his followers that he was destined to reign over Sicily. He laid siege to Lilybæum, but failed in his attempt. He then joined Salvius, another slave-leader, who had assumed the name of Tryphon, and who had a stronger force than A. The Rom. Senate sent L. Licinius Lucullus to subdue them, and although he was at first successful he was defeated when he laid siege to Triocala. Tryphon died, and A. succeeded him, but was defeated and slain by Manius Aquilius the consul in 101 B.C. Aquilius ended the war in 99 B.C.

**Athenion**, who lived in the first century B.C. was the son of a Peripatetic philosopher of the same name, by an Egyptian slave. He was set free, and assumed the name of Aristion. He kept a school in Athens, and ultimately became tyrant of that city. He helped Mithridates in his wars against the Romans, and with Archelaus, the general of the king of Pontus, held the city against Sulla. He was afterwards put to death by Sulla.

**Athenion**, a painter, who was b. at Maronea in Thrace. He was a pupil of Glaucion of Corinth. Pliny, in his *Historia Naturalis*, xxxv. 40, speaks of him in very high terms.

**Athenion**, a comic poet. Athenæus gives a long extract from his *Samothracians*, xxiv. 80.

**Athenodorus**: 1. Arcadian sculptor, *fl.* about 350 B.C. Most successful with noblewomen. 2. Rhodian sculptor of first century B.C. One of the three who produced the famous 'Laocöon'. 3. Gk. physician contemporaneous with Plutarch. 4. Of Tarsus, a Stoic philosopher surnamed Cordylion, was keeper of the library at Pergamum; afterwards removed to Rome, where he lived with M. Cato, at whose house he d. 5. Of Tarsus (74 B.C. to A.D. 7), also a Stoic philosopher, surnamed Cananites from Cana, Cilicia, the bp. of his father. Taught at Apollonia in Epirus, where the young Octavius (later the emperor Augustus) was one of his disciples.

**Athenry**, par. and unkt. tn. of Ireland, in Galway co., 10 m. N.W. of Loughrea. Friday is the market day. Pop. 3000. The pop. of the town is 800.

**Athens**, cap. of ant. Attica and modern Greece, situated on the Attic plain, 4½ m. from its harbour, Piræus, on the gulf of Ægina. The plain is surrounded by hills: Mt. Hymettus lying to the E., Pentellicus to the N.E., Parnes to the N.W., and Ægaleus to the W. and sloping S.W. to the Saronic Gulf. It is crossed by sev. lower ridges, partly occupied by the city itself. The greatest height of these, Mt. Lycabettus, directly overhangs the city, within which are the rocky masses forming the Acropolis and Areopagus. The plain is watered by the Ilissus and Cephissus, both irregular mt. streams. A. is approached on the W. by the 'Sacred Way,' over the plain of Eleusis, and on the S.W. from Piræus, over what was formerly a swamp, and

there are railways to Piræus, Laurium, and Corinth and a tram-line to Phaleron. This last was the first harbour of A., but it, together with Munychia and Zea, was early replaced by Piræus, now one of the chief ports of the Mediterranean. The city was connected with the ports by the famous 'long walls.'

The original site of the city was undoubtedly the Acropolis, on the summit of which have been found traces of a prehistoric wall. Buildings soon extended to the S. and W. of the hill, and this city, the foundation of which is ascribed to Theseus, was enclosed by a strong wall with 9 gates, portions of which still remain. There can also be

spot in the city. The square is surrounded by cafés which usually remain open all night. Here, too, is the entrance to the underground station, and 7 streets run into the square. Numerous wide boulevards, the most important of which are Piræus Street, Athens Street, Stadium Street, and Univ. Street, radiate from the central Place de la Concorde, and contain fine gov. and univ. buildings, and the offices of the many archaeological and other societies for which A. is famous. There are 2 univs. at A., the National and the Capodistria. It is the see of a metropolitan, and possesses an ugly cathedral built in 1855. Before the capture of A. by the Turks, the

ATHENS FROM THE ACROPOLIS

E.N.A.

traced the course of the great wall of Themistocles, built immediately after the Persian wars, 479 B.C. and the gate of Hadrian probably marks the limit of the extension to the E. made under the Emperor Hadrian. The modern city lies mainly to the N. and E. of the Acropolis, in the depression between it and Mt. Lycabettus. But the increase in pop. during the present century, owing to some extent to the arrival of refugees from Asia Minor, has led to the building of many suburbs, Mt. Lycabettus being now almost surrounded by buildings. Approaching the Acropolis, the streets become narrow and cobbled, and open drains run down the middle of some of them. A. has been almost entirely rebuilt since it became the cap. of the new kingdom of Greece at the withdrawal of the Turkish garrison in 1834, and is now a regular and attractive city, extending in the form of a semi-circle, and divided into 6 dists. It is connected with the older part by the 2 main thoroughfares of Hermes Street and Æolus Street, intersecting at Constitution Square the site of the royal palace, 1834-38. Omónia Plateia (Place of Harmony) is the business centre, but it belies its name, for it is the noisiest

Parthenon was the cathedral. The Theseum and Erechtheum were also converted into churches in the Middle Ages.

The antiquities of A. are probably unequalled in the world. The most famous is the Parthenon, dating from the reconstruction of A. after the Persian wars. It is white marble, 228 ft. long and 100 ft. wide, ornamented by Phe'dias, and surrounded by 46 Doric columns. Even in its ruins it is the most perfect specimen of Gk. architecture extant. To the N. of the Parthenon is the Erechtheum, which contained the statue and sacred olive of Athena, and had a wonderful portico of Caryatides. At the W. end of the Acropolis, just above the great gateway (the Propylæa) stands the temple of Athena Nike, or Apteros Nike (Wingless Victory). At the foot of the hill to the N. is the Theseum, dating from the time of Pericles, and in excellent preservation, and to the S. the temple of Dionysus and the Odeon of Herodes Atticus. The Areopagus, or Mars's Hill, was the meeting-place of the great council of that name, and popular meetings were held on the mound of the Pnyx, also near the Acropolis. Just outside the city to the S.E. are the ruins of

the temple of Olympian Zeus, begun by Pisistratus, and completed by Antiochus Epiphanes and under the Emperor Hadrian. The Stadium, on the banks of the Ilissus, was built by Lycurgus, 330 B.C., rebuilt by Herodius Atticus, A.D. 140, and after being largely destroyed in the Middle Ages, was restored in 1905. Thanks to the archaeological societies which have made A. their headquarters, the Acropolis has been entirely cleared of Turkish and medieval remains, and many of the anct. buildings have been restored as nearly as possible to their former state. Excavations which have led to the discovery of innumerable examples of Attic art were still being carried on before 1939.

The early hist. of A. is very obscure. It seems to have been originally one of numerous petty states, but early emerges as the cap. of Attica, traditionally united under Theseus. The earliest form of gov. was a monarchy, but the powers of the king were gradually limited by the nobles (Eupatrides), and the rule of archons (q.v.) represents a period of 'aristocracy.' The citizens seem to have been divided into 4 tribes, each consisting of 3 brotherhoods. The growth of the democracy was gradual, being assisted by the legislation of Draco, 621 B.C., Solon, 592 B.C., and Cleisthenes, c. 500 B.C. A. took a leading part in repelling the Persian invasion of 490 B.C., and in the final defeat of Xerxes, 480-79 B.C., and after this, by the establishment of the Delian League, became mistress of the whole of the Gk. states. The golden age of Athenian power and culture, 480-430 B.C., which reached its highest point under Pericles, witnessed the production of its finest buildings, its most perfect sculpture, by Pheidias, and the poetic drama of Æschylus and Sophocles. Its prosperity began to decline from the end of the Peloponnesian war, 403 B.C., when Sparta became the premier state of Greece, and suffered still further by the victories of Macedonia, culminating in the battle of Chæronea, 338. Its intellectual supremacy, however, long outlived its temporal power. In 146 B.C. A., together with the rest of Greece, became part of the Rom. empire. Under Rom. rule it flourished, and became a great educational centre, declining, however, with the spread of Christianity. At the fall of the empire it passed under Byzantine rule, and early in the thirteenth century became the seat of a Frankish duchy. In the mid-fifteenth century A. was captured by the Turks, and practically disappeared from European hist. for centuries. Except for a brief period of Venetian rule, 1687-90, it remained in the hands of the Turks till its capture by the Gk. patriotic party in 1822. It was retaken by the Turks, 1826-27, but became cap. of the new kingdom in 1834. A. has become the centre of archaeological research in Europe, the chief institutions being the Fr. School of Archaeology, 1846; the Ger. Imperial Archaeological Institute, 1874; the Amer. School of Classical Studies,

1882; and the Brit. School of Archaeology, 1883. The pop. of anct. A. in its time of greatest prosperity was about 300,000; in the sixteenth century it is said to have fallen to 12,000. In 1938 it was about 393,000. Recent public works of importance include the A.-Piræus electric light and power scheme and the A.-Piræus water supply scheme. As to the former, the Gk. Gov. concluded a contract in 1925 with an Anglo-Hellenic group for operation of power by various transport services in the A.-Piræus district. The question of an adequate water supply for A. had been discussed for some 40 years, when, in 1926, the Gk. Gov. decided in favour of a scheme for a dam near Marathon to hold up the waters of the Charadros and Varnariv. and eventually a contract was given to an Amer. company, the Ulen Water Company. The dam is nearly 300 yds. long and the reservoir holds over 40 million cub. ft. of water. A tunnel over 13 m. long leads the supply as far as Chelidonon, where the dam station is estab. In the sphere of education the A. Academy was inaugurated in 1920, during the regime of Gen. Pangalos; the statutes of the Academy provide for instruction in letters and fine arts, moral and political sciences, and positive sciences. Recently the A.-Piræus railways were taken over by the Hellenic Electric Railway Company, together with the tramways to the Piræus quays, which have now been extended to Perama. Some quarters of A. have become considerably extended since 1922 owing to the large immigration of refugees from Asia Minor following the Gk. debacle in the war against Turkey, 1921-22. The quarter especially affected is the Patesia dist. and also the environs of A., particularly Kephissia. In the Second World War the Gers. entered A. on Apr. 27, 1941. Brit. forces entered the city on Oct. 14, 1944. On Dec. 5 fighting began in the city between E.L.A.S. troops and Brit. and Gk. regulars. On Dec. 26 Mr. Churchill and Mr. Eden arrived in A. to settle the differences between the rival Gk. political parties and a week later the archbishop of A. became Gk. regent.

Davis, *A Day in Old Athens*, 1914; T. G. Tucker, *Life in Ancient Athens*, 1930; W. Judeich, *Topographie von Athen*, 1931; R. J. Bonner, *Aspects of Athenian Democracy*, 1933; and bibliography for ACROPOLIS.

Athens: 1. Cap. of Clarke co., Georgia, U.S.A., 92 m. N.W. of Augusta. It is the seat of the univ. of Georgia, and an important cotton market. Pop. 18,000. 2. Cap. of A. co., Ohio, U.S.A., on Hocking R., 40 m. S.W. of Marietta. The seat of Ohio Univ. and of a state asylum. Pop. 7000.

Atherfield Clay, beds of clay, forming in some parts the lowest strata of the Lower Greensand beds, and resting upon the Wealden clay. It is exposed at

A., in the Isle of Wight. The average thickness is 60 ft., and the deposit contains numerous crustacean fossils.

**Atherstone**, tn. of Warwickshire, England, 7 m. S.E. of Tamworth. The prin. industry is hat-making. Close by are the ruins of the Cistercian abbey of Merevale, founded 1149. The tn. stands on the Rom. Watling Street, equidistant from London, Liverpool, and Lincoln. Pop. 6700.

**Atherstone**, Edwin, Eng. poet (1788-1821), a friend of the painter Martin, whose works influenced his poetry. His chief publications were *The Last Days of Herculeum*, 1821, *The Fall of Nineveh*, 1828-30; *The Sea-Kings in England*, 1830; *The Handwriting on the Wall*, 1858; and *Israel in Egypt*, 1861.

**Atherton**, a tn. of Lancashire, England, 13 m. N.W. of Manchester. Contains large cotton factories, ironworks, and collieries. There were formerly many silk-weaving mills. The nonconformist chapel is famous for its minister, 'General' James Wood, who raised a troop against the Pretender, 1715. Pop. 20,000.

**Atherton**, Charles Gordon (1804-53), Amer. politician, b. at Amherst, New Hampshire; graduated at Harvard, 1822. After serving in the state legislature and as speaker of the Lower House, he was elected to Congress, 1837. In 1838 he introduced the famous resolution, 'That all petitions relating to slavery, or its abolition, be laid on the table without debate,' which was passed by 120 to 78. He was elected to the Senate in 1843 and in 1852.

**Atherton**, Gertrude Franklin (maiden name Hern) (1857-1948), Amer. novelist, grandniece of Benjamin Franklin, b. at San Francisco, settled in London, 1895. Her novels, etc., often deal with California as it was at different times, in the nineteenth century especially, and include *The Doomsman*, 1892; *Patience Sparhawk and her Times*, 1897; *A Whirl Asunder*, 1895; *Tower of Ivory*, 1910; *California—an Intimate History*, 1914; *The Living Present*, 1917; *Sleeping Fires*, 1922; *The Immortal Marriage*, 1927; *Dido: Queen of Hearts*, 1929.

**Atlas**, Emmanuel Ben Joseph, a Jewish rabbi and famous printer at Amsterdam, who d. in 1700. With the help of the most distinguished scholars at Amsterdam, he compared the old eds. and MSS. of the Heb. Bible, and pub. a new ed. in 1661, the summaries and preface of which were written by Jan Leusden. A second ed. was pub. in 1667, with many corrections. These eds. of the Bible were more correct than any former eds.; but still they contained errors in the vowel points and accents. A. also printed the Bible in Sp., Hebrew, Ger., and Eng.

**Athletics** in the form of public games have been part of the life of nations from the earliest day. The Gks. were among the first promoters of these festivals and the most celebrated; but they took the games from the Peloponnesians; though the origin of the famous Olympic Games reaches back into remote antiquity prior

to the commencement of the historical era in Greece, and by the Gks. themselves was attributed to a divine source. See OLYMPIA.

The Rom. games were held at the festivals of the gods, but the Gk. ideal became degraded by professionalism. The combats of gladiators were the occasion of national festivals, and fights between wild beasts were very popular. Pompey is said to have set 500 lions to slay 18 elephants, and this took 5 days to accomplish. Chariot races were the sport of the nobility, and the highest in the land took part. The great amphitheatre at Rome was supposed by Aurelius Victor to have seated 87,000 people. The chief games of the Romans were the Apollinarian, the Circensian, and the Capitoline.

Public games in the Middle Ages took the form of tournaments (q.v.), but archery and wrestling were the sport of the people, as the lists were the pastime of the nobility. Henry VIII., however, did not disdain to excel at hammer-throwing or 'casting the barre', but under Edward III. weight-putting was forbidden as interfering with archery. Later under Charles II. professional races for wagers began to be popular, and this aroused amateur enthusiasm, leading to the renaissance of amateur athletics in the nineteenth century. In 1850 a movement was started to organise sports meetings at the colleges of the univs. of Oxford and Cambridge. As a result of this, the first inter-univ. contest took place in 1864, each side winning 4 of the 8 events. Meanwhile the London Athletic Club and others had been formed, and finally in 1880 the need for a central authority gave rise to the Amateur Athletic Association. Since then, the A.A.A. has organised a yearly championship, now held in London.

As regards modern A., we must confine ourselves under this head to the field and track sports. Cricket, football, etc., will be found dealt with under their various heads. Modern A. may be said to have begun with the revival of the Olympic Games (q.v.), celebrated at Athens in 1896 as the result of the activities and enthusiasm of the Baron Pierre de Coubertin. One ideal of his was to promote through sport an international good feeling, but, the First World War having interrupted the quadrennial succession of the games, it was only in the ninth Olympiad of 1928 that Coubertin's idea had begun to be realised. These aims were subordinated in the fifteenth Olympiad at Berlin in 1936 to the propaganda of National Socialism; but a welcome return to the true spirit of the games was a feature of the 1948 Olympiad at London (the first to be held in Great Britain since 1908) when public interest and enthusiasm brought one and a half million spectators.

The eighth Olympiad at Paris in 1924 was remarkable for the performances of Paavo Nurmi, the great Finnish runner, who in that year secured, among the world's records, those for the 5000 metres

with 14 min. 28 sec. and for the 1 m. with 4 min. 10 sec. The 3-, 4- and 5-m. records were also his, but, although he applied for a 10-m. record of 50 min. 15 sec., A. Shrubbs' famous times still held officially for the 6 to 10 m. distances until 1938. In 1926 O. Peltzer, Germany, beat Nurmil over the 1500 metres and set up a world's record for that event of 3 min. 51 sec. Peltzer also secured the half-m. record of 1 min. 51½ sec., and D. G. A. Lowe won for Great Britain the Olympic record for 800 metres with 1 min. 51½ sec. America held the records for the shorter distances from 440 down to 100 yds., the former being run in 47½ sec. by J. E. Moredith in 1916. The present world's running records are as follows: 100 metres: 10½ sec., J. C. Owens, U.S.A. (1936); and H. Davis (1941) (P. Williams, Canada, and E. Tolan and H. Dillard, U.S.A., each 10½ sec., 1930, 1932, and 1948 respectively); 200 metres: 20½ sec., J. C. Owens, U.S.A. (1935); 300 metres: 33½ sec., R. Metcalfe, U.S.A. (1933), and C. W. Paddock, U.S.A. (1921); 400 metres: 46 sec., R. Harbig, Germany, (1939), and G. Klemmer, U.S.A. (1941) (A. Williams, U.S.A., did the distance in 46½ sec. in 1936); 500 metres: 1 min. 14 sec., R. Malett, U.S.A. (1938); 800 metres: 1 min. 46½ sec., R. Harbig, Germany (1939) (S. C. Wooderson, Great Britain, did distance in 1 min. 48½ sec. in 1938); 1000 metres: 2 min. 21½ sec., R. Harbig (1941); 1500 metres: 3 min. 43 sec., G. Haegg, Sweden (1944); 2000 metres: 5 min. 11½ sec., G. Haegg (1942); 3000 metres: 8 min. 14 sec., G. Haegg (1942); 5000 metres: 13 min. 58½ sec., G. Haegg (1942); 10,000 metres: 29 min. 35½ sec., V. Heino, Finland (1944) (T. Maeki, Finland, did the distance in 29 min. 52½ sec. in 1939); 20,000 metres: 1 hr. 3 min. 1½ sec., A. Csaplár, Hungary (1941); 25,000 metres: 1 hr. 21 min. 27 sec., E. Tamilla, Finland (1939); 30,000 metres: 1 hr. 40 min. 57½ sec., J. Ribas, Argentina (1932).

100 yds.: 9½ sec., F. Wykoff, U.S.A. (1930); D. J. Joubert, S. Africa (1931); J. C. Owens, U.S.A. (1935), and C. Jeffrey, U.S.A. (1940); 220 yds.: 20½ sec., J. C. Owens (1935); 440 yds.: 46½ sec., B. Eastman, U.S.A. (1932), and G. Klemmer, U.S.A. (1941); 880 yds.: 1 min. 49½ sec., S. C. Wooderson, Great Britain (1938); 1 m.: 4 min. 1½ sec., G. Haegg, Sweden (1945) (A. Andersson, Sweden, did the distance in 4 min. 1½ sec. in 1944); 2 m.: 8 min. 42½ sec., G. Haegg (1944); 3 m.: 13 min. 32½ sec., G. Haegg (1942); 6 m.: 28 min. 38½ sec., V. Heino, Finland (1944) (T. Maeki, Finland, did the distance in 28 min. 55½ sec. in 1934); 10 m.: 49 min. 41½ sec., V. Heino, Finland (1945) (P. Nurmil, Finland, did the distance in 50 min. 15 sec. in 1928); 15 m.: 1 hr. 19 min. 48½ sec., E. Tamilla, Finland (1937). In 1945 V. Heino ran 12 m. 29 yds. in 1 hr. Nurmil's distance for 1 hr. was 11 m. 1648 yds. in 1928.

*One-M. Records.*—W. G. George's record of 4 min. 18½ sec. in 1884 stood until 1893, when T. P. Conneff (U.S.A.)

did the distance in 4 min. 17½ sec. The gradual succession of records since then is shown in the following list (which is not exhaustive, because the previous record may have been beaten more than once in any given year): F. E. Bacon (Great Britain), 4 min. 17 sec. (1895); T. P. Conneff (U.S.A.), 4 min. 15½ sec. (1895); J. P. Jones (U.S.A.), 4 min. 15½ sec. (1911); J. P. Jones, 4 min. 14½ sec. (1913); N. S. Taber (U.S.A.), 4 min. 12½ sec. (1915); P. Nurmil (Finland), 4 min. 10½ sec. (1923); J. Ladoumégue (France), 4 min. 9½ sec. (1931); J. E. Lovelock (New Zealand), 4 min. 7½ sec. (1933); G. Cunningham (U.S.A.), 4 min. 6½ sec. (1934); S. C. Wooderson (Great Britain), 4 min. 6½ sec. (1937); G. Haegg (Sweden), 4 min. 4½ sec. (1942); A. Andersson (Sweden), 4 min. 2½ sec. (1943); A. Andersson, 4 min. 1½ sec. (1944); G. Haegg, 4 min. 1½ sec. (1945).

*Brit. Running Records (i.e. records made in Great Britain by athletes of any nationality).*—100 yds.: 9½ sec., E. Conwell (U.S.A.), 1947; E. McDonald Bailey (Trinidad), 1946; 220 yds.: 21½ sec., W. R. Applegarth (Great Britain), 1914; 440 yds.: 47½ sec., A. G. K. Brown (Great Britain), 1938, and M. Lanzi (Italy), 1939; 880 yds.: 1 min. 49½ sec., S. C. Wooderson (Great Britain), 1938; 1 m.: 4 min. 6½ sec., S. C. Wooderson, 1937; 2 m.: 9 min. ½ sec., G. Haegg (Sweden), 1945 (C. A. J. Emery, Great Britain, did the distance in 9 min. 34 sec. in 1919); 3 m.: 13 min. 53½ sec., S. C. Wooderson, 1946 (C. A. J. Emery in 1939 did the distance in 14 min. 8½ sec.); 6 m.: 29 min. 22½ sec., V. Heino, 1947 (J. A. Burns, Great Britain, did the distance in 1936 in 29 min. 45 sec.); 10 m.: 50 min. 30½ sec., W. E. Eaton (Great Britain), 1936; 15 m.: 1 hr. 20 min. 4½ sec., F. Appleby (Great Britain), 1902. In 1904 A. Shrubbs (Great Britain) covered 11 m. 1137 yds. in 1 hr.

The U.S.A. holds all the recent hurdling records:—120 yds. (3 ft. 6 in.): 13½ sec., F. G. Towns (1936) and F. Wolcott (1941); 220 yds. (2 ft. 6 in.): 22½ sec., F. Wolcott (1940); 440 yds. (3 ft.): 52½ sec., R. B. Cochran (1942), who also holds 400 metres record, 51½ sec. (1948). Brit. hurdling records:—120 yds. (3 ft. 6 in.): 14½ sec., F. G. Towns (U.S.A.) (1936), and E. H. Lidman (Sweden) (1939) (D. O. Finlay (Great Britain), 14½ sec., 1937); 220 yds. (2 ft. 6 in.): 24½ sec., Lord Burghley (1927); 440 yds. (3 ft.): 52½ sec., N. V. Cochran (U.S.A.) (1939) (Lord Burghley, 53½ sec., 1930). The field events are gradually returning to favour, although jumping has generally been popular. This latter includes high jump, long jump, and pole vault, at all of which America excels. L. Steers having cleared 6 ft. 11 in., J. C. Owens (1935) 26 ft. 8½ in., and C. Warmerdam (1942) 15 ft. 7½ in. at the pole vault. Best Brit. records: high jump, W. Vessie (U.S.A.), 6 ft. 7½ in. (1947); long jump, E. B. Hamm (U.S.A.), 25 ft. 1 in. (1928); pole vault, E. Meadows (U.S.A.), 14 ft. 2 in. (1936). Throwing the hammer, which event goes back to the anc. Celtic Games of Ireland, is performed with a hammer of 16 lb.

weight, attached by a steel wire to a triangular handle, the whole length not exceeding 4 ft. In 1937 P. O'Callaghan (Ireland) made the record throw of 198 ft. 8½ in., but the officially recognised record is 193 ft. 6½ in. by E. Blask (Germany) (1938). Putting the weight, an iron shot weighing 16 lb., is a usual event at meetings; the holder of the record is J. Torrance (U.S.A.), with a put of 57 ft. 1 in. (1934). The discus-throw record is held by R. Fitch (U.S.A.), whose throw, in 1946, was 180 ft. 2½ in. The discus weighs about 4½ lb., is made of wood, and is 8 in. in diameter, with brass plates let into the centre. There are 2 methods of throwing, the free style and the Gk. style; the latter is represented by the statue of the Discobolus.

The tug-of-war has long been a popular contest, and one in which the City of London Police are very proficient. Walking has not been so popular of recent years, as it was a century ago in the time of the famous Capt. Barclay. The record for a 1-m. walk is 6 min. 21 sec., made in 1936 by P. Bernhard (Canada). V. Hardmo (Sweden) holds the walking records for 2, 7, and 10 m., his times being 13 min., 48 min. 53½ sec., and 1 hr. 41 min. 7 sec. respectively. G. E. Larnar (England) holds the Brit. record for 2 m., his time being 13 min. 11½ sec. His time for 1 m. (1904), 6 min. 21 sec., was unbeaten for 32 years. The record for the 100-m. walk is held by T. W. Richardson, who walked the distance in 17 hr. 35 min. 40 sec. in 1936. G. E. Larnar walked 8 m. 438 yds. in 1 hr.

Paper-chases were the origin of cross-country running, but are nowadays rather falling out of public favour, though cross-country races still retain their popularity. The sport is governed by the National Cross-country Union, and the season lasts from Sept. to Mar. In 1912 a cross-country race was included in the Olympic Games, and in 1920 and 1924 this event was won by Nurmi. In 1928 it was omitted as unsuitable for a summer programme.

The ninth Olympiad will be remembered as being the first to include events for women athletes. These were the 100- and 800-metre flat race (the latter won in record time, 2 min. 16½ sec. by L. Radke, Germany), the 400-metre relay race, the high jump, and discus-throw. The best time for 100 yds. is 10½ sec. by F. E. Blankers-Koen, of Holland, in 1944, who also holds the women's record for 80 metres hurdles (with M. Gardner, Great Britain), 11½ sec. (1948). The Women's Amateur Athletic Association was founded in 1922, one year after France had given the lead in women's A. by forming the Fédération Sportive Féminine Internationale. Under the auspices of the F.S.F.I. the first women's Olympic Games were held at Paris in 1924. The chief women's running records are as follows: 60 metres in 7½ sec. in 1933, by S. Walasiewicz (Poland); 100 yds. in 40½ sec. by F. E. Blankers-Koen in 1944; 100 metres in 11½ sec. by H. Stephens (U.S.A.) in 1937;

200 metres in 24½ sec. by F. E. Blankers-Koen (1948); 250 yds. in 24½ sec. by S. Walasiewicz in 1935; and 440 yds. in 50½ sec. in 1932 by H. Halstead (Great Britain); 880 yds. in 2 min. 19½ sec. in 1938 by O. M. Hall (Great Britain). Other records for women are: F. E. Blankers-Koen, high jump, 5 ft. 7½ in. and long jump, 20 ft. 6 in., both in 1943; putting the shot, 47 ft. 2½ in. by G. Mauermeyer (Germany), 1934; javelin, 154 ft. 11½ in. by A. Steinhilber (Germany), 1942; discus, 158 ft. 5 in. by G. Mauermeyer, 1936.

Women's A. are now a recognised institution, having survived much criticism. Men's performances have recently so much improved that those of women have suffered by comparison. But if record-breaking is not the object of sport, any criticism on these lines is misconceived. See H. M. and A. Abrahams, *Training for Athletes*, 1928; Members of the Achilles Club, *Athletics*, 1938; D. G. A. Lowe, *Track and Field Athletics*, 1947; and F. A. M. Webster, *Great Moments in Athletics*, 1947, and *Athletics: Teaching and Training*, 1948.

Athlone, a tn. on borders of Westmeath and Roscommon, Eire, on R. Shannon, 80 m. W. of Dublin. There are manufs. of felts, friezes, and linens. A canal, a m. long, enables steamers to avoid the riv. rapids at this point. The Shannon is crossed by a fine bow-string and lattice iron bridge. The castle was founded in John's reign, and besieged by William III. in 1688, being finally taken by Gen. Ginkell. The tn. is strongly fortified. Pop. 7000.

Athlone, Alexander Augustus F. W. A. G. C., Earl of, Brit. administrator, b. Apr. 14, 1874, at Kensington Palace, third son of the late duke of Teck and late Princess Mary Adelaide. After passing out at Sandhurst, he was commissioned to a Hussar regiment, the Royal Horse Guards, and the 2nd Life Guards, and served with distinction in Matabeleland in 1896 and in the S. African war, 1898-1900. Appointed governor-general of the Union of S. Africa from 1925 till 1931. Governor-general of Canada, 1940-46.

Athlone, Godart Ginkell, Earl of, Dutch general (1630-1703), accompanied prince of Orange to England, 1688; fought in battle of Boyne, 1690, and was made commander-in-chief in Ireland, 1691, when he took Athlone and defeated the Irish. Received his title, 1692. Commanded Dutch in Flanders, 1695-96, and Dutch troops under Marlborough, 1702.

Athol, a tn. of Worcester co., Massachusetts, U.S.A., on Miller's R., 82 m. N.W. of Boston. It has manufs. of boots, cloth and silk, furniture, and tools, and has a public library. Pop. 11,000.

Atholl, a dist. in the N. of Perthshire, Scotland, on the S. slopes of the Grampians. Its chief tns. are Blair Atholl, Pitlochry, and Dunkeld; its lakes, Loch Rannoch and Loch Tummel, are famous for their beauty. The head of the Murray family is duke of Atholl.

Atholstan, Sir Hugh Graham, first Baron, of Atholstan, Quebec (1848-1938), Canadian newspaper owner. Founder and

president of the *Montreal Evening Star*. Knighted in 1908 for his public services. Most zealous in connection with the dispatch of the Canadian contingent in the Boer war. Canadian delegate to the Imperial Conference in 1909. Raised to the peerage as a baron of the United Kingdom in 1917. Took his seat in the House of Lords, 1920.

**Athor, or Hathor**, queen of heaven, an Egyptian goddess, daughter of Ra; the female counterpart of Osiris, and with a close affinity to Isis. She was symbolised by a cow, and worshipped throughout Egypt under many local forms and names.

**Athos**, a mt. of Greece, at the extremity of the most E. of the 3 tongues of the Chalcidice Peninsula, on the Aegean Sea. It is about 6350 ft. in height. The name is also applied to the whole tongue of land, which is connected with the mainland by an isthmus just over a m. broad. The peninsula is about 30 m. long and 3-6 m. wide. There are still traces of a canal cut through the isthmus by Xerxes to avoid the dangerous promontory. Since the Middle Ages Mt. A. has been the seat of a monastic republic. It was a medieval centre of Gk. theology and learning, and the remains of magnificent libraries exist. There are now 20 Gk. monasteries and numerous chapels and hermitages on the peninsula, with a pop. of about 6000 monks.

**Athy**, a tn. of Kildare, Eire, at the junction of R. Barrow and Grand Canal, 40 m. S.W. of Dublin. There are manufs. of bricks and tiles. It was the site of a great Irish tribal battle in the third century. The tn. grew up round the monasteries of the Crutched and Dominican friars, and was plundered by the Scots in 1515 after the battle of Ardsnull. Pop. 3000.

**Atitlan**, lake of Guatemala, Central America. It is 4700 ft. above sea-level, 24 m. long and 10 m. wide, with a circumference of 84 m., surrounded by mts., very deep, and with no visible outlet.

**Atkarsk**, a tn. of Saratov, Russia, on R. Atkara. Has a trade in grain. Settled in fourteenth century. Pop. 15,000.

**Atkins**, Tommy, slang term for the Brit. private soldier. Its origin is similar to the use of 'M. or N.' by the Church, or 'John Doe and Richard Roe' by lawyers, as it was the name selected by the War Office to fill in the specimen form of a manual distributed throughout the Army, in which were to be entered details concerning each man.

**Atkinson**, Sir Harry (1831-92), a politician. In 1855 went to New Zealand, where he soon distinguished himself. He became captain in the Waitara war, 1860-64, and minister of defence in the Cabinet of Sir Frederick Aloysius Weld, 1864-65. He was 3 times prime minister of New Zealand, and 4 times colonial treasurer.

**Atkinson**, John (1835-97), Amer. Methodist Episcopal preacher, b. at Deerfield, New York. He wrote the well-known hymn *We shall meet beyond the River*, and historical works on Methodism.

**Atkyns**, Richard (1615-77), typographical writer. Famous for his broadside *The Origin and Growth of Printing*, 1664, in which he tried to estab. that printing was a Crown monopoly, and endeavoured to secure the office of patentee for himself.

**Atlanta**, cap. city of Georgia, U.S.A., and co. seat of Fulton co. in the N.W. part of the state. It is the seat of Clark and A. Univs. While it has considerably developed as an important manufacturing city, it is even more important as the distributing centre for the S. Many of the great industries of the N. have depots here, and it is also a kind of insurance cap. for the S. As a consequence, it is a city of skyscraper office buildings. Settled in 1840, it was besieged and captured by the Union troops under Gen. Sherman in the Amer. Civil war and the business section was destroyed. Its growth at the end of the nineteenth century was rapid. Its pop. in the 1940 census was 302,000, but with the near-lying tns., which are really its suburbs, Greater A. has a total pop. of 390,000.

**Atlantes**, an architectural term designating male figures used as columns to support cornices, architraves, etc.

**Atlantic**, a city and co. seat of Cass co., Iowa, U.S.A. Manufs. canned corn, drugs, bricks, and umbrellas. Pop. 6000.

**Atlantic**, Battle of the, a compendious name given to the Ger. U-boats' assault, in the Second World War, on Brit.—and later, allied—sea power and its defeat. It was a long-drawn-out battle, fought with skill and determination on both sides, and it is described in a comprehensive popular account issued in 1946 by the Admiralty and the Air Ministry entitled *The Battle of the Atlantic*. This account conveniently distinguishes 8 separate phases of the struggle, taking in the Indian as well as the A. Ocean. In the first phase, from the beginning of the war to June 1940, sinkings of Brit. ships were not very numerous, for Germany then possessed only 57 operational boats, while Britain was ready to put a convoy system into force from the start. The sinkings were scattered off the W. approaches to the Eng. Channel and bay of Biscay, with a few in the North Sea, while but few U-boats were sunk. In the second phase, June 1940—Mar. 1941, things became rapidly worse; for U-boats were rapidly increasing in numbers, and Britain was very short of escort craft, while the Gers. were using long-range aircraft in collaboration with submarines. The area of destruction shifted to the N.-westward of the Brit. Isles, where the circles on the illustrative charts (issued with the official pamphlet) indicating merchant losses are clustered thickly, while there is still hardly a cross-indicative of U-boat sinkings—to be seen. Air escort, however, was being developed by Britain and, in the third phase, up to the end of 1941, crosses are dotted all over the E. half of the A. from Greenland to the Equator and the W. African coast. The fourth phase (Jan.-July 1942) saw America's

entry into the war, with consequently high losses among the dense sea traffic of the Caribbean and U.S. seaboard, where full defence was yet to be organised. The whole area of Ger. submarine activity now shifted to the W. half of the A., leaving the E. half almost free. But there were sinkings in the Arctic, on the convoy route to Russia, in the S. A., and in the Indian Ocean. In the fifth phase, Aug. 1942-May 1943, the Amer. E. coast had been cleared, though there were still substantial losses in the Caribbean, the chief source of allied fuel supplies. With the allied landing in N. Africa Ger. U-boats came into the Mediterranean, where an increasing number of them were destroyed; while the development of air collaboration in convoy defence had driven U-boat A. activity out into the gap that could not be covered by air patrols from Britain, Iceland, or Newfoundland. Hence this gap is shown on the chart to be densely studded with circles, though the crosses showing U-boat destructions are increasing in all parts. The introduction of escort carriers, however, had an immediate effect which is obvious in the chart of the sixth phase, June-Aug. 1943; for there were now hardly any sinkings of ships in the N. A., while the approaches to the bay of Biscay are studded with the destruction of U-boats, aircraft of Coastal Command (*q.v.*) taking heavy toll of the enemy as they tried to pass through to the operational bases in France. In this phase for the first time in the battle more Ger. submarines were sunk than merchant ships; the tide of battle had turned. In the seventh phase, in which Italy had surrendered, and the Mediterranean route was re-opened, the N. A. was thickly studded with U-boat sinkings, while merchant vessels were sunk only in the outer oceans. But the enemy was now pinning his faith to the new devices already in preparation. The eighth and last phase began with the allied invasion of Normandy. The Gers. placed great reliance on the ability of their submarines to impede the Channel crossing, but they were forestalled by the massive air offensive against them, by which the Channel approaches, through which their submarines had to pass from their bases on the Fr. A. coast to reach the place of the allied landing, were so closely patrolled by Coastal Command aircraft and escort groups co-operating with them that not a U-boat got through. *See further under NAVAL OPERATIONS IN SECOND WORLD WAR.*

**Atlantic Charter** (or **Eight Points**), the popular name given to a joint declaration of peace aims by Mr. Winston Churchill, Brit. Prime Minister, and President Roosevelt, in Aug. 1941. The declaration opened with the general statement that the signatories 'deemed it right to make known certain common principles in the national policies of their respective countries on which they based their hopes for a better future for the world' and then proceeded to specify the principles as follows: *First*, their countries

sought no aggrandisement, territorial or other; *second*, they desired to see no territorial changes that did not accord with the freely expressed wishes of the peoples concerned; *third*, they respected the right of all peoples to choose the form of gov. under which they would live; and they wished to see sovereign rights and self-gov. restored to those who had been forcibly deprived of them; *fourth*, they would endeavour, with due respect for their existing obligations, to further enjoyment by all states, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which were needed for their economic prosperity; *fifth*, they desired to bring about the fullest collaboration between all nations

Imperial War Museum: Crown Copyright

#### ATLANTIC CHARTER

President Roosevelt and Mr. Churchill.

in the economic field, with the object of securing for all improved labour standards, economic advancement, and social security; *sixth*, after the final destruction of Nazi tyranny, they hoped to see established a peace which would afford to all nations the means of dwelling in safety within their own boundaries, and which would afford assurance that all the men in all the lands might live out their lives in freedom from fear and want; *seventh*, such a peace should enable all men to traverse the high seas and oceans without hindrance; *eighth*, they believed all of the nations of the world, for realistic as well as spiritual reasons, must come to the abandonment of the use of force. Since no future peace could be maintained if land, sea, or air armaments continued to be employed by nations which threatened, or might threaten, aggression outside of their frontiers, they believed, pending the establishment of a wider and permanent system of general security, that the disarmament of such nations was essential. They would likewise aid and encourage all other practicable measures which would lighten for peace-loving peoples the crushing burden of armament.

The significance of this declaration lay

in the fact that belligerent Britain and non-belligerent America found themselves identically minded about the principles that must determine the peace and the shape and structure of the world which that peace would largely re-create. It is to be observed that the essentially Wilsonian 'self-determination' doctrine (see FOURTEEN POINTS) which is, curiously enough not to be found in the Fourteen Points, is explicitly set forth in the A. C. (third point). Wilson also demanded that the world should be made fit and safe to live in (cf. point six above) and, for the rest, disarmament is also to be found in both documents; and equally, economic equality and the destruction of trade barriers; the freedom of the seas and, though in different language, the creation of 'a general association of nations' (Wilson) or a 'wider and permanent system of general security' (Roosevelt-Churchill).

Atlantic City, co. seat of A. co., New Jersey, U.S.A. Most celebrated seaside resort in the U.S.A., it is situated on an ls. 60 m. S.E. of Philadelphia. Its close proximity to this city and to New York and its splendid railroad connections with the rest of the U.S.A. assure it an enormous all-the-year-round patronage. It has one of the finest bathing beaches in the world. It boasts the longest boardwalk on earth. This walk, which is a very extensive promenade, is faced on one side by the sea and on the other by many magnificent seaside hotels, some of which are of skyscraper size. Pop. 64,000.

**Atlantic Flights.** During the decade after the First World War repeated attempts to cross the A. by aeroplane were made. Sev. flights were successful, but the majority ended in the loss of the aviators. Flying a Sopwith-Rolls-Royce plane, Harry C. Hawker, pilot, and Commander Mackenzie Grieve, R.N., navigator, started from St. John's, Newfoundland, on the evening of May 18, 1919, the proposed route being to a point on the Galway coast, a distance of 1880 miles. To improve his chances, Hawker, just before reaching the sea, dropped the under-carriage of his machine, including the wheels, to lighten the load. No news reached England of the progress of this flight for a week, and it was assumed that it had ended fatally. But on May 19 a cable ship sighted the machine's red light in 50° 28' N. lat., 30° 2' W. long., some 150 m. N. of the main steamer routes and 900 m. out of the direct course between St. John's and Galway. On May 25 a Dan. steamer, *Mary*, reported that she had picked up the crew of the machine, who had been in the water for about 90 min. before rescue. The plane was then in lat. 50° 20' N. long. 29° 30' W., 1100 m. from Newfoundland and 750 from Ireland, the engine having failed through mechanical defect. Simultaneously with this attempt, 3 Amer. seaplanes, N.C. 3, N.C. 4 and N.C. 1, started from Trepassay Bay, Newfoundland, on May 15 at 11 p.m., the proposed route being via the Azores to Lisbon

and thence to England, a distance of 3368 m. The only machine to complete the distance was N.C. 4, piloted by Lt.-Commander Read, U.S. Navy, who reached the Azores at 2.25 p.m., May 16, but remained some time there, only reaching Plymouth on May 31. The third attempt, which proved entirely successful, was begun June 14 at 4.28 p.m., by Capt. John Alcock, pilot, and Lt. Whitten Brown, navigator, in a Vickers-Vimy machine, and the journey from St. John's to Clifton, Galway, about 1880 m., was accomplished in 16 hrs. 12 min., the plane landing in a bog at 8.40 a.m., June 15. The mean speed was somewhat over 120 m.p.h., and for the greater part of the distance the plane was at an altitude of 4000 ft. Practically the whole time the aviators were either in a fog or flying between banks of fog, so that readings of his position by Lt. Brown were rarely possible.

Other competitors were forthcoming for the prize of £10,000 offered by the *Daily Mail* for a transatlantic flight, but mishaps or bad weather prevented them from starting. The flight of the Amer. seaplanes which was organised by the U.S. Navy administration did not come within the conditions of the newspaper prize competition, which eventually went to Capt.—later Sir John—Alcock; but the flight of the Amer. seaplanes was organised with much precision and was most useful as pioneer work. No other attempts were made to cross until the year 1927, when, on May 20, Capt. (later Col.) Charles Lindbergh, an Amer. air-mail pilot, left Long Is. alone at 12.31 p.m. in his monoplane *Spirit of St. Louis*, and landed at Le Bourget aerodrome near Paris at 10.22 p.m., May 21, having crossed in a little over 33 hrs., covering about 3000 m. Just prior to this success Capt. Nungesser, the Fr. aviator, with a fellow countryman, Capt. Coll, attempted the flight from E. to W. in a Levasseur biplane, but no trace was afterwards found of them. In June 1927, 2 other Amers., Mr. Chamberlain, an airman, and Mr. Levine, left New York in a Wright monoplane of 200 h.p. and crossing the ocean alighted at Eisleben, Germany, a distance of about 3900 m. In just over 42 hrs. These successes acted as a spur to many subsequent aspirants, but it is evident that insufficient regard was paid to the vagaries of wind and weather, for many perished. In the late summer of 1927 Col. B. Minchin, Capt. L. Hamilton, and Princess Löwenstein-Wertheim tried to cross from E. to W., but were lost. Commander (now Rear-Adm.) Byrd (q.v.) with 4 passengers, flew from New York to Ver-sur-Mer, France, June 29–July 1, 1927, a distance of 3744 m., in 46 hrs. 6 min., coming down safely near the coast after flying many hrs. over France in a fog. The earliest successful E. to W. flights were those of W.C. Kingsford Smith, who, with companions, crossed from Portmarnock, Dublin, to Newfoundland in June 1930, and of Capt. Coste and M. Bellonte, who

in Sept. of the same year flew from Le Bourget to New York.

The first transatlantic flight with a full complement of passengers was made by the Boeing flying-boat of Pan-Am Airways, the *Fankee Clipper*, which left Baltimore Harbour on Mar. 26, 1939, on a survey flight, and arrived at Horta, Azores, on Mar. 27, covering the distance of 2448 m. in 17 hrs. 32 min. The flying-boat carried a crew of 11 and 10 passengers.

Negotiations for the long-projected airmail service across the A. between the United Kingdom, U.S.A., and Canadian Govs. were completed in 1935. Trial flights were made by the United Kingdom flying-boat *Caledonia* in 1937 and by the *Cambria* later in the same year. This Imperial Airways boat averaged 190 m.p.h. for the whole journey, her flying time from Botwood, Newfoundland, to Foynes, Ireland, being 10 hrs. 33 min. Further experimental flights were made in 1939. See further under AIR MAIL.

**Summary of Transatlantic Flights.**—The following have flown the Atlantic, in the year stated: 1919: Alcock and Brown; 1927: Lindbergh; Chamberlin, and Levine; Commander Byrd (in monoplane *America*, which came down in the sea 200 yds. from the beach at Ver-sur-Mer, France; Brock and Schlee (Amer.) (reaching Croydon); 1928: Fitzmaurice, with the Gers. Kohl and von Hunefeld (first E. to W. crossing); Amelia Earheart, with Wilmer Stultz (pilot) and a mechanic (later she was the first woman to make a solo flight); 1929: Yancey and Williams, (left Old Orchard (Maine) for Rome, but, short of petrol, landed in Spain); Assolant and Lefèvre (from Maine to Spain, with a stowaway); 1930: Kingsford Smith (*Southern Cross* monoplane, from Ireland to Newfoundland); Coste and Bellonte (Fr. airmen, made the first flight to end at New York, flying 3700 m. in 37 hrs.); Capt. Boyd and H. Connor (from Newfoundland, landing on one of the Scilly Isles in 24 hrs.); 1931: Hillig and Holris (Dan.) (from Newfoundland to Krefeld, Germany); Pangbourn and Herndon (Amer.); Post and Matty (made a record A. crossing during a round-the-world flight); Magyar and Endresz (Hungarian); Boardman and Polando (set up long-distance flight record—4984 m.); 1932: J. A. Mollison (from Portmarnock, Dublin, to Lennfield Ridge, New Brunswick); J. A. Mollison and Amy Johnson (crashed at Bridgeport, Connecticut); Wiley Post (solo round-the-world flight) (killed in 1935); Codos and Rossi (New York to Paris in 54 hrs. 44 min.) (in the following year they flew from Paris to California); Mattern and Griffin (speed record); 1934: J. and B. Adamowicz (Poles), (from Newfoundland, coming down at Fliers, near Paris); Poma and Sabelli (forced down in Glamorgan); 1935: Waitkus (Lithuanian), (from New York to Ireland); 1936: Hitchman and Merrill (double Atlantic flight); Mrs. Markham (first woman to fly from E. to W., landing at Cape Breton); 1937: Merrill and Lambie

(double flight—Brooklyn to N. Weald and Southport to Quincy); Pan-Am. *Clipper III* (from Botwood, Newfoundland, to Foynes (Ire), under Capt. Gray); Brit. flying-boat *Caledonia*, under Capt. A. S. Wilcockson, flying from Foynes to Botwood—simultaneously with the W. to E. flight of the Amer. *Clipper IV*. Each machine made a return flight; flying-boat *Cambria* (Newfoundland to Foynes, under Capt. G. J. Powell, 10 hrs. 36 min., the fastest A. air crossing to that date—Sept. 28); 1938: H. Hughes (reaching Le Bourget); Corrigan (New York to Baldonnell, Ireland); *Mercury* (being the upper component of the Mayo composite aircraft) crossed from Foynes to New York in 13 hrs. 29 min.—fastest E. to W. passage: *Brandenburg*, under Capt. Alfred Henke (Ger. air-liner, from Berlin to New York, and returning). The Ger. airship *Graf Zeppelin* made crossings in 1928 and 1931. In a non-stop flight of 3100 m. from Montreal to an airport on the W. coast of Britain in 11 hrs. 35 min., Capt. Richard Allen eclipsed all long-distance and transatlantic air-speed records when flying a B24 Liberator on the R.A.F. Transport Command, N. A. shuttle ferry for Brit. Overseas Airways Corporation (Nov. 29, 1943). His time was 21 min. shorter than the previous best in Oct. 1943, by a Brit.-built Lancaster piloted by Capt. M. B. Barclay of Perth, Scotland, on the Canadian Gov. A. service operated by Trans-Canada Air Lines. The best time in a Liberator before this flight was 12 hrs. 51 min. by Capt. S. T. B. Cripps, of Brit. Overseas Airways Corporation. In Nov. 1944 the time was reduced to 10 hrs. 13 min. by Capt. G. B. Lothair in a Lancaster from Montreal to Britain. In the same month—Capt. E. M. Gill, R.A.F. Transport Command, crossed the A. in a Canadian-built Mosquito (2230 m.) in 6 hrs. 8 min. On Mar. 30, 1945, F./Lt. H. C. Graham flew from Newfoundland to Scotland (2184 m.) in 5 hrs. 30 min. The fastest E. to W. A. crossing was made on Sept. 6, 1945, by an R.A.F. Mosquito which flew from Mawgan (Cornwall) to Torbay, Newfoundland, in 7 hrs. 2 min., piloted by W./C. J. R. H. Merfield. Brit. Overseas Airways claimed a record for the flight from New York to Shannon (Dec. 2, 1946) by a Bristol 11 (pilot Capt. B. C. Frost), which covered the 3,200 miles in 8 hrs. 32 min., or at an average speed of 375 m.p.h. See also under AERONAUTICS.

**Atlantis Monthly**, an Amer. review, founded at Boston in 1857. Its contents were somewhat similar to, though rather more purely literary than, those of its famous and older rival the *North American Review*. James Russell Lowell at one time was editor, and the magazine was directed by William Dean Howells, 1865–81, while among the most famous contributors have been Longfellow, Oliver Wendell Holmes, and Whittier.

**Atlantic Ocean**, one of the 5 great hydrographical divs. of the world, named after either Mt. Atlas or the mythical Atlantis, and, lying as it does between

Europe and Africa on the E. and N. and S. America on the W., dividing the Old and New Worlds. It stretches from about 70° N. to 40° S., from the Arctic to the Antarctic Ocean, and is usually taken as being divided by the Equator into the N. A., with an area of about 14,000,000 sq. m., and the S. A., with an area of about 10,100,000 sq. m. The breadth varies from 4500 m. between the Saharan coast and Florida, to 16,000 m. between the Guinea coast and Brazil. It communicates with the Baltic and Mediterranean Seas, and among the smaller seas and gulfs forming part of it are the North Sea, the Irish Sea, the Caribbean Sea, the bay of Biscay, the gulf of Guinea, the gulf of Mexico, and the gulf of St. Lawrence. Continental is. are numerous, including the Brit. Isles, the W. Indies, Newfoundland, and the Falklands; among the comparatively few oceanic is. are Iceland, the Azores, St. Paul's Rocks, Ascension, Tristan da Cunha, Jan Mayen, the Bermudas, the Canaries, the Cape Verdes, Madeira, Fernando Noronha, Trinidad, and St. Helena. The A. receives the drainage of almost all W. Europe, most of Africa, N. America E. of the Rockies, and S. America E. of the Andes, the chief riv. systems flowing into it being those of the Rhine, Loire, Tagus, Senegal, Niger, Congo, St. Lawrence, Mississippi, Orinoco, Amazon, and La Plata.

The average depth of the A. is 2200 fathoms (2-3 m.), the bed being usually a gently undulating plain. A low submarine ridge, over which the average depth is 1700 fathoms, runs approximately down the centre from N. to S. There is a considerable E. to W. extension of this ridge between Ireland and Newfoundland, along which the chief cables have been laid, and on both sides of the main elevation are to be found the greatest depths, often between 3000 and 4000 fathoms, while the Nares Deep, N. of the Virgin Is., reaches 4561 fathoms. There are sev. large sandbanks rising to within a few fathoms of the surface, the chief of these being the Newfoundland, the Dogger, and the Agulhas Banks. The continental shelf all round the A. is narrow and falls away in a steep slope. The surface temp. varies from about 85° F. at the Equator to 40° F. in the N. and S. temperate regions, and the bottom water temp. averages about 35° F. The water is saltiest (density over 1.0275) in the trade-wind regions, and least in the belt of equatorial calms, always increasing in salinity below the surface.

The trade winds, which determine the course of the ocean currents, take their rise in high-pressure areas in the middle of both N. and S. As. The S.E. and N.E. trades produce the warm equatorial current, which divides at Cape St. Roque and flows S. as the Brazil current and N. through the Caribbean Sea and gulf of Mexico, emerging as the Gulf Stream, which has an enormous influence on the climate of N.W. Europe. A cold current flows E. from the Arctic Ocean, and, as the Labrador current, passes beneath the

Gulf Stream off the Newfoundland Banks. The N. A. current leaves a patch of central calm, between 40° and 75° W. and 20° to 35° N., which is occupied by the Sargasso Sea, in which are enormous floating banks of gulf-weed. The surface waters teem with animal and vegetable life, which decreases in mid-ocean and at great depths. It is rich in edible fish, and herring and cod fishing form important industries on both the Amer. and European shores of the N. A.

The A. is the great commercial highway of the world, its shores being inhabited by the most civilised nations in existence. The chief danger to navigation is the presence of floating ice, which is carried N. from the Antarctic to 38° S., and S. from the Arctic to 40° N., thus interfering with the great steamship route between England and N. America. This crossing can now be made in under 4 days, indicating the enormous progress in navigation since 1620, when the *Mayflower* took 106 days for the journey. There are now numerous trans-A. submarine cables and others along the shores connecting important ports, while wireless telegraphic stations are working in Cornwall and Nova Scotia. See *Reports on the Scientific Results of the Voyage of H.M.S. 'Challenger'*, ed. by Sir Wyville Thomson and Dr. John Murray, 1880-89 (37 vols.), and *Results of a Deep-Sea Sounding Expedition in the North Atlantic during the Summer of 1899*; Royal Geographical Society: *Supplementary Papers*, 1910; J. Murray and J. Hjort, *The Depths of the Ocean*, 1912; C. C. Howell, *Ocean Research and the Great Fisheries*, 1921; F. C. Bowen, *Century of Atlantic Travel, 1830-1930*, 1932.

**Atlantic Pact**, see North Atlantic Treaty and Europe, *History*.

**Atlantic Passage Records**, the first recorded crossing by a sailing vessel was of course, that by Christopher Columbus, who, in 1492, reached Guanahani in 70 days. The first crossing by a steam-boat was made by the *Sirius* in 1838 in 19 days. The *Great Western* was the first steam-boat built for a regular transatlantic service, and indeed only failed, by a few hours, to forestall the *Sirius*. The fastest crossings to date are those of the *Queen Mary* in 1938 (3 d. 21 h. 45 min. and 3 d. 20 h. 42 min.). Other fast crossings: *Mauretania*, 4 d. 10 h. 41 min. in 1909; *Europa*, 4 d. 17 h. 6 min. in 1930; *Europa*, 4 d. 15 h. 56 min. in 1932; *Bremen*, 4 d. 17 h. 43 min. in 1933; *Empress of Britain*, 4 d. 6 h. 58 min. in 1934; *Normandie*, 4 d. 3 h. 2 min. in 1935; *Queen Mary*, 3 d. 23 h. 57 min. in 1936; *Normandie*, 3 d. 23 h. 2 min. The record crossings by the *Queen Mary* in 1938 and that of the *Normandie* in 1937 were all made from Bishop Rock to Ambrose Light—a distance of 2907 m. The *Queen Mary's* second 1936 voyage was 2938 m.

**Atlantic Shipping Trust**, or 'Morgan Combine,' a popular expression for the International Mercantile Marine Company, organised in 1902 by Mr. J. Pierpont Morgan, to control the chief Brit.

and Amer. N. Atlantic steamship companies. In 1902 provisional agreements were entered into for the acquisition before the end of the year of the White Star Line, the Dominion Line, and the Leyland Line (Brit.), and the Amer. Line and A. Transport Line (Amer.), by a corporation of which the total capital stock amounted to £120,000,000. By this agreement Brit. ships were to sail with Brit. registers and have Brit. officers and crews. The combination was incorporated at Trenton, New Jersey. The Brit. Gov. also entered into agreements with Mr. Morgan by which it was secured that Brit. companies in the combination should remain Brit. The agreements were to hold good for 20 years, and were finally ratified in 1903. In 1927, during the great post-war slump in shipping, the International Mercantile Marine Company decided to dispose of part of their holdings. The White Star Line and the Shaw, Savill & Albion Company, together with the Aberdeen Line, were sold to the great Brit. combine headed by Lord Kylsant.

**Atlantic Star**, Brit. decoration to commemorate the battle of the A., designed primarily for convoys and their escorts and anti-submarine forces, as well as for fast merchant ships that sailed alone. The ribbon is blue, white, and sea-green, shaded and watered. The star is granted for 6 months' service afloat in the Navy in the A. and home waters since Sept. 3, 1939, and until May 8, 1945. The Merchant Navy is awarded the star under the same conditions as the Navy, except that 6 months' service anywhere at sea qualifies, provided that one or more voyages were made in the defined area. Air crews of the R.A.F. are also eligible for the award.

**Atlantic Telegraph** (see TELEGRAPHY). The idea of a transatlantic cable was first mooted by Morse, in 1843. A company, formed 1856, laid a cable in 1858, which soon broke down. Another, laid in 1865, broke, and the first real success was made in 1866.

**Atlantic Transport Company**, running between London, Philadelphia, and New York, and mainly carrying refrigerated meat and live stock. The present company, formed in 1889, includes the ships of the National Steamship Company, the Wilson Line, and the Furness-Leyland Line. The vessels of the company fly the Brit. flag, but the combine was largely financed by the U.S.A. The 2 finest vessels of this company are the *Minnetonka* and the *Minneapaca*, each of about 22,000 tons gross. These sister ships were built, respectively, in 1924 and 1923. Their length is 600 ft., and they have a speed of 16½ knots. Their funnels are red with black top, and they are fitted to burn liquid fuel.

**Atlantis**, an anc. mythical is., supposed to lie in the Atlantic, W. of the Straits of Gibraltar. It is described by Plato in the *Timæus* and the *Critias*, where it is stated that Solon was told of its existence by an Egyptian priest. Plato represents it as having been en-

gulfed in the sea 9000 years previously as a punishment for the impiety shown by the inhab. in waging war against Athens. A shoal of mud still marked its site. It has been variously identified with the Canaries, America, and Scandinavia, but is probably only a Gk. form of the Celtic Island of the Dead, always placed in the W. Ocean.

**Atlantosaurus** (Gk. Ἀτλας, σαῦρος, lizard), a fossil genus of reptiles containing the most gigantic of animals ever known to exist, being estimated at 115 ft. in length. This Dinosaur was herbivorous and 4-footed, the tail was long and head minute. Remains are found in the Jurassic strata of N. America.

**Atlas**, in Gk. mythology, one of the Titans, son of Iapetus and Clymene. He led the Titans against the gods, and was therefore condemned to stand near the Hesperides and bear the heavens on his shoulders. According to another legend, he was turned into Mt. A. by Perseus with the Gorgon's head. The term is also applied to the highest vertebra of the spinal column, and to a collection of maps, having been first used in this latter sense by Mercator in the sixteenth century.

**Atlas Mountains**, a great mt. system of N.W. Africa, stretching N.E. from Cape Nun in Morocco to Cape Bon in Tunis. For the most part there is no continuous chain, but an irregular mass of mountainous land, including vast plateaux and highlands. They may be roughly divided into (1) the Moroccan A., and (2) the Tunisian and Algerian A., both containing numerous minor divs. In (1) there are 4 main chains: (a) the Great A., containing the peaks of Tizi Likumpt (13,151 ft.), Tizi Tamjurt (14,500 ft.), and Miltain (11,430 ft.); (b) the Middle A., to the N. of (a); (c) the Anti-A., connecting with (a) near the peak of Sebel Ayashin (12,000–14,000 ft.); (d) the Jebel Bane, to the S. of (c). In (2) there are 2 main ranges: (a) the Great A., containing the peak of Sheliya (7760 ft.), and (b) the Little A., containing the peak of Lella Khedija, the two being separated by a plateau. The A. Mts. are non-volcanic, and only very few summits are perpetually covered with snow. The valleys are very fertile, and the lower slopes covered with forest. The dist. is difficult of penetration, except in Algeria, where there are some excellent military roads. The geological formation of the mts. is crystalline rocks and schist, with flanking of limestone. The mineral wealth is as yet practically unworked.

**Atlixco**, a tn. of Mexico, 16 m. S.W. of Puebla, situated at an altitude of 5460 ft. in a fine fruit-growing dist. Pop. 10,000.

**Atmolysis**, a method of separating gases of different densities by passing them through a porous tube or diaphragm. Let a tobacco-pipe stem be cemented into an outer glass tube so that its ends project, and let the outer tube be exhausted by an air-pump. If a slow current of air be passed through the pipe, the nitrogen diffuses through the porous clay quicker

than the heavier oxygen, so that the air emerging is richer in oxygen than ordinary air. By repeating the process with the same gas a number of times, a fairly pure supply of oxygen is obtained.

**Atmometer**, an instrument used to determine the amount of water passing into the air by evaporation. It consists of a hollow ball of unglazed clay fitted with a narrow glass tube. The instrument is filled with water and inverted with the glass tube dipping into a mercury bath. As the water percolates through the porous clay and is evaporated into the atmosphere, the mercury rises in the glass tube, and the level of the mercury gives a rough indication of the humidity of the atmosphere.

**Atmosphere**, the gaseous covering or envelope of the earth or any other planet, extended to mean the somewhat indefinite influence surrounding a person or thing. The earth's A. is the remainder of the collection of gaseous matter, part of which has cooled down to form the earth and sea. The gaseous constituents still unliquefied are a mixture of gases comprising about 21 per cent of oxygen, 78 per cent of nitrogen, 1 per cent of argon and other gases, and a slight trace of carbon dioxide. If the air is moist, it contains aqueous vapour to a limit of about 3 per cent. Other ingredients are found in particular localities; gaseous compounds of sulphur and nitrogen in fens, salt at the seaside, and everywhere dust composed of inorganic particles, decaying organic matter, tiny seeds and pollen from plants, and countless bacteria of all sorts.

The oxygen of the A. is breathed into the lungs of animals and enters the gills of fishes after absorption by the water, and it is constantly entering into combination with other substances by combustion or the slower processes of oxidation, as in rusting iron. The animals breathe out carbon dioxide, and combustion of carbon compounds sets free a great amount of the same gas, so that if there were no opposing influences at work, the air would quickly become too much vitiated to sustain life. All plants with green colouring matter, however, are able to absorb carbon dioxide, utilising the carbon to build up their tissues, and setting free most of the oxygen to preserve the balance in the A. Carbon dioxide is also more soluble in water than oxygen, so that any greater pressure of the former gas causes increased absorption by all water surfaces, thus tending to keep the proportions constant. Nitrogen serves as a diluent for oxygen in breathing, and is converted by lightning flashes, and to some extent by certain bacteria in the roots of leguminous plants and in the soil, into compounds necessary for most forms of plant life. Argon (q.v.) is a remarkably inert gas, discovered in 1894, and is accompanied in the air by smaller quantities of similar gases, viz., helium, neon, krypton, and xenon.

The height to which the A. extends is not absolutely known, but it exerts a

pressure of about 14·7 lb. on every sq. in. of surface. Our bodies have an internal pressure which in ordinary circumstances exactly balances atmospheric pressure, and is therefore not felt by us. Similarly, fish that live in the ocean depths are adapted to sustain the correspondingly great pressure, so that if they are brought to the surface they explode. There are, however, certain variations of pressure caused by the variations of heat-expansion of the air, and the consequent currents, whirlpools, and cyclones (*see* METEOROLOGY).

**Atmospheric Railway**, *see* RAILWAYS.

**Atoll** is the name of a type of coral is. consisting of low circular coral reefs, which form a ring of land around a central lagoon. Their origin was for long an enigma, as they rise abruptly from ocean floors of a depth far exceeding that at which the coral insect can live. They are found in the tropical Indian and Pacific Oceans. It was formerly thought that the A.s. were so shaped because they had grown upon the ruins of submerged volcanic craters; but their size and irregularity of shape, and the fact that no volcanic rocks were found in their neighbourhood, disproved this hypothesis. Darwin's explanation is now generally accepted. They are, according to him, due to the upgrowth of coral reefs over ls. that have gradually subsided at a rate no greater than the upward building of the coral. Thus the A. began as a fringing reef, and then became a barrier reef as the land slowly subsided.

**Atom and Atomic Theory**. *Atom* (Gk. *ἄτομος*, indivisible) is the name given to the smallest particle into which matter could, until recent times, be divided. Among the ancients, there were 2 theories as to the nature of matter, or substance. Some, such as Anaxagoras and Aristotle, held that matter was infinite and continuous, and that therefore any substance could theoretically be divided and subdivided to an infinite extent. Others, such as Epicurus and Democritus, taught that matter was *grained*, that is, consisted of minute particles which could not be divided. Both theories were based on naturally slender experimental evidence. The question has its interest in the domains of chem. and physics, and different conceptions of the nature of the smallest particles of matter have arisen to explain chemical and physical phenomena respectively.

**Atomic Theory**.—Towards the end of the eighteenth century the development of experimental chem. led to a desire for greater quantitative exactness. The theory of 'phlogiston' had been held to explain many chemical changes. In combustion, for example, the burning body gave forth 'phlogiston,' which was regarded as an element and therefore as transferable from one body to another. The effect of weighing the products of combustion was, however, to show that weight was gained and not lost. About this time Priestley discovered oxygen, and a new light was thrown on the phenomena of combustion. The idea gradually

prevailed that the combined weight of the substances concerned in chemical change was not altered at any stage of the process; that is, if all the substances are weighed before the action, and all the products collected and weighed, the 2 results will be found to be equal. This was known to be true with regard to simple actions where there is no change from gas to liquid or solid, or vice versa, and other experimental evidence caused the principle of the 'Conservation of Matter' to be extended to all cases. The value of this principle has been enormous, particularly in the direction of detecting new elements, and it was soon seen that the combined weights of the elements in the substances decomposed remained constant although the elements became otherwise combined.

John Dalton believed, with Newton, that gases consisted of particles, or 'corpuscles.' He appears to have reasoned that, as all the particles of the same substances are alike, any chemical action between 2 substances means a similar change in the individual particles of the substances concerned. The particles, therefore, must be chemically divisible, the particles of a compound into 'As.' of the elements combined. Dalton enunciated the law of *constant proportions*, which states that when 2 elements unite to form a compound the weights that combine are in an invariable ratio, a ratio that is characteristic of that compound. When, for instance, oxygen and hydrogen combine to form water, as all oxygen As. are of the same weight, and the weight of hydrogen As. likewise constant, and as each molecule of the resulting water contains the same proportion of hydrogen and oxygen As., it follows that the weights of the quantities concerned will be proportional to the weights of the As. Dalton considered that a molecule of water consisted of 1 A. of hydrogen and 1 of oxygen. As it was necessary to have 8 times as much oxygen by weight as hydrogen to produce water, it was calculated that the weight of an A. of oxygen was 8 times that of an A. of hydrogen. Other reactions, however, modified this view. For example, marsh gas consists of carbon and hydrogen. From the constitution of carbon monoxide ( $\text{CO}$ ) it was found that a weight of 6 units of carbon combined with 8 units of oxygen. On the assumption that the atomic weight of oxygen was 8, hydrogen as the lightest gas being 1, the atomic weight of carbon must be 6. In forming marsh gas 6 units of carbon combine with 2 units of hydrogen. This gives  $\text{CH}_4$  as the formula for marsh gas. It was found, however, that a quarter of the hydrogen could be replaced by half an equivalent of chlorine, giving  $\text{CH}_3\text{Cl}$ , which is absurd. This must therefore be read as  $\text{C}_2\text{H}_5\text{Cl}$ , which means that the formula for marsh gas must be revised to read  $\text{C}_2\text{H}_4$ . But if the atomic weight of carbon is 6 it always appears in organic reactions in even numbers; therefore the probability is that

the atomic weight is 12. This necessitates again revising the marsh gas formula, which now reads  $\text{CH}_4$ . Therefore, from the formula  $\text{CO}$ , the atomic weight of oxygen is 16. Besides, if oxygen were 8, other formulæ would appear with O as an even number. Therefore, formula for water =  $\text{H}_2\text{O}$ .

The above is an example of the reasoning by which the relative proportions of the As. in molecules were arrived at, and each result helped to confirm or revise previous determinations. It was known that the same elements combined in different proportions to form different substances; carbon, for instance, forms 2 oxides  $\text{CO}$  and  $\text{CO}_2$ . The relations between such substances is expressed by the law of *multiple proportions*, which asserts that if 2 elements form more than 1 compound, then the weights of the 1 element which are found combined with unit weight of the other in the different compounds must be in the ratio of 2 or more whole numbers.

Shortly after Dalton's A. T. had been enunciated, Gay-Lussac investigated the volumetric conditions of gases in combination, with the result that he discovered and pub. the law that when gases combine together they do so in vols. which bear a simple ratio to one another and to that of their product. In 1811 Avogadro pub. his hypothesis on the molecular constitution of gases, which asserts that under the same conditions of temp. and pressure equal vols. of all gases contain the same number of molecules whether those molecules consist of single As. or are composed of 2 or more As. of the same or different kinds. Both hypotheses were well supported by experimental evidence, and form in combination an interesting corollary to Dalton's A. T. It was found that 2 vols. of hydrogen united with 1 vol. of oxygen at the same temp. and pressure to form 2 vols. of water vapour under the same conditions of temp. and pressure. From Avogadro's hypothesis it follows that there must be the same number of molecules of water vapour as there were of hydrogen. Therefore each molecule of water contains just as many As. of hydrogen as a molecule of hydrogen. As the formula for water is  $\text{H}_2\text{O}$ , it follows that a molecule of hydrogen contains 2 As. If the molecular weight of hydrogen be taken as 2, the molecular weight of any vapour can be obtained by comparing the weight of an equal vol. of hydrogen at the same conditions of temp. and pressure. If the molecular weight of all compounds of oxygen be found in this way, and if each compound is decomposed and the weight of oxygen determined with relation to the rest of the constituents, the weight of the As. of oxygen in the molecules of its compounds can be calculated. These will bear a simple relation to each other, and the least is taken as the atomic weight, for it is assumed for this purpose that an element enters into at least one compound as a single A.

In this and other ways the atomic weights of all the elements have been

determined and tabulated. At first it appeared as if they would all bear a simple relation to one another, but this proved to be illusory, and many of the early atomic weights which were relied upon on account of their simplicity have been superseded by more accurate determinations. The whole mechanism of formulæ and equations is based on atomic weights, so that the progress of chem. may be said to be determined largely by the A. T. In considering organic compounds we find no such simple procedure as in inorganic substances; some of the molecules, such as that of sucrose,  $C_{12}H_{22}O_{11}$ , contain a surprising number of As., and the molecules are credited with a certain structure in which the various As. have peculiar tendencies and affinities. On the whole, however, it may be said that the A. T. provides a good foundation for the theory of organic chem., and a number of interesting syntheses have been made possible through its instrumentality.

*Atomic Structure and Atomic Energy.* Until near the close of the nineteenth century it was possible to regard the As. of the various known elements as completely stable particles, and although As. of different elements have different properties and must therefore have diverse internal structures, little or nothing was known of these. It was found, however, that certain of the heavier As., such as those of uranium, thorium, and radium, emit continuously certain types of radiation which came to be known as alpha, beta, and gamma rays. Rutherford and Soddy were able to show in 1902 that such radioactive As. are unstable and break up spontaneously to form As. of a different kind, and the alpha rays themselves are found to consist merely of charged helium As. travelling at very high speeds. By studying the collision of alpha particles with other As. Rutherford, in 1911, showed that practically the whole mass of any A. is concentrated in an extremely small central nucleus bearing a charge of positive electricity, the magnitude of the charge being characteristic of the element to which the A. belongs. Around the nucleus, and at relatively great distances from it, revolve a group or groups of electrons, or charges of negative electricity, in number sufficient to counterbalance the positive nuclear charge and render the A. as a whole neutral. These ideas of structure were further developed by Bohr, Sommerfeld, and others, and have proved extremely fruitful in explaining the properties of different As., and hence of matter in bulk.

Since the electrons surrounding a nucleus shield the latter from the action of other As. the chemical and physical properties of an element are determined, in the main, by the number and grouping of the electrons, and the similarity in this respect of As. of the same element explains why they behave in the same way in chemical reactions. Many elements, however, are found to be made up of As. which differ from one another in that, while they possess equal nuclear charges,

they have nuclei of differing masses. Such similar As. are called isotopes. In hydrogen 2 isotopes are found whose masses are in the ratio of 2 to 1, and these differ somewhat in their physical and chemical properties. In general, however, the percentage differences of mass of the isotopes of an element are small and it is practically impossible to separate them by taking advantage of the very slight differences of their chemical behaviour. Very minute quantities of isotopes may be separated readily from a mixture of them by allowing the As. to pass, while electrically charged, through suitably arranged electric and magnetic fields, and considerable progress has been made in increasing the amounts so obtainable. Another method of separation makes use of the fact that, in a gas, the speed at which As. wander from point to point depends upon their masses.

The alpha particles from radioactive As. are emitted at very high speeds, and Rutherford showed that if they collide directly with the nuclei of other As. which are normally stable ones, these can themselves be transformed into As. of a different element. During its passage through matter, however, an alpha particle loses speed through interactions with electron groups surrounding nuclei, and as the nuclei themselves are extremely minute the usual fate of an alpha particle is for its speed to be reduced in this way to a low value before a direct collision occurs. As a result, the transmutation of an A. to one of a different type by an alpha particle collision is a very rare event. Atomic transmutation on a larger scale was produced in 1932 by Cockcroft and Walton when they bombarded lithium As. with high-speed hydrogen nuclei and obtained helium, but the amounts of the product were still extremely small.

The natural and artificial disintegrations of atomic nuclei are not only of interest from the point of view of transmutation, but also because of the enormous amounts of energy involved. The source of the high speed of alpha particles is found in the destruction of a small fraction of the mass of the A. that disintegrates. As a deduction from his theory of relativity Einstein showed in 1905 that there is no essential difference between mass and energy, and that the destruction of mass would result in the production of large quantities of energy. Since the complete destruction of 1 oz. of matter would release an amount of energy comparable with that obtained by the combustion of 100,000 tons of coal, even the small mass destruction which accompanies certain nuclear transmutations may be of immense practical importance. Until recent years, however, the release of energy in considerable amounts had not been achieved, owing to the difficulty of bombarding nuclei by particles which could, except in rare instances, penetrate within them. Alpha particles, as well as the nuclei used in such experiments as those of Cockcroft and Walton, are positively charged and so are repelled by the positive charges of other

nuclei, with the consequence that only a very small fraction of the bombarding particles approach sufficiently closely to cause nuclear changes. A much more potent bombardment would obviously occur if the bombarding particles carried no charge. In 1932 such neutral particles, called neutrons, were shown by Chadwick to result from the bombardment of beryllium by alpha particles, and streams of neutrons produced in this and other ways were soon shown to be very efficient agents for producing nuclear changes.

The methods of obtaining streams of neutrons involve the expenditure of considerable amounts of energy, and since many neutrons are necessarily slowed down and lost by absorption in atomic nuclei, the bombardment of most substances does not result in the production of a useful balance of energy. It is found, however, that if the rare isotope of uranium known as U235 is subjected to bombardment by neutrons of a suitable speed the uranium nuclei disintegrate into 2 fragments of approximately equal masses with the simultaneous production of further neutrons and release of large amounts of energy. Since the neutrons so produced are themselves capable of causing the disruption of other uranium nuclei, the process can, in a mass of U235 of suitable size, rapidly develop and release enormous amounts of energy, as in atomic bombs. The size is of importance since the neutrons produced in a small mass of U235 can escape from it without colliding with nuclei, and so without producing other neutrons. By the admixture with U235 of other As. capable of retarding and capturing neutrons the rate of release of energy can be slowed down and controlled, to be used for industrial purposes. The more abundant isotope of uranium, U238, if bombarded with neutrons of a suitable speed, is transformed into plutonium, an element which is not found in nature. This element, like U235, has potentialities as a source of atomic energy. Apart from the immense technical difficulties of using U235 as a source of industrial power, the separation of this isotope from U238 is both expensive and difficult. The extent to which atomic energy will be used in the near future to replace other sources is therefore a matter for speculation.

For the hist. of the A. T. see H. E. Roscoe and A. Harden, *New View of the Origin of Dalton's Atomic Theory*, 1896. For modern conceptions, see E. da C. Andrade, *The Structure of the Atom*, 1923; and *The Atom and its Energy*, 1947, or any modern textbook of general chem., e.g. F. A. Philbrick and E. J. Holmyard, *A Text-book of Theoretical and Inorganic Chemistry*, 1932.

**Atomic Bomb.** Scientific research dating from the close of the nineteenth century showed that particular types of atoms are unstable and disintegrate spontaneously to form atoms of other types, with the simultaneous release of large quantities of energy. In the period 1934-39 a new type of A. disintegration was found to occur when certain

atoms—in particular those of uranium—were bombarded by neutrons (see ATOM AND ATOMIC THEORY). These A. changes are known as nuclear fission. They differ from ordinary radioactive ones not only in the production of much larger amounts of energy, but also because they may, under certain circumstances, be self-propagating. During nuclear fission other neutrons are set free, and these, by collision with atomic nuclei, generate further supplies of energy, and still more neutrons. The result of this chain reaction is that, if the mass of material is of sufficient size for more than a certain fraction of the secondary neutrons to undergo nuclear collisions before they escape into the surrounding space, an enormous amount of energy is released in a very short time, and the material acts as an immensely powerful explosive. Since sufficient neutrons are always present to initiate the chain reaction, any mass of the material greater than a certain critical one is self-detonating, whereas smaller masses, from which neutrons can escape without nuclear collision, are not explosive.

A committee was set up in Great Britain in 1940 to investigate the possible use of A. fission in a bomb, and similar work was undertaken about the same time in the U.S.A. It soon became apparent that such a weapon was a possibility, and after the U.S.A. entered the war the scientists of the 2 countries collaborated closely in its development. Owing to the greater facilities available in America the large-scale work of production was undertaken there. Among the problems to be solved were: (a) The isolation in considerable quantities of the rare isotope of uranium, U235, which is present in ordinary uranium to the extent of 0.7 per cent only. The commoner isotope, U238, is unsuitable. (b) The measurement of the distances neutrons travel in U235 without collision with nuclei, and of the number and speeds of neutrons set free during fission. These factors determine the critical mass, above which the bomb will be explosive. (c) The design of the bomb itself. Owing to the peculiarities of U235 as an explosive, the bomb must be carried to its destination in parts the union of which causes it to explode. If, however, the parts are brought together slowly they will be driven apart again as the reaction is initiated, and it will cease before it has proceeded far. To permit more than a negligible fraction of the available energy to be released the 2 parts of the bomb must collide at a speed comparable to that of a high velocity shell from a gun.

The solution of such problems and the production of sufficient quantities of the atomic explosive had been achieved in 1945, and 2 A. Bs. were dropped on the Jap. cities of Hiroshima and Nagasaki. The enormous devastation caused, and the knowledge that they were powerless to prevent further attacks of a similar nature, were important factors in influencing Jap. leaders to sue for peace, and Japan surrendered shortly afterwards.

**Atomic Heat**, the capacity for heat possessed by the atoms of different elements. Dulong and Petit, by a careful determination of the specific heat of 13 of the solid elements in 1819, showed the chemical equivalent and the specific heat of these substances. They therefore concluded that the specific heat of the substances varies inversely as the A. weight, and proposed to adopt as the A. weights those numbers which, multiplied by the specific heat, gave a constant product. Within certain limits of temp. the theory is true for the greater number of elements in the solid state. Thus if we take a number of grammes of an element equal numerically to the A. weight, as, for instance 35.5 grammes of chlorine, 12 grammes of carbon, we find that they require approximately the same amount of heat to raise their temp. 1 C. degree. The theory has been useful in determining the A. weight in doubtful cases.

**Atomy**, properly plural of Lat. *atomus* (*atomi*), was used as a singular noun meaning a mote, a speck. It was also used to denote a diminutive, insignificant being, a pigmy (Shakespeare's *Romeo and Juliet*, I. iv. 57, 'Drawn with a team of little atomies'). Also used by Shakespeare and other authors as a term for a skeleton (abbreviation of anatomy).

**Atonality**, a style of musical composing without conscious reference to any scale or tonic. The desire to elude a fixed tonality (key) is as old as Mozart, but the term was first given to the work of Arnold Schönberg (q.v.). The sources may be traced through the chromatic harmony of Wagner's *Tristan*. A. also came about through building up dissonances on every degree of the chromatic scale, so that each degree gains the function of a dominant. Schönberg uses A. in a contrapuntal way, often polytonally. Amongst the purely atonal writers are Bartók (q.v.), Honegger (q.v.), Bliss, Stravinsky (q.v.), and Sorabji. Debussy achieves atonal effects often through the use of the whole-tone scale. Richard Strauss and Granville Bantock resorted occasionally to A. before 1911. See Dent's *Dictionary of Modern Music and Musicians* (ed. A. E. Hull), 1924.

**Atonement**, a theological term denoting the doctrine of the necessity for a means of some form of satisfaction or reparation for sin, leading to reconciliation between God and man. Such a theory presupposes that the natural relation of God towards man is favourable, that it has been disturbed by man's sin, and that a restoration of the previous relations is possible. The means of this restoration, i.e. the problem of the A., is one of the greatest and most difficult questions of theology.

The term is common in the O.T., but its teaching on the subject is very varied and disconnected. Its general trend, however, through the rites of sacrificial law, is towards vicarious A., though the ideas of punishment, repentance, and amendment are frequently included, and this sacrificial theory is connected with

Christ by the writers of the N.T. Here the word atonement is used only once, such terms as reconciliation, propitiation and salvation taking its place with various meanings. The teaching of St. Paul is directly in the line of the Jewish doctrine of vicarious suffering, the death of Christ being held to satisfy the outraged divine righteousness. St. John looks upon Christ more in the light of a propitiation for man's sin, provided by the love of God, and as man's advocate with God, while the writer of Hebrews teaches that Christ's death is the transcendent completion of the ritual of the law.

Later Christian interpretations of the A., while in the main following St. Paul's substitutionary doctrine, have assumed many different forms. The early fathers paid more attention to the Incarnation, but seem to have held that the death of Christ was a ransom paid to the devil for the sinful souls of whom he was lawful owner. The subject was raised into prime importance by Anselm's treatise *Cur Deus Homo*, which regarded the A. as necessary to satisfy the honour of God, and the offering of Christ as of sufficient value to outweigh man's sins. This is sometimes referred to as the commercial theory. In Anselm's belief A. was necessary, but this was controverted by Abelard, who held that God could have forgiven sin without requiring equivalent satisfaction. St. Bernard held to the old idea of the A. as a ransom from the devil, necessary for man's redemption, an opinion adopted by Aquinas, admitting, however, only a conditional necessity for the A. by Christ's death. The chief teaching at the Reformation was on the substitutionary basis, holding that, to satisfy the divine justice, Christ bore a punishment equivalent to that deserved by man. Later theories were that of Socinus, teaching that the Crucifixion was an assurance of God's love and an example of obedience, and the governmental theory of Grotius, to the effect that the A. took place to further the divine gov. of the world by exhibiting God's hatred of moral evil.

The present tendency of thought on the subject is to modify the old objective explanations of the A. either on substitutionary or governmental grounds in the direction of the subjective theories, taking up the attitude of the moral effect of the Passion on man. F. D. Maurice and McLeod Campbell hold to the view that Christ completely identified Himself with man, and in His death offered up an equivalent repentance. Kitzschl believes that the main idea of the A. is not propitiation, but reconciliation. Dr. Dale's *Atonement* teaches that the need for Christ's sacrifice lies in an ideal law of righteousness, not in the personal demands of God. In all probability the view of Bishop Butler, that no theory of the A. is competent, is nearest to the truth.

Sir Oliver Lodge, in his suggestions towards a re-interpretation or modification of the Christian doctrine of A., considers that the doctrine represents a

survival of religious beliefs held some 6 centuries before the Christian era, and cites Euripides' account of the sacramental tasting of blood by the Orphic congregations. He denies the existence of any 'original' or 'birth' sin, and thinks that the consequence of such a belief leads to the denial of the hope of a higher humanity, merely in order that man's sins may be superhumanly atoned for. He takes up the position that man is beginning to realise a further stage in the process of A. and rising to the conviction that we are a part of Nature and of God, and that the union with Divinity and not anything legal or commercial is what science itself will some day tell us is the inner meaning of the redemption of man.

See J. M. Campbell, *Nature of the Atonement*, 1871; R. W. Dale, *Atonement*, 1875; H. N. Oxenham, *The Catholic Doctrine of the Atonement* (3rd ed.), 1881; A. Ritschl, *The Christian Doctrine of Justification and Reconciliation*, trans. 1900; J. Denny, *Death of Christ*, 1903; G. B. Stevens, *Christian Doctrine of Salvation*, 1905; Sir Oliver Lodge, *Man and the Universe*, 1911; L. W. Grensted, *A Short History of the Doctrine of Atonement*, 1920; J. K. Mozley, *The Heart of the Gospel*, 1925; R. S. Franks, *The Atonement*, 1934.

**Atooi** is the name of one of the larger Sandwich Is., in the N. Pacific Ocean. Hills rise from the sea, and at a little distance back are well wooded, whilst the central peaks attain a height of 7000 ft. The is. has a length of nearly 40 m., and is situated in long. 158° 40' W., lat. 21° 59' N. The chief ports are Warnea and Hanalei.

**Atossa**, Queen of Persia, daughter of Cyrus, and wife successively of Cambyses, Smerdis the usurper, and Darius Hystaspis, to whom she bore Xerxes and 3 other sons, and whom she influenced to invade Greece. She is mentioned by Herodotus and is a prominent character in the *Persæ* of Æschylus.

**Atrato**, a riv. of S. America in W. Colombia, rising in the W. Cordilleras, at an elevation of over 10,000 ft. It flows almost due N. for 400 m. into the gulf of Darien, forming a large delta at its mouth, though none of this is navigable. The riv. is navigable for about half its length, and at one time received much attention as a possible basis for a canal across the Isthmus. Gold is found around its tribes.

**Atrebates**, an anct. people of Belgic Gaul, whose cap. was Nemetacum. They formed a confederacy with the Nervii against Julius Cæsar, by whom they were utterly defeated at Axona. A branch of them settled in Britain, where is now the co. of Berkshire. From their name came the modern Artols (prov. of France) and Arras.

**Atrék**, or **Attrék**, a riv. in the N. of Persia, flows partly along the frontier, then into the S.E. corner of the Caspian Sea. It is 250 m. in length, and almost dry at the mouth during the summer.

**Atrous**, in Gk. legend, the son of Pelops and Hippodamia, and brother of

Thyestes. The fate of the house of Pelops, which afforded materials to the tragic poets of Greece, runs thus. As a result of their murder of their step-brother Chrysippus, A., and Thyestes were forced to flee to Mycenæ, where A. became king. Thyestes seduced Aërope, his brother's wife, and was driven from the country. To avenge himself he sent Pleisthenes, a son of A. by his first wife, to kill his father, but A. slew him without recognising him. It was now the turn of A. to plan vengeance. He pretended reconciliation with Thyestes, and having slain his 2 sons, served them up at a banquet. Thyestes fled in horror. Later A., ignorant of her family, married Pelopia, the daughter of Thyestes, and adopted Ægisthus, her son by Thyestes. Agamemnon and Menelaus, the sons of A. by Aërope, find Thyestes and take him to their father. Thyestes is imprisoned and A. sends Ægisthus to kill him. But Thyestes recognises his son by the sword with which the latter intended to slay him, and having made his own identity known to Ægisthus, the father and son decide to kill A. They do this, and seize the throne. It is noteworthy that though this is reputed the most horrible legend in Gk. mythology, no mention of it whatever is made in Homer. The legend figures in 2 plays of Sophocles and 1 of Euripides, all of which are lost.

**Atri**, a tn. of Italy, in the prov. of Teramo. Its fine Gothic cathedral contains interesting frescoes and paintings. Pop. 13,200.

**Atrium**, the prin. room of the anct. Rom. house. It contained the nuptial couch, the hearth, and the family gods. Though in early times it was used as the common living-room, in more sumptuous times it came to be reserved as a room for the reception of clients and guests. There were many varieties of atria. The word was also applied to public halls and buildings, such as the A. Vestæ, and was later given to the porch or court before a temple or basilican church.

**Atropa**, a genus of Solanaceæ, containing many poisonous species. *A. belladonna*, deadly nightshade, grows in thickets and hedges of Britain, and has a purple bell-shaped flower. It contains *atropine*, from which belladonna is made; the drug is used in medicine in cases of nervous diseases, and when injected into the eye causes a dilatation of the pupil. The berries are poisonous, as are the roots and leaves. *A. mandragora*, the mandrake, found in S. Europe, is an even more dangerous species.

**Atropatene**, see AZERBAIJAN.

**Atrophy**, the diminution in the size of a tissue or organ, the result of degeneration of the cells or a decrease in the size of the cells. The immediate cause of degeneration is the cessation or diminution of the supply of nutriment to the part. The opposite condition is *hypertrophy*, when increased nutrition causes an enlargement of the tissues. A. may be due to loss of functional activity when such activity has become unnecessary, as

in some embryonic appendages, the shrivelling of the ovaries after the child-bearing period, etc. It thus plays an important part in the process of evolution, procuring that a part which is no longer used gradually passes out of existence. A. occurs when the normal supply is obstructed by accident, disease, or deliberate constriction. The shrinking of the feet in Chinese women is an example of the latter, and probably certain forms of A. of the liver may be traced to the practice of tight-lacing. Yellow A. of the liver is an acute disease of doubtful etiology. It is characterised by increasing jaundice, vomiting, the presence of a large amount of bile, with leucine and tyrosine in the urine, and is almost invariably fatal.

**Atropine** ( $C_{17}H_{23}NO_3$ ), an alkaloid obtained from *belladonna* leaves or root. It is used in medicine as a sedative and local anodyne. In large doses the drug is a powerful poison, producing hallucinations, delirium, and a marked stimulation of the heart, which ultimately becomes paralysed. When dropped into the eye, A. causes marked dilatation of the pupil and at once relieves pain in that organ. It is used externally to relieve neuralgia, and in small doses as an antidote to opium poisoning.

**Atropos**, the unalterable (Gk. *ἀ*, privative and *τροπή*, to turn), the eldest of the Fates, whose duty it was to cut the thread of human life, which had been measured by Clotho and drawn out by Lachesis. She is generally represented with a cutting instrument, scales, or a sun-dial.

**Attaché** (Fr., attached), a subordinate attached to the suite or company of a commanding officer. In practice, the term is restricted to military or naval As., who are young diplomatic officers, attached to an embassy or a legation, or travelling with an ambas. to a foreign country. It is their duty to make themselves familiar in an honest fashion with the naval and military condition of the country they are in, and to report on all matters likely to be of interest and value to the home gov. In time of war there are various As. at the headquarters of each army. This post is then generally conceded to the envoys of those foreign powers who need representatives at the seat of war.

**Attachment**, a legal process by which a defendant may be brought before a court by the taking of his person or his goods. The writ is issued to the sheriff. It is a process properly applicable to the offence of contempt of court, and therefore is not necessary where the offence has been committed in open court, for the offender is then present, and can be dealt with without the necessity for A. It differs from arrest in that it can be effected on a man's goods as well as his body, and also that the person attached is kept till the day appointed and not brought before a court at once. It differs from distress in that it is not applicable to lands, but only to goods. County courts can only punish for contempt in presence of the

court, and therefore cannot issue writs of A.

**A. of Debts.**—By the Common Law Procedure Act, 1854, and Judicature Act, 1873, a creditor, after obtaining judgment against a debtor, and after affidavit that the debt is not paid and that debts are owed to the debtor by a third party, may attach all such debts and issue execution if the third party does not dispute the debt. Wages of a servant, labourer, or workman (Wages Attachment Abolition Act, 1870), and of a seaman or apprentice (Merchant Shipping Act, 1894), are not open to A.

**Foreign A.**—A legal process peculiar to the Mayor's Court in London and also in Bristol, Exeter and Lancaster, by which a creditor may, before judgment, attach money owed to the debtor or property belonging to him in the hands of third parties. See also GARNISHEE.

**Attainder** (Norman-Fr. *ataindre*, Lat. *attingere*, to reach, to touch upon). The erroneous derivation of the word from the Lat. *tingere*, to dye, to taint, had far-reaching consequences on the Eng. common law, giving rise, as it did, to the doctrine of corruption of blood. A. is the consequence which follows from the passing of sentence of death upon a criminal, or of outlawry in cap. felonies, outlawry in these cases being equivalent to a sentence of death. By the sentence the prisoner became *attaind*, that is to say, he lost all power over his property, and was incapable of performing any of the duties, or enjoying any of the privileges, of a freeman. The blood of the prisoner was said to be corrupt or tainted, neither land nor titles descending to his heirs. By an Act of 1870 A. was abolished in the United Kingdom. In Eng. hist. there have been frequent instances of As. by express legislative enactment, called Bills of A. These enactments provided for the attaind and punishment of persons held to be guilty of offence against the peace and security of the State, and were known as Bills of A., or Bills of Pains and Penalties. The effect of such a Bill is to supersede the ordinary process of law, and although the imprisonment and execution of persons by this means are entirely legal (as coming from the source of law, Parliament), yet in both its employment and its administration it is quite arbitrary. Persons were attaind upon mere hearsay evidence, and some upon no evidence at all, without being heard in their defence. The practice of introducing Bills of A. into Parliament arose in the reign of Richard III., somewhere about 1477, and by the end of the reign of Henry VIII. scarcely a year passed without persons of the highest rank being brought to the scaffold by this means. Under the Stuarts recourse was seldom had to this proceeding, but it was adopted by the Long Parliament against Lord Strafford. His A. was reversed after the restoration of Charles II., and all records of the proceedings cancelled by Act of Parliament. On the other hand, in the same reign the 4 regicides—Cromwell, Bradshaw, Ireton, and Pride—were

attainted, although deceased. The last execution to take place by means of an Act of A. was in 1797, and the most recent instance of a Bill of Pains and Penalties is that directed against Queen Caroline, the wife of George IV., in 1820.

**Attaint**, a writ, which formerly lay to inquire whether a jury had given a false verdict. It was first introduced by Henry II. at, it is said, the instance of Chief Justice Glanville. At first it only lay on the trial of writs of assize, but it was extended gradually, and by the reign of Edward III. it applied to all pleas whatsoever, whether real or personal, except writs of right, where the issue was joined on the *mere right*. If the jury on the A., who were 24 in number, found that the verdict was false, the judgment against the jury who found the false verdict was very severe. But more moderate judgment was introduced in the reigns of Henry VII. and Elizabeth. So ineffectual, however, was this proceeding, that in the time of James I. it gave place to the now-existing practice of setting aside verdicts on motion and granting new trials. By 6 Geo. IV. c. 50, which consolidated the laws relating to juries, proceedings by way of a writ of A. were abolished.

**Attalea**, a genus of S. Amér. palms (order Palmæ). *A. funifera*, called *piacaba* by the natives, yields a very strong fibre used in rope-making.

**Attalia** or **Attaleia**, an anct. seaport on the coast of Pamphylia, near the mouth of the R. Catarrhactes, and about 15 m. distant from Perga. It was built by Attalus II. (159-138 B.C.), and subdued by the Romans under P. Severus Iulianus. It is now named Adalia (q.v.). The place was visited by Paul on his first missionary journey (Acts xiv. 25).

**Attalus**, name borne by 3 kings of Pergamus: 1. Surnamed Soter, reigned 241-197 B.C., became an ally of Rome in that city's struggle against Philip of Macedon and the Achæans. He was wealthy, just, and wise, and a liberal patron of literature. 2. Surnamed Philadelphus, reigned 159-138 B.C., succeeded his brother Eumenes. Like his father, he was an ally of Rome and a great patron of the arts. 3. Surnamed Philometer, reigned 138-133 B.C.; by his will left Pergamus to the Rom. people. There are conflicting accounts of his life.

**Attalus**, a senator of Rome, in the reign of Honorius, was sent by the Romans to that emperor at Ravenna to represent to him the difficult situation of the cap., threatened at that time by Alaric and to advise him to fulfil the conditions of a treaty which he had concluded with that Gothic chief; but Honorius refused, and Alaric, being joined by his brother-in-law, Ataulphus, laid siege to Rome. A., who was then prefect of Rome, was proclaimed emperor by Alaric, who required the Romans to swear allegiance to him A.E. 409. A. then went with an army of Romans and Goths to besiege Honorius in Ravenna, who proposed to associate him in the empire, but A. refused to listen to the proposals, thinking him-

self possessed already of the real power. A., however, having opposed Alaric in some of his views, was immediately deposed by the Gothic chief. After this, Alaric again besieged Rome, took it, and gave it up to pillage in Aug. 410. Upon Alaric's death, A. followed the fortunes of his successor, Ataulphus, whom he accompanied into Gaul. After the death of Ataulphus, his successor, Vallia, having concluded peace with Honorius, A. endeavoured to escape the emperor's vengeance, but was taken, and, by order of Honorius, confined in the is. of Lipari, after having had the fingers of his right hand cut off, in order to prevent him from being able to write. A. was afterwards recalled to Rome, where he d. in obscurity. (Zosimus, Orosius, and Gibbon.)

**Attalus**, general under Philip II. of Macedon, and uncle of Cleopatra, whom Philip espoused c. 337 B.C. At the wedding, he offended Alexander, son of Olympias, whom Philip had repudiated, by expressing a wish for a legitimate successor to the throne. After the death of Philip, he opposed Alexander, but his soldiers deserted him and he was slain.

**Attar of Roses**, the essence or oil of the *Rosa centifolia*, or *Rosa damascena*, produced from these flowers by distillation in water, the oil being then collected from the surface of the water by means of a feather. It is chiefly prepared in Persia, India, and Turkey, from which countries it is exported in small vials. The perfume is very costly, and is in itself too strong to be at all pleasant. It is freely used as an ingredient in other perfumes, a few drops of it scenting a great quantity. It is also known as Otto of Roses.

**Attempt**, a technical term in criminal law applied to an act done with the intent to commit a crime. In England any act which if uninterrupted and successful would have been a crime, is regarded as an A., even if the accused of his own free will decides not to carry out his original intent. An attempted murder, however, is termed felony.

**Attention**. In psychology two kinds of attention are recognised: (1) The passive, being the concentration of the consciousness upon a definite object or objects by isolating the perception from other objects. As all consciousness depends upon a certain degree of isolation, such passive attention may ultimately be regarded as the necessary condition of consciousness. (2) The active, being the voluntary act of fixing the mind upon a definite object or objects. The force of this act of volition varies with the individual, and is capable of development.

**Atterbom**, Per Daniel Amadeus (1790-1855), the great poet of the Romantic movement in Sweden, was b. in E. Gothland. He studied at the univ. of Upsala, where he founded the Aurora League, a society for the reform of Swedish literature. The best known of his works are *The Isle of Blessedness*, a romantic drama, and the series of lyrics entitled *The Flowers*, which introduced

the sonnet to Sweden. He also left an unfinished fairy drama, *The Blue Bird*. His works are marred by a tendency to introduce philosophic and religious meditations and allegory. In 1835 he was made prof. of aesthetics and literature at Upsala. His *Swedish Seers and Poets* is an interesting series of biographies.

**Atterbury, Francis, Bishop of Rochester** (1662-1732), distinguished as an Eng. man of letters, a bishop, and a politician, was b. at Middleton Keynes in Buckinghamshire. He was educated at Westminster School, from which he proceeded to Christ Church, Oxford. As a Protestant, he answered an attack made on the spirit of the Reformation which aroused the indignation of the Papists by the vigour of its rhetoric. He took holy orders in 1687, and readily swore allegiance to William III. after the Revolution. He won great fame as a preacher, and became in 1691 lecturer of St. Bride's, chaplain to William and Mary, and minister to Bridewell Hospital. In 1698 appeared the Hon. Charles Boyle's attack on Bentley's *Dissertation on the Epistles of Phalaris*, an attack which was mainly from the pen of A., who was Boyle's tutor. He distinguished himself also by his defence of ecclesiasticism against the attacks of the civil law. In 1701 he became an archdeacon, a prebendary of Exeter Cathedral, and a D.D. In 1704 he became dean of Carlisle, in 1709 preacher at Rolls Chapel, in 1712 dean of Christ Church, in 1713 bishop of Rochester and dean of Westminster. He was probably instrumental in the drawing up of Sacheverell's defence. He took part in the coronation of George I., but his influence was destroyed, since his leanings towards Jacobitism were known. In 1717 he held direct communication with the Pretender. In 1721 he was arrested for participation in a plot to proclaim King James, and in 1722 imprisoned in the Tower. In 1723 he was deprived of his titles and banished. He entered the service of the old Pretender and d. in France in 1732. He was buried secretly in Westminster Abbey. He numbered amongst his friends and correspondents all the great literary men of the period.

**Attestation.** Most important legal documents, especially wills and deeds (*q.v.*), require to have the signature of the person making the instrument attested by one or more witnesses or 'attestors.' All deeds are required by Scots law to have 2 witnesses, unless there is special statutory exemption, and in England wills and grants of land to charities must have 2 attestors. In Scotland no deed is valid if written by another than the party making the deed unless the testing clause (*q.v.*) is regular. The A. of 2 justices is necessary to the indenturing of pauper apprentices to the sea. One witness is necessary to a bill of sale, and to witness a warrant of attorney or a cognovit (*i.e.* an admission by a defendant of the justice of the whole or part of a plaintiff's claim) the signature of a solicitor is obligatory.

**Atthis**, a genus of small humming-birds found in S.W. U.S.A. and elsewhere.

**Attic**, a term in architecture designating a low storey introduced above the main cornice in the elevation of a building. An *A. base* is a form of base employed in the Ionic order, and sometimes in the Corinthian. It consists of 2 toruses, separated by a scotia (concave moulding in base of a column) resting upon a plain square plinth.

**Attic Dialect**, the language of Athens during the period of her literary greatness, originally a development of the Ionic dialects. It is the basis of ordinary Gk. grammars, the Old Ionic or Homeric, Æolic, and Doric dialect forms being given as variants.

**Attica**, one of the divs. of anct. Greece of which Athens was the cap., bounded on the N. by Boeotia, on the W. by Megaris and the Saronic Gulf, on the S. by the Ægean Sea. It was a fertile and prosperous state, and sent out many colonies. Striking features of the country are the mts. of Hymettus and Laurium, the latter of which contains silver mines.

**Atticism**, an elegant and classic phrase, characterised by brevity and intellect. The Attic dialect was the purest and most literary of the Gk. dialects. *Attic salt* signifies a poignant and delicate wit peculiar to the refined Athenians and foreign to the blunter Romans.

**Atticus, T. Pomponius** (c. 109-32 B.C.), a Rom. knight, b. at Rome. His name was originally Titus Pomponius; on his return to Rome, 65 B.C., he took possession of the estate left him by his uncle and assumed the name of Quintus Cælius Pomponianus. The name A. was given him from his residence in Athens, and his deep acquaintance with the Gk. literature and tongue. Amongst his fellow students may be mentioned C. Marius and M. Cicero. He left Rome on the outbreak of war between Marius and Sulla, and took up residence in Athens. He refused to take sides in the Civil war, and was an intimate friend of the leaders of all parties. He was a believer in the Epicurean philosophy. He was a great friend of Cicero, from whom he received many letters which are still extant, and a number of whose works he read and corrected.

**Atticus Herodes, Tiberius Claudius** (c. A.D. 104-180), a famous Gk. teacher of rhetoric, who was b. at Marathon. His fame as a teacher of rhetoric was equally known at Rome and at Athens. He numbered amongst the more famous of his scholars the future emperor, Marcus Aurelius, and his future colleague, L. Verus. He became a consul in the year 143. He was exceedingly wealthy, and spent a great part of his wealth in beautifying with magnificent buildings the Grecian ins. of Athens and Corinth.

**Attidian Brethren**, a body of 12 priests in Umbria who had wide authority in that region. The Eugeubine Tables are the records of their acts.

**Attila** (the Scourge of God) (c. A.D. 406-53), king of the Huns, succeeded his uncle Rua or Roua with his brother Bleda

in 433. He claimed for himself divine origin and descent, and from the finding of the so-called sword of Mars, claimed the dominion of the earth. Bleda was put to death in 445, and A. was able to proclaim himself king of the Barbarians from the North Sea to the boundaries of China. He ruled over the Vandals, Ostrogoths, and Gepids. In alliance with Genseric he invaded Mœsia and defeated the forces of Theodosius II. He devastated the whole of the E. portion of the empire, and Constantinople only saved itself by means of its impregnable fortifications. The whole of the Balkan Peninsula was at his mercy, and Theodosius was forced to make peace with him practically on his own terms (446). In 450 a Rom. conspiracy against his life was formed, and in the same year he prepared to invade Gaul. He besieged the tn. of Orleans in 451, but an alliance of the Roms. and Visigoths forced him to raise it and defeated him at Châlons, where 200,000 men are said to have perished. Forced back into Hungary, he invaded Italy in the following year, placed after place falling into his hands. He took and completely destroyed Aquileia (q.v.) in 452, after a siege of 3 months. Rome itself was only saved at huge expense—though according to some authorities A. did not attack Rome in consequence of his interview with Pope Leo the Great. In the next year he d., and with the death of A. his empire fell to pieces. See E. A. Thompson, *A History of Attila and the Huns*, 1948.

**Attis**, see **ATYS**.

**Attius**, see **ACCIUS**.

**Attle**, a miner's term for dirt or rubbish left over after the ore is worked. Originally a Cornish term.

**Attleboro**, a tn. of Bristol co., Massachusetts, U.S.A., 32 m. S.W. of Boston. The tn. manufs. jewellery, silver ware, cotton goods, etc. It comprises sev. vils. and contains the A. Home Sanatorium and a good public library. Pop. 22,000.

**Attleborough**, a mkt. tn. in the co. of Norfolk, England, 15 m. S.W. of Norwich by rail. In the fourteenth century it had a college of the Holy Cross, and its anct. par. church contains some interesting remains. Pop. 2,600.

**Attlee, Clement Richard** (b. 1883), Brit. statesman, educated at Haileybury and Univ. College, Oxford. Called to the Bar, 1905. Secretary of Toynbee Hall, 1910. Lecturer on social science, London School of Economics, 1913-23. Served in the First World War, retiring with rank of major, 1919. Mayor of Stepney, 1919-20. M.P. (Labour) Limehouse div. of Stepney, since 1922. Member of India commission, 1927-30; under-secretary for war, 1924. Chancellor of Duchy of Lancaster, 1930-31; postmaster-general, 1931. In the crisis of 1931 he stayed out with Arthur Henderson, J. R. Clynes, and George Lansbury, preferring the political wilderness and his friends to the high places with Ramsay MacDonald and J. H. Thomas, and in the ensuing general election his friends were decimated. Only Lansbury came back and A. became

deputy leader of the Parl. Labour party. Succeeded George Lansbury as leader of the Labour party, 1935. Privy councillor 1935. Leader of the Opposition when the Second World War broke out. Joined Churchill's Gov. in May 1940 as lord privy seal and leader of the House of Commons, secretary of state for dominion affairs, 1942. Prime Minister and First Lord of the Treasury, and minister of defence, July 26, 1945.

Karsh, Ottawa

**CLEMENT ATTLEE**

**Attock**, a tn. and fort of Pakistan, in the Punjab. It is situated on the l. b. of the Indus, 45 m. E.S.E. of Peshawar, and was founded in 1531 by the Emperor Akbar. It is an important strategic position, as here is the chief bridge over the Indus. It has been the route by which almost all the invaders of India by land—Alexander, Tamerlane, etc.—have made their approach.

**Attorney**, 'one substituted' (from *atourné*, *atournatus*, respectively derived from the Fr. *atourner* and the Lat. *atournare*, to substitute), signifies in its widest sense one put in the place or *turn* of another to manage his affairs. For its use in this general sense, see article **POWER OF ATTORNEY**. In the narrower sense A., or more properly attorney-at-law, was the name given prior to the Judicature Acts, 1873-75, to those members of the legal profession who represented litigants in the courts of common law and briefed counsel on their clients' behalf. The equivalent term for those who practised in the chancery or equity courts was solicitor. Since the enactment above referred to, which extended equity to all courts, the title of solicitor is applied to both solicitors and As. Sec., therefore, article **SOLICITOR**. In the

U.S.A. the term A. includes both barristers and solicitors.

**Attorney, Letter or Power of, see POWER OF ATTORNEY.**

**Attorney-General.** The A.-G. is the chief law officer of the Crown and chief legal adviser to the Gov. He is appointed by letters patent, and his office is in many respects similar to those of the lord advocate of Scotland (*q.v.*), though less extensive and more clearly defined. Originally, he was simply the king's A., and stood in the same relationship to the king as any other A. does to his client. The additional term general probably arose from the need of differentiating him from As. appointed to act for the Crown in particular courts, such as the A. for the court of wards, or the 'coroner and A. for the king,' the official name for the master of the Crown office in the King's Bench Div. The origin of the office is obscure, the first mention of the title being in the reign of Edward I. towards the end of the thirteenth century, when the holder of it is called the *attornatus regis*. Gradually the office has become one of great dignity and importance. Till recently the king's serjeant was the chief officer of the Crown in criminal proceedings. A dispute between this officer and the A.-G. as to precedence was settled in 1811 by George IV., then prince regent, declaring by a special warrant that the A.-G. and the solicitor-general should have precedence over all other members of the Eng. Bar. A similar problem as to precedence between the lord advocate of Scotland and the A.-G. arose in 1834, and was decided in favour of the latter. The A.-G., like his confrère the solicitor-general, is always a member of Parliament and a member of the ministry. He is paid £7000 a year, and receives fees for Crown business, but he has not now the right that he formerly enjoyed of engaging in private practice. Till 1912 the A.-G., though a member of the ministry, was not a member of the Cabinet or of the Privy Council, but in that year Sir Rufus Isaacs, M.P. (later Lord Chief Justice) was given a seat in the Cabinet. The duties of the A.-G. are to represent the Crown in criminal prosecutions, particularly in those heinous misdemeanours that tend to disturb or endanger the State, and in civil cases to conduct suits and prosecutions relating to public questions of professional etiquette. The duchies of Cornwall and Lancaster and the co. palatine of Durham each have their A.-G. The A.-G. of the U.S.A. Gov. differs in some respects from his Eng. prototype. The lawyer chosen for this post is always a lawyer of eminence, though not necessarily in the front rank of the Bar, political considerations having, as in England, much to do with determining the President's choice. The A.-G. exercises a general supervision over the Federal judicial departments, and more especially over the district attorneys (*see* DISTRICT ATTORNEY) and those executive court officers called U.S. marshals. Further, he is a fully fledged member of the

President's Cabinet, and is the regular legal adviser of the President, a function of especial importance, in all those difficult questions which arise as to the constitutional limits of the executive power of the President, and the relations of Federal to state authority. In England the A.-G.'s opinions are treated as confidential, but those of the Amer. A.-G. are often pub. officially, not only in justification of any particular line of action taken by the President, but to inform the world of the view which the executive takes of its legal position and duties in any matter of moment. These opinions have a quasi-judicial authority although they are only of 'persuasive' and not 'authoritative' efficacy, inasmuch as the Federal Court can override them. *See* Bryce, *American Commonwealth*, 1888.

**Attraction** (Lat. *attrahio*, from *ad*, to, *trahere*, to draw), a condition of stress such that 2 bodies tend mutually to approach one another, and to resist separation. Various kinds of A. are those exercised in gravitation, capillary A., chemical A., cohesion, magnetic A., and the universal A. which regulates the movements of the planets. The laws of gravitation were first formulated by Newton, and his law for the A. of masses may thus be stated: Any 2 particles of our planetary system, of mass M and M', respectively, separated by a distance U, exercise upon each other an A, which may be denoted as  $f \frac{MM'}{U^2}$ , where  $f$  is a

constant: i.e. gravitation A. follows the law of inverse squares. The forces of gravitation and magnetic A. act when the bodies are distant from one another, whereas in cohesion (which follows the laws of gravitation) and chemical A. the bodies must be in contact.

**Attrak, see ATREK.**

**Attribute**, properly a necessary property or characteristic of a thing, is used in painting, logic, and metaphysics with special meanings.

In painting, an A. is a conventional symbol added to identify the personage represented.

In logic an A. of a thing is any quality or characteristic which belongs essentially to it, which may be specifically predicated of it. It is in this use opposed to accident.

In metaphysics an A. is the necessary quality of a substance, whether material or spiritual. In Spinoza's philosophy, for instance, an A. is that which the mind perceives as constituting the essence of the thing in question. Divine substance, he says, may have an infinite number of As., but human minds can perceive only extension and thought.

**Atwood, Thomas** (1765-1838), organist and composer, was the son of a coal merchant. Was sent by the Prince of Wales to study music in Italy. On his return he became organist of St. Paul's, and composer to the Chapel Royal.

**Atur, Aturis, or Aturus, see ADOR.**

**Atwood, George** (1746-1807), mathematician and physicist, was b. in London.

He was educated at Trinity College, Cambridge, and having graduated with high honours, was elected a member of the Royal Society in 1770. He wrote various papers for *Philosophical Transactions*, and among his other works may be named his *Treatise on the Rectilinear Motion and Rotation of Bodies, with a Description of Original Experiments Relative to the Subject*, 1784, which described the apparatus known as A.'s machine, to demonstrate the laws regulating falling bodies.

**Atwood's Machine**, an apparatus designed to demonstrate the relations of time, space, and velocity in the motion of a falling body. It consists essentially of a wheel over which 2 masses are suspended, weighing respectively, say, 49½ grammes and 50½ grammes. The total mass is therefore 100 grammes, and the force acting upon the machine is due to the excess in weight of one body over the other, that is, 1 gramme. Let this gramme be a piece of wire which can be removed by a ring on one of the supports of the wheel. A pendulum is provided which regulates a timepiece. The heavier weight is supported by a plate which can be dropped as the pendulum ticks. The ring is slid down so that the weight takes exactly 1 sec. to reach it, which can be arranged after some trial by making the click of the wire on the ring and the tick of the pendulum coincide. The weight, relieved of the wire, still travels downwards until it is stopped by a plate arranged as before to catch it at the end of 1 sec. This plate will be found to be about 9·81 centimetres below the ring. That is to say, the weight of 1 gramme, acting for 1 sec., has imparted to the whole mass of 100 grammes a velocity of 9·81 centimetres per sec. This additional velocity is the acceleration due to gravity, which may be measured in dynes by multiplying the mass by the acceleration, thus:  $F = ma = 100 \times 9\cdot81 = 981$  dynes.

**Atys**, the name given by Leach to a genus of long-tailed decapodous crustacea. They have forceps ending in 4 claws; these are cleft as far as the base and thus appear to be composed of 2 fingers, or lashes, which are joined at their origin.

**Atypus**, a genus of spiders having 6 spinneret glands.

**Atys**, or **Atis**, a deity worshipped in Phrygia in connection with Cybele, whose worship gradually spread throughout the Rom. Empire and Asia Minor. The story of A. is told in various conflicting ways, the best-known account being that by the Rom. poet Catullus.

**Atzgersdorf**, a tn. in Lower Austria, 5 m. S.W. of Vienna; pop. 8800.

**Auah**, see OUDH.

**Aubagne**, a tn. in the dept. of Bouches-du-Rhône, S. France, on the Iruveaune. E. of Marseilles. Its chief manufs. are pottery and leather, whilst the wine of the dist. is also renowned. Its hist. has been varied and it has sev. times been sacked. Pop. 14,000.

**Aubaine**, an anct. Fr. right by which

the property belonging to strangers (not naturalised) or to Frenchmen who left their country became on their decease the property of the lord of the dist. or of the king. It was abolished in 1819.

**Aubanel**, Théodore (1829-86), a Fr. author who, in collaboration with Mistral and Roumanille, devoted himself to the work of reviving and carrying on the native Provençal dialect and literature. He kept up, however, his family trade of printing and editing. His best-known poem is *La Mivugrano entreduberto*. One play of his, *Lou pan dou pecat*, was acted in Provençal and in Fr.

**Aube**, dept. of N.E. France, bounded N. by Marne, N.W. by Seine-et-Marne, W. by Yonne, S. by Yonne and Côte-d'Or, and E. by Haute-Marne. It is formed of the S. part of the old prov. of Champagne and part of Burgundy. Its E. part is watered by the A. and its W. by the Seine, to the basin of which the dept. belongs. The climate is moist and mild, and the chief industry is agriculture. The N.E. is chiefly pastoral, but the S.W. is fertile, and here wheat, oats, vegetables, etc., are extensively cultivated. Chalk, potter's clay, building-stone, and limestone are among the minerals, while cotton-spinning and weaving are the chief industries. Prin. exports, timber, cereals, wine. Cap. Troyes. Area 2326 sq. m. Pop. 243,000.

**Aube**, trib. of the Upper Seine, rises in plateau of Langres. Length 150 m.

**Aubenas**, tn. in the dept. of Ardèche, in S.E. France. It is built in a fine situation on the side of a hill. Chief industries, coal and iron mining, paper and silk making. Pop. of com. 8000.

**Auber**, Daniel François Esprit (1782-1871), Fr. composer of operas, was b. at Caen in Normandy. His father, a print-seller, sent him to London to acquire a knowledge of business methods, but the young man was already deeply imbued with a passion for music, to indulge which he returned to Paris in 1804. After producing 4 concertos for the violoncello and 1 for the violin he resorted to the comic opera *Julie*. Intending to study music seriously, he now put himself under the tuition of Cherubini, and after writing a mass, part of which he later utilised in *La Muette de Portici*, he produced a 1-act opera, *Le Séjour militaire*, which failed miserably. This failure led him to write nothing more until he was compelled by the death of his father in 1819 to make music his means of livelihood. After a half-success in *Testaments et Billets-doux*, he scored a brilliant success in 1820 with *La Bergère châteline*. In 1822 he began his association with E. Scribe, the libretto-writer, and the two began a series of popular and successful productions, among which may be named *Le Domino noir*, 1837; *Le Lac des fées*, 1839; *Les Diamants de la couronne*, 1841; *La Fiancée du roi de Garbe*, 1864.

**Aubergine**, a name for the fruit of a species of *Solanum*. Also called the egg-plant from the shape of the fruit.

**Aubervilliers**, a tn. on the St. Denis

Canal in dept. of Seine, N. Franco. Formerly numerous pilgrims came here to honour Notre-Dame-des-Vertus. It has manufs. of chemicals, perfumery, etc. Pop. of com. 56,000.

**Aubignac, François Hédelin, Abbé d'** (1604-76), Fr. author and critic, tutor to the nephew of Richelieu, who conferred on him the abbey of A. His best-known work is a tragedy, *Zénobie*, 1647, written in prose as an exemplification of critical rules, and he later arranged these in his *Pratique du théâtre*. He was the first to throw doubts on the existence of Homer.

**Aubigné, Françoise d',** see MAINTENON, MARQUISE DE.

**Aubigné, Jean Henri Merle d'** (1794-1872), a Swiss historian, b. at Eaux-Vives. He studied here and at Berlin until, in 1818, he became pastor of the Fr. Protestant church at Hamburg. Five years later he removed to Brussels, where he was appointed court preacher. In 1830 he returned to Geneva and became prof. of church hist. in the newly founded theological school there. He visited England on sev. occasions, where he was warmly welcomed, the univ. of Oxford conferring the D.C.L. degree on him. His best-known work is the *Histoire de la Réformation au XVI<sup>e</sup> siècle*, 1835-53.

**Aubigné, Théodore Agrippa d'** (1550-1630), Fr. soldier and scholar, b. at Pons in Saintonge. He early showed a remarkable talent for languages, especially for the classics, but his attachment to the Huguenot cause made him spend the early part of his life in the military profession. He rendered good service to Henry of Navarre, whom he later criticised with freedom and candour. After Henry's assassination he retired to Geneva and resumed his literary studies. His best-known work is his *Histoire universelle, 1550-1601* (1616-19), which for its indulgence in satire was officially burnt in France. His satiric bent is also shown in most of his other works, e.g. *Confession catholique du sieur de Sancy*. His poems, *Les Tragiques*, are highly praised by Lanson.

**Aubin, a tn.** in the dept. of Aveyron, S. France, on the R. Enne and the Orleans railway. In the vicinity are extensive coal and iron mines, the former of which have been worked since the Middle Ages. Pop. of com. 7,500.

**Aubonne, Baron d',** see TAVERNIER, JEAN BAPTISTE.

**Aubrey, John** (1626-97), Eng. antiquary, b. at Easton Percy in Wiltshire. His early education was given him at the neighbouring tn. of Malmesbury, at the grammar school which was then under Robert Latimer. In 1642 he entered Trinity College, Oxford, and in 1646 became a student of the Middle Temple, though he was never called to the Bar. In 1652, on his father's death, he succeeded to large estates, the subject, however, of innumerable lawsuits which eventually left him without any means of support, 1670. From this time he visited his friends, journeying from house to house till, in 1697, he d. at Oxford.

Only one of his works, the *Miscellanies*, was pub. in his lifetime (1696), but he left a large mass of material which was ed. by others. His *Lives of Eminent Men*, given to Anthony & Wood as material for his *Athenae Oxonienses*, appeared in 1813, and his *Remains of Gentilisme and Judaïsme* in 1831. His *Natural History and Antiquities of the County of Surrey* had already appeared in 1719. The *Miscellanies* (stories about dreams, ghosts, and visions) are full of interesting chatter, but A.'s extreme credulity and his appetite for folklore and gossip sometimes make them unreliable. His valuable and entertaining *Brief Lives of Contemporaries between 1669 and 1696* was ed. for the Clarendon Press in 1893 by Rev. Andrew Clark from the MSS. in the Bodleian.

**Aubriet, Claude, a Fr. artist, b.** at Châlons-sur-Marne about 1635. He succeeded Jean Joubert in 1700 as painter for the Jardin du Roi. He is noted for his beautiful illustrations of natural hist. on vellum, and many of his works are preserved in the National Library.

**Aubrieta, a genus** of herbaceous plants of the order Cruciferae. *A. deltoidea*, the purple rock cress found in Brit. gardens, is a native of central Italy, Greece, Asia Minor, and Syria.

**Aubriot, Hugues, was b.** at Dijon in the early part of the fourteenth century. He was made provost and captain of Paris in 1364 by Charles V. and in his 17 years of power did a great deal of good to the city. Built the Bastille, 1369. He made many enemies by his honesty and upright dealing, and was condemned by the bishop's court to imprisonment for life in the Bastille after Charles V.'s death. He escaped, however, in 1382, and retired to Bourgogne, dying in the same year.

**Aubry de la Boucharderie, Count Claude Charles** (1773-1813), general of artillery, was b. at Bourg. He fought in several campaigns, of which the chief was the expedition to Moscow, during which he constructed the famous bridge over the Beresina. He was slain at Leipzig in 1813.

**Aubry de Montdidier, a nobleman** of the court of Charles V. of France, assassinated in 1371, it is said, by his companion Richard Macaire. A's dog displayed afterwards the most determined animosity to Macaire, and the king, his suspicions being roused, ordered a combat between the two. The dog, says the popular story, was the victor, and Macaire died on the scaffold.

**Auburn:** 1. Co. seat of Cayuga co., New York, U.S.A., situated at the N. end of Owasco Lake; has manufs. of wool, silk, carpets, boots, paper, etc., and also makes agric. machinery on a large scale. Here there is a state prison, founded in 1816, which accommodates over 1000 prisoners; there are also a state asylum and armoury, and the A. Theological Seminary (Presbyterian), opened in 1821. Pop. 37,000. 2. The co. seat of Androscoggin co., Maine, U.S.A.; it manufs. boots and shoes. Pop. 19,000.

**Auburn-Lissoy, a vil.** in par. of Kilkenny W., co. Westmeath, Eire, 6 m.

N.E. of Athlone, near Lough Rea. It is noted as being the 'Auburn' of Goldsmith's *Deserted Village*, but Austin Dobson, in his *Goldsmith*, like Macanlay, refuses to accept this. See *Goldsmith's Poems and Plays* (Everyman's Library).

Aubusson, the cap. of the Fr. dept. of Creuse, is situated at the junction of the Creuse and the Bauze. A pretty and well-constructed tn., it manufs. cotton and woollen goods, and has a trade in salt. It is celebrated for its weaving of carpets and tapestry.

Aubusson, Pierre d' (1423-1503), a grand master of the order of St. John of Jerusalem. He served under the Emperor Sigismund and the Dauphin, afterwards Louis XI. He joined the order of the Knights of Rhodes, was signally successful against the pirates of the Levant, and successfully resisted Mohammed's siege of Rhodes in 1480. He perfidiously kept captive Jem, one of the brothers claiming Mohammed's throne, until the other brother, Bayezid, was successful, when he handed Jem over to Pope Innocent VIII. in 1489. He was rewarded by being made a cardinal.

Aucassin and Nicolette are 2 lovers in a medieval romance (Arabic in origin and Provençal in setting), in mixed prose and verse, of the thirteenth century (it is included in Moland and Héricault's *Nouvelles du 13<sup>e</sup> et du 14<sup>e</sup> siècle*). It resembles the story of the much more popular *Florie et Blanchefleur*. A. was the son of the count of Beaucaire; N., though brought up by Saracens from an early age, and looked upon as a slave, was in reality the daughter of the king of Carthage. In a simple and touching narrative the story of their vicissitudes, their long separation, and their final happiness is realistically told. Sedaine wrote the libretto for an opera by Grétry, which was first performed in 1779. Other composers, including Enna, the Dane, have set versions of the story. See *Aucassin and Nicolette* (Everyman's Library).

Auch is the cap. of the Fr. dept. Gers. The Augusta Auxorum of the Romans, it is built on a hill, topped by one of the finest Gothic cathedrals in France. It is the seat of an archbishop, has manufs. of woollen and cotton goods, and a trade in wines and Armagnac. Pop. 13,000.

Auchel is the name of a tn. in the Fr. dept. of Pas-de-Calais, situated 10 m. S. of Béthune. Pop. 13,000.

Auchenia (Gk. *αὐχην*, neck), the scientific name of the llama (*q.v.*), a ruminant of the family Camelidae and order Ungulata. It is smaller than the camel, has woolly hair, no hump, is very vicious.

Auchinleck, a tn. in Ayrshire, Scotland, is situated 15 m. E. of Ayr. In the par. is A. House, the seat of the Boswell family. Pop. 7000.

Auchinleck, Sir Claude John Eyre (b. 1884), Brit. soldier, b. in Ulster, son of Col. John Claude A., R.A., educated at Wellington College. Served in Egypt, 1914-15, and elsewhere in the Middle E. during the First World War. Mohmand operations, 1935. Deputy Chief of General Staff Army Headquarters, India,

1936-38. G.O.C. Southern Command, 1940. Earned the reputation of an expert in mountain warfare before the outbreak of the Second World War. Was commander-in-chief in India in the early part of the war; in July 1941, when Gen. (later F.M.) Wavell relinquished the chief command in the Middle E., A. succeeded to that command, and at a time when the Brit. forces were still inadequately equipped. On Nov. 18 (1941) A. launched a new offensive. It snatched victory at Sidi Rezegh, relieved Tobruk, and, on Dec. 24, recaptured Benghazi; but it failed before the lines at El Aghella, and a Ger. counter-offensive threw it back to Gazala in the middle of Cyrenaica. After some months' quiescence, Rommel (*q.v.*) attacked; Tobruk fell, and the Brit. retreat continued to El Alamein, when Gen. (later F.M.) Montgomery succeeded A. A. then became commander-in-chief in India for the second time, and it is probable that his greatest service in the course of the war was that he rendered in India when the whole responsibility for the administrative background to the campaign in Burma lay upon him. He won the confidence of the Indian Army, and his flair for the political work which fell to him made him equally successful in council. Promoted to field marshal, June 1, 1946. Commander of the combined force operating in the Punjab, 1947. Retired soon after the declaration of Indian independence.

Auchterarder is a tn. in Perthshire, Scotland, 14 m. S.W. of Perth. It was the opposition to the presentee to the church of A., in 1839, which began the contest leading to the formation of the Free Church of Scotland. A. manufs. tweeds and tartans. Pop. 3100.

Auchtermuchty is a royal and police burgh of Fife, Scotland. Native place of John Glas, founder of sect of Glassites in 1387. Weaving and distilling are carried on here. Pop. 1700.

Auckland is the name of a prov. of New Zealand, and also of the cap. of that prov. The prov. of A. includes practically a half of the N. Is., being 400 m. long and 200 m. wide at its greatest breadth. Area, 25,400 sq. m. The bays of its coast-line afford safe harbours, whilst its rvs. convey the produce of the interior to its ports. It is formed into 3 divs., the N. peninsula, the E. coast dist., and the Waikato country. The soil is of 2 kinds, a light volcanic loam and a stiff yellow clay. A. is rich in minerals, gold, copper, tin, iron, and coal being found; the kauri pine, of which also the fossil gum is exported, flourishes abundantly. The climate is pleasant and healthy. N. of the city of A. conditions are almost sub-tropical. In winter the prevailing winds are N. and W.; changes to the S.W. or S.E. mostly account for the rainfall. Southward, of A. city the climate is more varied, the W. coast having more rain. In the winter months frosts, which are unknown farther N., occasionally occur at nights. Volcanic action has left effects on the land, and there are warm lakes and geysers 90 m.

S.E. of A.; nearer A. is an active volcano. The pop. of the prov. is about 488,000.

The city of A. is a seaport on the E. coast of the prov. in Eden co. It was founded in 1840, and was cap. of New Zealand till 1865. It has some fine buildings, including a univ. college (which forms part of the univ. of New Zealand), and it is the seat of a bishopric. It has splendid wharves and graving docks, and a harbour on the W. side in Manukan, only 6 m. distant. It is connected with all the chief centres of New Zealand by telegraph and wireless. In addition to its shipping trade, it has boiler and glass works, sawmills, sugar factories, etc. The pop. is 218,000.

Auckland, George Eden, Earl of (1784-1849), son of Baron Auckland (q.v.). He was a steady supporter of reform, and in 1835 was made governor-general of India. The successful beginning of the unfortunate Afghan war of 1838 won him his earldom.

Auckland Isles, a group of is. situated 180 m. S. of New Zealand, were discovered by the whaler *Brislow* in 1806. Enderby, Adams, and Auckland are the chief is. They are valuable as whaling stations, but have no settled inhab.

Auckland, William Eden, Baron (1744-1811), the third son of Sir R. Eden, baronet, of W. Auckland, Durham, was a prominent politician and diplomatist. He was chief secretary to the Irish viceroy, and in charge of a commission which treated with the Irish insurgents. As minister plenipotentiary to France he concluded a commercial treaty in 1786, and was afterwards ambassador to Spain and Holland, and postmaster-general. He was created Baron A. in 1793.

Auction, a method employed for the sale of property, which derives its name from the Lat. *auctio*, an increase, because the property was publicly sold to him who would offer most for it. The usual form of A. is to offer the property at a low figure, and by the competition of the various bidders, each offering a little more than the predecessor, to raise the price to that point beyond which the bidders refuse to go. The goods are then 'knocked down' to the highest bidder. The Dutch A., originating, as its name indicates, in Holland, is the reverse of this, and is a method generally employed by the cheap-jack. The property is offered at a higher price than is likely to be paid for it, and the price is gradually lowered till somebody bids for it. The first person to bid gets the property. The mere offer of a bid does not bind the bidder until the auctioneer brings down his hammer, which is the equivalent of accepting it. Until such time a bidder may, if he chooses, withdraw his bid. It has been laid down that the buyer of goods at an A. is not bound to perform his contract if he was the only bona fide bidder at the sale, and if public note was not given of the intention of the vendor to bid. This applies even though his agent was authorised to bid only to a certain sum. This rule is to protect purchasers against the practice of employing

persons to make mock biddings with a view to raising the price by their apparent competition. The acceptance of a bid is generally indicated by the auctioneer striking his rostrum with a small hammer (wooden), but sometimes lighted candles are employed to measure the time during which bids will be entertained. The length of candle generally employed is 1 in., and the last bidder before the light expires is the purchaser. Yet another method employed is the running out of sand in the sandglass. Formerly excise duties were payable on sales by A., being first imposed during the Amer. war of Independence, in 1777. As much as £329,000 was raised by this means in one year, but in 1845 the duty was repealed. In 1927 Parliament, feeling the need for further control of As., passed the Auctions (Bidding Agreements) Act, 1927. This was directed against the evil of the 'knock-out'; in other words, the prior agreement between a ring of possible bidders that one only of their number should make a bid and that the advantage gained by this course of action should be shared by the members of the ring. The Act directs that, under a penalty of £20 for non-compliance, the name and address of the auctioneer, together with a copy of the Act, shall be exhibited before and during the sale.

*Auctioneer's Powers and Duties.*—The auctioneer's duty is previously to the commencement of every sale to intimate to intending purchasers the conditions under which the sales take place, but for the purposes of the Act it is considered sufficient if these conditions are posted up in the A. room. Every auctioneer is required by the Auctioneers Act, 1845, to take out an ann. licence, which expires on July 5, and for which £10 is paid, but the same statute specifically exempts certain sales. Such sales include goods sold under a distress for rent when the amount does not exceed £20. In such cases the sale may be conducted by the bailiffs without a licence. The penalty for selling goods by A. without a licence is £100, but the lack of a licence does not render such a sale nugatory. The ordinary licence entitles the holder to act as an appraiser also, but for the sale of dutiable goods an additional licence is required. An auctioneer has certain statutory exemptions and liabilities. Thus he is held responsible for the safe custody of goods entrusted to him for sale, and he is liable to an action for selling goods to which the person who employs him has no title, though in this matter he is afforded some relief by the Factors Act. He is debarred from purchasing for himself the property he exposes for sale. On the other hand, the auctioneer himself has power to sue the bidder for fulfilment of contract, and has a lien on the vendor's goods for his commission and expenses. If the vendor sells the goods by private sale after the auctioneer has unsuccessfully exposed them for sale, then the auctioneer is entitled to a commission as if he himself had sold them. He is also not liable to the vendor for the price

bid for the goods until he has received it. The number of licensed auctioneers in the United Kingdom exceeds 8000, about three-quarters of whom are members of the Auctioneers' and Estate Agents' Institute, London. The institute, which watches carefully all legislation affecting its members, was founded in 1886.

**Auction Bridge.** In this popular modification of the 4-handed game, the dealer is the first to call, either a bid or a pass, thus opening the A. Each player in succession to the left then calls; he may pass, double, or increase the bid. An overcall means a declaration to take tricks of higher total value, but more tricks in a lower suit may constitute an overcall even if the value is only equal; thus, a 2-club call takes precedence of a 1-heart call. This is known as 'value calling,' but there is an optional method, 'majority calling,' which is recognised as optional, but not preferred, by the Portland Club (*see* revised laws, 1928). Majority calling is, however, universal in the U.S.A., the Eng. method not being used there at all. 'Majority calling' means that the number of the tricks contracted for, irrespective of their suit, and not their value decides the bid. The bidding or doubling continues until all are satisfied, when the final declaration determines trumps, and that partner who originated the call in that suit becomes 'dealer,' and his vis-a-vis dummy. Doubling does not affect declarations, but only the score. If the declaration is won, the winners score the value of tricks above 6 below the line. If the declaration has been doubled, a bonus of 50 is scored in the honour column, and 50 points for each over-trick. If the winner or his partner has redoubled, the bonus is doubled. If the declaration fails, nothing is scored below the line, but the adversaries score in the honour column 50 for each under-trick, or 100 or 200 if the declaration has been doubled or redoubled. The loss of a 1-spade declaration is limited to 100 points. Honours are scored as in ordinary B. Grand slam counts 100 points, little slam 50 points. Chicanes is abolished. The tendency of A. B. to force itself to a no-trump declaration has led to a new count, in which clubs count 6, diamonds 7, hearts 8, spades 9, no trumps 10. The general result of the new count is to equalise the values of the blacks and reds, and to make it possible to overcall even a strong no-trump declaration. 250 points are added for rubber.

**Aucuba**, a genus of Cornaceæ, a dioecious plant native to Asia. *A. japonica*, the Japan laurel, is cultivated in Britain as a hardy evergreen shrub.

**Aude**, a maritime dept. in the S. of France, is formed from part of the anc. prov. of Languedoc. It takes its name from the R. Aude, which crosses it. It is bounded on the E. by the Mediterranean, on the N. by the depts. Hérault and Tarn, on the N.W. by Haute-Garonne, on the W. by Ariège, and on the S. by the Pyrénées-Orientales. The S. portion is occupied by the spurs of the Pyrénées, reaching 4037 ft. in altitude;

in the N. the offsets of the Cévennes reach 4018 ft. The greater portion of the dept. lies in the valley of the lower A. The coast is very flat, no bays being found, but sev. lagoons. The soil of the plain is chiefly calcareous, but fertile, cereals, fruits, and wines being produced. There are iron and manganese mines and stone quarries; and wild animals, game, and fish are abundant. The climate is warm and pleasant on the whole, but varies to a considerable extent. The manufs. of woollen and silk are of considerable value, and cereals and honey are exported. The chief tn. is Carcassonne. The area of A. is 2448 sq. m., and pop. 68,900.

**Audebert, Jean Baptiste** (1759-1800), an eminent Fr. artist and naturalist, was b. at Rochefort, and studied at Paris. Having attained a reputation as a painter of miniatures, he turned his attention to natural hist., and in 1800 produced a hist. of the apes beautifully illustrated in colour. Two other works, on the humming-birds and the birds of paradise, the latter left unfinished, were pub. after his death. He was the originator of the method of using gold-leaf to depict the plumage of birds. *See* his *Oiseaux dorés ou à reflets métalliques*.

**Auden, Wystan Hugh** (b. 1907), Eng. poet and dramatist, now a naturalised U.S. citizen. Educated at Grosham's School, Holt, and Christ Church, Oxford. His importance as a poet has been said to lie in his synthesis of the typical thought and practice of poetry of his own time. Owes some of his best qualities to T. S. Eliot, but is more modern in his concentration on psychology and social doctrine. All his faults are implicit in the term 'contemporary poet.' 'the cheapness, the jazz, the slang, the easy thrills, the disrespect and slovenliness of a muddled age' (Francis Scarfe). But he corresponds to a marked state of mind of his generation, and there is hardly a young poet who is not indebted to him. His poetry has an intense belief in the future of man, which he presents emotionally; while the stir, savour, and hypocrisies of modern life are conveyed by mythological thinking, a sentiment for all manner of places and all kinds of people, and a characteristic power of brutal generalisation. It is significant of his psychological outlook that in his essay, *The Arts To-day*, he defends Freud's view of the artist as a social misfit, who tries to reconcile himself with society through his art. First pub. work, *Poems* (1930); then *The Orators* (1932), an attack on neurotics; and *The Dance of Death* (1933). His later work emphasises his interpretation of political and social problems in terms of psychology. His most sustained, perhaps the best of his poems, is *Spain* (1937), the argument of which is that Spain can only be saved by an internal effort, and that the individual conscience will in its turn be uplifted or cast down by the fate of Spain. A. has an element of mysticism in his psychology, and seems to waver between Marxism and the Freudian idea that social evils springs from psychic evil. In the collection

**Look, Stranger!** (1936) A.'s work is much matured, and he here shows a broader sense of community. Has adopted a fairly consistent pacifist attitude; his *New Year Letter* (1941) is an attack on Brit. political hypocrisy and Ger. apathy since the First World War. Married a Ger. woman and settled in the U.S.A., electing to stay out of the struggle of 1939. Has created no recognisable style, but has a large and vital vocabulary, and is sensitive to the musical qualities of words, as, e.g., in his well-known *Madrigal*. Has tried to write a poetry very close to common speech, and has succeeded in so doing. Has promise as a dramatist, as, e.g., in *The Dog beneath the Skin* (1935) and *The Ascent of F.6* (1936), the former a play with social implications, the latter turning on the Oedipus complex, both written in collaboration with C. Isherwood. Other works: *Some Poems*, 1940; *Another Time*, 1940; *For the Time Being*, 1944; *Tennyson*, 1946; *The Age of Anxiety*, 1947; and ed. *The Oxford Book of Light Verse*, 1938. Collaborated with C. Isherwood in *Journey to a War*, 1939, and with Louis MacNeice in *Letters from Iceland*, 1941. See F. Scarfe, *Auden and After*, 1942.

**Audenaarde** (Fr. Audenarde), Oudenarde, or Oudenardes, a tn. of E. Flanders prov., Belgium, on the Scheldt, 15 m. S.W. of Ghent. Its tn. hall dates from the sixteenth century. Once noted for its tapestries, it now manuf. linen and cotton, and has tanneries. Marlborough here defeated the Fr. under the dukes of Burgundy and Vendôme (1708). Pop. 6600.

**Audenshaw**, a Lancashire vil., 4 m. E. of Manchester. Pop. 8500.

**Audhumla** (Audumbla) is the name of the cow made by Surt, by whose milk the first created being, the giant Ymir, and his race were fed. The story comes from the Scandinavian mythology.

**Audians**, or **Audeans**, a sect of heretics founded by Audius or Audeus, who lived in the fourth century. He attacked the clergy and the gov. of the Church, and when he assumed the episcopal office was banished by Constantius to Scythia. The opinions and practices of Audius and his followers were: the celebration of Easter after the usage of the Jews; the admission of all persons indiscriminately to the Lord's Supper; the doctrine of the eternity of fire, water, and darkness, and especially that of anthropomorphism, or the resemblance of the Deity to the human form. Information of Audius has been obtained from Athanasius, Augustine, Epiphanius, and Theodoret, and not from Audius himself, or his followers.

**Audjelah**, see AUGILA.

**Audincourt** is a small industrial tn. in the Fr. dept. of Doubs, and the arron. of Montbéliard. It has an ironworks and an industry in iron. Pop. 10,000.

**Audiometer**, an adaptation of the telephone designed to measure the acuteness of hearing.

**Audiphone**, an instrument for communicating sound to the bones of the head. It consists of a plate of thin vulcanite bent and kept by strings under a certain degree

of tension. The edge is placed in contact with the front teeth, by which means sound is rendered audible to those whose auditory ossicles fail in their function.

**Audit Ale**, a strong ale of extra quality brewed for use at Oxford and Cambridge colleges on A. day.

**Audita Querela**, a form of action allowed to a defendant, against whom judgment has been rendered and who is thereby in danger of an execution, by which the execution may be recalled or prevented, and damages recovered, if he can show that some matter has occurred since judgment, which amounts to a discharge. In some of the states of the U.S.A. it has been superseded by the granting of summary relief upon motions.

**Auditor**, a person appointed to examine the accounts of the State, a public body or corporation, a company, or of a private person, and to certify that they are correct and properly kept. The duties of an A. are those of an accountant, and are in all cases of importance performed by a professional accountant. All payments and receipts must be proved by vouchers, but they must also certify to the accuracy of balance sheets and of the statements as to revenue, etc. (See ACCOUNTANT.) In the Companies Act, 1900, incorporated in the Act of 1908, strict provisions are made for the appointment and remuneration of As., and their rights and duties are clearly laid down. Before 1900 regulations as to the audit of company accounts were left to the articles of association, except in the case of joint-stock banks. The Society of Accountants and As. was incorporated in 1885. In the Brit. civil service the exchequer and audit dept. plays an important part. The comptroller and A.-general in 1866 replaced the comptroller-general of the exchequer and the commissioners for auditing the public accounts. As comptroller he authorises issues from the exchequer in accordance with accounts that have received parl. sanction, and authorises borrowings to meet deficiencies; he examines the daily accounts furnished by the Bank of England as to the payments paid to the exchequer account; as A.-general he ascertains whether money expended has been applied to the purpose for which it was granted, and generally verifies the public accounts and reports to Parliament. In the U.S.A. the central and state govts., together with the municipalities, have their accounts submitted to public As. The accounts of the Federal Gov. are audited by a comptroller-general, who is the chief official of the general accounting office. The comptroller-general operates through an audit div., which is quite independent of the executive gov., being solely responsible to Congress direct. With the exception of the accounts of the Post Office, which are audited by their own As., the post office div. (co-ordinated with the audit div.), all the central gov.'s accounts are submitted to the comptroller-general's dept. The Fr. public audit dept. is styled *Cour des Comptes*; the Ger. *Rechnungshof*. In

Scotland, an A. of the court is equivalent to the Eng. taxing-master.

**Auditory Nerves**, the special nerves connected with the sense of hearing. They rise from the *medulla oblongata* as the eighth pair, or, according to some anatomists, the *portio mollis* of the seventh pair, of cranial nerves, and pass downward to the ear. See **BRAIN** and **EAR**.

**Audley** is the name of a Staffordshire par.,  $\frac{1}{2}$  m. N.W. of Newcastle-under-Lyme. It has a pop. of 15,000.

**Audley, Sir James**, was one of the original knights of the order of the Garter, which was founded in 1344 by Edward III. He greatly distinguished himself at the battle of Poitiers, was governor of Aquitaine in 1362, and great seneschal of Poitou in 1369. He *d.* in 1369 at Fontenay-le-Comte.

**Audley, Thomas** (1488-1544), was an Essex man, whose precise genealogy is unknown. He is thought to have studied at Magdalene College, Cambridge. He was autumn reader in the Middle Temple in 1526. He afterwards became a member of Wolsey's household. In 1529 he became Speaker of the House of Commons, and by means of his servile submission to Henry VIII. he obtained the lord chancellorship in 1533.

**Audouin, Jean Victor** (1797-1841), an eminent Fr. entomologist, was *b.* at Paris. He began to study law, but his strong natural inclination led him to the study of the natural sciences, and of medicine. He was made prof. of entomology at the Jardin des Plantes in 1833. He made the study of insects his speciality, and wrote on this subject and on the natural hist. of the coasts of France. His chief work, *Histoire des insectes nuisibles à la vigne*, was continued after his death by Milne-Edwards and Blanchard and pub. in 1842.

**Audran, Edmond** (1842-1901), a Fr. musical composer, was *b.* at Lyons. He was originally intended to enter the church, but his tastes were for the musical profession, and he became a church organist at Marseilles. He was first brought into the popular notice by his operetta *Le Grand Mogul*, which was produced in 1864. He afterwards produced a number of melodious, light, and graceful vaudevilles and comic operas, such as *La Poupée*, *La Cigale*, etc.

**Audrian, Gérard** (1640-1703), a Fr. engraver, *b.* at Lyons, and studied in Rome. He obtained considerable fame by his engraving of Pope Clement IX., and was appointed engraver to Louis XIV.

**Audubon, John James** (1780-1851), a celebrated Amer. ornithologist, *b.* in Louisiana. He was educated at Paris, and studied drawing under David. His father estab. him on a plantation in Pennsylvania, and in 1808 he married the daughter of a farmer, Miss Lucy Bakewell. His ardour for the study of natural hist. was indomitable. Annually for 15 years he explored the primeval forests of America, and as he was able to transfer the results of his labours to paper with a spirited hand, his works have great value. His *Birds of America*

(1827-38) was praised in enthusiastic terms by Cuvier. He was of an unassuming and deeply religious nature, handsome in form and feature, and of a keen and clear-sighted intelligence. See *Life* by Buchanan (Everyman's Library).

**Aue**, a Ger. industrial tn., 13 m. S.E. of Zwickau, which had a technical school connected with the tin plate industry; pop. 19,000.

**Auenbrugger von Auenbrug, Leopold** (1722-1809), a physician, *b.* at Graz in Styria. He became physician to the Sp. nation in the Imperial Hospital of Vienna. His work, entitled *Inventum Novum*, 1761, gave an account of his discovery of an application of the laws of acoustics to the investigation of the phenomena or action of the internal parts of the human body, i.e. his work first introduced percussio (*q.v.*) as a means of detecting chest diseases. It has been trans. into Fr. by Rozière, 1770; by Corvazart, 1808; and into Eng. by Dr. Forbes of Chichester, under the title *Original Cases*, London, 1824. A. also wrote a work on madness, in Lat., 1776.

**Auer, Hans** (1847-1906), a Swiss architect, carried on his profession and taught in Vienna. The federal administrative offices and house of parliament at Bern were designed by him, and he was made professor of architecture there in 1890.

**Auer, Leopold** (1845-1930), Hungarian violinist, *b.* at Veszprém. Studied at Budapest under Köhne, and at Hanover under J. Joachim. In 1863 he was leader of the orchestra at Düsseldorf; in 1866 at Hamburg; and in 1868 imperial solo violinist at St. Petersburg and prof. of the violin at the conservatoire there. From 1867 to 1892 he led the concerts of the Russian Imperial Music Society; in 1895 he was ennobled; and in 1903 created Staatsrat. Later, he lived in Dresden. In 1918 he went to New York, where he pub. *Violin Playing as I teach it* (1921). Also wrote an autobiography, *My Long Life in Music* (London 1924).

**Auerbach, Berthold** (1812-82), an eminent Ger. author of Heb. extraction, *b.* at Nordstetten in the Black Forest in 1812. He was educated at the Talmud school of Hechingen, and at the univ. of Hohenasperg, Munich, and Heidelberg. He was imprisoned for sev. months in the fortress of Hohenasperg as a member of the students' association. He originally studied theology, but later turned to law, and from law to hist. and philosophy, making a special study of Spinoza. He made his name in 1843 with a vol. of vil. stories, *Schwarzwälder Dorfesgeschichten*. Unrivalled in his studies of peasant life in the Swabian side of the Black Forest. Some of his stories of broken love and disappointed passion are suggestive of Thomas Hardy. His later philosophical novels, mostly concerned with the evolution of the thought of individuals, are clever, but tedious.

**Auerbach's Keller**, a wine cellar in A.'s tavern in Grimmelshausen Strasse, Leipzig. It forms a scene in the Faust legend, and appears in Goethe's *Faust*. Two sixteenth-

century mural paintings of incidents in the story were to be seen in this cellar.

**Auersperg**, Anton Alexander, Count of (1806-76), an Austrian poet, b. at Lallbach. He was elected a member for life of the Upper House of the Austrian Reichsrath in 1861. In political affairs he was distinguished by his liberalism and his Ger. leanings. It is, however, under his *nom de plume* of Anastasius Grün that he is best known, his humorous poems and political satires reaching a very high standard. He d. at Graz.

**Auerstadt**, the name of a little vil. in the prov. of Saxony, 10 m. W. of Naumburg. The Fr. army under Davout routed the Prussians with heavy loss here on Oct. 14, 1806. Pop. 600.

**Auerstädt**, Duke of, see DAVOUT.

**Auffenberg-Komarov**, Moritz, Freiherr von (1852-1928), Austrian field-marshal (1905), and war minister (1911-12); b. at Troppau, son of Hofrath Auffenberg. Took part in occupation of Bosnia, 1878; in charge at Sarajevo, under Archduke Franz Ferdinand (q.v.). With the Fourth Army he was victorious at Komarov, Sept. 1914; but his force proved unable to cope with superior numbers of Russians at Lemberg later. In 1915, tried for alleged irregularities as war minister, and acquitted. A contributor to the *Ency. Brit.*

**Aufrecht**, Theodor (1822-1907), a noted philologist, b. at Leschnitz in Upper Silesia. He studied at Berlin, settled there in 1850, and devoted himself to the study of Sanskrit and the old Ger. language. He aided Max Müller with his ed. of the *Rig-Veda*, and wrote *Die umbrischen Sprachdenkmäler*, 1849-51, a book on the comparative philology of old It. languages. He was appointed to a place in the Bodleian Library, of which he compiled a catalogue. In 1862 he was

appointed prof. of Sanskrit and comparative philology at Edinburgh; in 1875 he resigned this post for the professorship at Bonn. He brought out scholarly eds. of sev. Sanskrit classic works.

**Augarten**, a fine park in the Fr. style in Vienna, Austria. It extended over 125 ac., and was opened to the public by the Emperor Joseph II. in 1775. It was formerly noted for its musical associations,

concerts having been started there by Mozart in 1782.

**'Auges**, see HERCULES.

**Augan Stables**, see HERCULES.

**Auger**, a carpenter's tool for boring holes in wood; also a tool for boring in the earth.

**Auger**, Athanas (1734-92), was a dis-

tinguished Fr. classical scholar. He early applied himself to the study of the Gk. and Rom. writers, and was appointed prof. of rhetoric in the college of Rouen. Amongst his translations are those of Demosthenes and Æschines, 1777; Isocrates, 1783; Lysias, select orations of Cicero, and selections from Chrysostom and Basil. He also wrote an essay on the constitution of Rome, *De la constitution de Rome sous les rois et au temps de la république*, pub. after his death as an introduction to the whole of Cicero's orations, 1792-94; *Projet d'éducation publique, précédé de quelques réflexions sur l'Assemblée nationale*, 1789; and *Catéchisme du citoyen français*, 1791.

**Augereau**, Pierre François Charles, Duke of Castiglione (1757-1816), marshal of France, b. in Paris. He served in the Neapolitan army till 1787, and volunteered for the Fr. army in 1792. His conduct in Vendée and the Pyrenees was so brilliant that he was general of div. in 1793. Sent to the It. army, he highly distinguished himself at Lodi, Castiglione, and Bologna. He took part in the *coup d'état* of Fructidor 18 (Sept. 4), and was a member of the Council of Five Hundred in 1799; in 1804 he was created marshal of the empire and grand officer of the Legion of Honour. He submitted to Louis XVIII. on Napoleon's abdication, and was created a peer.

**Aughrables Falls**, on the Orange R. in S.W. Africa, about 25 m. E. of the E. boundary, in Cape Prov. They are 320 ft. in height or about twice as high as the Niagara Falls, but the latter are much wider and have a greater flow of water.

**Aughrim**, see AGHRIM.

**Augier**, Guillaume Victor Émile (1820-1889), a Fr. dramatic poet, was b. at Valence. He was educated as a lawyer, but soon turned his attention to literature. Collaborated with Musset, Labiche, and Sandeau. Among his plays are *Le Fils de Giboyer*, 1863; *Contagion*, 1866; and *Les Éffrontés*, 1893; all satires on avarice, social demoralisation, and lust of power; *Mariage d'Olympe*, showing the idealised courtesan, 1855; *Jern de Thommeray* (with Jules Sandeau), 1873, sounding the note of patriotism, following Fr. reverses in 1870; and *Les Fourchambault*, 1878, on the Dumas model. His *Le Gendreau de M. Poirier*, 1854 (prose), also with Sandeau, still holds its place. He was not inclined to paradox, and was not easily influenced by chimeras, but defended the commonsense view against sophistry. He did not, however, take up the attitude of a reformer or an apostle. His verse is not that of a great poet, but has fine dramatic qualities. He was made a member of the Academy in 1858, a commander of the Legion of Honour in 1868.

**Augila**, Ajulla, or Audijelah, is an ill-built, dirty tn., situated in an oasis of the desert of Barca, in 29° 18' N. lat. and 21° 53' E. long. It is in the track of caravans travelling between Cairo and Fezzan. The oasis of A. is under the dominion of the beylik of Benghazi, which is a prov. of the regency of Tripoli. The vil. of

AUGERS

Mojabra and Meledia are also situated in the oasis. Though the surrounding country is flat and sandy it is well tilled and laid out in gardens.

**Augite** (Gk. *αὔγη*, lustre), an important mineral belonging to the pyroxene group, which commonly forms rocks. It is often found in volcanic rocks. It is green when in fibrous masses, black when it crystallises, and is distinguished from hornblende by its crystals, which are smaller and thicker.

**Augmentation** is used with special significance in heraldry, in music, and in Scottish law.

In heraldry, an additional charge to a coat-of-arms was known as an A. The right to add such a charge was conferred as a mark of honour.

In music, especially in counterpoint and fugue, A. is the name given to the repetition of the subject in notes of twice the original length.

In Scottish law, an increase of stipend obtained by a par. minister in the court of teinds by a process of A. against the titulars and heritors was known as an A. See also **BENEFICE**; **TENDS**.

**Augmentation, Court of**, a court set up by 27 Henry VIII. c. 27, for the purpose of managing the revenues and possessions of all monasteries under £200 a year, which by an Act of the same session had been given to the king, and for determining suits relating thereto. The origin of the title of this court is seen by referring to its full title, 'The Court of the A. of the revenues of the King's Crown.' It was a court of record, with one great seal and one privy seal. All the dissolved monasteries under the above value, except those preserved incorporately, were in survey of the court, and the chancellor of the court was directed to make an annual report of their revenues to the king. The yearly revenue of 376 monasteries under £200 a year, which were suppressed, was £32,000, and the value of their goods and chattels, etc., was estimated at £100,000.

**Augsburg** is a historic city of Bavaria, situated at the junction of the Wertach and Lech rivs., 37 m. W.N.W. of Munich. It was founded by Augustus in 13 B.C. and named Augusta Vindelicorum. It became the cap. of the prov. of Rhaetia, but was laid waste by the Huns in the fifth century. It next came under the dominion of the Frankish kings, and in Charlemagne's war with Thassilo of Bavaria it was again destroyed. It became a free city of the empire in 1276, and reached the summit of its prosperity in the latter half of the fourteenth century. It was important, however, in the sixteenth and seventeenth centuries, though the discovery of the road to India by the Cape, and of America, caused the commerce of the world to flow through new channels and dried up the sources of A.'s prosperity. Many diets of empire were held there, and it continued to be important for commerce, manufs., and art till the war between Charles V. and the Protestant league of Schmalkald in 1540. It now presents rather a de-

serted and antique appearance, but has some fine streets and squares, and numerous handsome buildings. The cathedral, the work of sev. generations, was begun at the end of the tenth and finished in the fifteenth century. The town hall, one of the most beautiful architectural monuments of Germany, contains the famous golden hall, in which public ceremonies took place. Amongst other notable edifices are the church of St. Ulrich, and the episcopal palace, formerly an imperial palace. Before the Second World War A. was known as the chief centre of the textile industry, and it produced agric. and industrial machinery. Subsequently it became an important aircraft manufacturing centre. It also had important chemical works. It was bombed sev. times by the R.A.F., twice at night in Aug. 1940 and again, by daylight, on Apr. 17, 1942, a flight involving a journey by heavy bombers of over 1000 m. across enemy ter. Seven of the 12 bombers were lost. S./Ldr. Nettleton was awarded the V.C. for his part in the raid. Pop. 185,000.

**Augsburg, Confession of**, was the name given to the formula, drafted by Luther and modified and revised by Melancthon, which contained the confession of faith of the Protestants, and which was presented by them to the Emperor Charles V. at the diet of Augsburg in 1530. The original form was adhered to by the Lutherans, then altered by the Ger. Reformed Churchmen. The original document presented to the diet is preserved in the Austrian archives.

**Augsburg Interim** is the name of a document which Charles V. caused to be drawn up by the theologians of both sides, at a diet meeting at A. in Sept. 1547. He hoped by this to restore the unity of the Church, but though the Interim was accepted by the diet, neither Romanists nor Protestants would agree to it.

**Augur.** The Rom. college of A.s. foretold events and interpreted the will of the gods from various signs and omens. Such were thunder and lightning, the flight and song of certain birds, the appetites of birds, particularly chickens, the movements and attitudes of beasts and reptiles, and incidents occurring at the moment when a magistrate performed some public act, or during an augural consultation. The answers of A.s., as well as the signs governing their utterances, were called *auguria*, *auspicia* being properly confined to divinations from birds. The political importance of the A.s. was very great, as nothing of any importance could be undertaken unless they were consulted, and they could postpone business at their pleasure. The number of the A.s., taken from the patrician class only till 307 B.C., was 4 until 81 B.C. In 81 B.C. the number was increased to 15, and Augustus elected A.s. as he pleased.

**August.** The month of A. was originally called *Sextilis*, being the sixth month in the Alban or Lat. calendar, and it retained that name in the calendars of Romulus, Numa Pompilius, and Julius

**Cesar.** When Numa reformed the calendar it became the eighth month of the year. In the Alban calendar *Sextilis* consisted of 28 days; in that of Romulus, of 30; in that of Numa, of 29. Julius Caesar restored it to 30, and Augustus Caesar, from whom it derived its new name of Augustus, extended the number of days to 31, which number it has since contained. The first day of A. is called *Lammas Day*, and also the *Gule of A.* The Anglo-Saxons called it *hlaf-mæsse*, loaf-mass, and it was the feast of thanksgiving for the first-fruits of the corn.

**Augusta**, the anct. name of a number of tns. in honour of the Rom. Emperor Augustus, or one of his family. Three considerable tns. at present are so called: (1) The cap. of Maine, U.S.A., and co. seat of Kennebec co., situated on the W. bank of Kennebec R., 45 m. from its mouth; a dam 17 ft. high gives it considerable water power which is utilised in cotton, paper, and pulp mills. There is a U.S. arsenal. Pop. 17,198. (2) The co. seat of Richmond co., Georgia, U.S.A., is the head of the steamboat navigation on the Savannah R. It is a popular health resort, and is one of the largest cotton markets in the S. Other industries are gun-founding and sash, door, and blind manufs. Pop. 60,204. (3) A tn. in the Syracuse prov. of Sicily, situated on the is. of Xiphonia, but is now joined to the mainland by a bridge. It was founded by the Emperor Frederick II. in 1232, and rebuilt in 1693, after having been destroyed by an earthquake. It is a fine fortified port, has large salt works, and produces cheese, fruit, honey, and sardines. Van Ruyter, the Dutch admiral, was killed here in 1676. Pop. 17,000.

**Augusta Emerita**, see *MERIDA*.

**Augusta Historia**, the name given to a series of biographies of the Rom. emperors from Hadrian to Carinus, a period of 167 years. The 6 writers generally included in the collections of the A. H. are *Ælius Spartianus*, *Julius Capitolinus*, *Ælius Lampridius*, *Vulcatius Gallicanus*, *Trebellius Pollio*, and *Flavius Vopiscus*, who lived under Diocletian and his successors, Constantius and Constantine. Among the eds. of these writers is that of Cl. Salmasius, Paris, 1620, and the Bipontine ed., 1787.

**Augustales** was the name by which the games held at Rome and in other parts of the empire, in honour of Augustus, were described. By a decree of the senate in 11 B.C., they were celebrated annually on the birthday of Augustus. The name A. was also that of a body of priests which was founded by Tiberius in order to attend to the worship of Augustus and the gens Julia. It was divided into 2 classes, one at Rome and the other in the municipia; the former class, 21 in number, was selected from the nobility of Rome, and was also augmented by certain members of the imperial family; the latter class was usually composed of wealthy libertini. They formed a collegium, and were appointed by decuriones,

or senate of the municipia. The 6 chief members of the order were called *seviri*.

**Augustan Age**, a term referring to that epoch in Rom. hist. when the national greatness, especially in literature, reached its highest point, under the Emperor Augustus. Other nations also have boasted their A. As., as in England, the period of Queen Anne's reign—the 'classical' age of Eng. literature adorned by Swift, Addison, Pope, etc.; and in France the time of Louis XIV. with Corneille, Molière, and Racine.

**Augusta Suessionum**, see *SOISSONS*.

**Augusta Taurinorum**, see *TURIN*.

**Augustenburg**, a small seaside tn. in Alsace ls., Slesvig, Dan. since Austria's proposal in 1865 to make the prince of A. ruler of Schleswig-Holstein was one of the ostensible causes of the Seven Weeks war between Austria and Prussia.

**Augusteo**, the famous concert hall in Rome, and the most important in Italy. Built on the ruins of the mausoleum of Augustus. Last century it was used for popular spectacles and then closed. The Rom. municipality converted it into the present magnificent hall, inaugurated in 1908, and the orchestral and choral concerts previously held in the hall of Santa Cecilia were transferred to the A., and very soon it became the centre of the lt. musical movement as far as symphonic works are concerned. All the greatest conductors and concert artists have appeared there. The hall belongs to the municipality and is managed by the Royal Academy of Santa Cecilia.

**Augusti, Johann Christian Wilhelm** (1772-1841), Ger. theologian of Jewish descent, was educated at Götting and Jena. He studied oriental languages, and was prof. successively at Jena, Breslau, and Bonn; later he became chief of the consistorial council at Coblenz. His most important writings are volumes on Christian archaeology, and on the exegetics of the O.T.

**Augustine, St.** (354-430), the greatest father of the Lat. Church, b. on Nov. 13, A.D. 354, at the tn. of Tagaste, in the prov. of Numidia, of poor parents. His father Patricius, was a pagan, but his mother instructed him in the broad outlines of the Christian faith, and of his mother we are left a magnificent picture from the skilful pen of her son. As a boy he showed promise, and his education was carefully looked after, both his parents taking considerable interest in it. He was educated partly in his native tn. and later in the tn. of Madaura, whence he returned at the age of 18 to his native home. In spite of the teachings of his mother, and at one time of his own desires, he grew to manhood without being received into the Christian Church. Before he was sent to the univ. at Carthage his father d., having been at last induced to become a Christian. By the help of a fellow townsman, Romanus, he was at last sent to the univ. at Carthage. It was during his univ. career at Carthage that A. formed that illegitimate connection with a young woman by whom he had a son, Adeodatus

(given by God). This union, unlawful as it was, continued for some 14 years, whilst A. was always passionately fond of his son. He had during his period of study been devotedly attached to the Lat. poets and writers, although his acquaintance with Gk. was so small that it has been doubted whether he was able to read the Gk. gospel in the original. The *Hortensius* of Cicero had great influence on his career, giving him a desire for wisdom, and showing him the folly of the life he had been leading. Manichæism, the so-called Higher Christianity, was the first philosophy that he embraced. At first he set up as a teacher of grammar

ST. AUGUSTINE  
A painting by Botticelli.

in his native town, but he soon returned to Carthage. His study of psychology soon led him to doubt Manichæism, and after a short stay as a tutor in Carthage, he set out for Rome, where again, after a short illness, he was disgusted with the mannerisms of the students, and left there in order to become the prof. of rhetoric at Milan. At Milan we get the beginning of his definite break with the Manichæans, and for a time he fell under the influence of the philosophy of the Sceptics; but the oratory of Ambrose, bishop of Milan, gradually drew him under its influence, and although at first it was only the oratory, later the divine message of the preacher began to have its influence also. He studied the Pauline epistles, and now he began to see the divinity of the Christian call, and he ended by retiring into seclusion and announcing himself as a candidate for baptism. The conversion of St. A. may be said to date from the summer of 386, in his thirty-third year.

He was baptised with his friend Alypius and his son Adeodatus. A few

days later his mother, who had rejoined him, *d.* at Ostia. A. did not immediately return home to Tagaste, he remained for some time in Rome, but in 388 he returned to his native tn. Here was laid down the beginning of that rule of life which later developed into the monastic system of A., and which at this time he and a devoted band of followers carried out. He was speedily invited to take a more active share in the work of the Christian Church, but declined until about 390 he went to Hippo to visit some Christian friends, and was invited to become presbyter of Hippo, later coadjutor to the bishop, and finally bishop of the see itself. The rest of his life was taken up with the controversies which form such an important part of the influence and work of St. A. Not unnaturally his first great attack came against his first faith, Manichæism. The greatest of all these writings in his first controversy is *Contra Faustum Manichæum*, i.e. against Faustus of Milan, his old friend and associate. His second great controversy was against the Donatists. Although the doctrines of the Donatists, who took their name from a bishop of Carthage, set up as a result of the Diocletian persecutions, had been declared false by the bishop of Rome and by the Emperor Constantine, the party had made great progress and had excited the indignation of A. He vented his wrath in 7 books, *The Seven Books on Baptism*. In these and later writings A. in his wrath gave utterance to certain statements concerning the use of civil power to control separatism in the Church, which later ages misconstrued and misused.

A.'s greatest controversy, however, was against the Pelagian heresy. He himself, converted at a comparatively late age, held to a theology that was tinged with darkness, and therefore found himself in bitter opposition to Pelagius and Cælestius, who put forward the following opinions: that Adam's sin was purely personal and affected no one but himself, that therefore man is born pure and is only corrupted by temptation and frailty, and that children who die without baptism are saved. This controversy lasted for many years, and the doctrines of Pelagius were refuted in no less than 15 treatises. In these we have the Augustinian theories of original sin, the need for infant baptism, and the relation of human to divine righteousness; in all an attempt by A. to express the relations of the human and the divine. Amongst his greatest works are *De Civitate Dei* (The City of God), a vindication of the Christian Church, and his *Confessions*. *The City of God* was commenced in 413 and finished about 426. His *Confessions* begin with his elevation to the see of Hippo. His *De Opere Monachorum* had great influence on monastic work. The rule of St. A. was never formally laid down by him, but was culled from his writings during the monastic revival of the eleventh century. It is taken from his writings on community life. A. *d.*

during the great siege of Hippo by the Vandals in 430, before the city had the humiliation of surrendering. An early ed. of all A.'s works is that of the Benedictines, pub. in Paris, 1879-1800, and reprinted in 22 vols. in 1836; and, ed. by Pilkington and others, *Select Library of Nicene and Post-Nicene Fathers*, vols. i.-viii., 1887-92. A translation of the works, by Dr. M. Dods, was pub. 1871-76. There are also translations of A.'s works from many hands: *Confessions*, trans. by E. B. Pusey, 1838, and *The City of God*, trans. by John Healey, 1610, are in Everyman's Library. Lives: P. Schaff, *Life and Labours of Augustine*, 1854; J. MacCabe, *St. Augustine and his Age*, 1902; and M. I. Barry, *St. Augustine the Orator*, 1924.

**Augustine, St.**, first archbishop of Canterbury, was sent from Rome by Pope Gregory I. to undertake the conversion of the Eng., A.D. 596. With 40 monks he landed in the Isle of Thanet, and through the influence of Queen Bertha (already a Christian) was well received by King Ethelbert of Kent, who, however, would not at first receive the mission within doors for fear of magical arts. A. gradually won his confidence, and within a year or two Ethelbert and his people were converted. The chief seat of worship was at Canterbury, and the first regular services were held at the church of St. Martin, a relic of Rom. Christianity. Other churches rapidly arose, and in 601 A. received from Gregory the pallium as archbishop of Canterbury and primate of Britain. There was already a Christian community in the W. country, founded by the disciples of St. Columba, their prin. church being at Bangor, on the Dee. These declined to acknowledge A.'s authority, and a conference held at A.'s Oak (somewhere near the Severn) failed to convince them; but only a few years later the settlement at Bangor was utterly destroyed by the pagan Ethelfrid. As an administrator, A. seems to have been both firm and moderate. The date of his death is uncertain, but was probably between A.D. 604 and 610.

**Augustine, St., Canons of the Order of.** Until the Lateran synod, 1059, almost the only religious order in the W. church was the Benedictine. But the canons regular of St. A., founded soon after and in consequence of the Lateran synod, made a new departure. Taking for their guidance the rule of St. A. of Hippo, estab. by him about the end of the fourth century, they took religious vows and lived in communities, yet they were not monks, but clergy doing pastoral work. Their separate 'houses' soon began to draw together and organise themselves into 'congregations'; among the chief were those of the Lateran, Rome, of St. Victor, Paris, and of the Gilbertines, England. These congregations spread all over W. Europe, and were very strong in England. At the dissolution of the greater monasteries by Henry VIII. in 1539, no fewer than 60 of them were Augustinian. Only a

few houses of canons regular still remain, but of late years there has been a revival of the order in England.

**Augustow**, a tn. founded by Sigismund Augustus of Poland in 1557. It is about 120 m. N.E. of Warsaw, on a canal connecting the Vistula with the Niemen. It has some linen manufs., and great horse and cattle fairs are held in its spacious market place. During the First World War, in 1915, the S. wing of the Russian Army was here surrounded by the Gers, and forced to surrender. Pop. 10,000.

**Augustulus**, Romulus, the last of the nominal emperors of Rome. He was placed on the throne by the soldiery in A.D. 475 at the instigation of his father Orestes, but in 476 the Herulian chief Odoacer raised a revolt, slew Orestes, deposed A., and proclaimed himself king of Italy.

**Augustus**, a title borne by all the emperors of Rome from the time of Gaius Octavius, on whom it was conferred by the senate in 27 B.C. in recognition of the services which he had rendered to the state.

Gaius Octavius, b. in 63 B.C., was the grand-nephew of Gaius Julius Caesar, his mother being the daughter of Caesar's sister. He himself came on the paternal side from a family of good origin, but which had only recently acquired senatorial rank. In very early youth he lost his father, and passed on the next year under the control of a stepfather, L. Marcus Philippus. He advanced rapidly from rank to rank, in Rome, and in 45 B.C. he was made a patrician by the senate and Caesar's master of the horse for the next year. In the year 44 B.C. he was quietly studying at Apollonia when the news of Caesar's murder reached him. Almost immediately he crossed to Italy, to be greeted with the news that he had been adopted into the gens Julius, and had been appointed sole heir by the great dictator.

His claims as heir of Caesar were scornfully and lightly regarded by Marcus Antonius, Brutus, and Cassius, but nevertheless he soon began to gather round him a band of faithful followers, and he took part in the struggle which drove Antonius from Rome across the Alps. In the meantime Brutus and Cassius had dispersed to their provs., and in 43 B.C. Gaius Octavius, Antonius, and Lepidus formed a triumvirate. This triumvirate is marked by the huge proscription which took place under it. Their next move was to put down the power of Brutus and Cassius, who held, with the Republicans who had escaped the proscriptions, the E. portion of the empire, and in 42 B.C. at Philippi, Brutus and Cassius were defeated and killed themselves. Quarrels almost immediately broke out between the successful allies, but were soon patched up by means of the marriage of Antonius to Octavia, the sister of Gaius Octavius. Sextus Pompeius, who by his successes had forced the allies to grant him the is. of the W., was next attacked and routed, Octavius bearing the brunt of the battle

and being well supported by his life-long friend, Marcus Agrippa. Practically now the struggle for power lay between Antonius and Octavius. The years which elapsed between the decisive campaigns were spent by Octavius in reforms and reorganisation at home, an attempt to prove to the people that in him and him alone lay the safety and preservation of the sacred customs, institutions, and frontiers of Rome. His arms had been carried in triumph in Asia, Spain, Dalmatia, Pannonia, and Gaul. At home he had abolished the laws of the triumvirate, and had removed numerous abuses. Gradually every honour that Rome had to offer came into his hands. The tribunician power had been granted him for life, the office of pontifex maximus became his at the death of Lepidus, the form of gov. of the Rom. republic still remained, but gradually became nothing but a shadow. The question of succession was a difficult one. His brilliant stepson Drusus *d.* in 9 B.C., after proving himself a great general and a useful administrator. For the time he turned to his stepson Tiberius, but Tiberius was never a very lovable man, and soon he turned to his own blood relations and recognised his nephews, Gaius and Lucius, both of whom were raised to the consulship, as his heirs, but in A.D. 2, Lucius *d.* on his way to his command in Spain, and in the next year *d.* Gaius, returning wounded from Armenia. A. bowed to the inevitable, and Tiberius was recognised as heir, became a colleague of the princeps, and was adopted by him as a son.

The rumour of the founding of a Græco-Oriental empire, together with the discarding of Octavia by Antonius, roused the feeling of Rome and led to the decisive campaign. The great battle of Actium was fought in 31 B.C., and a year later Antony and Cleopatra *d.* by their own hands on the fall of Alexandria (30 B.C.). Octavius's next task was the reorganisation of the Rom. empire. The republic was restored, the power of the senate, the magistrates, and the assemblies was again given back. Into the hands of Octavius, however, was delivered the controlling authority, the gov. of the frontier, the command of army and navy, the control of the foreign affairs of the republic. In Jan., 27 B.C., the senate conferred upon him the title of Augustus the Venerable, the Majestic.

● The rest of this period of power is one long record of prosperity and victory, marred only by the defeat of the Rom. legions under Varus, A.D. 9, by Arminius. Tiberius, during the later years of A., was closely associated with him in the gov. of the empire. In A.D. 14, after a journey to Naples, A. *d.* at Nola on Aug. 19. The final act was his elevation to the number of the gods. During his period of power Rome had been practically rebuilt, he found it stone and he left it marble, while if we view A.'s reign from the point of view of literature, there are few, if any, periods, to which we can compare it. It was the original Augustan

age (*q.v.*) of literature—that of Horace, Virgil, Ovid, Tibullus, and Livy.

Augustus, the name of 3 electors of Saxony; 2 of them were also kings of Poland.

Augustus I.'s (1526–86) chief title to fame was his adoption of the Calvinistic form of religion and his later conversion to Lutheranism. When he became a Lutheran he violently persecuted the Calvinists. To him is due also the founding of the great library at Dresden.

Augustus II. (1670–1733), elector of Saxony and king of Poland. After the death of Sobieski in 1697 he became a candidate for the kingdom of Poland, which he succeeded in obtaining owing to the lack of opposition from France, whose claimant was the prince of Conti. A. now changed the hereditary religion of his family and became a Catholic. In alliance with Russia he fought Sweden in a vain attempt to win back the provinces which Sweden had previously conquered, and also in an equally vain attempt to make his elective power as despotic as his power in his hereditary dominions. He was defeated, and in 1704 deposed, Stanislas Leszczynski being elected in his place. After the battle of Poltava he marched into Poland with an army and regained the crown, which he kept until his death in 1733. He attempted to make his elective crown of Poland hereditary. His court was the most immoral in Europe, and of his numerous children only one was legitimate.

Augustus III., only legitimate son of A. II., elector of Saxony and king of Poland. On his accession the war of the Polish Succession broke out. The candidates were A. and Stanislas Leszczynski, the deposed king. By the help of Russia A. drove Stanislas out and became sole king in 1734. During the war of the Austrian Succession he was first against Maria Theresa, but ultimately on her side. He was defeated by Frederick the Great at the battle of Kesseldorf, and the treaty of Dresden was concluded. In 1756 he was driven from Saxony by Frederick the Great, whose aid found its own justification in the archives of Dresden. The treaty of Hubertsburg of 1763 restored Saxony to him. A. III. *d.* in the same year.

Aquila, see AUGILA.

Auk, a family of oceanic birds, scientifically known as the Alcedæ, belonging to the Charadriiformes, including the As. (*Alca*), the guillemots (*Uria*), and the puffins (*Fratercula*). They have short wings, webbed feet, heavy bodies; they feed on fish, and lay their solitary egg on a rock. *A. impennis*, the great A., formerly common in Spitzbergen, has been extinct since 1844; *A. lorda*, the razor-bill, most common in Labrador, is killed for its breast-feathers; *Fratercula arctica*, the puffin, is seen found the Brit. coast; *U. troile*, the guillemot, is common around the Brit. coasts. The great A. could not fly, but other As. use their wings for short distance flights and also as oars in the sea. See GARE-FOWL.

Auk, Black-billed, see RAZORBILL.

**Auk, Little, see ROTCHE.**

**Aulacodus** (Gk. *αυλας*, furrow, *ὄδους*, tooth), a genus of rodents of the family Octodontidae, found in S. Africa. It is a ground-rat, about the size of a cat, and is related to the porcupine and guinea-pig.

GREY AUK

**Aulapalai, see ALEPPI.**

**Aula Regis**, a royal court of justice estab. by William the Conqueror, and developed under his successors. It had depts. for hearing various kinds of pleas; from these descended the courts of king's bench, common pleas, and exchequer. See CURIA REGIS.

**Auld Lang Syne**, the name of a very familiar song by Robert Burns, written in 1789.

**'Auld Lights,' see PRESBYTERIANISM.**

**Aulic Council**, a legislative and executive body, estab. by the Ger. king Maximilian I. in 1497, to assist in governing the Holy Rom. Empire. At first its business was very wide, including every question, home or foreign, which might come before the emperor, but it was afterwards restricted to affairs of the empire only. The council consisted of about 20 members, of whom 6 were Protestants. There was much rivalry between the council and the imperial chamber, with which it had concurrent jurisdiction.

**Aulie-Ata**, 'holy father,' a tn. of Soviet Turkmenistan, in the Syr Daria basin; captured by Russia in 1861. Pop., mainly Kirghiz, 12,000.

**Aulis**, an anc. Boeotian seaport on the Euripus, famous as the starting place of the Gk. fleet for the Trojan war, also as the scene of the sacrifice of Iphigenia.

**Aullagas**, the name of a salt lake in Bolivia, which receives the surplus waters of Lake Titicaca through the Rio Desaguadero. As Lake A. has only 1 perceptible outlet, and that of inconsiderable dimensions, the destination and outlet of the surplus waters are unknown. Another name for Lake A. is Lake Poopo.

**Aulnoy, Marie Catherine, Baronne d'** (1650-1705), Fr. authoress. She wrote sev. romances now forgotten, and some lively but untrustworthy memoirs, but her *Contes des fées*, among which may be mentioned 'The Blue Bird' and 'The Yellow Dwarf,' have had a lasting success. She conspired against her husband, bringing a false accusation of treason; being detected she fled to Spain, but after some years was allowed to return in reward for secret services rendered to the gov. of Louis XIV.

**Aulophyte**, a plant, not a parasite, that shelters within another.

**Aulus Gellius**, a Lat. grammarian, b. in Africa between A.D. 125 and 130. At the age of 16 he came to Rome to study, and among his tutors were Apollinaris and Fronto. The work by which he is best known, *Noctes Atticae*, is a dialogue in which the most varied questions of grammar, philosophy, hist., and archaeology are discussed. It derives its title from the fact that it was composed at Athens and was written during the winter nights. Although the author's style is by no means free from affectations and obscurity, and the work as a whole is most pedantic in tone, it is nevertheless very valuable from the great number of references to personages and customs which are found therein. The first ed. appeared in 1469, and later ones are Eronovius, 1706; Hertz, 1903.

**Aumale**: 1. A manufacturing tn. of Normandy, on the Bresle; has cloth, steel, and glass works. Formerly called Albemarle or Aumerle; pop. 2500. 2. A Fr. military station in Algeria, on the site of an old Rom. settlement, about 80 m. from Algiers.

**Aumale, Counts and Dukes of**. The co. of A. in Normandy was granted by William the Conqueror to his brother-in-law, Odo of Champagne. Havoise, countess of A. in her own right, married firstly, William de Mandeville, earl of Essex (d. 1189), secondly, William de Fors (d. 1195), and thirdly, Baldwin de Behen (d. 1214). On the demise of Baldwin, count of A. by right of his wife, the co. was claimed by William de Fors, son of Havoise by her second marriage, and was confirmed in his possession by King John. But Normandy had in the meantime been conquered by Philip Augustus, and A. was taken by the Fr. Crown. The title of earl of A. (subsequently earl of Albemarle) was retained by William de Fors. A. was conferred on the son of Philip Augustus. After passing through many hands it came into the possession of Louis XIV., who gave it to the duke of Maine, and subsequently it came into the hands of the dukes of Orleans. The title of duke of A. has been borne by the sons of dukes of Orleans since the reign of Louis Philippe.

**Aumale, Charles de Lorraine, Duc d'**. A violent partisan of the Guises during the religious wars in France. A leader of the league and, together with the duke of Mayenne, leader of the Catholics on the death of Henry of Guise. Was defeated by Henry IV. at Ivry and other

battles. Refusing to surrender, he fled to the Spaniards, and betrayed sev. places into their hands. Was sentenced to death but escaped. *D.* in exile in Brussels in 1631.

*Aumale, Henri Eugène Philippe d'Orléans, Duc d'*, fifth son of Louis Philippe, king of France. Distinguished himself early as a soldier. Volunteered for service with the Fr. in 1870. Was refused, but subsequently became inspector-general of the army. Protested against the disfranchisement and exile of heads of families that had reigned in France. *D.* in 1897.

*Auncel*, a kind of balance or steelyard formerly used in England. It had a movable fulcrum and fixed weight, and the finger was often used as the fulcrum, which gave great opportunity for cheating.

*Aune*, or *Aulne*, an old European cloth measure, connected etymologically with Lat. *ulna*, elbow. It roughly corresponded to the Eng. ell, varying from 27 to 54 in. in different localities and periods. It is still used in Switzerland, where it measures 47½ in.

*Aungerville, Richard* (1281-1345), bishop, statesman, and author, was b. near Bury St. Edmunds, and hence known as Richard de Bury. Educated at Oxford, he became tutor to Prince Edward of Windsor, on whose accession as Edward III. he obtained rapid advancement, being sent sev. times on embassies to the pope (then at Avignon) and the Fr. court. In 1333 he became bishop of Durham, next treasurer, and then chancellor of the realm. He is best known to posterity as an ardent book-lover and collector; his authorship of the famous *Philobiblon* is, however, disputed.

*Aunis* was the name of an old prov. of France, between Saintonge, Poitou, and the Atlantic. It now, together with Saintonge, forms the modern dept. of Charente-Maritime.

*Aura*, in medicine, a term applied to the sensation of heat or cold, beginning in the extremities and creeping towards the head, which precedes an epileptic fit; also, to a creeping sensation sometimes accompanying gout.

*Aural Diseases*, see *EAR*.

*Aurangabad* is the name of 2 places in India. The more important is a walled tn., 67 m. N.E. by N. of Ahmednagar, and cap. of the prov. of A. It has the ruins of a palace built by Aurungzebe, and some noted caves, partly Buddhist. The trade is reviving. Pop. 40,000. A. is also the name of a vil. in the Bengal dist. of India, 40 m. W. of Gaya. Pop. 5000.

*Aurangzeb*, see *AURUNGZEBE*.

*Aurantaceae*, a sub-order of Rutaceae, which consists of trees and shrubs found exclusively in the temperate or tropical parts of the Old World. It contains the genus *Citrus* (q.v.), which includes lemons, oranges, and limes; *C. aurantium* is the sweet orange.

*Auray*, a Breton tn., in the dept. of Morbihan, 3 m. up the R. Auray. Famous for the ann. pilgrimage to its chapel of

Ste. Anne, called Le Pardon d'A. Besides having a market for agric. produce, it carries on fishing and boat-building, and has important oyster beds. Pop. 7000.

*Aure* is the name of a small Fr. riv. in Normandy, in the dept. of Calvados, which, after almost disappearing in the marshes to the N.W. of Bayeux, flows to the mouth of the Vire.

*Aurelian Wall*, a fortified wall surrounding anct. Rome, mainly built by the Emperor A. in A.D. 271 and completed by Probus in 280. Its circuit of about 13 m. can still be traced, and much is in an excellent state of preservation. The wall had an average height of 50-60 ft. and a width of 12 ft. It was constructed of concrete, with brick facing, with square towers at intervals of 45 ft., and was pierced by 14 gates.

*Aurelian Way*, an anct. road of Italy, which ran from the Janiculan gate at Rome northwards along the coast, through Civita Vecchia, Pisa, and Genoa to Antipolis (Antibes) in Gallia.

*Aurelianus, Caelius*, a physician who lived at Sicca, in Numidia, probably about the fifth century; he left some valuable translations of anct. medical treatises.

*Aurelianus, Lucius Domitius*, Rom. emperor. Born in Pannonia c. A.D. 214 of obscure family, he became a soldier and by his valour and capacity rose to the highest military rank. On the death of Claudius II. he was proclaimed emperor by the army. His reign, which lasted 5 years, was largely occupied with foreign wars, the most noted being that against Queen Zenobia, but he also found time for internal reforms. He was treacherously murdered by his own officers, A.D. 275.

*Aurelius Antoninus, Marcus* (A.D. 121-180); his original name was Marcus Annus Verus. His mother, Lucilla, was of consular rank, while his father had been raised to the rank of patrician by the Emperor Vespasian. The young Marcus was adopted by his grandfather on the death of his father, and his early moral training must have been exceedingly good—in fact, well-nigh perfect. He early attracted the attention of the Emperor Hadrian, by whom his uncle (Antoninus Pius) had been adopted on condition that he in turn adopted Marcus and Lucius Commodus, the son of the heir designate of Hadrian, who had d. In 139 the title of Caesar was bestowed upon him, and in the following year he became a consul. He himself, in his *Meditations*, says, 'To the gods I am indebted for having good grandfathers, good parents, a good sister, good teachers, good associates, good kinsmen and friends, nearly everything good.' His education left nothing to be desired; he was brought up under the careful training of tutors, one of whom was Herodes Atticus (q.v.). At the early age of 11 he fell under the influence of the Stoic philosopher and painter Diogenetus, and finally abandoned the rest of his studies for philosophy and law. He adhered strictly to the tenets of the Stoic philosophy, and learned to

work hard, to avoid slander, to endure misfortunes, and never to depart from his set purpose.

On the death of Antoninus Pius in 161, he became emperor, but although the name of Verus was not mentioned, he himself admitted Verus as his partner, and bestowed upon him full powers. Verus, who led a loose and licentious life, had one virtue which probably overshadowed his vices, that of respect and deference to the judgments of Marcus Antoninus. The opening of his reign was far from propitious. At home an overflowing of the Tiber wrought disaster, in Britain the Rom. legions were in revolt to make their general emperor, in Cappadocia the Parthians annihilated some of the Rom. forces. Verus, sent to oppose the Armenians, failed hopelessly, and although the Armenian war was brought to an end, the Armenian army of Verus brought with it back to Rome a terrible disease. Many of the Romans thought that the last days of empire had come, but through it all Marcus never abandoned hope, and always remembered the Stoic command never to give up that on which he had set his mind. In 169 Verus died, and Marcus became the sole master of the Rom. empire. His work now concerned every dept. of empire. The economic reforms that were necessary, the social problems which Rome had to face, necessitated the constant attention of the emperor, and this attention never failed. His time was fully occupied, and yet, in spite of poor health, he managed to work from early morning until late at night, and seem no worse for it.

In 169 he set out to quell a rising which had broken out with the Ger. tribes in Pannonia, and for the next few years his time was constantly taken up with this, until in 174 he won the victory which gave rise to the fable of the 'Thundering Legion.' In Germany he received the news of the revolt of Avidius Cassius, who had proclaimed himself emperor. At the end of 3 months Avidius Cassius was dead, his head had been brought to Marcus Antoninus, his family pardoned at the request of the emperor, and the rising quelled, largely owing to his unexpected clemency. In the meantime his wife, Faustina, had *d.* After the death of his wife A. returned to Rome, visiting Athens on the way, and enjoying in Rome a triumph for his Ger. victories. In the following year (177) he returned to take the field against the Gers., and *d.* probably at Vienna in Mar. of that year. The accounts of his death differ, but the probability is that he *d.* of acute stomachic trouble. His son Commodus was with him when he *d.*, and erected to his honour the Antonine column. A. was, of course, deified, and became recognised as one of the household gods of Rome.

In 176 had occurred a persecution of the Christians for which A. has been attacked. Christianity was to Marcus A. simply heresy, and, as heresy, was to be punished. It will be noted that he never

directly ordered the persecution of the Christians, but only the persecution of heretics. A. did not understand Christianity, but only considered it as a damper to Rome and Rom. ideals. A. was the author of the *Meditations*, which contain the ideals of his philosophy. A large number of scholars have tried their hands at translating A. The task is no doubt unusually difficult, because the text abounds in Stoic technical terms to which there are no exact modern equivalents; while the underlying psychology of the Stoics was very different from ours,

MARCUS AURELIUS  
National Museum, Naples.

being too much based on the rational and conscious, though in some respects it anticipated some of our recent discoveries. See *The Meditations of the Emperor Marcus Antoninus*, ed. with translation and commentary by A. S. L. Farquharson (2 vols.), 1945.

Aurelius, Victor Sextus, Rom. historian, lived in middle of the fourth century, was a favourite of the Emperor Constantius. He wrote hist. of Rome before and after Augustus. Another historian of the same name continued his hist. of the emperors a century later.

Aureole, a shining cloud surrounding the representation of sacred personages in Christian art. Originally confined to divine figures only, but afterwards more widely used. The A. surrounds the whole figure; a luminous ring round the head only is called a nimbus; this is also found in anct. pagan art, and is probably of mythological origin.

Aures Mts., in S. Algeria, one of the Atlas ranges; highest peak, Shelliya, 7760 ft.

Deep snow lies on the A. in winter. There are many fertile valleys and 1 considerable plain, the Medina. The river mostly flows S.; some are absorbed by irrigation, others fertile oases in the Sahara. Their largest basins are called shotts. The dist. was under Rom. rule, and its people, mostly Berbers, are of very mixed descent, showing frequent traces of fair, probably Gaulish or Vandal, ancestry. The A. were occupied in 1845 by the Fr., whose chief settlement, Batua, is near the great Rom. ruins of Lambæsis.

**Aureus.** The stater aureus of anct. Greece equalled 25 Attic drachmæ of silver, about £1 Eng. The first Rom. aureus, of pure gold, was struck about the close of the war with Hannibal, and was copied from Gk. models. It was worth about 16s. Eng. It did not become a standard coin until the time of Julius Cæsar. Later emperors debased its value.

**Aurich.** a tn. of Hanover, cap. of E. Friesland, on the Ems-Jade canal. 18 m. from Emden. It has breweries and paper manufactories. Its old palace has been turned into gov. offices. Pop. 6000.

**Aurichalotte** (Lat. *aurum*, gold; Gk. χαλκός, copper), an amorphous, green, transparent mineral formed of hydro-carbonate of copper.

**Auricle:** 1. The flap of the ear, with the auditory tube. See EAR. 2. The name given to 2 cavities in the heart, leading to the ventricles. See HEART.

**Auricula** (*Primula auricula*) is a plant of the order Primulacæ. It grows abundantly on the Swiss Alps, and has many florists' varieties.

**Auricula** (Lat. *dimin. of auris*, ear), a genus of univalve-shelled molluscs, which inhabit marshes and their borders. The animals are snails of the Pulmonata and family Auriculidæ; they are found in the warmer climates, where they feed on plants. Fossil Auriculæ are found in the Jurassic system, and the shells are long and spiral. *A. midæ*, or Midas's ear, is found in the E. Indies.

**Auricular Confession,** see CONFESSION.

**Auriculate**, a term used in botany to describe the state of a certain kind of leaf. It possesses no petiole, or leaf-stalk, and consequently is fixed directly to the stem. The vagina, or leaf-base, which is continuous with the blade, is winged, and its 2 lobes project on either side of the stem.

**Auriga** (Lat., the Charioteer), a constellation situated between Perseus and Gemini. It is represented as a man holding a bridle in his right hand and supporting a goat and kids on the left arm. Alpha Aurigæ, in the body of the goat, called Capella (and Alloth by the Arabs) is brighter than the first magnitude, and by it the constellation is most easily found. The neighbouring constellations on either side are Perseus and Taurus, and the prin. stars are never below the horizon in the Brit. Isles. The mythology of the figure is uncertain, being attributed by some to the Horus of the Egyptians, whilst others accord it a

Euphratean origin. Capella is the fifth brightest star in the heavens, its magnitude being 0.2. Its proper motion has been calculated as 44" a century. The spectrum of Capella is full of metallic lines showing a composition similar to the sun. In 1900, at the Lick Observatory, Prof. Campbell, and at Cambridge, Prof. Newall, found that Capella consists of 2 stars which revolve about one another in a period of 104 days. A new star, Nova Aurigæ, discovered with the naked eye by Dr. Anderson in 1891, then of a magnitude 4.4 and still visible to powerful telescopes, is one from which we have learned much about the various novæ, or new stars.

**Aurigny**, the old Fr. name for Alderney, the northernmost of the Channel Is.; Macaulay uses it in his poem on the Armada.

**Aurillac**, cap. of the dept. of Cantal, in central France, on the R. Jordanne. Its abbey was founded in the ninth century, and became one of the greatest monastic schools of France. Pope Sylvester II. was b. at A. The present abbey dates from the seventeenth century. A. is a prosperous commercial tn. Pop. 16,000.

**Auriol**, a manufacturing tn. with a coal-mine, in the Fr. dept. of Bouches-du-Rhône, 15 m. E.N.E. of Marseilles. Pop. under 3000.

**Aurispa, Giovanni** (1370-1459), It. scholar of the Renaissance, patronised by Cosmo de' Medici and Pope Eugenius IV. He visited Constantinople and brought away valuable MSS.

**Aurlandsfjord**, a branch of the Sogne Fjord (q.v.), on W. coast of Norway, being a winding inlet running to the S. of the main fjord.

**Aurochs**, the anct. wild ox of Europe, and a descendant of the gigantic cattle of the Pleistocene period. It was known in the Middle Ages, but is now extinct.

**Aurora**, the Rom. goddess of the dawn, corresponding to the Gk. Eos.

**Aurora:** 1. A city of Kane co., Illinois, U.S.A., first settled in 1834; an important centre, with large railway works, iron foundries, flour and cotton mills. Pop. 48,000. 2. A tn. of Lawrence co., Missouri, U.S.A., near a lead and zinc mining region; manufs. iron goods. Pop. 3500. 3. A popular vil. summer resort in Cayuga co., New York. Seat of the Wells College.

**Aurora Borealis**, a phenomenon seen at night-time in N. lats. It takes the form of beams of many coloured lights quivering in the sky. It is to be observed in the N. of Norway and in corresponding lats. The phenomenon is believed to be due to emanations of an electro-magnetic nature from the sun. See further under LIGHTS, NORTHERN.

**Aurungzebe, or Aurangzeb** (1618-1707), third son of Shah Jehan, a Mogul emperor of Hindustan. At an early age he showed great military talent, and was entrusted by his father with the command of sev. expeditions. Shah Jehan being taken seriously ill, his eldest son, Dara, seized the throne, but by a series of crafty negotiations and manoeuvres,

**A.** made himself master, shut up Shah Jehan in prison, slaughtered his brothers, and so became sole ruler. His reign of 49 years, 1658-1707, was the most brilliant period of the Mogul dynasty, but his despotic gov., and especially his Mohammedan bigotry, excited intense opposition, and the latter part of his reign was greatly troubled by the princes of Rajputana and the Mahrattas under Sivaji.

**Ausable Chasm**, a deep gorge 2 m. long, near A. Riv., New York, noted for its beautiful scenery.

**Auschwitz (Oswiecim).** The Ger. commandant of the A. concentration camp, Rudolf Franz Hoess, was tried and executed in Warsaw in 1947 for the murder of 4,000,000 persons in this admittedly the worst of all Ger. death-camps. Hoess was a man aged 47, father of 5 children, with a fair, characteristic countenance and the mild demeanour of a clerk. Against all the testimony of State witnesses, 48 of whom were Polish and 18 foreigners, as to his personal participation in sadistic methods of execution, his defence was that he was merely carrying out the orders of Himmler (q.v.). He was originally a farmer, joined the Nazi party at the outset, and became a personal friend of Himmler. When the A. camp was being built in 1941 he was informed of Hitler's decision to liquidate the Jews there, that he was to be the commandant, and that between 6,000,000 and 7,000,000 Jews were to be annihilated, the majority at A. The figure Hoess gave for those executed by gas was 1,500,000, all Jews, but he admitted under cross-examination that on one night train-loads of Jews and gipsies were taken on arrival and thrown into an immense pit and there burnt alive. Witnesses said the number so put to death was 40,000. Such evidence of horrors continued to be given at the trial day by day. It confirmed in pitiless detail the evidence on A. given at the Belsen trials, of acts against humanity unparalleled in this or any other age. The trial was scrupulously conducted, and the court was specially constituted, consisting of the presiding judge, 4 assistant judges, and 4 members of the Polish Seym or Diet. Neither in this nor in any other Polish trials of terrorists did the ideological element play any part; though naturally such trials were utilised politically to show the risk of opposition to the new Gov. or to the fundamentals of the new Polish State. It was emphasised at the trial by the public prosecutor that Hoess was a willing link in the system aiming at the total destruction of the Slav people, a system which, it was averred, began 1000 years ago when the Poles were driven from the Oder and Neisse; while in the twentieth century it employed the most scientific methods of destruction with the object of wiping out the entire Polish nation. This was the theme most elaborated in court to serve definite political ends by constantly reasserting the ever-present menace of Germany and the fact that those who wanted to rebuild Germany could never be friends of Poland.

**Ausgleich**, the name of a treaty which governed the fiscal, financial, and commercial relations between Austria and Hungary, first concluded in 1867, and renewed in 1878, 1887, 1902, and 1907. Its chief function was the regulation of the amount contributed by each towards the imperial exchequer, and the proportional div. of the national debt.

**Ausonians**, the name by which Virgil in the *Aeneid* designates the Itals. as though they were named after Auson, son of Ulysses. It is also used by Milton.

**Ausonius, Decimus Magnus** (A.D. 310-c. 390), a Lat. poet, son of a physician of Burdigala (Bordeaux), where he received his education. He first became an advocate, but afterwards a prof. of grammar and rhetoric. He was so successful that the Emperor Valentinian invited him to Rome to be the tutor of his son Gratian. When the latter came to the throne he bestowed high rewards on his teacher, giving him the prefectures of Gaul and Italy, and afterwards the consulship. At the death of Gratian, A.D. 383, A. retired to Burdigala. His contemporary reputation seems hardly justified by his works; he was rather a versemaker than a poet, and his writings are marred by licentiousness.

**Auspices**, see AUGUR.

**Aussee**, a small tn. on the R. Traun, in the N.W. corner of Styria, Austria. Has beautiful Alpine scenery and saline springs; favourite health resort. Pop. 1500.

**Aussig (Usti)**, tn. and river-port of Bohemia, on the Elbe, is also an important railway centre; manufs. (1939) chemicals, glass, and textiles, and trades largely in coal, stone, and timber from the surrounding dist. Suffered much during Thirty Years war and Seven Years war. Pop. 43,900.

**Aust-Agder**, a S. co. of Norway, bordering the Skagerrak. Area, 3606 sq. m. Pop. 74,700.

**Aust Cliff** is the name of a famous bone-bed in Gloucestershire, the deposits of which are usually classed with the Lias formation. A few organic remains have also been found there which appear to belong to the Keuper deposits. This has been thought sufficient evidence for removing them from the Lias classification, but the mineralogical and geological relations of the bed render this course unjustifiable.

**Austen, Charles John** (1779-1852), younger brother of Jane A., Brit. rear-admiral (1814). Assisted in the capture of the *Komel*, the *Tribune*, the *Ville de l'Orient*, and the *Scipion*; was wrecked in the *Phoenix* (1816); commanded the *Aurora* in the W. Indies (1826-28), being engaged in suppressing the slave trade; assisted at the bombardment of St. Jean d'Acre (1840).

**Austen, Sir Francis William** (1774-1865), elder brother of Jane A., the novelist, entered the Royal Naval Academy in 1786. Two years later he joined the *Perseverance* brig, thus commencing a long and honourable career. During the great Fr. war he was in constant

service, attained post rank in 1801, and was flag-captain on the *Canopus* in 1805. In 1809, for distinguished service in the E. Indies, he was presented by the E. India Company with £1000. From 1810 to 1814 he served chiefly in the North Sea and Baltic. Was made K.C.B. in 1837, and admiral of the fleet in 1863.

Austen, Jane (1775-1817), one of the most famous of Eng. novelists. Her father was rector of Steventon, near Basingstoke, in Hampshire. She was the youngest of 7 children, only 1 other of whom was a girl. Two of her brothers were afterwards admirals. In person she was very attractive, tall and graceful. She was educated by her father, and had the advantage of a far superior education to most girls of her day.

From childhood she wrote stories, and one of her chief amusements was to tell long impromptu tales to children. For the first 25 years of her life she lived at Steventon. In 1801 she went with her family to Bath, and to Southampton in 1805. After the death of her father 3 years later she moved to Chawton, a vil. near Winchester, and it was from this place that her first novels were issued. The first one, *Sense and Sensibility*, was pub. in 1811 (written in its present form in 1797-98), which was followed by *Pride and Prejudice* in 1813 (actually written in 1796-97). The next year she pub. *Mansfield Park*, and 2 years later *Emma*. Early in the next year her health began to decline, and to be nearer proper medical treatment she went to live at Winchester. It was found that she was suffering from severe consumption, and her friends were grieved to hear that it was but a question of months till the end. *Northanger Abbey* (written in 1798) and *Persuasion* were pub. in 1818, the year following her death. *Lady Susan*, *The Watsons*, and other fragments were first pub. in the second ed. of J. E. Austen-Leigh's *Memoir*, 1871.

She may be said to have been the founder of the domestic novel, and all her characters were drawn from those with whom she came in daily contact. She is strong in the delineation of character, especially of persons of her own sex, through delicate touches arising out of everyday incidents in the life of the middle and upper classes. Her characters, though of ordinary types, are drawn with such firmness and precision that they retain their individuality intact through their entire development and they are never coloured by her own personality.

Her fine work met with the approval of such critics as Sir Walter Scott, Lord Macaulay, Southey, and Coleridge. In the diary of the first-named he wrote of J. A.: "That young lady had a talent for describing the involvements, feelings, and characters of ordinary life which is to me the most wonderful I have ever met with." Lord Macaulay went so far as to say that she was nearly equal to Shakespeare in the delineation of characters, and once said of her work

that 'There are in the world no compositions which approach so near to perfection.' And such unstinted praise from such men is an honour which falls to the lot of few authors, and when one thinks that her best work was done when she was a girl of 22, her greatness can best be appreciated. A collection of the juvenilia of J. A., recently discovered in MS., was pub. in 1933 under the title *Volume the First*.

Auster, in Rom. literature, the S. or S.W. wind; referred to by Virgil in his second eclogue, l. 58.

Austerlitz, a small tn. in Moravia, near Brno and about 80 m. N.E. of Vienna. On Dec. 2, 1805, Napoleon here won a decisive victory against the Russian and Austrian armies, capturing 15,000 prisoners and 133 guns. A few weeks later Austria concluded the peace of Pressburg.

Austin: 1. Cap. of Texas, and co. seat of Travers co., U.S.A., on the Colorado. First built and named Waterloo by Amer. settlers in 1838, Texas being then Amer. ter. In the next year the Texans proclaimed their independence, and chose Waterloo as their cap., renaming it A. in honour of one of their leaders. It is now a city with large trade and manufs., a fine capitol, and a univ. Pop. 88,000. 2. A tn. in Minnesota, U.S.A., has meat-packing establishments, furniture manufs., etc. Pop. 18,300.

Austin, St., see AUGUSTINE.

Austin, Alfred (1835-1913), poet laureate, the son of a Leeds merchant, was b. at Headingley. He was educated at Stonyhurst, Oscott, and London Univ., graduating in 1853. He became a barrister in 1857; but within a few years turned to literature, making his first success in 1861 with a lively satirical poem, *The Season*; this being strongly attacked, he retorted with another satire on his assailants. He pub. many works in prose and verse, including tragedies (*Savonarola*, 1881, and *Flodden Field*, 1903), lyrics, poems on historical persons and events, and above all, poetry and prose descriptive of nature, the latter subject being perhaps most congenial to his muse. One of his best-known books is *The Garden that I Love*, 1894-1907, a prose idyll. A. had a considerable place in journalism as a leader-writer and correspondent, and was for some years editor of the *National Review*. At the death of Tennyson in 1892 every one recognised that the 2 greatest surviving poets were both 'impossible' for the laureateship; and the selection, which aroused much controversy, was left in abeyance until 1896, when A. was appointed. See A.'s *Autobiography*, 1911.

**Austin, Horatio Thomas** (1801-65), Eng. navigator and explorer, served under Parry in 1824 in his fruitless attempt to find the N.W. Passage. He distinguished himself in the Egyptian expedition of 1840. In 1850 he was appointed to the command of an expedition sent in search of Franklin.

**Austin, John** (1790-1859), the celebrated writer and authority on jurisprudence; after a short career in the army, during part of which he served in Sicily, was called to the bar in 1818. His success as a barrister was indifferent, and in 1825, his health giving way, he retired from legal practice. In 1826 he was appointed prof. of jurisprudence in the newly founded univ. of London, where he had as hearers such distinguished men as John Stuart Mill, Sir G. C. Lewis, and Lord Romilly. The success of the lectures, however, was not maintained, and in 1832 lack of students induced A. to resign the chair. In 1833 he was appointed a member of the commission on the reform of the criminal law, and in 1836 a member of the Maltese commission. On the letter of these he distinguished himself considerably. The 10 years following he spent on the Continent, returning to England in 1848 in consequence of the revolutionary disturbances. A.'s lectures and writings on jurisprudence are distinguished by originality and power of expression, and have exercised great influence in modern conceptions of the subject. The philosophical value of his work has been disputed, but in his *Province of Jurisprudence Determined*, pub. in 1832, and treating of the relation between law and ethics, his doctrine of utilitarianism is admirably presented. His *Lectures on Jurisprudence* or *The Philosophy of Positive Law*, was ed. and pub. after his death by his wife, Mrs. Sarah A. (see below). His collected writings have been pub. under the editorship of his son-in-law, Mr. Robert Campbell, and in this form have gone through sev. eds. See Preface by his wife to *The Province of Jurisprudence*, 1861, and the interesting account by John Stuart Mill in his *Dissertations*. Mrs. Sarah A., wife of the above, pub. sev. translations from the Fr. and Ger., including Guizot's *English Revolution*, 1850; Ranke's *Popes*, 1840, and Ranke's *History of the Reformation in Germany*. She was also the author of *Germany from 1760 to 1814* (1854), and *Letters on Girls' Schools and on the Training of Working Women*, 1857. She d. in 1867, at the age of 74.

**Austin, Stephen Fuller** (1790-1836), founder of the state of Texas, was the son of one of the early settlers in the dist. In 1821 he founded the settlement which is now the city of A. In 1834, in consequence of his attempts to secure the recognition of Texas as a separate state of the Mexican Confederacy, he was imprisoned for some months in Mexico city.

**Austin, William** (1587-1634), religious writer and lawyer, was the author of *Devotionis Augustinianæ Flamma* or *Certaines Devout, Godly, and Learned*

*Meditations* (1635; new ed. 1637), and *Hæc Homo, wherein the Excellency of the Creation of Woman is described by way of an Essay*, 1637. He also trans. Cicero's *Cato Major* or *the Book of Old Age*.

**Austin Friars**, the name of a well-known monastery of the Augustinian order, at one time situated in Broad Street, London. It was founded in 1253 by the Earl of Hereford.

**Austral**, see TUBUAI.

**Australasia** (S. Asia). This term is sometimes used as the equivalent of Oceania, and as such indicates Australia with the neighbouring is.—Tasmania, New Zealand, New Guinea, the New Hebrides, New Caledonia—the Malay Archipelago, the Philippines, and the other is. of the Pacific. Geographically it is most frequently used to denote Australia with Tasmania, New Guinea, New Zealand, New Caledonia, and the Solomon, Bismaruk, and New Hebrides groups. It is also popularly used to signify the Brit. Australian possessions.

**Australia**, the one continent lying wholly in the S. hemisphere. Its position is between 10° 4' and 39° 8' S., and between 113° 8' and 153° 39' E. Its dimensions are 2400 m. from E. to W., and 1971 m. from N. to S. Approximately the area is 2,974,581 sq. m. Its nearest distance to England is about 11,000 m. Its coast-line is 8850 m.

**Physical**.—The whole continent of A. is, roughly speaking, a vast, irregular, and undulating plateau, part of which is below sea level, surrounded by a mountainous coast-line, with many intervals of low sandy shore in the N.W. and S. The noticeable features of the continent of A. are: (1) its comparatively smooth outline; (2) its poverty of water communication with the interior; (3) the absence of active volcanoes and snow-topped mts.; and (4) its antiquity. In the question of age, A. claims to be one of the oldest existing land masses. Its boundaries are, on the N. the Timor Sea, the Arafura Sea, and Torres Strait; on the E. the Pacific Ocean; on the S. the Bass Strait and the S. Ocean; and on the W. the Indian Ocean. The land surface stands at the top of a series of 3 terraces which rise from the ocean bed. In the Pacific the base of these foundations lies at a depth of 15,000 ft. below the sea level. The next layer has a depth of 8000 ft. Where this terrace approaches the coast it becomes a continental shelf, and by it are connected A., New Guinea, and Tasmania. The continental shelf of A. is comparatively narrow, while at some points on the E. the coast descends sharply to the deepest part of the ocean bed, providing a phenomenon rarely met with elsewhere. The Great Barrier Reef forms the edge of this shelf as it rounds the Queensland coast. Compared with other continents A. attains a mean altitude lower than them all. Generally the whole continent may be called a plateau whose interior is depressed and barren. The E. half of the continent is occupied by a plain 500,000 sq. m. in extent.

The Australian coasts are singularly free from inlets of the sea, save for those of the N. coast. Here the gulf of Carpentaria forms the chief bay of the entire coast. To the W. of this is Van Diemen's Gulf, of less extent but greater advantage, for it is protected from the violence of the sea by Melville Is. Beyond are Queen's Channel and Cambridge Is. Indentations are more frequent on the N.W. and include Admiralty Gulf, Collier Bay, and King Sound. The only bays on the coast of W. A. are Exmouth Gulf and Shark's Bay. This scarcity is characteristic of the rest of the coast, the exceptions being Spencer Gulf, Gulf of St. Vincent, and Port Phillip on the S., and Moreton Bay, Hervey Bay, and Broad Sound on the E. Those harbours spacious enough to mention are noted under the various states in which they are situated. The most interesting and most prominent feature of the Australian coasts is the Great Barrier Reef. Of all coral reefs it is the greatest, its length being 1200 m. The openings that break its continuity are found opposite the riv. mouths, and a theory is advanced that the gaps have been worn by the fresh water thus reaching the reef. A more reliable cause, however, is that of subsidence, as the distance from the mainland of the breaks is from 30 to 90 m. Tasmania is the only important is. belonging to A., those of New Guinea, Timor, etc., belonging to other systems. Off the W. coast are numberless small is., but none of any commercial significance. On the E. are a few, but again relatively unimportant is., while in Bass Strait are the Flinders and the Clarke Is., and others of small size and less importance. At the entrance of St. Vincent Gulf is Kangaroo Is., one of the largest is. of the Australian coast. On the N. are Melville and Bathurst Isles, while in the gulf of Carpentaria, among numerous small ones, is Groote Eylandt. The mts. of A. may be classed into the E. Cordillera group, the central mts., and those of the W. With the E. Cordillera are comprised the Great Dividing Range, running parallel with the E. shore, and its spur the Bellenden Ker Range, in Queensland; the New England and Liverpool Ranges and Blue Mts., in New S. Wales; and the Australian Alps, Pyrenees, and Grampians, in Victoria. The central mts. are the Lofly Flinders and the Gawler in the S.; the Macdonnell and Musgrave in the centre; and those of Murchison and Ashburton in the N. The W. mts. include the ranges of the Darling, Roe, and Stirling in the S.W., and King Leopold Range in the N. The highest point of the continent is Mt. Kosciuszko, 7327 ft., in the Australian Alps, New S. Wales. Others which are among the most prominent are: Mt. Townshend, 7266 ft., and Mt. Twynnam, 7200 ft., also in New S. Wales; Mt. William, 3827 ft., in the Grampians (Victoria), with Boyong, 6508 ft., Featherston, 6303 ft., and Hotnam, 6100 ft. in the Australian Alps. Mt. Sea View, 6000 ft., and Ben Lomond, 5000 ft. in New S. Wales; Woorenooran, 5400 ft., Sophia and Dalrymple, both

4200 ft., in Queensland; Mt. Remarkable and Mt. Brown, each 3100 ft., and Mt. Lofly in S. A.; Mt. Barrett and Mt. William, 3000 ft., Kegenepur, 3500 ft., and Ellen's Peak, 3420 ft., in W. A.; Cradle Mt., 5000 ft., in Tasmania.

It is only within recent times, geologically speaking, that volcanic absence has been a characteristic of A. On some of the mts. in W. Victoria the cones are quite intact and beds of scoriae have not yet been affected by denudation. Towards the Tertiary Age, large beds of lava have been poured from sev. points of the Great Dividing Range, and it is worthy of note that volcanic action was confined to a wide region parallel to the coast. A peculiar phenomenon in A., in a spur of the Liverpool Range, is that of Mt. Wingen. Though not a volcano, it fulfils the erroneous description sometimes applied to one. It is, in fact, a 'burning mountain.' Its state of chronic combustion is caused by the burning of coal underground, resulting in a lavish expulsion of smoke and steam. It has been estimated that this combustion has been active for 800 years.

The coastal region, save for the country round the Bight and Spencer Gulf, is well watered. In the E. coast, flowing into the Pacific Ocean, are many large rivs., but the majority have short and rapid courses. Of the Queensland rivs. the finest is Burdekin. It drains an area of 53,500 sq. m. and empties itself into Upstart Bay. The numerous tribs. feeding it help to carry a large amount of fresh water even in the driest season. Second in size is the Fitzroy, flowing into Keppel Bay. The Brisbane R. empties into Moreton Bay, and owes its importance to the tn. of Brisbane on its banks. There are sev. important rivs. in New S. Wales, of which the largest is the Hunter, whose course is 200 m. In order of position, from N. to S. the others are: Richmond, Clarence, Macleay, Hastings, Manning (Hunter), Hawkesbury, and Shoalhaven. The Snowy R. has its mouth in Victoria, though the large part of its course is in New S. Wales. Other rivs. worthy of mention are the Yarra, entering the sea at Port Phillip, the Hopkins, and Glenelg. The Murray, 1520 m. in length, is the largest, although it is not the longest, riv. of A.; it passes through Lake Alexandrina, thence into the sea at Encounter Bay, in S. A.; its chief tribs. are the Murrumbidgee, Lachlan, and Darling. The only other rivs. in S. A. are the Torrens and Gawler, neither of which is of much importance. In the S.W. the Swan is of some importance, at whose mouth Perth, the cap. of W. A., is situated. The prin. rivs. between the Swan and the N.W. Cape are Greenough, Murchison, and Gascoyne; on the N.W. coast Ashburton, Fortescue, and De Grey, and in the Kimberley dist. the Fitzroy, Panton, Prince Regent, and Ord. There are sev. navigable rivs. in the N. ter. The Victoria is navigable for about 40 m. for large vessels, and 120 for small. The Fitzmaurice, a large stream, discharges itself into the estuary of the

Victoria. The Daly, in its upper course the Katherine, is navigable for some considerable distance; the Adelaide is navigable for about 40 m.; the S. Alligator is navigable for over 30 m. and flows into Van Diemen's Gulf. Other smaller rivers have their mouths on the N. coast, while on the W. of the gulf of Carpentaria is the mouth of the Roper, a large river navigable for 80 m. by the largest vessels. Amongst the rivers that discharge their waters from the coast of Queensland into the gulf of Carpentaria are the Norman, Flinders, Leichhardt, Albert, and Gregory on the S. shore, and Batavia, Archer Coleman, Mitchell, Staaten, and Gilbert on the E. Those rivers draining the country round the gulf of Carpentaria are sub-tropical in character. The Darling, one of the longest rivers of the world, is navigable for small steamers in time of freshets as far as Walgett, 1758 m. above its junction with the Murray.

A noteworthy feature of the interior is the lake region. The extent of the lakes varies with the advent and retirement of the rainy seasons. Their waters are brackish, and during the dry season nothing is seen but salt-encrusted marshes. The largest of the series is Lake Torrens, with a length during flood of 100 m.

Central A. is prolific in its store of subterranean water. In 1880 the first well was bored in the W. of New S. Wales. Two years later it was concluded that a deep artesian basin lay in the W. of Queensland. At 1645 ft. below the surface water was reached, and 291,000 gallons a day was discharged. This was the first of the artesian wells. The deepest well is that of Whitewood, 5046 ft. deep. The water is forced to the surface by hydrostatic pressure of accumulated water at a higher level.

The climate of A. would be expected to vary considerably, owing to its great size. This, however, is less the case than in other continents. Its distance from the Antarctic circle and the equator, and enormous absorption of heat by day causing its radiation by night, in the great plains, form powerful factors in determining the uniformity of the climatic conditions. The fierce heat of the day causes two-fifths of the surface of A. to receive less than 10 in. of rain throughout the year. Whatever vapour masses are formed remain in that condition owing to the absence of any condensing medium. But the remainder of the continent may be said to enjoy a fairly good supply. The N.W. coast is subject to a tropical downpour from Dec. to Mar., while the remaining coasts enjoy a mean rainfall of 50 in. in the E., much less in the S., being on an average 24 in., while part of the S. and W. coasts attain only 10 in. to 20 in. The visitations of drought prove ruinous to many farmers and cattle-breeders, and this feature of uncertainty of rainfall constitutes a never entirely absent menace to colonists. In 1884 a drought destroyed 10,000,000 sheep, and all the rivers, with the exception of the Murray proper shrunk to insignificance. Again, the return of the

season, coming with its tempestuous floods, causes an almost equal destruction of life and property by means of the floods which the swollen rivers bring about. All that can be done in the matter of irrigation to lessen the unreliability is in operation, and irrigation colonies are in existence on the Murray. The scarcity of the natural water supply has been mitigated to some extent by borings and by the construction of dams on a large scale. The largest reservoir is the Hume dam, on the Murray near Albury. It has 2½ times the area of Sydney harbour, and

Australian Government  
RIBBON OR MANNA GUM (*E. viminalis*)

The ribbons of bark that hang from the trunks are often 15-20 ft. long.

may still be increased in size. The further conservation of great volumes of water, which would otherwise run to waste in the wet season, is being developed by a system of river locks and weirs.

Geologically, A. seems to consist chiefly of Palaeozoic and Cainozoic or Tertiary formations, though Mesozoic or Secondary deposits have been revealed. The Grampians, Pyrenees, Great Dividing Range, Australian Alps, in Victoria, the Blue Mts. in New S. Wales, the Dividing Range in Queensland, consist chiefly of Silurian strata interrupted here and there by granite, syenite, etc. This Silurian character also dominates S. A.; a large area to the S. and W. of W. A. shows igneous rocks, while traces of Palaeozoic elements are found in the Darling Range. There are no Carboniferous rocks at present known in S. and W. A. Metamorphic rocks occur at intervals in Queensland and in the N.W. of Arnhem

**Land.** In New S. Wales and the S.E. of Victoria sandstone is found among the older substances. A huge area of the continent abounds in Tertiary deposits stated to be Pliocene. These formations include the desert sandstone, coral limestone, and to a large extent the conglomerates and clays of the gold diggings. The earliest discoveries of gold were made in recent and Tertiary alluvia. Quaternary deposits occur in the Upper Macquarie and Upper Murrumbidgee rivs., and they are rich in fossils which supply an illuminating knowledge upon the past fauna of A.

The botany of A. contains many characteristics both unique and phenomenal. Its species number many more than are found in all Europe. A feature of the trees growing on the coast highlands is their uniformity of shade. This is a dark olive, and is observed on both the upper and under surface alike. Their foliage extends in a vertical direction, and hence there is a great increase in the amount of available sunlight. In large and monotonous areas is the 'scrub,' a plant of dismal and unbroken appearance. It contains, however, one agreeable type, that of the tea-tree, a flowering shrub and a species of the *Melaleuca*. This is found in nearly every part of the continent. The forests contain many giants, among which is the gum-tree, or *Eucalyptus* (*q.v.*), attaining a height of 250 ft., with a girth of 12 to 20 ft., while in the S. there are many trees which grow to over 300 ft. high. The valuable she-oaks, beef-woods, or *casuarinas* frequent the S., W., and interior. They bear no leaves and have at the termination of their branches rigid drooping 'tails.' The jarrah, or Swan R. mahogany, through its power to resist the attack of the white ant, is used for railway sleepers and piles. The most interesting feature is the acacia. It is represented by 300 species, and with their striking yellow blossoms and fragrance provide a great source of beauty. Here and there are spots most luxuriantly vegetated. Palms, Indian figs, creepers, ferns, flame-trees combine to form a harmony of colour. The flame-tree is so named from the effect it presents when in blossom. Its clusters of red flowers, indeed, are sufficiently conspicuous on the mts. to act as a signal to ships miles out at sea. Araucarian pines are now confined to A. and adjacent regions. Many European trees have been successfully introduced, and the Scotch thistle, from its readiness to develop, has caused the different municipalities much expense in its extermination.

But if the flora of A. presents strange characteristics, the zoology is even more striking. The mammals of other lands are absent to a remarkable degree, while the pouch-bearing animals, here so prolific, are only represented elsewhere by the opossums of America. Of these marsupials the largest is the kangaroo, which attains a height of 6 ft. Other varieties are the wallaby, the hare kangaroo, and the rat kangaroo. In

New S. Wales and Queensland the fruit-eating bat is found, while seals and sea lions frequent the shores, that of Queensland abounding in the dugong or sea cow. Phalangers are nocturnal animals, feeding on leaves and inhabiting the hollows of trees. Flying opossums may be seen at night-time, while the flying mouse, of extraordinarily minute dimensions, is a feature of the continent. Other animals include the tarsipes, a honey-sucker; the wombat, 3 ft. high, a root and grass feeder; the dingo or wild dog and the koala bear; native cats (*dasyures*), also marsupials and carnivores; the ant-eater of W. A., and the platypus. This last has no teeth, being provided with 2 flat, horny projections, and possessed of broad, webbed feet. The introduction of European creatures has proved only too successful. The prolific increase of the rabbit and sparrow has involved the Gov. in enormous expense in the attempted suppression of the now-recognised vermin. Originally introduced for the purposes of exploration, the camel is now used with great profit in outlying districts as a beast of burden. Australian birds excel those of more temperate lands in beauty of plumage and form. Those specially famous for their beauty are the parrot, cockatoo, regent bird, rifle bird, fly-catcher, and lyre bird. A scarcity of fruit and an abundance of flowers cause the prevalence of flower-eating birds, among which are the varieties *Meli-phagidæ* and *Trichoglossidæ*. The emu and cassowary belong to the same family as the ostrich of Asia and Africa. A strange and unsightly bird is the podargus, commonly known as morepork, from its queer cry. There are altogether 650 different species of Australian birds, while Europe can boast only 500. There are many snakes, and though the viper is unknown, the *Elapine* (which include the Indian cobra) comprise the majority of Australian snakes. Though all are venomous, only 5 kinds are fatally so. Fish teem in rivs. and the sea.

The aborigines of A. may have come from the Malay Peninsula, driven thence by wilder and fiercer tribes. They were probably the most backward, in some respects, of any of the aboriginal tribes. They were entirely a hunting race, and had not developed on the agric. side at all. But at the same time they had developed a system highly satisfactory to themselves by making each man responsible for a certain amount of supplies. They developed also a highly graduated language, to which a considerable grammar attached itself. The aborigines of A. are coffee-coloured, and quite separate from other coloured races, and though their height is that of a European, their physique is very inferior. Apart from the ordinary application to the human senses, the intellect of the aborigine is little developed. Certainly in tracking and running down his prey he is unsurpassed. Attempts at the portrayal of sharks and other creatures are very crude. Beyond the manufacture of primitive weapons and domestic articles, he

does nothing except under supervision. Marital relations are most elementary. His wife is valued as property with his club and spear. Her appearance is or was generally marked by spear-wounds received as punishment for supplying insufficient vegetable food, for this is her part of the contract. Among their weapons is the boomerang. This is a curved stick which is thrown with sufficient dexterity to ensure its return to the owner. Outside the family rule there is no gov. whatever, and as for religion, their only inclinations towards the supernatural are contained in a dread of ghosts and demons. Their life is necessarily nomadic, as they are insufficiently intelligent to practise thrift, and hence abandon a locality as soon as its resources are exhausted. Civilisation of course has caused their rapid disappearance, and while some are to be seen working as stock-men on farms, most follow their original mode of existence.

The aborigines could offer but little resistance to colonisation by Europeans, and some became victims of outrages at the hands of the settlers in retaliation for thefts and murders of white men. At times a policy of repression was followed as in Van Diemen's Land in 1835, where a lieutenant-governor organised a systematic hunt for natives, and although he failed to capture all of them, the aborigines there soon joined the ranks of vanished races. But the 'black-fellows' on the mainland were more fortunate, and the continent gave them a refuge until such time as the missionary and humanitarian sentiment had become sufficiently interested to intercede effectively in their behalf. Misconceived policies, rather than actual ill-treatment, have led to the degeneration, decline, and sometimes extinction of the aborigine. Neglect has, often enough, played its part, but missionary effort and 'protectorates,' extending back into the early Victorian period, greatly weaken this old charge and that period was characterised by a most intensive effort to civilise the aboriginal. But however well-meaning may be the efforts of humanitarians, literature over a long period, on the Australian aboriginal, leaves a definite impression of his marked inferiority in the scale of human civilisation. Their numbers would appear to be still on the decline, for full-blood aborigines are stated to number 47,000 (1946) whereas in 1939 there were 51,557. In Queensland to-day some 75 per cent of the natives are self-supporting—employed under supervision in pearl and trochus fisheries and by station managers in cattle-raising; but this relative success is due to Queensland's climate and wide and comparatively unsettled spaces, and also to the foresight of its 'protectors' in encouraging the natives to take up occupations less in conflict with their habits and inclinations than agriculture.

In general Australian policy in the management of its aboriginal pop. in recent years has undergone modifications compatible with a more idealistic outlook. At the Conference on Aboriginal Welfare

held in Canberra in 1937 the Chief Protector for the N. Ter. declared that unless the black pop. were soon absorbed in the white, the white would be absorbed in the black in about a century and a half (i.e. owing to the rapid increase annually of 'mixed bloods'). The Federal Gov. now realised that its local administration of the aborigines of the N. Ter. was most inadequate, and its expenditure *per capita* incredibly mean, especially as compared with the liberality of the U.S.A. towards their aboriginals and of the sev. Australian states in the administration of the aborigines in their control. Lyons and Menzies, during their terms of office as Prime Minister, both improved matters by inclining to something in the nature of a 'new deal' for the aborigines, while Curtin extended certain social services to cover the aborigines. In 1944 the Commonwealth Gov. incorporated in its referendum proposals a request to take from the states the management of the aboriginal pop. (See also under *History* and see E. J. B. Foxcroft, *Australian Native Policy*, 1941.)

A. is politically divided into six states, the Is. of Tasmania forming an integral part of the Australian Commonwealth. Added to these are the Ters. of N. A. (cap. Darwin), Central A. (cap. Alice Springs) and Federal Cap. Ter. (Canberra). The pop. of the whole commonwealth in 1911 was 4,455,005, which showed an increase of about 700,000 during the preceding 10 years. The pop. (exclusive of full-blood aborigines), according to the census of 1921, was 5,435,734, or 980,700 increase during the preceding decade; the 1933 census showed a total pop. of 6,629,839, an increase on 1921 of 1,194,105; and the estimated figure for June 30, 1946, was 7,448,603, an increase of 818,764 on 1933. The rapid increase has been due mainly to natural expansion, by which is meant the excess of births over deaths. Immigration since 1891 has been comparatively slight. The above pop. is exclusive of deaths of defence personnel, and of aborigines, who are estimated at 47,000. The total estimated white pop. in 1946 was made up of:

New S. Wales	2,324,656
Victoria	2,030,887
Queensland	1,091,226
S. Australia	636,460
W. Australia	494,080
Tasmania	251,063
N. Ter.	5,250
Australian Capital Ter.	14,981
Total	7,448,603

The area of the different states and ters. is:

New S. Wales (inclusive of Federal Ter.)	sq. m. 309,432
Queensland	670,500
S. Australia	380,070
Tasmania	26,215
Victoria	87,884
W. Australia	975,920
N. Ter. and Central Australia	523,620
Total	2,973,641

Six of the Australian cities contain a pop. of over 100,000, and there are 30 whose inhab. number over 10,000. The chief cities are Sydney, 1,398,000; Newcastle, 128,000; Broken Hill, 26,500; Wollongong, 19,000; Goulburn, 16,000; Cessnock, 15,000; Lithgow, 14,000; Lismore, 21,000; Wagga Wagga, 14,000; Maitland, 13,000; Albury, 13,000; Bathurst, 12,000; Tamworth, 11,000; Grafton, 10,000; and Orange, 10,000 (New S. Wales); Melbourne, 1,170,000; Geelong, 41,000; Ballarat, 39,000; Bendigo, 31,000; Warrnambool, 9000; and Mildura, 7000.

ann. figure of approximately \$50,000,000 (the figures, in Australian currency values, were, \$262,529,000 in 1936-37; \$246,984,000 in 1937-38, \$242,629,000 in 1938-39, and \$269,260,397 in 1945-46). Compared with the wool industry, those of cattle and horse-breeding are of lesser importance, though there are possibilities of extensive increase in the oversea trade. In dairy produce the assistance of improved methods of refrigeration in water carriage has given the trade great impetus, and has materially extended the markets for beef and mutton.

*Australian Government*

AN AUSTRALIAN MERINO SHEEP STATION  
Sheep being brought in from the back country for shearing.

(Victoria); Brisbane, 385,000; Rockhampton, 34,000; Townsville, 37,000; Toowoomba, 34,000; Ipswich, 26,000; Cairns, 15,000; Maryborough, 15,000; Bundaberg, 15,000; Mackay, 12,000; Gympie, 8000; and Charters Towers, 8000 (Queensland); Adelaide, 360,000; Port Pirie, 13,000; Whyalla, 8,000 (South A.); Perth, 263,000 (including Fremantle, 28,000); Kalgoorlie, 11,000; Boulder, 7000; and Bunbury, 7000 (W. A.); Hobart, 54,000 (with suburbs, 71,000); Launceston, 36,000 (Tasmania); and Canberra, 12,200 (Australian Cap. Ter.).

As the continent is fundamentally of a pastoral nature, products of the flocks and herds form the chief element of Australian commerce. A line drawn along meridian 145° encloses with the Great Dividing Range a huge natural pasture, equipped with natural advantages for the growth of wool. Of the world's sheep, those of A. represent one-sixth, and the value of the wool export has reached, in 50 years, the colossal

As a source of wealth, agric. pursuits come next in order of importance. Originally wheat was cultivated only in the coastal strips, but experiments further inland within the 20- to 40-in. rainfall dist. have been attended with much success. Within the last 17 years the value of wheat and flour export has more than doubled itself. In 1910 it was represented by over £11,000,000, and in 1937-1938 the total value of wheat and flour exports was £27,040,000, in 1938-39 £13,275,000, and in 1945-46, £217,569,946. Other important crops include maize, oats, hay, potatoes, sugar cane, and wine. The chief wheat districts, are in Victoria, S. A. and New S. Wales. Maize and sugar cane are cultivated in New S. Wales and Queensland, while the vine is grown in all the states. Fruit is both large in quantity and rich in variety and quality, the prin. kinds exported being oranges, pineapples, bananas, and apples. Timber exports were valued at £1,280,000 in 1937-38 (in 1938-39,

£927,000, but in 1943-44 the figure fell to £272,000; in 1945-46, £249,000. The timber wealth of A. lies chiefly in the E. and a part of the W. coastal belts. Fishing is followed with some advantage, and oyster cultivation for the purpose of collecting pearls is to be recognised.

A. is one of the greatest gold producers in the world. The mineral is found throughout the continent. It is obtained principally from quartz reefs, though many alluvial deposits are still yielding. Victoria is the busiest centre and possesses some very deep mines. In the Bendigo dist. 8 mines are over 3000 ft. deep. In New S. Wales dredging is adopted to win gold from river deposits. Copper exists in all the states, and in S. A., New S. Wales, Queensland, and Tasmania is extensively worked. Tin and iron also exist, and although the latter is found distributed all over the continent, it has been little worked in the past on account of the lack of capital necessary to commence operations. The ann. pig-iron production is about 900,000 tons. Other minerals include antimony, bismuth, manganese, platinum, tellurium, lead, mercury, titanium, wolfram, zinc, nickel, cobalt, uranium, and arsenic. Australian states are plentifully supplied with coal. It occurs in 5 varieties, and attempts were made to use brown coal (lignite) for ordinary fuel, but without success. 13,886,000 tons of black coal were produced in 1946. Asbestos has been discovered in New S. Wales, and many specimens also in W. A. Of gems, diamonds are found in all the states, and the search has been organised only for these stones and opals. Other precious stones include the sapphire, emerald, ruby, amethyst, garnet, topaz, turquoise.

A. makes over 2,000,000 tons of the world's cheapest steel, and about two-thirds of the machine tools required by her rapidly expanding industrial plants.

**Exports and Imports.**—The total value of the imports in the year 1945-46 was £103,793,341, the prin. items being arms, ammunition, and explosives, £18,114,000; oils in bulk, £17,441,000; vehicles and parts (including aircraft), £14,270,000; cotton and linen piece goods, £8,183,000; motive power machinery (except electric), £7,014,000; silk, £6,237,000; electrical machinery, £5,051,000; tobacco, cigars, and cigarettes, £4,683,000; tea, £4,546,000; drugs and chemicals, £3,992,000; yarns, cotton, and Amer. silk, etc., £2,627,000; fertilizers, £2,221,000; paper and printing, £2,201,000; stationery and books, £2,146,000; bags and sacks, £1,912,000; seeds, £1,787,000; hessians and jute piece goods, £1,271,000; timber undressed, £1,125,000; tools of trade, £1,071,000; canvas and duck piece goods, £1,056,000. The exports were £184,360,000; the chief items being wool, £69,280,000; gold, £26,411,000; meats, £14,011,000; butter, £12,272,000; hides and skins, £11,836,000; flour, £11,337,000; wheat, £6,223,000; lead (pig and in matte), £4,222,000; arms, ammunition, and explosives,

£3,831,000; sugar (cane), £3,080,000; vegetables (preserved), £2,699,000; piece-goods, £2,474,000; zinc bars and blocks, £2,266,000; iron and steel manufs., £2,196,000; milk and cream, £2,156,000; dried fruits, £2,140,000; eggs, £2,090,000; concentrates and ores, £1,739,000; cheese, £1,689,000; jams and jellies, £1,342,000; fresh fruits, £1,265,000; fruits (preserved), £893,000; wine, £741,000. Gold exports which in 1938-39 were £1,459,000 (out of an output worth £14,026,615) rose to £26,411,299 in 1945-46. The ratio between exports and imports shows an excess of imports in the earlier years of Australian trade, but this increase represented the introduction of capital into the country in the shape of Gov. loans or for investment in private undertakings; the excess of exports in later years represented the interest and profit on these loans, repayments of loans overseas, and freight on trade borne on vessels of the United Kingdom and foreign countries. In recent years (apart from the war-time year 1943-44, when the adverse balance was £63,000,000) the balance of trade has sometimes been greatly in favour of imports, in 1923-1924 the excess being £24,000,000. This was due to A.'s requirements in the way of machinery and manufs. of metals, including motor cars and other vehicles, apparel, textiles and manufactured fibres. The year 1930 saw, however, a crisis in Australian trade, the slump in both the wheat—due chiefly to a disastrous drought—and wool exports resulting in so serious an adverse trade balance that the A. Federal Gov. under Mr. Scullin (Labour), who defeated Mr. Stanley Bruce (Conservative) in 1929 on the issue of Federal or State control of industrial arbitration, found it necessary to curtail imports by a drastic protectionist tariff, the primary object of which was to encourage Australian manufs. at all costs. At the same time, too, the Gov. decided to suspend assisted immigration for all settlers but farm boys and domestic workers. All this had a bad effect on Australian credit and made it difficult to float a loan in London. But the Brit. Gov. agreed to the suspension, from the year 1931-32, of the repayment of prin. moneys due under the funding arrangement whereby the War Loan debt was to be extinguished about 1956, and of the interest moneys from 1932 to 1933; and in 1931 the internal debt of £558,000,000 was the subject of a voluntary conversion plan directed to financial rehabilitation. The country quickly recovered and, by 1937-38, the revenue was £89,458,000 or £4,395,000 over expenditure (in 1938-39 the revenue was £95,065,000 and expenditure £98,031,000), and in 1943-44 the revenue was £467,156,000 and expenditure £464,828,000 (the totals for the 6 states being £169,616,000 and £167,288,000 respectively). Steamship routes connect Australia with London and other Brit. ports, Germany, Belgium, France, Italy, Japan, China, India, San Francisco, Vancouver, New York, and Montevideo.

*The Commonwealth Government.*—According to the Constitution Act of 1900 the gov. of A. is represented by a governor-general, who stands for the king. A Senate consisting of 36 members, 6 from each original state, and directly elected by the people of the state, operates for 6 years. Next is the House of Representatives, which consists of 75 members elected for 3 years by the Commonwealth. These are proportionate to the pop., with a minimum of 5 representatives for each state. In 1939 there were 28 for New S. Wales, 20 for Victoria, 10 for Queensland, 6 for S. A., 5 each for Tasmania and W. A., and 1 from the N. Ter. The governor-general has 7 ministers. In the general election of 1946 the Labour Gov. was returned to office with the loss of only 6 seats (Labour, 44; Liberal, 17; Country party, 12; Independent, 1. Senate: Labour, 33; Opposition, 3).

*The Commonwealth Constitution.*—Efforts have been made to alter the Constitution of 1900, but resolutions for that purpose submitted to a referendum have generally been rejected. In the 1913 election 6 questions were submitted, all but 1 being repetitions of old proposals to extend the legislative powers of the Commonwealth Parliament over trade, commerce, industrial matters, monopolies, trusts, and corporations. The new proposal referred to railway disputes. All were rejected, but by smaller majorities than previously. In 1926 a referendum was taken to alter the Constitution so as to give wider legislative powers in regard to industry and commerce and essential services, but in both cases the electorate decided against the proposals. The inference is that the individual states are in no mind to give the Commonwealth overriding powers, especially in regard to trades disputes. In 1934-35, the primary producers of W. A., feeling themselves at a great disadvantage vis-à-vis the E. states of the country, induced the W. Australian Gov. to petition the Imperial Gov. to pass an Act enabling the state to secede from the Australian Commonwealth. Their petition was rejected on the ground that the matter was essentially one for the Federal Gov. In 1937 a referendum was held on the Federal Gov.'s proposals that the Commonwealth Parliament should be able to make laws regulating air navigation and aircraft; and that it should also have power to pass laws controlling interstate trade. Both proposals were rejected. Three Bills were introduced in 1946 to amend the Constitution in order to expand the federal power in the social services; to legislate for the organised overseas marketing of primary products; and to regulate wages and conditions of employment; but the first only of these proposals survived the referendum. In May (1946) it was decided to set up a national medical service throughout A., the service to be free and without any means test.

*New Capital.*—Up to 1927 the Commonwealth Parliament sat in Melbourne in the State parl. buildings, the Victoria

Parliament occupying the Exhibition building. The site for the cap., which under the Constitution must be not less than 100 m. from Sydney was fixed in 1908 at Canberra. The first meeting of the Federal Parliament at Canberra was held in 1927, the inauguration ceremony being performed by the duke of York (now King George VI.).

*Immigration.*—In 1920 an arrangement was arrived at between the Commonwealth and state govts. under which the Commonwealth is responsible for the recruiting of immigrants abroad and for their transport to A.; the function of the state Govs. is to advise the Commonwealth as to the numbers and classes of immigrants they are prepared to receive. Contributions towards the passages of approved settlers are jointly donated by the Brit. and the Commonwealth Govs. In 1925 the 2 Govs. entered into an agreement to make available to the various state Govs. loans at a very low rate of interest, to enable land to be made available for settlement or such public works to be carried out as might tend to develop settlement areas and so attract a greater pop. The maximum amount of loan moneys provided for was £34,000,000, and, up to 1930, about £9,000,000 had been lent, when the policy of assisted migration was suspended and the £34,000,000 agreement terminated. There was no resumption of assisted passages until 1938, when the Commonwealth Gov. decided to grant such passages to United Kingdom residents nominated by individuals or by approved organisations, to household workers and farm youths requisitioned by a state, and to pensioners. The total number of assisted immigrants for the 11 years 1914-24 was 939,472, the average for the last few years being 25,000. In 1939, following the 'cession' of Austria and Czechoslovakia to the Ger. Reich, A. offered to take 15,000 immigrants in the succeeding 3 years. In 1946 the Brit. and Commonwealth Govs. agreed to schemes to provide free passages to United Kingdom ex-service personnel and their dependants, and assisted passages at low rates to other Brit. residents of the United Kingdom not eligible under the free passage schemes. The question of immigration and a 'white A.' is one of the most difficult problems which the Australians and the Brit. Empire have to face. The Australians refuse to admit on equal terms Asiatics, especially Jap. and Chinese.

*Discovery and Exploration of Australia.*—The actual date of the discovery of A. is doubtful. Various claims are made, among them the sighting of W. A. in 1522 by Magellan's followers. In 1598 it was mentioned in a book by Cornelius Wytfliet. Torres Strait refers to a visit there by Torres in 1606, while Dirk Hartog Is. recalls Dirk Hartog in 1616. In 1618 a Dutch vessel *Amherst* explored the coast of Arnhem peninsula. As far as known the first Brit. sight of A. took place in 1688, when Dampier gave his name to an archipelago in the N.W.

In 1770 Capt. Cook, during a circumnavigation of the globe, explored the entire E. coast from Gippsland in Victoria to Cape York. In 1790 Surgeon Bass gave his name to Bass Strait, and in 1792 Lt. Flinders named a range of mts. in S. A. and also a riv. discharging into the gulf of Carpentaria. The exploration of the whole coast was completed by Darwin in the *Beagle* in 1837-1843. In 1788 the first Brit. settlement was made at Port Jackson (where Sydney now stands). Brisbane R. was opened up next by Oxley, and in 1824 Hamilton

same time another expedition under Burke and Wills was begun. The result unhappily was very different. They started from Melbourne, and at Cooper's Creek abandoned the bulk of their elaborate equipment. They advanced alone, and reached the gulf of Carpentaria near the mouth of the Flinders. Returning, they *d.* of starvation at Cooper's Creek. With the object of searching for the missing explorers, McKinlay crossed the continent to the Albert R. and proceeded thence to Burdekin R., travelling eastwards to Port

*Australian Government*

#### SYDNEY HARBOUR BRIDGE, NEW SOUTH WALES

It is constructed to carry 4 lines of electric railway, 6 lines of vehicular traffic, and 2 footways.  
The bridge was opened in March 1932.

Hume reached the Murrumbidgee. Five years later he travelled from Sydney to Port Phillip, crossing the Upper Murray on the way. The exploration of the Murrumbidgee to its junction with the Murray, and the Macquarie to its junction with the Darling followed. In 1840 E. J. Eyre (subsequently governor of Jamaica) discovered Lake Torrens, and in the following year accomplished the perilous and distressing but successful feat of a march of 1209 m. from Adelaide to King George's Sound. In 1845 Capt. Sturt started from the Darling and reached a point after many privations within 150 m. of the centre of the continent. Of all Australian attempts at exploration one of the finest was the passage across the entire continent from N. to S. It started from Adelaide to a place to the W. of Chambers Bay in 1862, and was successfully achieved by J. M'Douall Stuart. Practically at the

Denison in Queensland, 800 m. of the N.W. coast were explored by F. T. Gregory in 1861. Attempts were encouraged to the W. coast by the installation of the telegraph line in 1872, and Giles started from Chambers Pillar, but in spite of desperate determination only reached 100 m. to the N. of Lake Amadeus. Later, in 1873-74, he started 200 m. farther S., and this time reached halfway across to the W. coast. At the same time Col. Warburton started from Alice Springs, just N. of the tropic, and with the aid of camels arrived at the R. Oakover in W. A. In 1874 John Forrest, using only horses, reached the wire just to the N. of Peake Station, from Murchison R. on the W. coast. In the next year Giles crossed from the head of St. Vincent Gulf to Perth, having experienced in his crossing of 2500 m. country altogether unfit for settlement. In fact for over 1000 m. he had a chronic

struggle with that stubborn difficulty, the Australian scrub. The first settlement was made at Port Jackson in 1788, consisting of over 1000 convicts. Moreton Bay, in 1825, was adopted as a settlement, and in 1859 had risen to the position of a separate colony. Queensland now occupies the original site. In 1829 the Swan R. settlement took place in what is now W. A. From 1851 to 1889 it was a penal settlement. Edward Henty, a Sussex sheep farmer, settled in Portland Bay in 1834, and in 1837 settlers colonised Port Phillip, thus choosing the site of Melbourne for the nucleus of a new colony, later named Victoria. These 2 events were commemorated in the centenary celebrations in Melbourne in 1934, when the duke of Gloucester was invited to represent the king. Brit. colonisation of S. A. dates from 1836.

*Hist. of Australian Settlement.*—The first settlements by white men seem to have been made about the middle of the sixteenth century, but probably for thousands of years the aboriginal tribes had occupied the whole of the continent. The Portuguese were constantly sending out exploring parties to discover this unknown world, and the Spaniards, especially from their settlements on the W. coast of S. America, also sent out expeditions. Some of these explorers actually sailed within sight of the coasts of A., yet failed to recognise the existence of a new continent; and though for centuries geographers had assumed the existence of a S. continent and numerous explorers sought it, the true facts were only estab. by Capt. Cook (*see under TERRA AUSTRALIS INCOGNITA*). Following on the explorations by the Spaniards and Portuguese came the explorations by the Dutch. From the E. Indian Is., the Dutch sent out many exploring expeditions which failed only because their commanders did not fully realise the significance of the discoveries which they had actually made. The journey from the Cape of Good Hope to their possessions often led them to the W. coast of A., and gradually belief in the existence of a New Holland hardened. Under the regime of the governor, Van Diemen, many discoveries were made and many expeditions were sent out. The chief of all these expeditions was that under the explorer Tasman, which led to the accurate charting of the N. and W. coasts of A., and to the discovery of Van Diemen's Land (Tasmania) and New Zealand. Even now the full significance of the discoveries was not grasped, and with the death of Van Diemen and Tasman, exploration on a large scale died out for nearly a century. The part played by Englishmen in the exploration of the early days was small. Dampier was the only Englishman to bring back any report of A., and his report was so bad that no further attempt was made until Cook discovered that part of A. which is now known as New S. Wales. Cook's discovery was important, though the real significance of his voyages lay in their finally disproving the theory of an

immense S. continent. Of more positive importance was the report of Joseph Banks, the scientist, on the fertility of the land in the vicinity of Botany Bay. It was through his reports that A. came into popular view as a possible settlement for Eng. colonists. The early gov. of Australia, it is no exaggeration to say, owed its existence to Joseph Banks, for he alone stood between A. and the imperial Gov. in persuading them to renounce their decision to abandon settlement there. The first colonial project, as far as New S. Wales was concerned, was for the settlement there of a number of the refugee loyalists of America later known as the United Empire Loyalists. They finally settled elsewhere, but during the negotiations for settlement in New S. Wales it had been decided that, should they settle there, they should be protected by the Brit., and should also employ convicts from Britain to supply their labour. The first colonists largely consisted of convicts, and it was with men such as these that Capt. Arthur Phillip, R.N., the first Brit. governor of New S. Wales, had to develop the ter. reported by Banks as fertile and easily developed. Their success, as may be imagined, was not great; amongst the convicts there were none with pretensions to skill in agriculture, and above all, the land reported by Banks as so fertile turned out to be just the opposite. Still, in spite of difficulties some progress was made, some settlements were founded, and the tn. of Sydney began to be built. The colony, however, remained for some considerable time far from being self-supporting, and often the whole settlement was placed on short rations. The difficulty of maintaining discipline was also a great problem, but the greatest of all difficulties at the beginning proved itself in the convict guards. Enlisted from men who were more or less blackguards, officered by men who regarded A. as a purely financial speculation, they speedily obtained overwhelming authority, exploited the colonists to the best of their ability, and mutilated when the offences of which they had been guilty brought down the censure of their superiors. During this period, however, the coasts of A. and Tasmania were explored. The fallacy that Tasmania was part of the mainland was exploded, and developments in the number of convict settlements resulted from the new discoveries. The names which are most famous in this context are those of Bass and Flinders. Many of the settlements made were, however, unsuitable, and the settlers soon left them in disgust. The founder of A.'s greatest industry was one John McArthur. He experimented with the Sp. merino sheep, found the country admirably suited for the rearing of such animals, and proceeded to make this sheep industry the essential industry of A. He took the part of the convict guards against the governor, Bligh, and had him imprisoned by the mutineers for 2 years, during which time the convict guards were

the sole rulers of the colony. This mutiny brought matters to a head in A., the home Gov. adopted a fresh policy, and the governors appointed in future were not sailors but soldiers. The new policy also was a more reasonable one. A. was no longer to be regarded as a huge gaol. The convicts sent out there might speedily by good conduct earn their release and become property-owning citizens themselves. The emancipated convicts under the governorship of Macquarie began to build up a new society, but whereas many results were good, many of the attempts were failures. In the meantime the exploration of A. went on apace, and especially under the governorship of Brisbane was the colony developed. The next governor, Darling, was given great powers, and the colony was remodelled, being now made into a colony inhabited by freemen to whom the convicts were sent as servants. But Darling was opposed to the policy of emancipation, and the cry for real liberty in the colony was soon so great that Darling was recalled in 1831. The policy of emancipation was continued, the constant stream of immigrants from England helped on the policy, and the emancipated convicts were soon, by their good behaviour, able to palliate the memory of their crimes. Tasmania was made into the real penal settlement, and this quieted down into an orderly and disciplined country. With the development of New S. Wales went also the development of other parts of A. The Fr. had long desired to make settlements on the continent, and the Brit. Gov. had to hasten in order to prevent their doing so. The W. parts of A. were occupied between 1820 and 1830, and the Gov. adopted in part the ideas of James Peel. They advertised for settlers, to each of whom was to be given 40 ac. of land for every £3 or £3 worth of goods that he took out with him. But the policy of land giving was bad, for the smaller settlers quickly found themselves with property miles from any tn. and of bad quality, whilst the larger landowners, given the first chance, had appropriated the land in the vicinity of the tns. and of the best quality. Another problem which began now to face the white pop. of A. was the lack of servants, whence the necessity for an increased immigration. The experiments tried on this occasion were not worthy of success, and, further, did not succeed. These experiments in land and in the servant question had been carried out respectively in W. and S. A. But now under the able governorship of Rourke and Gipps in New S. Wales that colony was beginning to demand that it should be given self-gov. and that England should cease to send convicts to it. The transportation of convicts to the mainland of A. ceased in 1840, and the convicts were replaced by means of a system of assisted immigrations. In the meantime, in spite of considerable opposition, Port Phillip had been estab., and a year later came the

establishment of the tn. of Melbourne. By 1842 New S. Wales had developed to such an extent that she was granted a constitution and a council partly elected. A question which now agitated New S. Wales was the attempt of the home Gov. to commence again sending convicts to the colony. The convicts were not allowed to land, and the colonists definitely decided that in future no convicts would be allowed to be transported to A., and following on this came the freeing of Tasmania from the convicts who had previously been sent to it. In 1851 the colonies which were in existence were: New S. Wales, Tasmania, S. A., and Victoria (the last having then but recently objected to the union with New S. Wales, and been successful in obtaining separation). The gold rushes which commenced in 1848 were not a source of undiluted benefit to the Australian Gov. Frequent riots took place with which in many cases the Gov. was not capable of dealing, the most famous of these being the Eureka stockade episode. The gold rushes were, however, on the whole, of considerable benefit to practically all the Australian colonies, which profited by the increased trade and wealth which these rushes brought about. In 1855 S. A. received a constitution, and in 1859 we have the establishment of Queensland. Exploration had, in the meantime, continued to a great extent, and the hitherto unknown parts of A. were opened up. Since the grant of self-gov. to the Australian colonies many grave problems have had to be faced and solved.

*Establishment of the Commonwealth.*—The tendency set in rapidly towards the closer union of the colonies in a commonwealth, an object which was brought to a successful issue at the beginning of the present century. The colonies, however, had also the problems of the land question, education, railways, and immigration to settle. The land question, which was to A. the most important, seemed to have been settled when it was upset by the gold rushes, but the Torrens Act did much to settle disputed claims to land. The question of education provoked serious controversy, but was finally settled. While the ages of compulsory attendance at school vary, each state has a system of compulsory education. At Sydney, Melbourne, Adelaide, and Hobart are public univs.

In religion, no church is subsidised by the State, and the percentages of attendance at those of the various denominations are roughly as follow: Church of England 39 per cent, Rom. Catholic Church 22 per cent, United Methodists 12 per cent, Presbyterians 11 per cent, Congregationalists 2 per cent, and Baptists 2 per cent. In the matter of railways it was only natural that in order that the country should be fully developed the railway system would have to be perfected. The various states began after 1870 to develop the railways, and since that date over 27,900 m. of railways have been constructed, the money borrowed

for the purpose being a heavy burden to the pop., but the benefits which accrued being enormous. Most of the railways converge on state caps. After the Second World War the Commonwealth Gov. decided to proceed with the standardisation of railway gauges throughout A. The proposal was approved by the states, on the Commonwealth agreeing to accept responsibility for half the cost. A Bill to standardise gauges in New S. Wales, Victoria, and S. A. was passed.

*Hist. of A. during and after the First World War.*—The solidarity of the Australian people in the crisis of 1914 was an eloquent testimony to the strength of the bonds of empire. The Commonwealth Gov. put a div. of troops at the disposal of the Imperial Gov. as soon as the war began, and a small, highly efficient force was promptly sent to Ger. New Guinea. At no time did A. adopt conscription, though attempts were made to introduce it. This refusal was probably due, said the late Sir Charles Wade, agent-general for New S. Wales, to an entire misconception of the issue involved. Yet the sympathy of the Australian people for the allied cause was unmistakable, and, in its results, their voluntary effort was remarkable. Out of a pop. of less than 5,000,000, 400,000 enlisted, i.e. 8 per cent (the normal percentage in a conscript country is 10 per cent, but in the First World War this was exceeded). Their total casualties were approximately 214,000, of which the dead amounted to 55,585, and the prisoners of war to less than 200. Sixty-three Australians were awarded the V.C. and 16,814 were awarded other military honours. Australian forces took part in every theatre of war, but it was the Gallipoli campaign that shed an imperishable lustre on their endurance and bravery (see ANZACS; GALLIPOLI CAMPAIGN). They fought also in defence of the Suez Canal and on the Salonika front in the early years of the war. In 1916 the Anzac Corps went to Flanders, where in the Somme battles of that year they were engaged in the heavy fighting at Pozieres, Fromelles, and Mouquet Farm. The following year they were engaged in the battle of Arras, battle of Messines, Ypres battle, 1917 (third battle of Ypres), including the thankless struggle of Passchendaele and the battles for Polygon Wood. In the Somme battles of 1918 they rendered vital service in stemming the tremendous Ger. onslaught towards Amiens, joining in the historic counter-attack on Apr. 24, when the important position of Villers-Bretonneux was retaken (battle of the Lys). At Beaumont-Hamel (July) they took part in an effective combined attack of tanks and infantry. In the concluding battles of the W. Front the Anzacs were conspicuous in the second battle of Bapaume, especially at the capture of Mont St. Quentin (Aug. 31 to Sept. 3), a position which Gen. Rawlinson, commanding the Fourth Brit. Army, to which the Australians, under Gen. Monash, were attached, considered so

impregnable that he did not feel justified in attacking it. The initiative in this attack came from the Australians; they advanced day after day, undaunted by losses, but remorselessly breaking down the Ger. resistance. In the words of Gen. (afterwards Lord) Rawlinson, 'In the last hundred days the Australians gained a reputation which will live throughout Europe.' Elsewhere, their infantry and mounted troops co-operated in the victories of Gen. Allenby in Palestine, while yet other Australian forces took Ger. New Guinea, Nauru, and the Bismarck Archipelago, these former Ger. possessions subsequently mandated to the Australian Gov. under the League of Nations. The Australian Navy also took part in various operations, in the Pacific in 1914, in the W. Indies, and also in co-operation with the Grand Fleet in the North Sea. The Australian war debt was estimated at £300,000,000, of which two-thirds was raised in A. 2 years after the war. The interest on the debt represented £14,000,000, and the ann. charge for pensions was £5,000,000. A Navy Dept. was created in 1915, and Australian submarines rendered useful service in the war. Submarine *A53* was lost in the Dardanelles in 1915. The famous Ger. cruiser *Emden* was sunk off N. Cocos Is. by H.M.A.S. *Sydney* (1914). W./C. Goble and Lt. McIntyre accomplished the first seaplane flight round the continent in 1924, the year which saw the unfortunate loss of the battleship *Australia*. An impetus to Australian naval ambition was given in the same year by the visit of the Brit. cruiser squadron under Adm. Field.

Much of Australian hist. in the past 2 decades has been concerned with the Labour movement. From the nineties of last century, the Australian Labour party held the balance of power between the older parties and wrested concessions from them. It then entered into coalition with the other parties, but in 1915 it governed the Commonwealth and 5 of the states. In 1916, however, Labour split on the issue of conscription and, as the result, lost everywhere except in Queensland. In 1924 it again captured most of the state govts., but by 1929 had lost them all. Then came another sharp reaction, owing to the break in world prices of wool and wheat, and Scullin, the Labour leader, became Prime Minister, and, in a nationalist spirit, appointed his own governor-general in the person of Chief Justice Isaacs; but after A. had recovered from the world economic depression, the United A. party came into office under Joseph Lyons, who remained in office until his death in 1939, though in his last ministry he had to rely on an alliance with the leader, Earle Page, of the Country party. The United A. party's influence hardened in 1939 owing to the international situation, and all efforts were strained to the improvement of defence. Mr. Menzies succeeded Joseph Lyons as Prime Minister. Trade unionism, as it now exists in A., is the product of industrial arbitration,

a problem which throughout the twentieth century has been the most difficult in Australian domestic politics. It turned out sev. govts. in 1904 and 1905, and resulted in the overthrow of the Bruce-Page ministry in 1929. In the period up to the outbreak of the First World War nearly all the states' legislatures had introduced systems of compulsory arbitration on wages and working conditions. In 1928 Stanley Bruce's ministry passed an Act providing penalties for non-observance of awards and confirming the right of the Commonwealth Court to take secret ballots on union policy; but, unable to evolve a logical system in the administration of the Labour Arbitration Law, he introduced a Bill in 1929 to abolish the federal jurisdiction in arbitration cases and thus leave the whole working of arbitration to the states; but he was heavily defeated by the opposition under Wm. Morris Hughes. In the following year, the Labour movement made common cause under its political leaders and was returned to power by a great majority. Scullin, as noted previously, being Prime Minister. The task of his Gov. was to restore A.'s economic equilibrium, and in this it signally failed. The succeeding Lyons Gov. pursued a policy of sound finance, but maintained the new and increased tariff duties introduced by its predecessors in office.

*Hist. of A. during the Second World War (1939-45).*—Mr. Robert Menzies, formerly attorney-general, was elected leader of the United A. party in Apr. 1939, and became Prime Minister a week later. Mr. Casey, commonwealth treasurer, also being a candidate for the party leadership. Dr. Earle Page and other members of the Country party were excluded from the Gov., following a split with Mr. Menzies. A week before war broke out Mr. Menzies declared that if Britain were forced into war, Australia would stand by her side, thus giving the lie to Axis hopes that the Brit. Commonwealth would break and reveal disunity with the test of a new world war. Accordingly, on Sept. 3, A. declared war on Germany. Both the Labour and Country parties supported Mr. Menzies. Lord Gowrie, who, as governor-general, signed the proclamation of war, was continued in office, the new governor-general designate, the duke of Kent, having assumed a naval appointment. The militia force of 78,000 men was called up and an infantry div. of 20,000 enlisted for service in A. or abroad; and an Australian Air Expeditionary Force of 4 bomber squadrons and 2 fighter squadrons was offered to the Brit. Gov. A Bill authorising loans up to £20,630,000 for war purposes was passed. Compulsory military training, which had been abolished in 1929, was reintroduced, and it was decided that a special div. to be known as the Second Australian Imperial Force, should go overseas early in 1940, a motion by Mr. Curtin, Labour leader, opposing the dispatch of the forces on the ground that they were

needed in A. being defeated. The first squadron of the Royal Australian Air Force for active service in Britain landed there on Dec. 26. Early in 1940 an Australian contingent of troops landed in Egypt. It was decided also to recruit another div. for service abroad, and such further troops as were necessary to make up a full army corps, the plan involving the raising of an army of 90,000 men by June. The split with the Country party having now been healed, a coalition ministry under Mr. Menzies was formed (Mar.), a coalition which marked the renewal of a partnership which had been dissolved in Apr. 1939, after the death of the then Prime Minister, Mr. J. A. Lyons. In May Mr. Menzies announced the raising of a third div. for service abroad and the construction of a graving-dock for capital ships in Sydney. A., with the other dominions, declared war on Italy on June 10-11 (1940), thereby further emphasising imperial solidarity. In the same month the Country party, at a conference in Melbourne, resolved on complete participation in the Empire Air Training Scheme (which was being effectuated chiefly in Canada), the reinforcement of Australian Imperial Force divs. abroad, and compulsory military training, thereby abandoning the party's long-standing opposition to conscription. A Defence Corps, on similar lines to the Brit. Home Guard, was formed in the same month. On Aug. 13 3 Australian Cabinet ministers (Sir Henry Gullett, vice-president of the executive council, Mr. J. V. Fairbairn, air minister, and Brigadier Street, war minister), as well as Sir Brudenell White, chief of the army staff, were among 10 persons killed in an aeroplane disaster, the Lockheed-Hudson bomber, in which they were travelling to Melbourne for a Cabinet meeting, crashing near Canberra. A National Advisory War Council with Labour was formed in Oct., the Labour party, however, rejecting Mr. Menzies's proposal of a National Gov. or, alternatively, an executive war council in which the Opposition should be allotted half the seats. In Jan. 1941 it was decided to form an Australian Armoured Corps, together with an armoured div. for the Australian Imperial Force. In Feb. Mr. Menzies visited Britain for consultations with the Gov., and also visited the battle front in Cyrenaica where Australian troops were fighting. Although there was no doubt on the score of Australian unity, the Labour party still refused to join a National Gov., and, indeed, they continued to do so until they turned the tables on the other parties and formed an exclusively Labour Gov. The development of military operations in Greece, where the Australians had lost heavily in spite of their tenacity, gave rise in A. to apprehension and to criticism by the Labour Opposition, which complained that the War Advisory Council had not been consulted before the dispatch of the Australian troops. On May 27 Mr. Menzies's offer of half the seats in an

all-party Cabinet was again rejected by the Labour party. Sev. new ministries were, however, formed to speed up war production, and wider powers were taken to requisition factories and plant, prohibit strikes and lock-outs, and generally to enhance the war effort. The Volunteer Defence Corps was reconstituted as part of the citizen forces so as to provide for defence in depth and to engage in guerrilla warfare against the enemy wherever necessary. Yet again (Aug. 28) Mr. Curtin rejected an offer of an all-party Gov. There was admittedly a lack of political stability in A., though no want of unity in the people's will to defend themselves. On Aug. 28 Mr. Menzies resigned, and Mr. Fadden, leader of the Country party, became Premier, Mr. Menzies retaining his party leadership. Dr. Earle Page was sent to London as Cabinet liaison between the Brit. and Australian Govs., Mr. Menzies having refused this appointment himself. A.'s strength in armed forces at this date either on active service or ready for immediate mobilisation was: Australian Imperial Force, 200,000; Militia and Volunteer Defence Corps, 228,000; R.A.A.F., 124,000; R.A. Navy, 20,000. An Australian Women's Army Corps was also decided on so as to relieve men on non-combatant duties. The Fadden Gov. was, however, soon defeated on its budget, Labour opposing it on the ground that it made no true equality of sacrifice. Mr. Curtin now became Prime Minister, and with the support of the Independents formed a purely party administration. But so grave now was the crisis of the war and of the Jap. menace that the isolationist tendencies of the Labour party were forgotten in the realisation that the situation demanded the fullest co-operation with the Allies and the utmost national sacrifices. Thus the Curtin Gov. retained conscription for home defence, kept militia troops in the Pacific and Australian units in Malaya, and only recalled the Australian Imperial Force from the Middle E. after Japan had entered the war. A. had, perforce, co-operated with Britain in the policy of appeasement towards Japan, as, e.g. by either initiating or at least endorsing Britain's action in closing the Burma Road (q.v.). Inclined, generally, to pay more attention to domestic than to external affairs, A. could not but be alarmed at the growing threat of the Jap. advance in China and, before the Second World War, Lyons had proposed at the Imperial Conference that the countries bordering the Pacific should enter into a regional entente and mutual non-aggression pact. But 4 years later (1941) Jap. indications of their policy in E. Asia and the S. Pacific forced A. to realise that danger was imminent, and in that year the Australian Gov. sent forces into Malaya. Mr. Menzies warned the Australian people that A. had no option but to co-operate with the Brit. Commonwealth in the war. There were still, however, influential voices in A. which deprecated an 'alarmist' attitude in rela-

tion to Japan, but the attack on Pearl Harbour (q.v.) changed A.'s attitude in a moment and for the first time the people, theretofore confident in the protection afforded by the 'sure shield' of the Brit. Navy, were confronted with the probability of a racial war of the most extreme kind. But the Gov. acted with vigour and determination, calling up another 100,000 men for home defence and, like Britain, directing men and women to essential services. Britain co-operated by sending back the Australian Imperial Force, which was then sent to arrest the Jap. attack in New Guinea (q.v. and see also PACIFIC CAMPAIGNS IN THE SECOND WORLD WAR). One Australian div., however, remained in the Middle E. and, with the New Zealand contingents, rendered great assistance in checking the Ger. advance to Egypt. But these first steps were inadequate to cope with the Jap. drive through the Philippines, Java, and Brit. Malaya and, consistently with allied strategy, U.S. naval, military, and air forces, based on A., now provided that country with its main bulwark against Jap. aggression. In view of the seriousness of the situation the Australian Gov. tightened up controls of industry, increased taxation of incomes, and spent large sums on social services, therein following Britain's domestic policies. Despite these departures from labour tradition, the Australian electorate approved the Gov.'s general war policy, and in Aug. 1943 Mr. Curtin secured a decisive majority in the 2 houses of parliament. None the less he emphasised A.'s equal status with the other nations of the Brit. Commonwealth and her independence, especially in relation to political matters of Pacific concern. In a remarkable statement on Dec. 27, 1941, Mr. Curtin declared that A. 'looked to America free of any pangs as to her traditional links or kinship with the United Kingdom.' Yet while appealing for aid to America and Russia, he inconsistently underlined A.'s imperative need of foreign aid on the one hand and her independence of Britain on the other, and yet he was now asking Britain for direct representation on the Brit. War Cabinet in the formation and direction of policy and strategy in the Pacific. Russia could tender no aid, but America sent large forces to A., under the supreme command of Gen. MacArthur (q.v.) and indeed accepted a responsibility for both A. and New Zealand. Britain acceded to A.'s demand for representation on the War Cabinet, Mr. Stanley Bruce (q.v.) being appointed Commonwealth representative both on the Brit. War Cabinet and on the Pacific War Council in London.

With allied victories in 1943-44, however, there came the inevitable return to traditional policies of concentration on domestic affairs, such as social security, and an emphasis on A.'s Pacific imperialism, notwithstanding developments in international arrangements in which she might play her part. Australian Pacific war policy was, however, affected

by America's attitude towards 'Colonial Trusteeship' (q.v.), in which there were obvious differences of outlook between the Brit. colonial system and Amer. views on 'Brit. Imperialism.' It being evident in 1943-44 that the 'Colonial Question' might produce a conflict among the Allies, A. turned her back on Labour Isolationism, inclined still more strongly to Pacific Imperialism, and stressed the Brit. connection and Britain's influence on the fortunes of the war. This broadened conception of international matters led in 1943 to the appointment by the king, on the advice of his Australian ministers, of the duke of Gloucester as governor-general of A., while in May 1944 Mr. Curtin on a visit to England tried to improve the machinery of consultation and co-operation between the Brit. peoples by proposing the establishment of a Conference of Dominion Prime Ministers, thus reverting to Alfred Deakin's suggested Empire Secretariat; but his proposals were opposed by the other dominions and, consequently, rejected.

*The Arts.*—Percy Grainger, the Australian musical composer, has achieved international fame, as have the singers Dame Nellie Melba, Florence Austral, and Peter Dawson. Appreciation of music and drama is stimulated by broadcasts from the national stations of the broadcasting commission and commercial transmitters. In painting no national school has yet evolved, but the work of such artists as Tom Roberts, George Lambert, Elioeth Gruner, Margaret Preston, and others is laying a foundation. In portraiture William Dobell is noteworthy, and Will Dyson and Norman Lindsay have gained a reputation for black and white art outside their own country. Every state cap. has its national art gallery and also a state art school. Through the munificent Felton Bequest, the National Gallery of Victoria (now one of the richest-endowed galleries in the world) has laid the foundations of a great collection.

*Literature.*—The social hist. of A., from 1788 until the present day, has impressed itself upon the literature of the country: convict foundation, pastoral expansion, gold rushes, bushranging, national self-consciousness, war—these are salient aspects of Australian experience which provide much of the substance and character of Australian literature. At first penal conditions, and then arduous pioneering activity, dominated the colonial scene. It was, moreover, a very different scene, physically and mentally, from the Brit. Is. which the settlers had left. A. was a crude and rugged virgin wilderness, devoid of the N. traditions, a place that could only gradually pass from strangeness to familiarity in the soul of a N. stock. Among literary pioneers were Michael Massey Robinson, a transported convict, Barron Field, supreme court judge, and William Charles Wentworth, notable during formative stages of social and legislative growth in New S. Wales. *Australia, an Ode*, by Wentworth, written in a Cambridge Univ. prize com-

petition, seems to have been the first poem pub. by a native-born Australian. It must be said that, apart from factual books, such as those of Watkin Tench and William Collins, eye-witness accounts of settlement, little that has intrinsic, as well as historical, value was written either in verse or prose in or of A. before the middle of the nineteenth century.

During the second half of the nineteenth century, poets and writers of fiction began to produce impressions of the new land and life in it. Charles Harpur (1813-68) was the first poet to show moments of distinction. Henry Kendall (1841-82), a nature poet, wrote much musical verse with a bush setting, and some poignant sentimental lyrics. Adam Lindsay Gordon (1853-70) wrote ballads richly flavoured with stories of sporting prowess and one, *The Sick Stockrider*, which, in spite of sentimentality and technical defects, is the first significant achievement in Australian balladry. His *Wolf and Hound* is also known to all Australians. His name has survived in Australian literature, though he was a Brit. Australian who was never acclimatised to his adopted country, and his other chief poems, *Briarcliff* and *How we beat the Favourite*, are Eng. in sentiment and colour. It was not until Henry Kingsley (1830-78) wrote *The Recollections of Henry Hamlyn* (1859) that the life of the country was portrayed in fiction of any enduring quality. This was followed by what has come to be regarded as the classic of the convict era, *For the Term of his Natural Life* (1874) by Marcus Clarke (1846-81). Into the story the author infuses such intense drama of human suffering and endurance, heroism and baseness, that, improbabilities notwithstanding, it leaves an impression of emotional vastness. Bushranging is the chief theme of *Robbery under Arms* (1888) by Rolf Boldrewood (Thomas Alexander Browne) (1826-1915), whose scene is set in the goldfields of Victoria. Also full of spirited adventure are his *Squatter's Dream* and *The Miner's Right*.

The most widely read of the late nineteenth- and early twentieth-century poets are Andrew Barton ('Banjo') Paterson (1864-1919) and Henry Lawson (1867-1922). Paterson and Lawson are generally associated, both being of the *Bulletin* school. They and others began to write ballads of mining camps, droving, and the pursuits of the countryside, as well as, in the case of Lawson, ballads set in the city, dealing mostly with the unfortunate lot of the underdog. Bernard O'Dowd, the most intellectual of Australian poets, wrote *The Silent Land* (1906) and *The Bush* (1912), the latter a long poem of aspiration for the future of his country. This was the period when the *Bulletin*, famous Sydney jour., fostered a variety of local talent; it was the period immediately preceding the political federation of the colonies, when Australians were achieving their first vivid sense of nationhood. Technical flaws are frequent in the writings of the school, but now for the first time Australian literature acquired

a sense of unmistakable, if immature, body and character. A. G. Stephens was for many years editor of the *Bulletin* literary page, contributing much by his advice and criticism to literary development during that period. Other poets of this period include: Brunton Stephens (1835-1901), who settled in Queensland, was a Gov. office clerk, and wrote A's patriotic song, *The Dominion of Australia* (but his most notable work is *Convict Once* (1871), a poem of psychological insight); Barcroft Boake (1866-92), a true Australian in outlook whose best-known poem is *A Vision Out West*; Victor James Daley (1858-1905), whose most graceful verse is collected in *At Dawn and Dusk* (1898) and *Wine and Roses* (1911); E. J. Brady, whose *The Ways of Many Waters* is his best poem; C. J. Dennis, racy and slangy, whose poems betray the influence of the Fr. symbolists; Hugh McCrae, writer of verse of a puckish fancy; Roderic Quinn, whose poems are characterised by a Celtic subtlety; David McKee Wright, whose *An Irish Heart* has some pleasing lyrics; Shaw Neilson, a Wordsworthian follower; Zora Cross, sonneteer; and Dorothea Mackellar, whose lyric *My Country* is typically Australian in sentiment. Collected poems by Harley Mathews on Australian soldiers in the First World War, under the title of *Vintage*, appeared in 1938. Yet other poets of the present century, whose writings may be found in anthologies, are Christopher Brennan, Fumley Maurice (Frank Willmot), William Balyebbridge, Mary Gilmore, Leon Gellert, Kenneth Slessor, and Robert D. Fitzgerald. The talent of all these writers, their interests and their expression, are varied. Brennan's work is marked by its scholarship; Dennis, as 'the laureate of the larrikin', won great popularity during the First World War, *The Songs of a Sentimental Bloke* (1915) becoming favourite reading in the trenches. A war poet, too, of some distinction was Gellert.

In prose fiction of the present century names generally recognised as important are: Henry Handel Richardson (Mrs. J. G. Robertson) (see RICHARDSON, HENRY HANDEL), whose trilogy *The Fortunes of Richard Mahony* (1917, 1925, and 1928), an historical and psychological novel, is assuredly the most considerable work of Australian fiction in scope, characterisation, and construction; Mrs. Aeneas Gunn, authoress of *The Little Black Princess* and *We of the Never-Never* stories of the N. back blocks; Katharine Susannah Prichard, who has written stories of aboriginal life and timber-felling in W. A.; Miles Franklin, authoress of the precocious novel *My Brilliant Career* (1901), in revolt against the repressive influences of Australian country life as she knew it, and of *All That Swagger* (1936), a novel of outback pioneering. The last-named novel and *The Mittenfarts* (1928) by Martin Boyd (Martin Mills) and *A House is Built* (1929) by M. Barnard Eldershaw (the partnership of M. Barnard and F. Eldershaw), and *Landmakers* (1934) by Brian Penton are notable additions to the school of historical fiction in A. Eleanor Dark's

*The Timeless Land* (1941) is a *tour de force* in Australian literary self-realisation. *To-morrow and To-morrow* by M. Barnard Eldershaw (1947) presents a convincing picture of the years of boom and depression following the First World War.

The novel of Australian city life found its first assured impulse in many novels by a woman writer, Mrs. Campbell Praed, in the late nineteenth century. Her delineations of Brisbane society and political intrigue have, however, historical rather than literary interest. Louis Stone's *Jonah* (1911) is a unique story of the larrikin element of the Sydney slums. Turning from the novel proper, we may note the significance of such publications as *Such is Life* (1903) by Tom Collins; the true life stories of the N. Ter. of Mrs. Aeneas Gunn; *The Vanished Tribes* (1929) by James Devaney; and *Manshy* (1931) and *The Wells of Beersheba* (1933) by Frank Dalby Davison, the last-named being a moving account of the Australian Light Horse in Palestine.

In the sphere of short stories Henry Lawson (see above) showed talent as well as in sketches of life about the mines and shearing sheds—notably in the vols. *While the Billy Boils* and *Joe Wilson and his Mates*. Other short-story writers include: Louis Becke (George Lewis Becke) (1855-1913); Barbara Baynton, whose *Bush Studies* reflect the stark side of this life with some dramatic power; Gavin Casey, writer of W. Australian gold-mine stories; Peter Cowan, noted for bush stories of a psychological quality; Katharine Susannah Prichard (see above); Albert Dornington (b. 1871) and Robert S. Close.

The period of the Second World War saw a resurgence of Australian poetry, when many new names appeared, including Paul L. Grano, Rex Ingamells, and Flexmore Hudson. Two 'movements' which contributed much to this development are the Jindyworobaks and the Angry Penguins, the first with the aboriginal name, concentrating on indigenous themes, the second openly flouting the accepted conventions of 'romantic' literature. Following the pioneer work of Louis Esson and Vance Palmer, who wrote stage plays earlier in the century, such playwrights as Dymphna Cusack, Betty Roland, George Linden Dann, and others have pub. plays which hold out some promise for Australian drama.

Essays and belles-lettres are the natural outcome of literary development, and A. has so far contributed little in this sphere, the most notable works being the various vols. of essays by Walter Murdoch, *Unscientific Essays*; by Frederick Wood Jones, *Fourteen Minutes*; and *An Outline of Australian Literature* by H. M. Green, *Six Australian Poets* by T. Inglis Moore, *Creative Writing in Australia* by John K. Ewers, *Literary Particles* by R. G. Howarth, and *Singing to the Cattle* by Brian Elliott.

There are a number of anthologies of Australian verse which give a useful view of general achievement, and among these may be mentioned: *The Oxford Book of*

*Australasian Verse* ed. by Walter Murdoch, *An Anthology of Australian Poetry* ed. by Percival Serle and Fumley Maurice, *Modern Australian Poetry* ed. by H. M. Green, *Poets of Australia* ed. by George Mackaness, *New Song in an Old Land* ed. by Rex Ingamells. An anthology of verse by Australian servicemen of the Second World War is *Poets at War* compiled by Ian Mudie.

Outstanding Australian books for children are, in prose, the *Billabong* books of Mary Grant Bruce, *Seven Little Australians* by Ethel Turner and *The Magic Pudding* by Norman Lindsay, and, in verse, *A Book for Kids* by C. J. Dennis.

PERIODICALS: The *Sydney Bulletin* is a weekly journal which has had a strong influence on the development of Australian literature for more than half a century. Two modern periodicals performing a useful function in providing media for literary discussion are *Southerly*, the jour. of the Eng. Association of New S. Wales, and *Meanjin*, both pub. quarterly. *The Australian Quarterly*, pub. in Canberra, has articles on literary, economic, and political subjects. Ann. literary publications are *Coast to Coast* (short stories), *Australian Poetry*, and *Jindy-worobak Anthology*.

Morris Miller, *Australian Literature, 1810-1938*, 2 vols., 1942; *Annual Catalogue of Australian Publications*, pub. annually from 1936 by the Commonwealth National Library, Canberra.

**Australia Day**, Jan. 26, the anniversary of the foundation of Sydney, New S. Wales, in 1788 by Capt. Arthur Phillip.

**Australia House**, Strand, London, was erected, 1911-14, by the Gov. of the Commonwealth of A. as offices for their high commissioner and agents-general for Victoria and Tasmania. It was opened in 1918.

**Australian Alps**, a mt. range in the E. highlands of Australia, extending for about 300 m. through Victoria and New S. Wales in a N.E. direction, and forming a continuation of the Great Dividing Range. The chief peaks are Mt. Kosciuszko (7328 ft.), Mt. Townsend (7260 ft.), Mt. Bogong (6508 ft.), and Mts. Feather-top and Buller. The mts. are mostly well wooded and seldom attain the snowline.

**Australian Bight**, Great, a 1600-m. stretch of ocean S. of Australia and extending from Cape Arid in W. Australia to the Eyre Peninsula in S. Australia.

**Australian Commonwealth**, the federal union of New S. Wales, Victoria, S. Australia, Queensland, Tasmania, and W. Australia, constituted by proclamation on Sept. 17, 1900, under an Act of Parliament dated July 1900, which came into existence on Jan. 1, 1901. See AUSTRALIA.

**Australian Flights**, see AERONAUTICS.

**Australian Magpie**, see PIPING CROW.

**Austrasia**, the E. portion of the Frankish kingdom, included Belgium, Lorraine, and the r. b. of the Rhine. The cap. was at Metz. Founded in 511, it was ruled until the eighth century by the Merovingian kings. After Charlemagne's death it was merged into Germany.

**Austregisille, St.** (551-624), popularly known as St. Austrille or St. Otrulle, after serving at the court of Gontran, king of Burgundy, took holy orders and subsequently became archbishop of Bourges, his native place. His remains, exhumed in 1334, were burnt in the sixteenth century by the Protestants.

**Austremoine, or Stremonius, St.,** apostle of Auvergne in third century. He introduced Christianity into Issoire, and the church of St. Paul there is on the site of an older chapel built over his tomb. He was the first bishop of Clermont-Ferrand, and founded the abbey of St. Allys.

**Austria,** a country of central Europe. Prior to the First World War it was an integral part of the Austro-Hungarian or dual monarchy. A. then comprised Bohemia, Moravia, Upper A., Lower A., Salzburg, Styria, Tyrol, Carinthia, Carniola, Istria, Dalmatia, Vorarlberg, Silesia, Galicia, and Bukovina. When, in 1918, Hungary declared its independence and the independent state of Czechoslovakia was constituted, A. expressed a desire to attach itself to Germany, but this was prohibited by the Allies, and, in 1920, Ger.-speaking A. was declared to be a federal republic of 8 provs. and the City of Vienna. These provs. were Lower A., Upper A., Salzburg, Styria, Carinthia, Tyrol, Vorarlberg, and Burgenland, the combined area being 32,400 sq. m., and the pop. (1924) about 6½ millions. After 1919 there were tentative moves for closer association with Germany. A customs union was negotiated during the Brüning administration in Germany, but fell through owing to opposition by France and Britain on treaty grounds. But when the National Socialist (Nazi) party assumed control in 1933-34 in Germany, the Gov. and the Nazi party openly agitated for union, and, later, an Austro-Ger. agreement was concluded by which Austrian independence was recognised conditionally on her policy being assimilated to that of Germany. In 1938 a new agreement was made, under which authority was to all intents and purposes transferred to Germany, and, in Mar. of that year, Ger. troops occupied A. without meeting resistance, and the republic was formally annexed and renamed Ostmark. In Oct. 1938 the Sudeten dists. of Bohemia (a part of the old Austrian Empire) were surrendered to Germany by Czechoslovakia, of which they had formed part since 1918; and parts of the surrendered area were attached to Ostmark and Bavaria, while the remainder was constituted a separate gov., with its cap. at Reichenberg.

**The Austro-Hungarian Monarchy or A.-Hungary.**—The old Austro-Hungarian monarchy, or dual monarchy, as it existed prior to the autumn of 1918, comprised a total area of 240,456 sq. m. and, with the exception of Russia, was the largest separate state in Europe. It possessed, however, only 300 m. of coast line, all on the Adriatic Sea. The bordering countries were Italy, Switzerland,

Bavaria, Saxony, Prussia, Rumania, Serbia, Montenegro; and the aggregate pop. before the First World War was estimated at 51,250,000, made up of 12,000,000 Gers., 10,000,000 Magyars, 8,400,000 Czechs, 5,000,000 Poles, 4,000,000 Ruthenians, 3,700,000 Serbs, 3,200,000 Rumanians, 2,240,000 Jews, 1,250,000 Slovenes, and 770,000 Its. This pop. was unevenly scattered. The districts to the S.E. and those of the N.W. were, and are, the most thickly populated, while the Alpine regions and those of the Carpathians were, and are, the most sparsely inhabited. It was essentially the great diversity of races in A.-Hungary, especially in A., that led to the speedy disruption of the monarchy after the collapse of the Austrian and Hungarian armies. The most numerous race of the races embodied in the Austrian peoples before 1918 were the Slavs, who formed most of the inhab. of Bohemia, Moravia, Carniola, Dalmatia, Croatia, Slavonia, and Galicia. They were divided into the Czechs or Bohemians, the Ruthenians, and the Poles. The Gers. formed about a quarter of the whole pop., and inhabited chiefly A., Salzburg, Tyrol, Styria, Carinthia, and the W. of Hungary. Other inhab. were the Romance peoples (those speaking Rom. languages), of whom there are W. and E. classes. The W. are Its., Lats., and Friulians, the E. are Rumanians. The Magyars are located chiefly in Hungary and Transylvania.

The name Austria is derived from Osterreich, and means eastern kingdom. Though the old empire was formed by the union of the 2 countries under 1 crown, the administration of the 2 countries was separately recognised and, will be seen by reference to the hist. of A., Hungary agitated for a separate political existence over 70 years ago, the *Ausgleich* of 1867 being no more than a compromise based chiefly on commercial considerations. At the close of hostilities in the First World War, both A. and Hungary became separate independent republics and, on the principle of self-determination, a number of the constituent races, either singly or in combination, grouped themselves into independent sovereign states or were voluntarily incorporated in existing states. Thus, the Serbs, Croats, and Slovenes (Bosnia, Herzegovina, Montenegro, and Serbia) combined to form the kingdom of Yugoslavia; the Czechs and Bohemians proclaimed Bohemia, Moravia, Silesia, and Slovakia to be a new republic—Czechoslovakia; the Galician Poles became incorporated in the restored Polish state; while Transylvania was ceded to Rumania and the Ukrainians became one of the constituent states of the Union of Socialist Soviet Republics. (See also CZECHOSLOVAKIA; POLAND; RUMANIA; RUSSIA; YUGOSLAVIA.)

**Physical Features and Productions of pre-war A.**—Most of the surface of A. is mountainous, being crossed by Alpine ranges. The highest points are in the Noric Alps, which, with the Rhaetian Alps, extend from Switzerland

to the Danube. In this system is Ortler Spitze, 12,814 ft. (q.v.). Some famous mt. passes are the Stelvio, 9240 ft., leading to the Swiss Engadine, the highest pass in Europe; the Brenner Pass, 4600 ft., in the Rhetian Alps from Innsbruck to Botzen; the Semmering Pass, 3250 ft., in the Styrian Alps, between Neustadt and Graz, and the Grossglocknerstrasse across the Hohe Tauern from Zell-am-See to Heiligenblut. Of rivers that have navigable tribs. all that is left to A. is a part of the Danube from near Passau through Linz to Vienna, with the trib. Inn; but the Rhine flows for about 25 m. of its course between A. and Switzerland.

In its pre-war amplitude A. was ill supplied with canals, but still retains the chief, the Vienna-Neustadt canal, which in Lower A. has a length of 40 m.

The climate of A. is favourable. Generally speaking, Vienna, with about the same average temp. as London, has a much warmer summer and a more severe winter than the latter city. The rainfall of the Alpine district is excessive, reaching 60 in.

Regarding the mineral wealth, no European country could, before the First World War, boast more prolific resources than A., though Russia had gained the ascendancy over the output of gold and silver. Large quantities of lignite and anthracite are mined. Copper, zinc, and lead are also produced. In their output of minerals, Styria, Carinthia, Salzburg, and the Tyrol are, in that order, the leading provs., but are inferior to Hungary and Bohemia in that respect. There are gold dists. in Salzburg and Tyrol, and silver is also mined there. Mercury is found in Styria and Carinthia; zinc and lead in Carinthia; iron in nearly every prov., though most of it is mined in Styria, Carinthia, and Carniola. Arsenic, cobalt, sulphur, and graphite are also worked. Building stone, gypsum, and marble are quarried in profuse quantity. A feature of the mineral production of old A. was the salt output, produced by the evaporation of salt spring-water.

Agriculture is still, however, the principal occupation of the people of A. Half the total acreage is in Upper and Lower A. The chief crops are wheat, rye, barley, oats, potatoes, and turnips; but, although the country is predominantly agric., the foodstuffs produced were insufficient to meet the requirements of the pop. There is a fair output of raw sugar, and also of live-stock. Tobacco and hops are also raised, and a profusion of fruit is found in the orchards of Upper and Lower A. and the Tyrol. Cider in large quantities is made in Upper A. and Carinthia. Wine production, though small in comparison with that of Hungary, is cultivated in most of the provs., except Upper A. The forests offer many opportunities for the timber trade, among the chief secondary products being tar, potash, charcoal, bark, and cork.

The animals found in A. include bears, chamois, and wild goats in the Alpine dists. There is an abundance of fish in the Danube.

Plano-making, the manuf. of automobiles, furniture, and textiles represent the only industries of importance in old A. Tobacco enjoyed a monopoly and the ann. output of cigars, cigarettes, and smoking tobacco was great. The most important article of vll. industry is silk, Tyrol being the centre; but the rise of artificial silk injured the trade. Before the Second World War A. had 4160 m. of railway lines, most of which were operated by the State. After the peace treaty of 1919 the Austrian Army was reduced to 30,000 men, organised in mixed brigades; while the former Austro-Hungarian fleet ceased to exist.

Paul Popper

#### AUSTRIAN IN NATIONAL DRESS

*Hist. of A. before the War of 1914-18.*—The earliest known inhab. of A. were a Celtic tribe called Taurisci, who were succeeded by the Norici. In 14 B.C. the Romans conquered the Norici, and the ter. N. of the Danube passed into the hands of the Marcomanni, while to the S. were situated Noricum and Pannonia, 2 Rom. provs., in the latter of which lay Vindobona, now Vienna. At this time Tyrol formed part of Rhetia. An invasion of the Boii in the fifth century destroyed these boundaries, and a period of constant warfare and contention saw the succeeding occupations of the Vandals, Goths, Huns, Lombards, and Avars. Subsequently the Lombards settled in Italy, and the R. Enns now formed a div. between the Avars on the one side, with the Slavians on the other. In 796 Charlemagne conquered the Avars, and in order securely to hold his position there, estab. the E. Mark. It is from this ter. that the Austrian empire definitely

traces its origin and development. Shortly, however, it suffered almost complete obliteration at the hands of the Hungarians, who did not long profit by their success, for in 955 Otto the Great defeated them at the battle of Augsburg, thus restoring the E. Mark to the Gers. Later, in 983, he invested Leopold of Babenberg with the title of margrave. Under the Babenbergs the dominion received considerable enlargement of ter. and development of its internal strength. Indeed, the whole progress of the Austrian empire may be said to be due to this great and powerful house, and to the succeeding dynasty of the Hapsburgs. Between 1141 and 1177 2 dists., the E. Mark and the Lower Mark, i.e. the ter. lying below the Enns, were united into a dukedom under Henry Jasomirgott, who became the duke of the newly formed duchy. To Jasomirgott Vienna owes to a certain degree its foundation. He also participated in the second crusade. The duchy became much extended as a result of the efforts of his successors, while the title of the greatest of their house can be assigned to Leopold VI., whose sev. and successful campaigns directed against the Hungarians and Mussulmans earned him considerable distinction. In 1246 his successor, Frederick, d. in an engagement with the Magyars, at which event the famous house ceased to exist.

For a time the country was without a ruler, and in the confusion that followed, A., to which had been added Styria, supported their choice of Ottakar of Bohemia, but he opposed the imperial control of Rudolf of Hapsburg, and met his death during the battle of the Marchfeld, 1278. The emperor passed the ter. to the hands of his 2 sons, Rudolf and Albert, but shortly afterwards it was left to the sole possession of Albert, who now held A., Styria, and Carinthia. The great administration of the Hapsburg line now began. In the midst of his vigorous restoration of order in a country chaotic in its condition, Albert was murdered by his own nephew. In 1322 Louis of Bavaria defeated Frederick, one of Albert's 5 sons, in his attempts to succeed to the dukedom. Meanwhile the Swiss, in 1315, had revolted against Leopold, who suffered defeat. Albert III. in 1330 succeeded, and to a considerable extent expanded the duchy. He was succeeded by Rudolf and Albert II. respectively, and in the latter's reign Tyrol was added to the Austrian boundaries. Albert IV. assumed the reins of control, and his son, Albert V., by marrying the daughter of the Emperor Sigismund, succeeded to the ownership of Hungary and Bohemia. He now became Ger. emperor as Albert II. The possession of these 2 additional countries did not last long, for shortly after his death they were lost again, though the title of Ger. emperor remained with the Austrian monarch, now Ladislaus, son of Albert II. The death of Albert had changed the line to the Styrian side, in which dynasty rose Frederick III. He added to the importance of the country

by giving it the rank of an archduchy. The Austrian lands now passed into Frederick's hands, owing to the close of the Austrian house. In 1493 Maximilian I., his son, succeeded him.

From this reign it can safely be said that the Austrian empire under the Hapsburgs began suddenly and powerfully to gain in power and position. By a series of shrewd marriages the dominions leapt to the position of the greatest empire in the world. Maximilian himself married Mary, daughter of Charles the Bold, thereby acquiring the Netherlands. Phillip, their son, married Joanna of Spain. Phillip died in 1506, and his son, Charles V., inheriting the united countries, became emperor of Germany; but he passed his Ger. possessions to his brother, Ferdinand I., the continuation of the Austrian branch. Under his reign A. considerably gained, not the least significant circumstance being that which rendered A. the centre of Christian strength in E. Europe against the Turks. He now claimed Bohemia and Hungary on the death of Louis, whose sister he had married. In Hungary his claim was opposed by John Zapolya. With the aid of the formidable Sultan Soliman, Zapolya invaded Hungary with success until he reached Vienna. The tn. was besieged, but unsuccessfully, in 1539. Till nearly the end of the seventeenth century only a small portion of Upper Hungary remained in A.'s possession, Turkey holding the remainder. Ferdinand succeeded to the title of Ger. emperor when Charles V. abdicated the imperial throne, and d. in 1564. To him the Jesuits owed a great deal of support, notwithstanding the existence, during Ferdinand's reign, of strong conservative tendencies.

Of his 3 sons, the eldest, Maximilian II., inherited the crown of Germany, together with A., Hungary, and Bohemia; Ferdinand, the second son, received Tyrol and Upper A.; Charles, Styria and Carinthia. Maximilian's love of peace received gratification in a truce with the Turks, following the death of the famous Soliman. His eldest son, Rudolf, was crowned king of Hungary and Bohemia. Just and temperate as a ruler, tolerant in religion, Maximilian closed his reign in 1576. He was succeeded by Rudolf II., who became emperor, in whose reign the Jesuits prospered to a great degree, owing mainly to the apathy of the king, who left all his affairs in hands only too willing to control them. So bitter was the persecution of the Protestants that he was forced to concede a charter of religious liberty. Later he was compelled to surrender Hungary, Bohemia, and A. to his brother Matthias, 1612, who in turn ceded Bohemia and Hungary to his cousin Ferdinand, who was the third son of Maximilian II. He was succeeded by Ferdinand II., whose rule was ignored by the Bohemians. Instead, they nominated the elector palatine, Frederick V., the chief power behind the Protestant union. The Thirty Years war resulted, A., determined to support the cause of

Catholicism and fired with the desire to establish a dominance of the Ger. empire, acted a prominent part. At the battle of Prague, 1620, Ferdinand was victorious, and Bohemia was subjected to his rule. A severe and bitter persecution of the Protestants followed. Under his successor, Ferdinand III., the war continued, and in 1648, at the peace of Westphalia, he had to cede Alsace to France. A period of unrest, due to the severity of his successor, Leopold I., led to the crippling of Turkish power in Hungary, culminating in their final expulsion in 1690, at the treaty of Carlowitz. Leopold and Louis XIV. now struggled together over their claims to Spain. The war of the Spanish Succession followed, in the midst of which Leopold died. Noticeable in his reign was the growing influence and strength of the Jesuits, whose formidable power had never before reached such a height. Their rise was nourished chiefly, as in the case of Rudolf II., upon the lack of energy and need for active interest on the part of Leopold.

The war was carried on by Joseph I., who, dying without issue, was succeeded by his brother, Charles VI., in 1711. The war was concluded in 1714 by the treaty of Rastadt. By it A. gained the Netherlands, Milan, Naples, Mantua, and Sicily. Prince Eugene, by his brilliant victories over the Turks, forced them to accept the treaty of Passarowitz in 1718, by the terms of which they were completely driven from Hungary. The advantages from these victories, however, were of short duration, for, by the peace of Belgrade, that fortress and former conquests were restored to them. In 1740 the male line of the Hapsburgs became extinct, the succession being vested in the person of Maria Theresa. To this remarkable woman the practical unification of the Austrian state may be attributed. Moreover, it was during this reign that the old order of gov. with its conservatism and its lifeless monotony was changed for the beginnings of modern methods.

Immediately following the death of Charles VI. the European powers sought to take the advantage of a female ruler. Under the Pragmatic Sanction they had promised Charles to support her rule, but the atmosphere of the age was not conducive to honourable observance of oaths, and Maria Theresa found herself facing Europe. England alone stood by her. During the war Frederick II. of Prussia conquered Silesia. The elector of Bavaria was crowned king of Bohemia and elected emperor as Charles VII. in 1742. Supported still by the Hungarians, Maria Theresa, undaunted, managed against her numerous enemies practically to hold her own. At the peace of Aix-la-Chapelle, 1748, A. remained almost intact. Charles VII. *d.* in 1745, and Maria Theresa's husband, formerly the duke of Lorraine, was elected emperor of Germany as Francis I. Maria now saw that France was to be feared no longer as her most formidable enemy. In 1756 the treaty of Versailles was concluded, in which the long rivalry between the Hapsburgs and

the Bourbons came to an end. Chafing at the loss of Silesia, Maria, with the aid of France, Russia, Saxony, and Sweden, moved against Frederick of Prussia.

The Seven Years war ensued, at the end of which the Prussians still held Silesia. Joseph II. became Ger. emperor on the death of his father, Francis, holding with his mother the monarchical reins. In 1780 Maria Theresa *d.*

Relieved of the wise and restraining influence of his mother, Joseph's reign was characterized by a spirit of violent and ill-considered reform. Discontent, roused by the sweeping nature of his sudden changes, fermented in Hungary and the Netherlands, in the midst of which turmoil he *d.*, 1790, after being forced to reverse his entire policy of reformation. He was succeeded by his brother, Leopold II., who was successful in restoring peace with the Netherlands and Hungary. The fate of Marie Antoinette, his sister, and her husband, Louis XVI., led Leopold II. to ally himself with Prussia against France, an alliance which was disturbed by his death in 1792. No time was lost, however, for France immediately declared war on his son, Francis II.

During this reign the foreign policy of A. owed most of its adoption and execution to Metternich. Francis II. possessed few qualities calculated to suit the disturbing elements prevalent in A. when he succeeded to the throne. A consuming love of detail, added to a zest for thoroughness exacting to a painful and stifling degree, led to a gradual decay of all responsibility on the part of his ministers. Metternich, conscious of the disease, knew that its existence was due only to listlessness in the minds of the nation.

In 1797 France secured Lombardy and the Netherlands. Two years later Francis II. united forces with Russia, and the Austrian borders underwent many changes till 1804, when Francis, anxious to prevent an indignity to his country, in the event of Napoleon demanding its subordination, abandoned the title of Ger. Emperor, and adopted that of hereditary emperor of A. as Francis I. In 1809 the peace of Vienna seriously reduced the Austrian ter., after which event Napoleon's marriage with the Archduchess Maria Louisa was shortly announced. Hence, in 1812, A. became an ally of Napoleon, without, however, rendering him any practical assistance. At the battle of Leipzig, 1814, A., joining the Grand Alliance, assisted in the wrecking of Napoleon's power, and in the following year, at the treaty of Vienna, as a recognition of her struggles and vicissitudes, she received Venice and Dalmatia, important gains, on account of the opening thus afforded for her foreign trade. Till 1840 a long peace followed, during which A. became an important factor in determining European politics. She had also allied herself to Russia and Prussia.

Meanwhile, acute dissatisfaction felt and expressed against the rigorous character

of the bureaucratic system of gov. came to a head. Metternich owed his position as a minister to a great extent to the royal favour, and he was unwilling to suggest a reform of which he himself saw the urgent need. In Italy, Hungary, and Bohemia the growing discontent reached a climax, and on the death of Louis Philippe, 1848, revolutionary elements broke out over all Europe. In the crisis Metternich fled to England, and, left in the hands of the populace, the whole system tottered and fell. Austrian power and its gov. lay among the ruins. Chaos followed, the centre of disorder being Vienna. Finally, a check was placed upon the confusion by Prince Windischgrätz, whose energies in the battlefield crushed an attempt at revolt on the part of the Slavs in Prague.

It was in Italy that A. began first to recover herself, for Lombardy was delivered into her power, after a truce with the Sardinians. Affairs meanwhile were going from bad to worse. In Hungary the parliament was dissolved; but in the face of its dissolution it continued to hold meetings. The populace rose and, on the order of the 'dead' parliament to call out the militia, a fresh insurrection was complete. Windischgrätz, however, besieged the cap., which surrendered. A reaction followed, but Ferdinand, who had shown little ability and less readiness during the crisis, was persuaded to abdicate in favour of the young Francis Joseph. Under the direction of Radetzky the reclamation of N. Italy was speedily accomplished, its complete restoration culminating in the surrender of Venice, 1849. In Hungary, however, the Magyars, under Bem, met with more success, and Hungary was reproclaimed a separate state, free from the dominance of the Hapsburgs. Their freedom lasted for only a short time, for Francis Joseph, aided by Russia, completely crushed the Hungarians. The subjugation of Hungary was accomplished. While these operations had been in course of execution, A., keenly alive as ever to its interests, strenuously opposed a projected confederation of states under Prussia, thereby defeating the Prussian king in his wish to become emperor of Germany.

For the next 10 years a policy of bureaucratic gov. was revived, the constitution which had been granted in 1849 being destroyed. In almost every dept. of the gov. a rigorous and merciless system of oppression was followed. The Catholic Church lent its support to the bureaucracy, and, aided by an ally of such power, the lot of Hungary, Italy, and Bohemia became constitutionally insupportable. Intense irritation was felt by them at the ruthlessness which marked the Austrian treatment of the national aspirations. Moreover, Prussia began formidably to contend with A. for ascendancy in the Ger. empire, but the aggressive and determined attitude maintained by A. won her the coveted recognition.

Complication now arose during the Crimean war. Much of A.'s strength

lay in its position with relation to the Balkan Peninsula. This was now threatened, and anxiety concerning the preservation of her own standard of power struggled with feelings of gratitude towards Russia, to whom A. was so indebted. The time, with its uncertainties and its opportunities, became ripe for Italy to assume a threatening front. Austrian administration in Italy had given little satisfaction to the Its., and their national feeling centred in Sardinia. In 1859 Italy prepared for a determined opposition to a rule that cramped its national freedom. Napoleon added his services to the Sardinians with such success that the Austrian emperor was compelled to offer terms of peace. When all was concluded Venice was all that remained of Italy to Austrian control.

Smarting under the humiliation she had suffered, A. was yet again called upon to enter the field. Prussia had not forgotten the arrangement by which A. had become the leading element of the Ger. empire. The protracted rivalry was now brought to a head. During their alliance in expelling the Danes from Schleswig-Holstein, a quarrel arose between the co-operating victors. In 1866 war was declared, and A. suffered heavy defeat at the battle of Sadowa. Prussia now occupied the middle states of Germany which formerly had supported A. At the termination of the struggle A.'s supremacy over Germany was brought to an end, and Sardinia, who had taken the field against her, demanded and obtained the prov. of Venetia. Austrian influence to the W., so long successfully maintained, was now completely broken.

Hungary's claims to be recognised as a separate and distinct country were now, with great advantage, pressed forward. In 1867 its political rights were successful in being regarded as justified. This agreement was the famous *Ausgleich*, which was in force for some time and to a sufficient degree justified its adoption. By the year 1907, however, it became obvious that to exist separately was commercially prejudicial to both countries. Accordingly a 'customs and commercial treaty' was formed involving chiefly the following conditions: (1) Each country was to adopt a separate but identical tariff of customs. (2) Hungary was to facilitate railway communication from Vienna to Dalmatia, while each country bore the responsibility of construction in its own area. (3) A. was to facilitate railway communication between Hungary and Prussia. (4) A court of arbitration was to be formed for the settlement of state differences. (5) Commercial treaties with foreign countries were to be undertaken by separate nominees. After 1867 it became patent that the old system of gov. by bureaucratic methods was an absolute failure, and measures towards a more constitutional freedom were passed. The presence, however, of the many nationalities within its borders rendered the task of settling all claims difficult.

From a different point of consideration, however, the existence of so many conflicting requirements and national tendencies helped valuably to increase the security of the dual monarchy. For without union no significant disturbance could be organised and harmony of action, where the aims were so entirely opposed, it was impossible to establish.

The foreign policy of A. has been to create a tangible understanding with Germany and Russia. With Germany the difficulties were not so great, and from 1879 an informal agreement has existed. Bismarck visited Vienna and arranged a treaty by which Germany bound herself to support A. against Russia, while A.-Hungary promised to assist Germany against a combined attack from France and Russia.

For a time Russia joined the Triple Alliance with A. and Germany, but the question of Russia's aims in the E. made a more definite attitude towards each other difficult of settlement. During the Russo-Turkish war of 1877-78 this feeling was irritated by a decided tendency on the part of the Magyars to sympathise with the Turks. Meanwhile the position was made complicated by the gov. of Bosnia and Herzegovina. While these 2 states were under the direct control of A. her task in fostering them was more than ordinarily an anxious one.

*A.-Hungary in the First World War.*—The international solidarity of the dual monarchy before the First World War was founded largely on the maintenance of the alliance with Germany. The loyalty of the Archduke Francis Ferdinand, nephew of the Emperor Francis Joseph, to this alliance, coupled with his patriotism and administrative ability, rendered the future career of this prince one of peculiar importance to A.-H., more especially as he was credited with being chief protagonist of the policy of incorporating the Bosnian Serbs and the Serbo-Croats into a triple kingdom with A.-H. The archduke was, therefore, anathema to all patriotic Serbs and an obstacle to those dreams of territorial expansion which they had long entertained. Here, then, were the seeds of the gravest of European conflicts; for the Austro-Hungarian Gov. had frankly declared that the existence of the Dual monarchy was really in jeopardy through the intrigues of the Serbs, while at the same time Russia as openly espoused the cause of the Serbs. When, therefore, the archduke and his wife were murdered in the streets of Sarajevo, in June 1914, it became clear that A.-H. would receive the full support of Germany in crushing Serbia, particularly as the Austro-Hungarian Gov. had, a year previously, invited the co-operation of Italy to the same end, at a time when the situation was by no means ripe for drastic action. The occasion now, however, being opportune, matters moved precipitately towards a general European conflagration; for Germany at once recognised in it a favourable combination of circumstances for breaking through the 'iron ring' which

her diplomats imagined, on good or bad grounds, her neighbours were forging round her. There seems to be no doubt, in the light of the memorandum indiscreetly pub. in 1916 by Prince Lichnowsky, Ger. ambas. to London, in which that diplomatist deplored the mistaken policy of his own Gov., that this was the general position in 1914, and that the Ger. Gov. was only too eager to hasten the conflict against Russia and her ally France. Lichnowsky, in fact, saw in A.-H. a nation urged on to its doom by the machinations of its far more redoubtable neighbour. A.-H. sent an ultimatum to Serbia on July 23, and thereafter events moved rapidly. For though the Serbian Gov. undertook to comply with the demands of A.-H., and offered to refer all disputed points to The Hague or to a conference of powers, the Austro-Hungarian Gov. disregarded the reply and mobilised its army. Germany, by insisting that the dispute wholly concerned A.-H. and Serbia, and by opposing the efforts of the future allied powers to get it referred to The Hague, directly promoted not only the Austro-Hungarian plan of destroying Serbia as an independent nation, but inspired the design of wiping out Russian influence in S.E. Europe; and thus within a week of Austria's formal declaration of war against Serbia (July 28) Germany, A.-H., Russia, and France were in a state of war; and this soon involved, through the violation of Belgian neutrality, the intervention of Great Britain. By the end of the first week of Aug., A.-H. had formally declared war against Russia. There being no indication whatever that either of the central powers would make peace separately, the alignment of opposed nations was complete for a general outbreak.

At the very outset, A.-H. had to bear the brunt of the conflict against Russia. This entailed a weakening of her campaign against Serbia on the Bosnian front, besides necessitating the defence of Galicia, which by its natural position was really Russian ter., and also the maintenance of sufficient forces at home against the possibility of the intervention of Italy. Two Austro-Hungarian armies, to the number of 600,000 men, were concentrated in Galicia, based on Przemyśl and Jarosław and on Lemberg. Some initial successes were gained, largely because the Russian plans envisaged an attack on Galicia from the E. The Russian army then retired before the pressure of Gen. Dankl from Russian Poland, but, returning to the offensive, attacked the other Austrian army under Auffenberg, while another Russian army, under Gen. Brusilov, advancing from Kiev, assailed Auffenberg's flank in the Tarnopol quarter. Ruzsky, leading the first Russian army, took Sokal, and Brusilov captured the strong positions of Halicz and Tarnopol, and then turned against Lemberg, while Ruzsky, advancing N. of this city, pierced the Austrian left and threatened Auffenberg's communications. The battle of Lemberg

was fought on Sept. 1-2, and resulted in the capture of the city and of 100,000 prisoners. The advance into Galicia continued, and soon another battle was being fought on a front extending from the Vistula to the Dniester (Sept. 6-10). In this battle the Archduke Joseph was decisively defeated, and the whole Austrian front was routed. This occurred just when the first battle of the Marne was won on the W. front, but the sanguine hopes of the Allies were doomed to frustration, and the 'brilliant second,' supported by her far more powerful ally, was by no means annihilated. The Austro-Hungarian army in the vicinity of Cracow was reorganised by the Gers. and preparations were made for a counter-offensive, which was ultimately launched in Jan. 1915. This counter move failed, and the great fortress of Przemyśl, which had been besieged for 3 weeks, surrendered. The Russians then resumed the offensive previously begun by Brusilov in the Carpathians. Galicia had thus fallen to Russia, and the fate of A.-H. might well have been sealed early in the war but for the transfer by the Ger. High Command of large forces from the W. to the E. front.

With these distractions in Galician Poland—which, as usual, was the cockpit of the nations—the Austrian army, invading Serbia in Aug. 1914, across the Drina, had made but little progress and in a short time were hurled back into their own country. The struggle between the Austrians and the Serbs was never decisive, but Belgrade surrendered in Dec. 1914, after the second advance of the Austrians on Valjevo. Shortly afterwards the Serbians replied by decisively defeating 2 Austrian army corps at Valjevo, driving the Austrians across the Drina and recapturing their cap., which King Peter entered in triumph at the head of his army on Dec. 15. A period of comparative quiet now followed, owing largely to the attitude of Italy, who was making it clear to A.-H. that the 'punishment' of Serbia must not involve damage to It. interests in the Balkans without compensation; and before long Italy was demanding important concessions from A.-H. as the price of her continued neutrality (see ITALY). In Apr. 1915 the It. Gov. demanded of the Austro-Hungarian Gov. the surrender of Trentino, together with the towns of Bozen, Trent, and Rovereto, so as to restore the old boundary of 1811; the extension of her frontier along the Isonzo R. so as to embrace Gorizia, Monfalcone, and other strong positions; the autonomy of Trieste; the cession of certain Dalmatian is.; and the recognition of It. sovereignty over Avlona (g.r.). The rejection of most of these demands followed as a matter of course, and this, added to the It. Gov.'s mistrust of the Ger. Gov.'s guarantee of such concessions as A.-H. was willing to make, led to Italy's denunciation on May 4 of her treaty of alliance with A.-H. and, though A.-H. made a last desperate attempt to buy off Italy with an abject

compliance, at all events on paper, with virtually all the above-mentioned demands, Signor Salandra, the It. premier, broke off further negotiations and gave free rein to It. enthusiasm for the dream of the It. hegemony of the Adriatic to be fulfilled by force of arms. From this point, however, the Austro-Hungarian armies on the E. front, reorganised with amazing skill by the Ger. military authorities, met with better fortune, though it is to be borne in mind that they were threaded through and through with Ger. soldiers. Huge armies of massed Austro-Hungarians and Gers. were now gathered for a tremendous counter-blow in Galicia, while in Hungary 2 Ger. armies, under Gen. Boehm-Ermolli and Gen. von Linsingen, were preparing for a drive against the Carpathian positions. Under the able Ger. general, von Mackensen, their arms met with entire success. The days of the Russian 'steam-roller' were over. Von Mackensen, by dispatching von Linsingen to threaten Stry and Lemberg, kept the Russian command in a state of great uncertainty as to where the blow would fall. From being invaders, the Russians had fallen back on the defensive; Lemberg was soon untenable, and fell on June 22, or only 3 weeks after the fall of Przemyśl. Soon after the Ger. and Austro-Hungarian forces had entered Lemberg, the Russians were in precipitate retreat through the Carpathian passes and all the big fortresses of Galicia had been recovered by Mackensen.

At the beginning of 1916 there was general optimism in Germany. Russia had retreated and the Ger. forces were masters in the Near E. Both Germany and the Allies now tried to obtain a decision, and both failed. But there was this difference—that the failure of the Allies was but transient, whereas that of Germany was really the beginning of a 2 years' process of the gradual decline of the dream of *Mittel-Europa*. Towards the end of 1916, the central powers individually and simultaneously submitted proposals to the diplomatic representatives of the U.S.A., Spain, and Switzerland and other neutrals, to enter into peace negotiations. It is probable that Germany knew that she had reached the zenith of her war conquests, and that the time was ripe for the consolidation of those gains. The Allies rejected the offer on the ground of defect of reparations and guarantees, and, moreover, they had reached the point that their peoples were in a mood only to dictate, not to receive peace terms, nor were they dismayed by the military successes of the central powers, whose ter. was free of invaders and their solidarity intact. This solidarity remained unimpaired throughout 1917, in spite of the intervention of the U.S.A., the effect largely of the defection of Russia. Had the Russian armies been able to continue their pressure against the strung-out lines of the Austro-Hungarian armies from the Sereth to the Baltic Sea, while the Allies on the W. front, the It. armies on the Carso,

and the Army of the Orient in Macedonia took the offensive, the artificial conception of *Mittel-Europa* must have dissolved sooner than it did. But though the Russian revolution, in its earlier stages, seemed to promise some hope to the Allies, it soon became evident that the expectation that it would react on the central empires so as to encourage a continuance of internal disorders, especially in A.-H., to the ultimate disruption of the Germano - Austro - Hungarian alliance, was ill-founded. In the first 6 months of 1917 there was certainly grave turmoil in A.-H. The social upheaval in Russia was not without its effect in betraying, by analogy, the political inequalities of the heterogeneous peoples comprised in the dual monarchy; for in A. alone 10,000,000 to 12,000,000 Gers. overrode twice that number of Slavs, and in Hungary 10,000,000 Magyars dominated an equal number of Slovaks and S. Slavs. Necessarily only the Ger. elements of A. and the Magyars of Hungary acquiesced in the Prussian hegemony in *Mittel-Europa*. Plots and executions of civilians and mutinies occurred. The Czechs and Slovaks were on the point of open rebellion. The seeds of what was destined to be the governing principle of the treaty of Versailles, the principle of self-determination, were being sown among the Serbs and Montenegrins, the Roumans and Ruthenians and other races. The artificial entity of the dual monarchy was thenceforth doomed, though the early hopes of the Allies in that connection were for the time being sorely belied. The Emperor Karl, who succeeded the aged Francis Joseph in 1916, had been advised, as the best means of holding the dual monarchy together, to attempt the conversion of A.-H. into a 4-fold kingdom, consisting of A.-H., Yugoslavia, Poland, and Czechoslovakia; and with ostensible liberality of mind he appointed 2 Czechs, Count Czernin and Count Clam-Martinitz, to the posts of foreign and prime minister respectively in Austria. But the task of compromise as between the Pan-Germanists and the Czechs was too great for either minister. Count Clam-Martinitz, with a show of democratic principle, convened the Reichsrat, which had not met since the war began; but far from pacifying the discordant babel of conflicting nationalities, the assembly of deputies merely provided a convenient platform for still more vehement denunciation of the existing regime. Czech and Yugoslav members alike demanded complete independence, and the premier therefore tried to secure the support of the Poles so as to outvote the rest. The ruse was in vain, for the Poles were as insistent on their own unity and independence as the other 2 races. This political situation was aggravated by the formal indictment of the Hapsburg monarchy by the National Council of Czechs, for bringing on the war without the consent of the Czech members of Parliament, and for various crimes against the Czech soldiers and civilian pop. In July 1917 Dr. Trumbitch, the

leader of the Yugoslavs, signed with M. Pashitch, the veteran premier of Serbia, the celebrated declaration of Corfu, under which the signatories agreed to constitute an independent state comprising Serbia, Montenegro, and the S. Slavs of A.-H. The immediate effect of these events was that Clam-Martinitz gave way to a case-hardened bureaucrat, von Seidler; while in Hungary, Count Tisza, the distinguished Hungarian premier, who had been in office since 1913, was manoeuvred out of his post by a rival group of Magyars under Count Julius Andrássy. These changes, of necessity, were intended to harden resistance to democratic reform and demands for independence, but it was clearly realised by the Emperor Karl that the sole chance of saving the dual monarchy, if any, and of solving the intricate racial problems which now agitated his kingdom, lay in concluding immediate peace with the Allies. Hence, all through these earlier months of 1917, he and Count Czernin were secretly corresponding with the Allies for the conclusion of a separate peace; and in seeking to negotiate with the Fr. Gov. through his relative Prince Sixtus Bourbon, Karl even went so far as to offer his support to Fr. claims in Alsace-Lorraine. The morale of A.-H. was clearly weakening. The Allies, never ill-disposed towards A.-H., endeavoured by every means to wean A.-H. from the Ger. alliance, and the U.S.A., though in a state of war with Germany, refrained from declaring war against A.-H. till the end of the year. Thenceforth only Germany continued to cherish any illusions about the permanence of *Mittel-Europa*; for already Bulgaria was tired of the war, and Turkey had become disintegrated in its Asiatic terrors.

The strange vicissitudes of war, however, kept alive, even in A.-H., the external appearance of a favourable military and political situation. The soil of A.-H. was still free of invaders, the treaty of Brest-Litovsk (*q.v.*) and the treaty of Bucharest (*q.v.*) had released her arms from the Russian and Rumanian fronts respectively, and her forces held Montenegro, most of Serbia and Albania, to say nothing of a large part of N.E. Italy. But within the kingdom the disruptive tendencies noticed above were increasing, and, aggravated by the stringent economic situation, the victories or stories of victories availed nothing against starvation and political disillusionment. Marshal Ludendorff, the chief of staff of the Ger. Army headquarters, was baffled; he intimated unreservedly to the Austro-Hungarian Gov. that he would undertake to try to force an issue on the W. front, but that the effort must be conditional on A.-H. overwhelming Italy. Thus A.-H. was induced to make her supreme and disastrous onslaught against Italy, in the hope of getting that power out of the war by force of arms. A combined strategic plan for breaking through on the Asiago plateau from the Tyrol, in conjunction with a grandiose flanking movement on the Piave, so as to

come right down to the very gates of Venice, was launched. The offensive began in mid-June 1918, but at the end of a few days the It. and Brit. (under the command of Gen. Cavan) forces, commanded by Gen. Diaz, who was fully cognisant of the Austro-Hungarian plan, had assumed the counter-offensive and begun the final blow against the armies of A.-H.

Owing to these internal dissensions, the dual monarchy began to show unmistakable signs of collapse long before the defeat of Bulgaria and Turkey and long before the final allied victory on the W. Front. The position vis-à-vis the various constituent nationalities of A.-H. and the monarchy was like that of a couple of aged parents dominated by a numerous and determined progeny. From covert intrigues the innumerable associations of professional men and peasants and mercantile communities soon proceeded to open propaganda; mutinies in the Austro-Hungarian armies and wholesale desertions from the Czechoslovakian, Yugoslavian, and Polish units to the ranks of the Allies were increasing day by day; loyalty to the Hapsburgs had disappeared; national councils of the various subject nationalities were formed in the great allied camps, and in America. In the early part of 1918, the Poles at length threw in their lot with the other nationalities. Hitherto their sympathies had been undecided, owing to the grant to them by von Seidler in 1916 of the status of a separate kingdom; but when, through Germany's insistence, the Polish ter. of Cholm was handed over to the new Ukraine republic, the incensed Poles joined cause with the other separatists, and even Gen. Pilsudski (q.v.), the Polish national hero and friend of A., led so vehement an agitation against the Teuton influence that he was deported to Germany. Gov. by parliament became nugatory and the Reichsrat was summarily closed by Karl on the advice of his premier, von Seidler, early in 1918. Pan-Slavic congresses had been held in Prague and Agram in the winter of 1917-18. These were followed by the historic Congress of Oppressed Nationalities, convened in Rome in Apr. 1918. The Allies now openly espoused the cause of these nationalities, and organised armies of Poles and Czechoslovaks were aligned with the allied troops. At a meeting of the Supreme War Council in Versailles in June, the Brit., Fr., and It. premiers adopted resolutions to the effect that a united and independent Polish state was a *sine qua non* of peace. The complete independence of Czechoslovakia was also formally recognised by the prin. allies and by the U.S.A. in the early autumn.

Karl's officials, however, still endeavoured to maintain a semblance of order in their crumbling dominions. Martial law was proclaimed in Bohemia and Croatia, and a large army was located on the It. front, though with no hope of launching an offensive; while a few units

were dispatched to the W. front in the vain belief that Germany might win the war after all. The last hope of saving the hapless empire disappeared, however, when Gen. Diaz, in the last week of Oct., suddenly delivered a general attack on the whole front from the Piave to the Alps. Within a fortnight, the Austrians were completely overwhelmed; Trent and Trieste were captured, 300,000 Austro-Hungarian prisoners and 5000 guns, together with nearly all their stores, were taken. An Austrian mission then came to the headquarters of Gen. Diaz and offered unconditional surrender, and an armistice was signed on Nov. 3, without awaiting the outcome of the Ger. negotiations. This reverberating disaster to the Austro-Hungarian armies quickly led to the final disruption of the dual monarchy, and on Oct. 18 Czechoslovakia's independence was declared in Paris, and very soon a constitution was drafted for the new republic, with Prof. Masaryk (q.v.) as president, and the first National Assembly was convened in Prague to ratify the new regime. On Oct. 29, the Croats also formally declared the deposition of Karl, and the separation of their new kingdom of Croats, Serbs, and Slovenes, with King Peter of Serbia as king of Yugoslavia. The other nationalities, Transylvania and Bukovina, then in their turn seceded from A. and Hungary respectively, and negotiated for union with Rumania. It was now the turn of Hungary herself to repudiate any continuance of union with the Teutons, and at the end of Oct. a revolution in Budapest resulted in Count Karoly's announcing that the Magyars were freed from further allegiance to Emperor Karl, and would be constituted an independent republic. The dual monarchy was thus, at long last, at an end. The culminating blow to the 'ramshackle empire' was delivered in Vienna, when a mass demonstration of students and artisans called for a democratic administration. Karl relinquished his crown with dignity and bowed to the inevitable; and on Nov. 13 the National Assembly in Vienna formally declared Ger. A. a republic. *Consult* von Glaise-Horstenau, *The Collapse of the Austro-Hungarian Empire*, trans. by Ian F. D. Morrow (1930); Karl Mowak, *The Collapse of Europe* (1924).

*Hist. of A. from 1918.*—The Republic of A. was declared on Nov. 12, 1918, and the gov. assumed by a National Assembly which appointed a provisional Cabinet. Early in 1919, the National Constitutional Assembly, consisting of a single chamber, was elected on the basis of universal and proportional suffrage. Under the Constitution which came into operation in 1920, a president was chosen for 4 years by both Houses. The Legislature comprised an Assembly, the Nationalrat, and a First Chamber, the Bundesrat, the one elected by popular

vote, the other chosen by the provincial diets. The powers of the Bundesrat were advisory.

The political hist. of A. from 1923 was characterised by a bitter struggle between the Socialists and the bourgeoisie. Socialism, as was to be expected, dominated the National Assembly after the overthrow of the dual monarchy and the setting up of a republic. The first chancellor of the republic was the Socialist leader, Dr. Renner, whose domestic policy it was to establish a working agreement between the Social Democrats and the Christian Socialists. In the National Assembly of 1919 the Social Democrats numbered 70, the Christian Socialists 64 members, and the Ger. Nationalists, the Peasants' party, and others less than 30 between them. A working agreement between the 2 leading parties of necessity meant the virtual extinction of the middle classes, and it became an accomplished fact in the ensuing election; for the bourgeois parties obtained only 28 seats shared among 10 political sections, as against 80 Social Democrats and 61 Christian Socialists. Dr. Renner thereupon formed a coalition Gov., and this coalition was preserved when the Gov., which had resigned as a protest against the terms of the peace treaty presented by the Allies, was re-formed under the same chancellor. While the coalition lasted, with the Socialists as the dominant factor in the State, the aspirations of the middle classes, notably towards a *rapprochement* with Germany, were thwarted. In the next ensuing few years, the chief issues were the Tyrol question and the Anschluss, or union with Germany, the two being, in a manner, allied, as both had relation to pro-Ger. sympathies. The Tyrol question concerned the protection of the Ger. minorities in Tyrol—which old Austrian Crown land, after the First World War, was divided between A. and Italy, the N. going to A. and the S. to Italy—and was of considerable importance even outside the 2 countries immediately affected, because upon its solution depended the further question whether A. could retain even so much of the Crown land as was left to her by the peace treaty. The urgency of the other question, together with the growing influence of the bourgeoisie, destroyed the coalition and ranged the Clericals, who, for all practical purposes, might be regarded as representative of the middle classes, against the Socialists, whose powers now gradually declined. In July 1927 serious rioting occurred between the Socialists and the bourgeoisie. In the early part of the year following, the Tyrol question again became acute; but though the palpable intention of Mussolini, the It. dictator, to omit no step that might Italianise the whole Crown land, gave rise to strong and extensive comment in the press of both countries, no constructive measures were adopted to relieve the tension, despite the bitter complaints of the Tyrolese themselves. Towards this infiltration

policy of the Ita., the Clericals, under Chancellor Seipel (Christian Socialist), could, in the nature of things, adopt only an attitude of passive resistance. Seipel argued that while sympathetic towards his fellow countrymen in their oppression by Mussolini, he had no wish to interfere in the internal problems of a neighbouring state. Mussolini denied the charges of oppression, described the benefits conferred by Fascism upon the Tyrolese, and expressed contempt for

E.N.A.

A PEASANT WOMAN OF SOUTHERN  
TYROL IN NATIONAL DRESS

the suggestion that the matter should be referred to the League of Nations. The crucial point with Mussolini was the safeguarding of the Brenner Pass, which, he said, he would defend at all costs. Dr. Seipel, in view of the disparity between the armed forces of the 2 nations, was helpless, but he was nevertheless bitterly assailed, both in Tyrol and in A. generally, for his surrender to Mussolini's threats.

The bloody conflicts in A. in the summer of 1927 were an expression of revolt against the Seipel Gov., and from that point the power of the Socialists generally began to wane; and in the years following there was a further diminution of their strength. A significant outcome of the riots of July 1927 was the formation of the *Heimwehr*, or bourgeois private army, which was designed as a challenge to the activities of the Socialists' armed forces,

which, in times of stress, patrolled Vienna in the hope of overawing the middle classes. Far from achieving that result, a repetition of the July riots was only narrowly averted in the following Oct., when the Socialists and the *Heimwehr* came into collision at Wiener Neustadt, the recognised headquarters of the former force. The Socialists, as might be expected, accused the bourgeoisie of using the *Heimwehr* as a means of coercing them to the will of the middle classes, and more might have come of this feeling but for the fact that in 1928 all shades of political opinion in A. were united or not unfavourable towards the policy of Anschluss or the movement for a union between A. and Germany. Dr. Seipel, with true statesmanship, opposed such a union in his public utterances; but from the fact that he abstained from entering into any economic agreement with any of the succession states which did not include Germany, afforded evidence of his real sympathies. Towards the end of 1931 the Austrian Gov., which had been in financial straits, tried to form a *zollverein* with Germany, but the hostility of the Fr. Gov. frustrated the attempt. In fact the attempt had been made mainly at the instigation of Nazi politicians, both in Germany and in A., but when Dr. Dollfuss became chancellor of A. he strongly defended Austrian integrity and independence against the pretensions of the Nazis. He went to Rome, concluded a concordat with the pope, and seems to have found some support from Mussolini. But in A. his opposition to the Social Democratic party identified him in the eyes of his opponents with Fascism, so that he was isolated both from the Austrian Nazis as not being extreme enough, and from the whole of the Socialist elements as being a man of dictatorial aspirations, though he might well have won the full support of the Socialists had he given reasonable guarantees of constitutionalism. In Feb. 1934 the Socialists rose in revolt against the *Heimwehr* Fascists under Prince Stahrenberg, and for several days there was civil war in Vienna and in some of the larger provincial towns. The rising was crushed with heavy loss of life to the Socialists, and their leaders were executed; but Dollfuss, who had suppressed the rising, now forfeited much of the support he had previously gained in foreign countries for his resistance to the Ger. Nazis, besides driving the Socialists into a conspiracy with the Austrian Nazis to overthrow his gov. Stringent laws against political violence were now introduced, and some of the Nazi conspirators were imprisoned, with the result that, in July, there was a sudden Nazi revolt, and Dollfuss was assassinated, and succeeded in office by Kurt Schuschnigg. After 1934 Austrian independence was virtually surrendered, inasmuch as Austrian policy was perforce assimilated to that of Germany under an agreement with the Nazi Gov. of that country. Finally, in 1938, the president was forced to resign, the chancellor,

Schuschnigg, was put into prison; the army was incorporated with that of Germany; diplomatic representation abroad was taken over by Germany; the Austrian Diet was dissolved; the Ger. mark substituted for the Austrian schilling; and the country subordinated to the Reich and Hitler's dictatorship. Thus was A. annexed by Germany without resistance and the Anschluss had become an accomplished fact.

There was probably no determined or well-organised opposition to the Ger. occupation among the Austrians, though it was evident that by 1943 the attitude of the people generally was anti-Ger. Sabotage in agriculture was a prominent manifestation of that attitude. Then came opposition by industrial workers, who suffered heavy losses at the hands of S.S. execution squads. At St. Pölten strikes were followed by such serious riots that Himmler himself was compelled to intervene. But A. was useful to Germany as an air-raid shelter, and well-to-do Gers. evacuated their families to A. even before the mass evacuation to the Alpine dists. Hence A. suffered from a shortage of houses and food, and in 1943 the pop. was 10,000,000 compared with 7,000,000 before the war. At the Moscow Conference (Oct. 1943) Great Britain, America, and Russia pledged themselves to restore the independence of A. The armed forces of A. were enrolled with those of Germany, and used throughout the campaign against Russia; but in 1943 the Russian armies invaded A. and captured Vienna (Apr. 13) (for the campaign in Austria see EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR). On Apr. 29, 1945, a provisional gov. was set up in Vienna by the Russian authorities with the object of restoring an independent Austrian republic. After the cessation of hostilities various zones of A. were occupied by allied forces and administrations: the N.E. or Russian zone included Lower A. (excluding Vienna), that part of Upper A. lying on the l. b. of the Danube, and Burgenland; the N.W. (Amer.) zone, included Salzburg prov. and the rest of Upper A.; the W. (Fr.) zone, included Tyrol and Vorarlberg; and the S. (Brit.) zone included Carinthia (including Ost-Tirol) and Styria (excluding Burgenland). Vienna, within the 1937 boundaries of the city, was jointly occupied by armed forces of the 4 allied powers and its administration directed by an inter-allied governing authority of commandants appointed by the respective commanders-in-chief. At a meeting in Sept. 1945 the allied council of foreign ministers decided that the frontier of A. would not be changed save for minor rectifications, and this decision therefore barred the restoration to A. of the S. Tyrol, of which she was deprived in 1919, unjustly in the opinion of some, unavoidably in the view of most. Thrice in 1947 the major allies failed to agree about a peace treaty and A. remained (1948) divided into 4 zones of occupation. The chief obstacle to a treaty is a dispute over

the interpretation of the phrase 'Ger. assets' to which Russia is entitled under the Potsdam Agreement (q.v.); while Yugoslavia, through Marshal Tito, adhered to a claim for a large part of Carinthia.

**Religion.** Religious liberty is a fundamental law of the republic, and the principle is embodied in the treaty of St. Germain, 1919. There are approximately 6,000,000 Catholics, 200,000 Protestants, and nearly 200,000 Jews. The Catholic Church has 2 archbishops and 4 bishoprics.

**Austria, Don Juan d',** see JOHN OF AUSTRIA.

**Austria, Lower,** a prov. of A., which, before the First World War, was a Crown land, forming the E. half of the archduchy of A. Area 7452 sq. m. From 1938 to 1945 it was part of Germany. Pop. 1,521,000. It is traversed by the Danube, to the N. of which lies a tableland, while to the S. of the riv. is a mountainous region occupied by offshoots of the E. Alps. A good deal of the land is under forest, but prior to 1939 agriculture, vine-growing, and cattle-rearing were extensively carried on, and there were large manufs. of tobacco, glass, cottons, haberdashery, wine, chemicals, sugar, leather, etc. Sawmilling and weaving too are important industries. Largest tn., Wiener Neustadt. The old cap., Vienna, is now a separate prov.

**Austria, Upper,** a prov. of A., which, before the First World War was a Crown land of A., forming the W. half of the archduchy of A. It, too, became a part of the Ger. Itch. Area 4631 sq. m. Pop. 920,000. It is traversed from N.W. to S.E. by the Danube, to the N. of which lie the tablelands of the Böhmerwald, while to the S. is a mountainous region of the N. Alps. There is a large proportion of forest land. The chief industry is agriculture, all the cereals except maize, hay, fruit, etc., being largely produced. The climate is too cold to be altogether favourable for vine-growing. The mineral wealth includes salt, lignite, gypsum, whetstones, and granite. Cattle are reared in large quantities. The chief manufs. are steelware, textiles, rubber, leather, paper, and glass; and brewing and distilling form important industries. Cap., Linz; other tns., Steyr, Wels, and Gmunden.

**Autarky** (Gk. *αὐταρκεία*, economic self-sufficiency). The idea that a country should produce everything it required and

cut down foreign imported goods gained considerable impetus after the First World War. Eire and Italy are 2 outstanding instances, but in neither case was the experiment a success. Hitler's 'new order' (1941) stultified the efforts of other European countries in this direction. The movement for A. in Nazi Germany itself, however, provided the best instance, being based primarily on military considerations in the hope of making the country immune from the rigours of blockade. Autarchy (Gk. *αὐταρχία*) means the gov. of a single person, or absolutism.

**Auteuil**, dist. of Paris, on the r. b. of the Seine, close to the Bois de Boulogne. It was formerly a vil. in the dept. of Seine. Molière lived here, and the place has numerous literary associations.

**Autoun, or Autun, Jehan d'** (1466–1527), Fr. poet and historian, was a native of Beaurepaire, and a Benedictine monk. He was historiographer to Louis XII., the subject of his chief work, *Chronique du roi Louis XII.* Amongst his poetical works is a translation of Ovid's *Metamorphoses*.

**Authorised Version (of the Bible)**, the version of the Bible into Eng., made at the suggestion of James I. by 47 learned divines. It took 3 years—viz. from 1607 to 1610—to execute, and was first pub. in 1611. It is the only one 'appointed to be read in churches,' and until fairly recently its title-page contained the words 'printed by authority.' It has held its place so long more by its own merits than by the artificial support of law, and while there are numerous minor defects, which have been corrected in the R.V. of the N.T., it remains, in all essential respects, the same Bible which for nearly 3 centuries has been the most potent factor in the spiritual education of the Eng.-speaking race. See also BIBLE, THE.

**Authors, Playwrights, and Composers, The Incorporated Society of**, was founded by Sir Walter Besant and other literary men in 1883 for the protection of writers in the fields of general literature, drama, and music. It advises members with regard to the publication of their works, and in the interests of its subscribers keeps a vigilant outlook on publishers in regard to matters affecting payment, the drawing up of agreements, etc. In recent years the inventions of the gramophone, the cinema, and broadcasting have enormously extended the work of the society. There is an agreement between the society and the B.B.C. as to the fees payable for broadcasting its members' work. The society has now about 4000 members, and it publishes a quarterly jour. called *The Author*. The address of the secretary is 84 Drayton Gardens, London, S.W.10. In the U.S.A. the Authors' League of America, Incorporated, founded in 1912, renders its members similar services.

**Authors' League of America**, founded in 1912, opens its membership to authors, artists, playwrights, and writers of scenarios for the films, provided that they make a regular profession of their

work and are not merely unpaid amateurs. The league gives helpful advice to its members on the placing of their works, advises them as to the proper rates of remuneration, and assists them in legal difficulties.

**Auto**, the name of various types of religious and morality plays popular in Spain and Portugal from the twelfth century onwards, and still performed in the latter country. They reached their highest perfection in the *As. sacramentales* of Lope de Vega (1562-1835) and Calderón (1600-81). The former was the author of 400 *As*. These plays were generally represented on days of religious festivals, the feast of Corpus Christi being especially chosen for such performances. They were mostly of an allegorical nature, the leading characters being personifications of vices, virtues, etc. They were frequently produced with great elaboration.

**Autobiography**, see **BIOGRAPHY**.

**Autocars**, see **MOTOR CARS AND MOTOR CYCLES**.

**Autochthones**, the Gk. equivalent of the Lat. term *aborigines*, was applied to the first inhab. of a dist. as distinct from later comers. In the Gk. mythology various dists. had their own *As*., or first parents, who were supposed to have sprung from the rocks and trees.

**Autoclave**, an air-tight heating vessel, on the principle of Papin's digester, made of iron or steel, usually supplied with a safety-valve, in which substances can be heated above their boiling-points under pressure. Various types of *A.* are used respectively for sterilisation and chemical and cooking purposes. In chem. *As.* are used to produce reactions under great pressure.

**Autocracy**, see **GOVERNMENT**.

**Auto-da-fé** (act of faith), the ceremony of the Inquisition in Spain and Portugal at which heretics were burnt after a public procession and service in the church. All Saints' Day was a favourite day for the *auto-da-fé*. An *auto-da-fé* was celebrated in Mexico as late as 1815.

**Autogiro**, a heavier-than-air craft with freely rotating wings. Although resembling a helicopter (*q.v.*) in its general appearance the *A.*, invented by Don Juan de la Cierva, is an entirely original conception, and was the first practical rotary-winged aircraft. The aircraft consists of a fuselage, engine, and tail unit similar to that of a conventional aeroplane with rotor blades hinged to a pylon above the fuselage. These rotor blades are narrow-chord wings which obtain their lift (see **AEROPLANE**) by the air speed of their rotation. The blades are hinged, so that they can rise and fall considerably, and have a restricted lateral movement so that they are free to take up different positions to suit their relative air speeds and the forces acting on them. The essential feature of the *A.* is that, once it has been started and the machine is airborne, the rotor is not engine-driven, but is kept rotating by the air forces on the blades like the sails of a windmill.

The earliest *As.* (c. 1924) had cable-braced rotors which were started by a

rope wound round the hub and pulled by sev. men, the aircraft thereafter being taxied round until the rotor speed was sufficient for take-off. Later, with the development of aircraft brakes, the rotor was started by deflecting the air from the airscrew of the engine up into it by tilting the tail plane while running up. Then the engine was geared to the rotor for

FIG. 1. THE ORIGINAL CIERVA 'DYNAMIC-START' AUTOGIRO

It ascends vertically through the energy stored in the rotor.

starting purposes only. In 1934 Cierva invented a system whereby the rotor is held at a low incidence (i.e. negative lift) and turned by the engine at a higher speed than that necessary for take-off, then a control disconnects the engine from the rotor, and its incidence is increased so that the energy in the rotor is converted into lift, making the machine jump off the ground.

FIG. 2. A FRENCH CABIN AUTOGIRO

In this aircraft the air-cooled engine is behind the cabin, and drives the airscrew by a shaft. Weight distribution is improved by this system.

Although the *A.* was the invention of Cierva, and he did all the pioneer work on it, the principles were developed in America (where sev. successful types have been flown), in Britain by other designers, and also on the Continent. Prior to the 1939-45 war the *A.* had become a practical proposition, and the experience gained in actual flight with these autogiro machines laid the foundation for the practical development of the helicopter. The *A.* still has a place in aviation, since it is easier to fly than the helicopter, and its maintenance is much simpler.

**Autograph**, something written in a person's own hand. The term is applied both to mere signatures and to documents of any description. *A.* hunters have become one of the accepted nuisances of modern civilisation, but they may claim to be carrying on a custom which seems

to have its origin as early as the fourteenth century, in the *Liber Amicorum*, a kind of visitors' book. In the sixteenth century were formed such famous collections of As. as those of Loménie de Brienne and Lacroix du Maine. Evidence of a craze for the signatures of celebrities is afforded by a number of albums of the time of Elizabeth and James I. now in the Brit. Museum. Amongst high prices which have been paid for As. of famous people are the 300 guineas paid by the Brit. Museum in 1858 for a Shakespeare signature, and the £85 for a letter of Defoe, 1887. Many collections of A. reproductions have been pub., notably Nichols's *Autographs of Royal, Noble, Learned, and Remarkable Personages*, 1829; Delpech's *French Autographs*, 1832; *Isographie des hommes célèbres*, Paris, 1843; and *Facsimiles of Royal, Historical, Literary, and other Autographs in the British Museum*, 1896-1900. See also Günther and Schulz's *Handbuch für Autographensammler*, 1856; Scott and Davey's *Guide to the Collector of Historical Documents*, etc., 1891; and Broadley's *Autographs*, 1910. The relation between As. and character has been ingeniously treated in Poe's *Chapter on Autography*.

**Auto-intoxication**, the condition subsequent upon the production within the body of poisons due to perverted functions of organs or tissues. As all the tissues of the body are mutually interdependent, defect in 1 part is followed by widespread effects, and the symptoms of A.-I. are accordingly very varied. Among the most common types are uræmia, or the headache and drowsiness consequent upon excess of urea in the blood; Graves's disease, said to be due to excess of thyroid secretion; the delirium and coma of diabetes, caused by the saturation of the sodium salts of the blood by acetoacetic and oxybutyric acids, the products of imperfect proteid metabolism; the degenerative changes in the spinal cord in pernicious anemia, due to absorption of poisons from the alimentary canal; some forms of acute insanity, caused by defective metabolism or physiological instability, or both; and general symptoms produced by the products of fatigue or indigestion.

**Autolyus**: 1. The son of Hermes, and grandfather of Ulysses, was notorious for the cunning with which he stole his neighbours' flocks. He was at last detected by Sisyphus, who marked his sheep under the feet. Shakespeare's A. in the *Winter's Tale*, possesses similar characteristics. 2. A. of Pitane, an early Gk. writer on mathematics and astronomy (fl. fourth century B.C.), who is reputed to have taught Arcesilaus. He wrote 2 treatises of little value on the motion of the sphere and on the rising and setting of the fixed stars.

**Automatic Action**, a physiological and psychological term used to denote all non-reflex actions which are not the result of conscious endeavour. Actions may be purely A. when they are performed while the attention is fixed altogether upon

another object, or relative, when the details of an action are performed unconsciously while the attention is fixed upon the end or some other part of that action. Sleep-walking is one of the most common forms of A. A., and many of the phenomena of divination, spiritualism, etc., may be explained on this basis. A. As. are distinguished from reflex actions by being produced by an internal instead of an external impulse, but in practice the two are frequently indistinguishable.

**Automatic Machines**, a term generally applied to machines which, when once set in action and provided with necessary motive power, continue to work without further human intervention. Many types of wood-working and metal-shaping machines, conveyors, weighing appliances, etc., are constructed on this principle: A. voting machines, A. change machines, etc., carry out the same idea on a smaller scale.

**Automatism**, the power of self-movement without external stimulus as exhibited in life of the cell or organism, and in the will of man. The term is also applied to the philosophical doctrine that all the actions of living beings, including man, are physiological in their origin, and are not the effect of volition, which is merely an accompaniment of the action.

**Automaton**, a machine that imitates the actions of men and animals. The term is derived from the Gk., and signifies something which moves of its own accord. The first recorded A. seems to have been the wooden pigeon made by Archytas of Tarentum, 400 B.C. It is probable that many of the apparent miracles which from the earliest times have imposed upon the credulous are to be attributed to this agency. Among the reputed automata of the Middle Ages mention must be made of the fly made by Regiomontanus, which came back to his hand after a flight round the room, and his eagle, which flew round the Emperor Maximilian during his entry into Nuremberg; also the speaking brass head of Roger Bacon and the figure which acted as doorkeeper to Albertus Magnus. In the first half of the eighteenth century 3 remarkably ingenious automata were constructed by the Fr. mechanician Vaucanson. His flute-player, exhibited in Paris in 1738, was a remarkable imitation, the player placing his lips to the instrument and its fingers on the stops. The second was a tambourine player, and the third a duck that digested its food, in addition to eating, swimming, and drinking. Later came the writing A. of Knauss, exhibited at Vienna, and the trumpeters of Kaufmann and Maelzel. In 1851 a piping bullfinch attracted considerable attention at the London Exhibition. Amongst modern contrivances the place of honour must be given to Maskebyne's 2 figures, 'Psycho' and 'Zoe'. The former, first exhibited in 1875, played whist and worked out arithmetical problems, while 'Zoe' would draw the portrait of any one selected from a list of

200 persons of note. Kempelen's chess-player, introduced to London in 1783 as an A., was in reality worked by a human being skillfully concealed inside.

**Automobile**, see MOTOR CARS AND MOTOR CYCLES.

**Autonomy**, in its political sense denotes the polity of self-gov. or a self-governing community. Varying degrees of A. are exhibited by the Brit. colonies and dependencies, while a more perfect instance, perhaps, is afforded by the powers of independent action possessed by the anct. Gk. city communities. In Kant's philosophical use of the term it expresses the principle that no law without a moral foundation can be held as binding on the conscience.

**Autoplasty** (Gk. αὐτός, self, πλαστός, formed) is the repair of wounds or diseased parts of the flesh by means of tissues taken from other parts of the same body.

**Autopsy**, see POST-MORTEM EXAMINATION.

**Autotype**, see under PHOTOGRAPHY.

**Autran, Joseph** (1813-77), Fr. poet and dramatist, gained the Montyon prize of the Fr. Academy with his tragedy *La Pille d'Eschyle*, and was elected to the Academy in 1868. Amongst his vols. of verse are *La Mer*, 1835; *Miliana*, 1842; *Épîtres rustiques*, 1862; and *Sonnets capricieux*, 1873, all of which are distinguished by purity of form and beauty of rhythm.

**Autrefois Acquit and Autrefois Convict**, pleas by an accused person that he had been previously acquitted or convicted of the same crime of which he is now accused. The plea only holds good in cases of acquittal or conviction by a court of competent jurisdiction.

**Autumn**, in a popular sense, comprises the months of Sept., Oct., and Nov. In the N. hemisphere A. is astronomically the period between the autumnal equinox, when the sun enters the zodiacal sign of Libra (Sept. 22), and the winter solstice (Dec. 21). It corresponds to the springtime of the S. hemisphere.

**Autun**, a tn. and episcopal see in dist. of same name, dept. of Saône-et-Loire, France, on the Arroux, 31 m. N.W. of Chalon by rail and 55 m. N.N.W. of Mâcon. It has important paper-making, textile, and tanning industries. A. has been thought by some to occupy the site of Bibracte, at the time of Caesar's invasion of Gaul the most important city of the Ædul. Under the Romans the name was changed to Augustodunum, and the city became famous for its school of rhetoric. After being destroyed in A.D. 270 by Tetricus and rebuilt by Constantine the Great, it became a flourishing city, only to be sacked and burned in turn by the Vandals (406), the Burgundians (414), the Huns (451), and the Franks (534). It suffered a similar fate from the Arabs in 739, and from the Normans in 1895. It was burned by the Eng. in 1379. A. possesses many Rom. remains, including a theatre and a pyramid. The cathedral, dating from the eleventh and twelfth centuries, has a fine fifteenth-century spire. Pop. 13,856.

**Autun, Jehan d'**, see AUTHON.

**Auvergne**, a dist. of Central France, formerly a separate prov., now forms the depts. of Cantal and Puy-de-Dôme, with the N.W. portion of Haute-Loire. Upper A. is rugged and mountainous, with a climate subject to great extremes, while Lower A. is more level and contains some remarkably fertile dists. There are rich mineral deposits in the mountainous region, which also contains many mineral springs. The prov. was united to France in 1531, after passing through the hands of many families. The name is derived from the early inhab., the Arverni, who offered stern opposition to Caesar.

**Auvigny, Jean du Castro d'** (1712-43), Fr. writer and soldier, killed at the battle of Dettingen. He was the author of *Mémoires de Madame de Barnevelt* (in collaboration), 1732; *Histoire de la Ville de Paris*, 1735; and the first 8 vols. of *Les des hommes illustres de la France*, 1839-57.

**Aux Cayes**, see CAYES, LES.

**Auxerre**, cap. tn. of dept. of Yonne, France, 110 m. S.E. of Paris, on the R. Yonne. It has manufs. of cloth and chemicals, and produces wine. The fine Gothic cathedral dates partly from the thirteenth century. Other notable buildings are the prefecture, formerly the bishop's palace, and the abbey of St. Germain, now used as a school. Pop. 24,300.

**Auxiliary Territorial Service**, the Brit. women's army corps formed during the Second World War, but planned as early as 1938. By Feb. 1941 some 40,000 women had been enlisted; by Jan. 1942 there were nearly 100,000; and by 1944 some 212,000. Of the women's armies in this war they were the most numerous body. The chief controller had the equivalent army rank of a major-general; the other ranks, with their equivalent army ranks, were: senior controller (brigadier), controller (colonel), chief commandant (lieut.-col.), senior commandant (major), company commander (capt.), junior commander (lieut.), company assistant (second lieut.), senior leader (warrant officer class II.), section leader (sergt.), sub-leader (corp.), chief volunteer (lance-corp.), volunteer (private). The women were not directly conscripted, but enlisted through the directive machinery of the Ministry of Labour and National Service. The A.T.S. served in France, Canada, Germany, the W. Indies, Palestine, Egypt, N. Africa, E. Africa, Italy, and Washington. Some 3000 women qualified for the Africa Star. Twenty thousand worked in cookhouses; 30,000 were office, mess, and telephone orderlies; 14,000 were drivers; 10,000, postal workers; 9000, storowomen. Others served as butchers and bakers, ammunition examiners, hairdressers, welders, cine projectionists, camouflage modellers, chiropodists, and military policewomen. Others, specially trained, were on operational work as plotters, spotters, predictionists, and in other work as members of gun crews.

The girls of the A.T.S. endured many of the perils of war side by side with the soldier. They were subject to some at least of the military laws, in a way that the W.R.N.S., for instance, in relation to the Navy, were not subject. The name of the corps was changed in 1948 to the Women's Royal Army Corps.

**Auxiliary Verbs** are verbs which are used with other verbs to help to form the voices, moods, or tenses of the latter. When so used they lose practically all their original signification. Such verbs are 'have,' 'may,' 'must,' etc., in Eng.; 'haben,' 'werden,' in Ger.; and 'être,' 'avoir,' in French.

**Auximum**, see OSIMO.

**Auxonne**, fort. tn., dept. of Côte-d'Or, France, on the Saône, 20 m. S.E. of Dijon. Has cloth and other manufs. Noteworthy buildings are the Renaissance château and the church of Notre-Dame (fourteenth century). Pop. 5000.

**Auzout**, Adrien (1630-91), Fr. astronomer, and inventor of the micrometer for measuring the apparent diameters of the heavenly bodies. He was the author of *Traité du micromètre*, 1667; *Lettres sur les grandes lunettes*, and various scientific memoirs.

**Ava**, a ruined city, Burma, on the l. b. of the Irawadi, 6 m. S.W. of Amarapura. From 1364 to 1740 it was the cap. of Burma, and again from 1822 to 1838. It was destroyed by an earthquake in 1839.

**Ava**, see DUFFERIN and AVA.

**Avadavat**, see AMADAVAT.

**Avalanche** (Fr. *avalée*, to descend), a mass of ice or snow, mixed sometimes with earth, which becomes loosened from a mountain slope and dashes into the valleys, sometimes causing great destruction. There are various kinds—drift or powder As., composed of dry powdering snow, and blown into the valley like a cloud; As. caused by the melting of the snow in spring, in which case the ground itself becomes loose, and is swept down with trees and rocks; and ice As., consisting of frozen snow and ice, sweeping down from the glaciers, most frequently during the summer months. In 1827 no fewer than 88 people perished in an A. which swept away half the Alpine vil. of Bliel.

**Avalite**, a silicate found in green scales at the Mt. Avala mines in Belgrade, where mercury is found.

**Avallon** (auct. Aballo), tn., dept. of Yonne, France, 30 m. S.E. of Auxerre, on the R. Cousin. The tn. has a church dating from the twelfth century. Pop. 6000.

**Avalon** (Apple-green Island), the paradise of Celtic mythology. Tennyson's 'island-valley of Avilion. Some have thought to identify the A. of Arthurian legend with Glastonbury. A. contained a mystic fountain and the magic apples, and was the Valhalla of the Celtic heroes.

**Avalon**, peninsula, Newfoundland, forming S.E. portion of the is. In it stands the cap., St. John's.

**Avalos**, Fernando Francesco de, Marquis of Pescara, see PESCARA.

**Avanturine**, or **Aventurine**, a glass-like

variety of quartz, containing numerous spangles of brown mica. It is most common in the Ural Mts., but is also found in France, Spain, Austria, and India. There is also artificial A., consisting of glass into which red spangles of copper are introduced. A. is much used for the handles of umbrellas, brooches, etc.

**Avanzi**, Jacopo di Paolo d', It. painter of the fourteenth century. He is supposed to have been a pupil of both Franco Bolognese and Vitale delle Madonne. Only a few of his works remain. He painted the frescoes of the chapel of San Felice, in the church of Sant' Antonio at Padua, 1376; frescoes in the old church of the Madonna di Mezzarata, with Simone da Bologna; 2 Triumphs in a public hall in Verona; and some work in the chapel of San Giorgio in the church of Sant' Antonio at Padua, with Aldighieri da Zevio. Two pictures in the gallery of Bologna are also attributed to him.

**Avaris**, a city of anct. Egypt, on the isthmus of Suez, for long the centre of operations of the shepherd-kings. It has been identified with the Heropolis of the Gks.

**Avars**, a warlike people of Tatar origin who settled on the steppes of the Don and in the neighbourhood of the Caucasus. They penetrated as far as Dacia and served in the army of the Emperor Justinian, A.D. 558. Later they took possession of Panonnia, and in 566 joined the Longobards against the Goths. From this time until the close of the first half of the seventh century they greatly extended their dominion over the Bulgarians and the Slav peoples of the Danube, until, in A.D. 640, they were driven out of Dalmatia. Their power was finally destroyed by Charlemagne in 796, and as a separate race they seem to have disappeared shortly afterwards.

**Avasaksa**, a mt. of Finland, near Tornea, forming an excellent vantage ground for witnessing the phenomenon of the midnight sun.

**Avatar** (Sanskrit *avatāra*, descent) signifies in Hindu mythology the descent of a deity to earth in a visible form. The 10 incarnations of Vishnu are notable As.

**Avatcha Bay**, a large basin or the E. coast of Kamchatka, between Cape Gavaria and Areposki, the best harbour of the whole peninsula. The entrance, which varies in width from 4 m. to 1½ m., and is surrounded by high land, leads into a larger basin with a circumference of 30 m., in which are the 3 harbours of Radkoveena, Petropavlovsk, and Tarelski. The bottom of the bay is formed of a soft mud, and is level, whilst the depth varies from 12 to 14 fathoms. Fish are abundant, and the surrounding land is well wooded; the bay is generally frozen over in the winter. The R. A., at the head of the bay, is very rapid, and though a quarter of a m. broad at the entrance, it soon becomes narrow, and is navigable only by canoes. The light-house at the N.E. end of the entrance is situate in 52° 52' N. lat. and 158° 47' E. long.

**Avaugour, Pierre Dubois, Baron d'** (d. 1864). A governor-general of Canada, 1661-63. Was previously Fr. ambassador in Sweden. He quarrelled with Bishop Laval over the question of the sale of brandy to the Indians, A. regarding the traffic as commercially beneficial to Canada, and especially to the fur traders; but Laval succeeded in getting him recalled. It was during A.'s tenure that Groselliers and Radisson, Fr. fur traders, explored the country N. of Lake Superior, and in this matter, too, A. quarrelled, demanding part of the profits of the expedition. His report on Quebec shows that he was the first to point out the advisability of the Fr. seizing Lake Champlain and the Hudson R. as far down as Manhattan, so as to possess an open-water harbour in the S. In his time, too, the Iroquois were subdued (see ARGENSON), the colony making good progress thereafter. A. was killed in Hungary in a campaign against the Turks.

**Avebury, a vil. and par. in Wiltshire**, which is remarkable as the site of what appears to have been one of the largest pre-Celtic or Druidical temples in Europe. About 650 blocks of stone seem to have been placed in circles and rows. These stones, of which few remain, are of various sizes, from 5 to 20 ft. high and 3 to 12 ft. thick. There is a great variance of opinion as to the time when and the purpose for which this singular work was constructed, but it is thought that it was built over 3500 years ago, in the first phase of the Early Bronze Age. With its outer ring of massive stones enclosing over 28 ac., and its bank,  $\frac{1}{2}$  m. in circumference, rising originally 50 ft. above the bottom of the ditch, it is the most impressive of its kind in Europe, and the mightiest effort of prehistoric man. Yet for centuries this heritage was allowed to decay, and the megaliths were treated as quarries for building stone, while in the Middle Ages many were buried. Much is owed to Mr. Alexander Keiller, the owner of the site and director of the Morven Institute of Archaeological Research, for the work of preservation and restoration which was carried out in co-operation with the Ministry of Works. In 1925-26 Mr. Keiller bought Windmill Hill,  $1\frac{1}{2}$  m. N.W. of A., which hill, in his opinion, was of even greater significance than A. itself, and from 1929 he and his staff excavated the site. In 1938 the A. museum was opened in the eighteenth-century stables of the manor house. Previously, in 1935, the Office of Works first envisaged the preservation of A. and its surroundings in a planning scheme; but further anxieties for its preservation were set at rest in 1943, when the National Trust acquired 930 ac. of land at A. for the nation. The purchase from Mr. Keiller included the greater part of the group of prehistoric remains, the neolithic site of Windmill Hill, and the manor farm of 650 ac.

**Avebury, Sir John Lubbock, first Baron** (1834-1913). He was educated at Eton, finishing his education at home. As a politician he represented Maidstone in parliament from 1870 to 1880. The

different presidential chairs held by him at various times embrace those of Entomological, Ethnological, Linnean, Anthropological, Ray, Statistical, African, Antiquaries, Royal Microscopic, Sociological, Prehistoric, Archaeological, International Library, Societies and Institutions. His democratic tendencies were shown by his positions as principal of the London Working Men's College, and president of the London Univ. Extension Society. Among his voluminous works are *Prehistoric Times*, 1865; *On Origin and Metamorphoses of Insects*, 1874; *The Pleasures of Life*, 1887-89; *On the Senses and Instincts of Animals*, 1888; *The Use of Life*, 1894; *The Scenery of Switzerland*, 1896; *Free Trade*, 1902; and *Notes on the Life History of British Flowering Plants*, 1905. Better known, popularly, as the founder of Aug. bank holiday. Life, including bibliography, by H. G. Hutchinson, 1914.

**Aveiro**, chief tn. in the dist. of the same name in Portugal on the banks of the R. Vouga. It has earthenware factories, and salt is obtained from the lagoons about the tn.; besides this a trade in oil, wine, and oranges and a large fishing industry are carried on. It contains a cathedral, and is the see of a bishop. Pop. (dist.) 382,000, (tn.) 31,000.

**Avella**, the Rom. Abella, is an It. tn. in the prov. of Campania, situated 15 m. from Naples; pop. 4000.

**Avellaneda**, a manufacturing tn. on the R. Riachuelo, Argentine, named after Nicholas A. (q.v.). Pop. 234,000.

**Avellaneda, Nicolás** (1830-85), an Argentine statesman, b. at Tucuman. His family were exiled from the country, but after the fall of Rosas in 1852 A. returned. He became a member of Congress in 1860, prof. of political economy in 1861, and was minister of public instruction in 1868. During his tenure of office the country made remarkable progress, and in 1874 he was elected president of the republic. He put down the insurrection of Mibie in 1875, and in the same year sent an expedition against the Indians. He was superseded in power by Gen. Roca on Oct. 12, 1880.

**Avellino**, the cap. of the It. prov. of the same name, 30 m. from Naples. It is built in a valley by the R. Sabato. Three m. to the N. is the sanctuary of Monte Vergine, built in the eleventh century, and once a rich Benedictine abbey. The prov. abounds with nut-trees, whose fruit was much esteemed by the Romans under the name of *nux Avellana*. Pop. 25,694.

**Ave Maria**, the first 2 words of a Lat. prayer to the Virgin Mary used by Rom. Catholics. The first part is the salutation of the angel to Mary on her conception (Luke i. 28). The second part is an entreaty to the Virgin to pray for the salvation of sinners now and after death. The prayer usually follows the *Pater Noster* or Lord's Prayer.

**Avenpace**, or Avenpace, an Arabian philosopher and poet, of whose life we know little save that he was b. at Saragosa. He was some time a physician at Seville; d. in 1138. Among his works are treatises on the soul, on solitary life,

on logic, and on natural science. Many of these are unfinished.

**Avena**, the name of a genus of grasses which has deeply furrowed grains enclosed in glumes adherent to them. The genus contains 50 widely distributed species, of which the most important is the *A. sativa*, or oat.

**Avenches**, a vil. of Switzerland situated in a detached part of the Vaud. Formerly it was on the lake of Morat, but now it is  $1\frac{1}{2}$  m. from the present shore. It was sacked by the Huns in the year 447. Pop. 1600.

**Avens** are plants of the order Rosaceæ, related to the potentilla, strawberry, blackberry, and raspberry. The species *Geum rivale*, water A., and *G. urbanum*, wood A., grow in woods and damp fields of Britain. The mt. A., or *Dryas octopetala*, is an Alpine shrub.

**Aventail**, the flap or movable front of the helmet in old armour.

**Aventine Hill**, one of the 7 hills of Rome, lying to the E. of the Tiber. It was included in the city of Servius Tullius, and a settlement of the plebs was made upon it in 455 B.C. The anct. buildings formerly upon it have completely vanished.

**Aventinus** (1477-1534), a name used by Johann Turmair, the author of the *Annales Boiorum*. He was a native of Abensberg, whose Lat. name he adopted. He has been called the Bavarian Herodotus, and his work, *Annales Boiorum*, is a hist. of Bavaria of much fame. Part of this work was suppressed on account of its reflection upon the Rom. Catholics, but a more complete ed. was produced in 1580.

**Aventurine**, see AVANTURINE.

**Avenzoar**, or **Aven Zohar**, the name of 2 Arabian physicians who lived in Spain in the twelfth century. 1. Abumeron Avenzoar, or, in full, Abu Mervan Mohammed ben Abdal-Malik ben Zohar. According to the Arabian author Ebn Alabari, he was a native of Seville; lived as physician at the court of Ibrahim ben Yussuf ben Tashfin, the Almoravide sovereign of Morocco and Cordova, and d. in 1162. He wrote sev. works on medicine, the most important of which is the *Taisir*, or Introduction. Lat. translations of his other works are *De Cura Calculi* (Venice, 1497), and *De Itegrimine Sanitatis* (Basle, 1618). 2. The younger A., who is also named Rhasis, was his son. He was physician to Mansur, the Almoravide sovereign of Morocco, and d. in Morocco, 1197.

**Average**: 1. In the science of numbers an A. is a sum or quantity intermediate to a number of sums or quantities, which is obtained by adding the sums or quantities together and dividing by the number; thus, if 5 sacks contain 6, 8, 11, 12, and 13 lb. respectively, the A. weight will be  $\frac{6+8+11+12+13}{5} = \frac{50}{5} = 10$  lb. The A.

of such a kind is an arithmetical mean. But in ascertaining As. which are to be of value in statistical or for other scientific purposes, such arithmetical As. are not sufficient, and attention must be paid to

the relative importance to each other of the quantities thus added together, and as it is called by statisticians, the 'weighted' rather than the 'arithmetical' mean should be sought for. A simple example may be given. A offers to sell to B 3 plantations of trees, which he averages before counting the trees in each plantation at 2s. per tree for the first, 1s. 6d. for the second, and 1s. for the third. The arithmetical A. or mean price would be  $4s. 6d. \div 3 = 1s. 6d.$  On felling the trees in each plantation the numbers work out thus: 200 in the first, 100 in the second, 300 in the third; the weighted mean or A. will be then found by multiplying the number of trees in each plantation by the original price, adding the total, and dividing by the total number of trees; the weighted mean is then  $1s. 5d.$  2. A term is used in shipping law in relation to loss of or damage to cargo or ships. It is of 2 kinds: (1) *General A.*, which connotes all loss which arises in consequence of extraordinary sacrifices made, or expenses incurred, for the preservation of the ship and cargo. In this case, if the sacrifice was incurred to avoid a danger common to all the interests, and was both real and voluntary, then the cargo-owner or ship-owner who has sustained such loss or expense is entitled, provided the ship and cargo or some portion have actually been preserved, to be recouped his loss or part of it from the other interests in the adventure. The question of general A., which is entirely in the hands of A. adjusters, is regulated for the most part by the York-Antwerp Rules of 1877 (as revised in 1890), and most Eng. contracts of carriage and marine insurance embody a reference to these rules. (2) *Particular A.* (so called) or 'partial loss.' This arises whenever damage is done to the goods or property of an individual by accident or otherwise, but which damage is not suffered for the general benefit, e.g. damage by water to cargo.

**Averaging**, an operation on the stock exchange, by which a speculator increases his transactions at a higher or a lower figure when the market is going against him, so that the average price of the whole will be higher or lower than his original sale or purchase. Thus a 'bull' would purchase more stock and a 'bear' would sell more, as the price fell away or rose against him. A relatively smaller movement is thus necessary to ensure a profit.

**Averescu**, Marshal Alexander (1858-1938), Rumanian soldier and Prime Minister, b. at Ismail, Bessarabia, war minister, 1907; during the second Balkan War of 1913 he was chief of staff in the Rumanian invasion of Bulgaria. In the First World War he commanded the Rumanian army of the Danube in Transylvania and later held the supreme command in the Dobrudja. He strove to repel the Germano-Austrian advance under Gen. Mackensen, but had to fall back on Bucharest, which fell Dec. 7, 1916. He evacuated the Dobrudja Jan.

1917 and took up a new line on the Sereth in defence of Moldavia, but on the defection of Russia (see BREKST-LITOVSK, TREATY OF) was compelled to surrender unconditionally. After the war he founded the Popular party. He was Prime Minister in 1918, 1920-21, and 1926-27. Formed a political alliance in Rumania to combat any move to bring back Prince Carol.

**Averno**, a lake near Naples, about 2½ m. N.W. of Pozzuoli near the gulf of Baia. Its classical name was Avernus. It is a circular sheet of water, about 1½ m. in circumference and of great depth. It is the crater of an extinct volcano, and its darkness and the noxious vapours, which were supposed at one time to have arisen from it, said to be fatal to birds, caused the anc. poets to refer to it as the entrance to the infernal regions. The lake, which is 213 ft. deep and 3½ ft. above sea-level, figured as the scene of many other legends centuries ago. It was supposed to be connected with the lower world, hence Virgil's 'Facilis descensus Averno.' In 214 B.C. Hannibal made a pilgrimage to it. Remains of baths are on the E. of the lake, including a lofty octagonal hall called the Temple of Apollo.

**Averrhoa**, a kind of sheep-sorrel, or sour-grass, allied to the oxalis, native to India. The leaves are alternate and have no stipulae, while the flowers are arranged in cluster forming a panicle. Sev. varieties, such as the bilimbi tree or carambola, have an acid and refreshing fruit, used in the preparation of lemonades.

**Averroes** (1149-98), an Arabian philosopher and physician, was b. at Cordova, where his father was chief judge and priest. He studied theology and philosophy under Avempace and Tofall, and medicine under Avenzohar. He adopted the creed of the Ashari sect, and succeeded his father as chief judge. He was afterwards appointed chief judge in Mauretania, deposed for his heretical doctrines, but afterwards reinstated. The writings of A. were numerous. An ed. in Lat. was pub. at Venice in 1562. His commentaries on Aristotle and Plato's *Republic* are perhaps the best known. The Lat. eds. of his works include the *Kulliyat* (i.e. Summary), his chief medical work, usually known as *Colliget Aserrois*.

**Avers**, a valley in Grisons canton, Switzerland, adjoining the Hinter-Rhein Valley. The lower portion, known as the Ferrera Glen, lying between Canicul and Cresta, is said to be the highest inhabited place in Europe (6394 ft.).

**Aversa**, a tn. and episcopal see of Campania, Italy. It was the first place in which the Normans settled. In 1027 it was given to them by Duke Sergius of Naples as a reward for help against Pandulf IV. of Capua. It is connected by rail with Naples and Caserta, and it has a large lunatic asylum founded by Joachim Murat in 1813. Pop. 35,000.

**Avesnes**, a tn. in N. France. It forms the cap. of an arron. in the dept. of Nord. Its chief industry is wool spinning.

It possesses a sixteenth-century church famous for its fine peal of bells. Pop. 5400.

**Avesta** is the name under which the Mazdean texts are grouped. These are the sacred books of the anc. Persians, and are attributed to Zoroaster. For the information as to their purport, see ZOROASTRIANISM.

**Aveyron**, a dept. of S. France. Its area is 3336 sq. m. The first inhab. of the region were the Celtic Rutheni. It lies on the S. border of the central plateau of France, and has for its chief rvs. the Lot, A., the and the Tarn. All these are tribs. of the Garonne. The dept. has many interesting tns., the chief being Rodez. The climate is somewhat changeable owing to the varying elevations. In the mountains it is severe, while in the valleys it is mild. The chief crops are wheat, rye, and oats. The inhab. live by rearing live-stock. Roquefort cheeses, Entraygues, St. Georges, Bouillac, and Najac wines have some reputation. The chief tns. are Rodez, Espalion, Millau, St. Affrique, and Villefranche. The Orleans and S. railways cross the dist. Pop. 314,000.

**Avezzano**, a tn. of the Abruzzi, Italy. It is in the prov. of Aquila, on the main line of the railway from Rome to Castellammare Adriatico. The Palazzo Torlonia, which was used in the Second World War by the Gers. as a headquarters, was heavily bombed and damaged. Pop. 17,000.

**Aviano**, tn. of Italy, near Monte Cavallo, 30 m. W. of Udine. Pop. 7000.

**Avianus**, **Flavius**, a Lat. writer of fables. His age is not certainly known, but is probably fourth century A.D. He seems to have lived at Rome. His fables are 42 in number, and resemble those of Babrius. They were dedicated to one Macrobius Theodosius. See the *Prolegomena* to the ed. of R. Ellis (Oxford, 1837).

**Aviary** (Lat. *avis*, a bird), a structure erected for the purpose of keeping birds in captivity. It is stated that they were erected first by the Romans.

**Aviation**, see AERONAUTICS; AEROPLANE; AERODYNAMICS; AERO ENGINES; AIR MAIL; ATLANTIC FLIGHTS; AVIATION, CIVIL OR COMMERCIAL; SCHNEIDER TROPHY.

**Aviation, Civil or Commercial**. Civil A. received a great impetus from the First World War through the accelerated development of aeroplanes and the ever-increasing number of aviators. During the actual period of the war, civil A. was of course restricted, but when in 1919 it was possible to remove the restrictions, commercial services, and experimentation again went ahead. During the war the Air Council were invited by the Gov. to consider the development and regulation of civil aerial transport from the international standpoint. The council, through special committees, investigated questions of law and policy; technical and practical questions as to the powers of aircraft and

the requirements of aerial service; commercial outlook of the aircraft manufacturing industry; labour questions; and scientific research. (See *Reports of The Civil Aerial Transport Committee*, 1918. Cd. 9218.) An International Air Convention was signed in 1919 by all allied and associated powers (and, later, a number of other nations subscribed to it), the chief value of which was in co-ordinating the regulations for air traffic. Subsidies, long-distance demonstration flights, and foreign missions were among the methods used by various states to encourage civil A. and to secure public confidence in its future. Development in late enemy countries was retarded by disturbed political conditions, financial stringency, and the provisions of the peace treaties forbidding manuf. and importation of aircraft and accessories in ex-enemy countries for 6 months after the ratification of the treaties. In 1919 (Aug.) the first regular commercial service between London and Paris was estab. by the Handley-Page Company. A mail air service was instituted with Belgium during the same month. By the end of that year not far short of 1000 passengers were carried on the London-Paris route and about £100,000 worth of goods over the routes to France and Belgium. Before the end of 1920 at least 100 aerodromes had been licensed by the Gov., the first customs aerodrome being at Hounslow, others being organised at Cricklewood, Felixstowe, and Lympne. The Hounslow aerodrome was eventually removed to Croydon, which became the metropolitan terminus of commercial and civil flying from and to England.

Civil A. has undergone remarkable developments in the U.S.A., and even before the Second World War exhibited the greatest system in the world, with the possible exception of Germany. This development was due to the vast service of air mail which covers the U.S.A. like a network, and directly contributed to the growth of the nation's enormous commercial plane industry. None the less Brit. commercial machines, operated by Imperial Airways, continued to increase both the number of their journeys and their total mileage: whereas, e.g. in 1924-25 (the year of the inauguration of Imperial Airways), the total mileage flown by Brit. commercial machines was 853,000, it was over 5,000,000 m. in 1936-37. For further particulars of air mails, see AIR MAILS.

Practically all countries subsidise their air mails, either directly or by a hidden subsidy. In 1928 the Air Navigation (Financial Provisions) Act was passed, which, in pursuance of the recommendations of the Cadman Committee, increased the air transport subsidy from £1,500,000 to £3,000,000 (maximum). Expenditure in Great Britain on civil A. in 1936-37 was £215,600 (the total civil A. vote) and the direct subsidy was £291,000. As against this total, Germany was reported to have expended in 1934-35 (later figures are not available) £10,000,000—

but how far these figures can be regarded as reliable is conjectural. Next in order, in 1936-37, came the U.S.A., with £6,000,000; Italy, £805,000; Japan, £666,000; and Poland, £378,000.

*Brit. Civil A. during and after the Second World War.*—The war, perforce, gave a great impetus to air travel by civilians, not only by reason of the striking advances in aircraft development but because sea travel was too hazardous and shipping scarce. Early in the war it was realised by most govts. that civil A. after the war would undergo a vast expansion, with consequently keen international competition. Under an Act of 1939 the Brit. Gov. estab. the Brit. Overseas Airways Corporation (B.O.A.C.), not only to operate such services as the secretary of state for air required, but also to secure the fullest post-war development, consistently with economy, of overseas air transport services. The following year the Corporation acquired the air transport undertakings of Imperial Airways and Brit. Airways, which had been at the disposal of the secretary of state for air since the outbreak of war, and those 2 concerns accordingly went out of existence. During the war little could be achieved, but in Oct. 1944 the Ministry of Civil A. was instituted to take over the functions of the secretary of state in relation to B.O.A.C. to deal with aerial transport generally, both home and overseas and also with civil research and production. Early in 1945 the Brit. Gov. proposed to set up 3 sev. corporations for the empire, Europe, and Lat. America, with directorates appointed by the Ministry of Civil A. and linked together not only by the participation of B.O.A.C. in all three, but also by a common organisation in the overhaul of aircraft and a common school for the training of crews and technicians. Accordingly shortly after the war 2 new corporations were formed within B.O.A.C.—Brit. European and Brit. S. Amer. railway companies and shipping firms were excluded from any participation in the ownership of the new corporations for those regions, though they put their experience and preliminary organisation at the disposal of the Gov. It was evident that Brit. civil A. would ever, where have to challenge comparison with formidable Amer. achievements, especially as the Amers. had always insisted on the principle of entrusting air services to companies with no surface interests, whereas Brit. policy was to exploit Brit. enterprise and initiative in other forms of transport. At a conference in Bermuda (Feb. 1946) arrangements were made for the co-operation of the Brit. and Amer. Govs. in their common aim, defined as 'the widest possible distribution of the benefits of air travel for the general good of mankind at the cheapest rates consistent with sound economic principles,' and the conflicting principles of policy mentioned above were harmonised by the expedient of working on a schedule of international routes of interest to both Govs. In 1946 B.O.A.C. announced its 6 main services—the

Kangaroo to India, Australia, and New Zealand; the Tiger to the Middle E. and S. Africa; the Dragon to the Far E.; a W. African service; and a double N. Atlantic service to Montreal and New York. The Kangaroo was scheduled to run 4 times a week, the N. Atlantic service twice a day, most of the others approximately daily. Fares ranged from under £100 for the N. Atlantic to £131 to Johannesburg, £220 to Sydney and £187 to Tokyo. The European services were handed over to B.O.A.C. as trustee for the projected Brit. European Airways. Regular services on the S. Amer. route began in the spring of 1946. The aircraft available for the regular Brit. lines at the beginning of 1946 were discouraging—Brit. military types and foreign transports were being acquired and recourse was had to civilian modifications of military types. The position in regard to airports was also bad, but prospects for 1947-48 were promising. Heathrow was designated soon after the war as the airport for long-distance flights; and while it was being prepared, Hurn was the alternative, while Northolt, released by the R.A.F., was to replace Croydon as the terminal of the European routes. It was obvious at this time that conditions altogether precluded Brit. civil A. from being able to exist independently of Gov. support for some years; for only through the Gov. could it get aircraft and the use of airports and would have to rely on a Gov. subsidy for some time unless it were subsidised by the railways or shipping companies which was deemed impracticable. It was also equally clear thus early that Brit. civil A. would have to meet strong competition from Amer. airlines, though it was less certain whether that competition would be the open warfare of rate-cutting and uneconomic subsidies, but these subjects were among those discussed and tentatively settled at the Bermuda conference.

See further under AIRWAYS, BRITISH; AIRWAYS, IMPERIAL; and for record flights, see AERONAUTICS; ATLANTIC FLIGHTS; CAPE FLIGHTS.

**Avicebron**, Salomon ben Gabirol (1020-1070), Jewish poet and philosopher, b. at Málaga, educated at Saragossa, and d. at Valencia, after a wandering life. His great work, *Fons Vitæ*, written in Arabic, was trans. into Lat. by Gondisalvi, and influenced Erigena, Amaury de Bène, David de Dinan, Roger Bacon, and Giordano Bruno, and was fiercely opposed by Thomas Aquinas. Some of his short poems are preserved in the Jewish liturgy. See Kaufmann's *Studien über S. Ibn Gabirol*, 1899.

**Avicenna**, an Arabian philosopher (980-1037). He was b. at Afshena in Bokhara. During his youth the family migrated to Bokhara, then famous for its culture among Moslem cities. Under a tutor his marvellous progress excited universal wonder and envy. Before he was 16 he had mastered the Koran, much Arabic poetry, the *Isagoge* of Porphyry and the first propositions of Euclid, besides a thorough knowledge of

medical theory and the discovery of certain new cures. He encountered much difficulty in the study of more recondite philosophy, but invariably had recourse to prayer, with what success is not known. Varying fortunes followed till he reached the office of vizier. Insurrections, however, made the office insecure. A love of enjoyment proved so harmful to his constitution that he d. From the twelfth till the seventeenth century he was the guide of medical study in European univs. He owed his reputation to a treatise, *Canon of Medicine*. About 100 treatises are attributed to him.

**Avicennia**, a genus of tropical plants of the order Verbenaceæ. *A. tomentosa* is the white mangrove, used in Rio de Janeiro for tanning; *A. resinifera* is a native of New Zealand; *A. nitida* grows in Martinique.

**Avicula** is the name given to a genus of marine bivalves of the order Pseudomacellibranchia, with pearly shells. It derives its name ('little bird') from the wing-like expansions of the hinge which occur in typical species. It is allied to the pearl oysters, and in some classifications includes them.

**Avienus**, Rufus Festus, a Lat. poet, who probably flourished in the fourth century A.D. The only knowledge of his life that we have is derived from an inscription, printed in Meyer's *Anthologia Latina*, which is supposed to refer to him. He wrote on geographical and astronomical subjects, chiefly in hexameters, the latter including a translation of Aratus's *Phænomena*. He is supposed to be the Festus who was proconsul in Africa in 366, and in Achaia in 372.

**Avifauna**, a collective term applied to the various kinds of birds found in any country or dist.; the fauna as regards the birds of that region.

**Avigliano** is the name of a tn. in the lt. prov. of Potenza, 8 m. N.W. of the tn. of that name. It manufs. explosives, and cattle-breeding flourishes. Pop. 17,440.

**Avignon** is a city of Provence, cap. of the Fr. dept. of Vaucluse, situated on the l. b. of the Rhône, 75 m. N.W. of Marseilles. It was anciently Avenio, a tn. of the Cavares, a Gallic tribe, and there are numerous relics of Rom. times. The tn. and dist. afterwards belonged to the popes and were governed by a papal legate from 1348 to 1797, when France regained possession. It was also from 1309 to 1377 the residence of the popes, and from 1378 to 1418 the Fr. anti-popes dwelt there. Two ecclcs. councils were held there, in 1326 and 1337. The tn. is still surrounded by high crenellated walls dating from the fourteenth century, save on the N. side, where the Rocher des Doms, 200 ft. high, rises from the Rhône. The famous 'broken bridge of Avignon,' immortalised in the children's song, 'Sur le pont d'Avignon tout le monde y danse en rond,' was built across the Rhône, 1177-85, and has been in ruins since 1669. On one of the piers stands a chapel, 1234-37. There is the eleventh-century cathedral of Notre-Dame, with its papal throne, and

near by a papal palace, built in 1339. There are a multitude of churches in the tn.; Rabelais called it 'la villesomnante.' A univ. was founded in 1303, but abolished in 1794. The tn. is the seat of an archbishop, and contains a museum, picture gallery, and statues to Crillon, Petrarch, and do Girard. It manufs. paper, silk, leather, iron, etc., and is famous for its garden produce, and also produces fruit, wine, honey, etc. Pop. 60,000.

16 m. N. of Oviedo. Manufs. of earthenware, linen, etc.; there are near at hand coal and copper mines. Pop. 16,500.

Avion, tn. and com. in the Ribadavia dist. of Orense prov., Spain. Pop. of com. about 5000.

Avison, Charles (a. 1710-70), musical composer, b. at Newcastle-on-Tyne. Studied under Geminiani. Pub. numerous concertos, a few of which have been repub. in recent times, and many sonatas.

AVIGNON

The cathedral and palace of the popes with the Pont Saint-Bénézet—'le pont d'Avignon.'

Avila, a tn. of Spain, cap. of the prov. of the same name, 70 m. N.W. of Madrid. It is an anct. place, and its Moorish walls and towers are in a state of very good preservation. It possesses also a fine Gothic cathedral and a Moorish castle, and is the bp. of St. Teresa (q.v.). Pop. 15,200. The prov., which is part of Old Castile, is mountainous, having fertile valleys. Its mineral wealth is untouched, but it produces timber, chestnuts, and olives. The area is 2981 sq. m., and pop. 236,000.

Avila, Juan de, a Sp. mystic writer, was b. in La Mancha in the year 1500. He passed 20 years as a priest, and left sev. works which were pub. by Ruiz de Mesa in 1618. He has been called 'the apostle of Andalusia.' See Rousselet's *Les Mystiques espagnols*, 1867.

Avila, Sancho de, was a Sp. general who served under the duko of Alva. He defeated Louls of Nassau, and captured and sacked Antwerp in 1576. He was killed in 1579 at the siege of Maestricht.

Aviler, Augustin Charles d' (1653-1700), a Fr. architect, was b. at Paris. He was captured by pirates and taken to Tunis, where he designed a mosque. Having been set free, he studied at Rome under Mansard. He designed numerous edifices, including the archiepiscopal palace at Toulouse, and wrote many works on architecture.

Aviles, the anct. Flavionavia, is a seaport of Spain, in the prov. of Oviedo, and

His *Grand March* for harpsichord revived his name a century after his death, as one of the characters of Browning's *Parleyings with certain People of Importance in their Day*.

Avisseau, Charles Jean (1796-1861), a Fr. potter, b. at Tours. He was apprenticed to his father, a stone-cutter and potter, until 1816. After suffering privation and poverty, he succeeded in discovering the secret of firing coloured enamels at a high temp., so as to fix the colour permanently with no diminution in durability and beauty, a process which had been lost since Bernard Palissy. He refused to enrich himself by making forgeries of old *objets d'art*. His son Edouard succeeded him in the business on his death.

Avitus, Marcus Mæcilius, the date of whose birth is uncertain, was a well-born native of Auvergne. He was prefect of Gaul, and waged successful war against the Huns and the Vandals. After having been ambas. at the court of Theodoric, king of the Visigoths, he became emperor of the W. in A.D. 455 at the death of Maximus. He was, however, deposed after having been on the throne 14 months, by Ricimer, who appointed him bishop of Placentia. He d. in 456.

Aviz, is a Portuguese tn. in the prov. of Alentejo, situated on a small trib. of the R. Seda bearing the same name. In anct. times it was the seat of the order of Aviz. Pop. 7400.

**Avizandum** is a Scottish legal term. When the judge, after hearing a case, temporarily withdraws it for private consideration, or for some other reason, he is said to withdraw it *ad A.* In England he would be said to reserve judgment.

**Avlona** or **Valona** is a tn. and seaport of the state of Albania on the bay of Janina, 58 m. S. of Durazzo. It was under the gov. of Venice until 1691. It is an archiepiscopal see of the Gk. Church, and a station for Lloyd-Triestino steamers. Normally there is a large trade in oil, salt, and tortoise-shell. It demands on Austria-Hungary, as formulated in Apr. 1915, included recognition of her sovereignty over A. At the same time Italy was signing a secret agreement with the Allies whereby, *inter alia*, she was to annex A. and its neighbourhood. In May the dual monarchy made a belated offer of the sovereignty of A., together with a free hand in Albania as a whole; but the war spirit in Italy would brook no further negotiations (*see also under AUSTRIA*). In Dec. 1915 the Its. occupied A., together with Durazzo, but were compelled to evacuate the latter under the fire of the Austrian guns. They successfully held A., which was thus secured as a base to dominate all the S.-central part of Albania. After the downfall of Italy in the Second World War, the Allies set up a provincial gov. of Albania under Gen. Enver Hodja and A. therefore reverted to Albanian possession. Pop. 10,000.

**Avoca**, or **Ovoca**, is a short riv. of co. Wicklow, Ireland, formed by the junction of the Avonmore and Avonbeg streams. It runs through exquisite scenery, the 'sweet vale' of Thomas Moore's *Meeting of the Waters*.

**Avocado Pear** is the edible fruit of *Persea gratissima*, a species of Lauraceæ, which grows in the tropics. It is also known as the alligator pear.

**Avocet** is the name of a widely distributed wading bird belonging to the genus *Recurvirostra*, characterised by its curious

curved beak. The common A. bred in England till 1824, but then disappeared from England until 1947 when one bird returned and reared a family of 14 near Great Yarmouth. The genus is related to the snipe family and inhabits fen areas. It is found in Europe, Africa, and Central and S. Asia.

**Avogadro**, Count Amedeo (1776-1856), It. physicist, was made prof. of physics at Vercelli in 1809, and of mathematics at Turin in 1820. He enunciated in 1811 the hypothesis named after him: that equal vols. of gases at the same temp. and pressure contain equal numbers of molecules. This hypothesis is an important part of the atomic theory (*q.v.*).

**Avoldupols** is the name given to a system of weights and measures applied in Great Britain, Ireland, and the U.S.A. to all goods save metals, precious stones, and drugs. *See WEIGHTS AND MEASURES*.

**Avola** is a port on the E. coast of Sicily, about 20 m. S.W. of Syracuse. The 'honey of Hybla' comes from this neighbourhood. It produces wine, sugar, and almonds; tunny fishing is carried on, and a trade in agric. produce. Pop. 22,000.

**Avon**, a Celtic word meaning river, the name of many Brit. streams, of which the following are the chief: (1) The Upper or Warwickshire A. rises near Naseby in Northamptonshire, and flows through Warwickshire and Worcestershire into the Severn. (2) The Lower or Bristol A., 70 m. long, enters the Bristol Channel 6 m. below Bristol. It is noted for its very high spring tides, which sometimes reach a height of 40 ft. (3) The E. A. flows through Wiltshire and is navigable to Salisbury. It has a length of 50 m., and is noted for the delicate loach. There are also 3 As. in Scotland, tribs. of the Spey, the Clyde, and the Forth, and 2 in Wales, which flow into Swansea Bay.

**Avondale**, a par. of W. Lanarkshire, Scotland, 9½ m. S.W. of Hamilton. Famous as containing the scene of the battle of Drumclog, 1679. *See Scott, Old Mortality*. Pop. 6000.

**Avonmouth**, tn. of Gloucestershire, England, at mouth of Avon, 6 m. N.W. of Bristol. A rapidly increasing port with extensive docks. Pop. 3000.

**Avory**, Sir Horace Edmund (1851-1935), Eng. judge, b. in London; educated at King's College and Cambridge Univ. Called to the bar, 1875; junior counsel to Treasury, 1889; senior, 1899. K.C. 1901. Appointed a judge of King's Bench Div., 1910. Generally accounted the ablest criminal lawyer of his day. Had the reputation of an extremely stern judge and absolutely fair. It fell to his lot to try most of the worst criminals of his time—murder cases tried by him included those of Mahon, Vaquer, Brown and Kennedy, Field and Gray, Allaway, and Volsin. The Hatry case was also heard by A., and he also presided over the trial of Lord Kylant. As Crown counsel he prosecuted Adolf Beck, and it seems that the miscarriage of justice in that *cause célèbre* which led ultimately to the institution of the Court of Criminal Appeal

(q.v.) was due chiefly to his scrupulous wish that the laws of evidence should be observed. See Gordon Lang, *Mr. Justice Ivory*, 1935.

**Avranches**, tn. of Manche, France, on R. Sée, 35 m. E. of St. Malo; pop. 7100. It was an episcopal city till 1790, the cathedral having been consecrated in 1121. In it Henry II. of England received absolution for the murder of Becket. It was destroyed at the time of the first Fr. Revolution. The chief industry is leather-dressing. A. was the scene of decisive engagements in the Second World War. In July (1944) the Amers.' first task, after the capture of St. Lô, was to clear the W. of the Cotentin peninsula down to its S. limit at A. With large forces of tanks, preceded by low-flying aircraft and followed by motorised infantry and guns, they captured their goal on July 31, and made simultaneous threats—E. to Mortain, W. to Dinan, and S. to Rennes, and soon reached all 3 places. The reply of the Gers., who had been caught napping, was a counter-offensive with tanks towards A., the object being to cut the Amer. line in two; but though the Ger. counter-offensive reached, retook, lost, and again retook Mortain, it could not succeed further. See also WESTERN FRONT IN SECOND WORLD WAR, BATTLE OF NORMANDY.

**Awaji**, or **Awadsi**, an is. of Japan, in the strait at the E. entrance of the Inland Sea between Honshu and Shikoku. Much visited by tourists for its beautiful scenery. Chief tn. A. Length 30 m.; area 218 sq. m.; pop. about 200,000.

**Award**, the decision of an umpire in a submission to arbitration (q.v.). To be enforceable, the A. must determine all the differences at issue and no others.

**Awe**: 1. Loch in Argyllshire, Scotland, about 23 m. long and 1½ sq. m. in area. It is fed at the N.E. end by the Orchy and Strae. The scenery at this end is very fine, and on a peninsula, at high water an is., stands Kilchurn Castle. 2. Riv., issuing from the N.W. end of Loch A., and flowing about 5 m. into Loch Etive. It is an excellent salmon and trout stream.

**Awomori**, or **Aomori**, a seaport of Japan and chief tn. of the dept. of A., on N. coast of Nippon, 444 m. N. of Tokyo. It has a fine natural harbour, and a large trade, mainly local. Pop. 77,100.

**Ax**, a tn. of Ariège, France, on R. Ariège, 74 m. S.E. of Toulouse. It is noted for its hot sulphur springs, numbering about 80, with temps. of from 77° F. to 172° F. Pop. 1300.

**Axbridge**, a par. and small tn. in Somersetshire, 9½ m. W. of Wells on the Great Western railway; pop. about 1000.

**Aze**: 1. Riv. of Dorset and Devon, England, about 21 m. long, flowing through Axminster into the Eng. Channel at Lyme Bay. Not navigable. 2. Riv. of Somerset, England, about 25 m. long, rising in the Mendips and entering the Bristol Channel.

**Axel**, Dan. statesman, see ABSALON.

**Axel**, a tn. and fortress in the prov. of Zeeland, Holland, situated 17 m. N.E. by N. of Ghent; pop. 6300.

**Axenbergl**, a mt. in Uri, Switzerland, to the S.E. of Lake Lucerne. Alt. 3670 ft. On a ledge of rock at its foot stands Tell's chapel. The road called the Axenstrasse has been hewn out of the rock, and the mt. is pierced by a tunnel on the St. Gothard railway.

**Axestone**, see JADE.

**Axholme**, Isle of, a low-lying dist. of N.W. Lincolnshire, England, cut off by the Rs. Trent, Idle, and Don. Area 47,000 ac. It was probably originally covered with forest, and when this was destroyed, became a swamp, drained 1625-30 by Cornelius Vermuyden. There are still traces among the inhab. of the Flemish settlement at this time. Chief tns., Crowle and Epworth.

**Axil**, in botany, the upper angle between a leaf and the stem or branch from which it grows. Lateral buds usually grow out from the A., and are accordingly called axillary buds.

**Axilla**, the anatomical term for the armpit, or pyramidal space between the inner side of the upper arm and the wall of the chest. The apex of the cavity points upward and inward towards the root of the neck, and its extent depends on the position of the arm, being greatest when it hangs at the side. When the arm is raised, the fore and hind boundaries form the axillary folds. The skin of the A. is dark and covered with large sweat-glands and hair. Large nerves and vessels of the arm pass through it, and there are numerous lymphatic glands.

**Axim**, a vil. and fort on the Brit. Gold Coast of W. Africa, situated about 2° 15' W. long. It was acquired from Holland in 1872. It is well supplied with water, and is the healthiest place on the coast. Pop. 3500.

**Axinite**, the name of a mineral which is a silicate of aluminium, lime, etc., with boracic acid, containing varying amounts of iron and manganese. It derives its name from the fact that the edges of its glassy triclinic crystals bear some resemblance to the edges of an axe.

**Axiom**, a self-evident proposition which may be taken for granted and requires no proof. The use of the word is now practically restricted to the general premises on which the truths of geometry rest. The term was so employed by Euclid, following Aristotle. Plato limited it to specifically geometrical truths.

**Axis**, an imaginary line about which a body rotates, or is symmetrically disposed. The term has many special meanings in the various sciences. It is of frequent use in geometry, e.g. the A. of symmetry is the line joining corresponding points in symmetric figures; the A. of a solid is the line about which its angles are symmetrically disposed; the transverse A. of a conic passes through its foci; and there are similar uses in geometric crystallography and physics. In mechanics the term axis has the same meaning. As an anatomical term it denotes the second cervical vertebra, which supports the atlas.

**Axis**, in botany, is a term which is applied to the root and stem of the whole plant. When a seed has begun to germinate the plumule ascends into the air above the ground, while the radicle descends into the earth. The former is said to be the ascending A. of the plant, the latter the descending A., and around these axes of growth all other parts of the plant are arranged.

**Axis Deer**, a species found in India and the E. Indies, somewhat resembling the common European fallow-deer, being profusely spotted with white on a fawn background, shading from almost black on the back to white on the under-parts. The male has slender, pointed horns, not branched. It is easily domesticated.

**Axis, Rome-Berlin**, the political and, later, military entente between Hitler and Mussolini, concluded, ostensibly, to present a common front against Bolshevism, but really as an essential factor in the formulation of a common policy against the W. democracies in order to secure the nullification of the treaty of Versailles. In Aug. 1937, Mussolini, speaking at Palermo, said: 'Another reality of which account must be taken is that which is now commonly known as the R.-B. A. One does not reach Rome by ignoring Berlin, and one does not reach Berlin by ignoring Rome. There is an active solidarity between the two regimes. Let it be said in the most categorical manner that we will not tolerate in the Mediterranean Bolshevism or anything of a similar nature.' The term A. became a common description for the countries allied to Germany in the Second World War. See further under EUROPE, *History during the European War* (1939); GERMANY, *History*; ITALY, *History*; JAPAN, *History*.

**Axis**, a riv. of Macedonia, which rises in the mt. range connecting Mt. Scardus and Mt. Orbelus, and runs S.E. into the gulf of Salonika. It was called Bardarion in the Middle Ages, and the modern name, Vardar, is a corruption of this. In the upper part of its course it runs through narrow valleys between high mts. At its mouth alluvial deposits have made great encroachments, and the land is low and swampy, intersected with small creeks, the main branch being therefore very difficult to discover. The entrance is very intricate, but the riv. is navigable for boats of 30 tons for sev. miles. The depth of the riv. depends on the season of the year. It is as low as 4 ft. in summer, but in winter it is deep and rapid, and nearly 2 m. in breadth before reaching the sea.

**Axminster**, tn. of Devonshire, England, on R. Axe, 24 m. E. of Exeter. It was long celebrated for its carpets, the manuf. of which was begun in 1755. The industry has now moved to Wilton, and the chief industries of A. are the manuf. of brushes, textiles and leather goods, corn milling, and iron-working. The minster from which it takes its name is said to have been founded by King Atheistan, and it was evidently an important place in early times, standing as

it does at the intersection of Icknield Street and the Fosse Way. Pop. 2300.

**Axolotl**, a larval salamander of the genus *Amblystoma*, found in lakes in Mexico and the Rockies. It resembles a newt in shape, having a powerful tail, 2 pairs of weak limbs, and 3 pairs of simple external gills. In this form it breeds freely, laying eggs like a frog's, in strings attached to water-plants by a viscous substance, and the young, hatched in 2 to 3 weeks, resemble the parents. This was originally supposed to be the life hist. of the species, but from 1865 onwards experiments made in Paris proved that this form is prematurely sexual, and that the *Amblystoma* is capable of attaining an adult form in which gills and the tail-membrane are lost. The offspring of these, the full A.s., are gilled. Some kinds of the species never appear to make this change, which can be favoured or prevented by the conditions of life.

**Axona**, see AISNE.

**Axum**, anc. tn. of Tigré, Abyssinia, 85 m. N.W. of Antalio; now mostly in ruins, which include some very fine specimens of Gk. architecture. It was formerly cap. of an Ethiopian kingdom, and, after the adoption of Christianity in the fourth century, an eccles. centre. It is still regarded as a sacred city by the Abyssinians, and the anc. chronicles are kept in the church. The city surrendered to the invading It. forces under Gen. de Bono on Oct. 15, 1935. The possession of this traditional centre of Ethiopian life was of considerable importance to the Its., the more so from the fact that it had been the centre of religious celebrations for the Ethiopian victory of 1896. But the Its. wished to avoid wounding the religious susceptibilities of the pop. by occupying by force of arms a holy city in which, according to tradition, there still rested the ark of the covenant which had been brought from Jerusalem by the son of King Solomon and the queen of Sheba. Hence the It. problem was conveniently solved by a deputation of priests, headed by their political and religious chief, the Nevraid, coming out and delivering the keys of the city to the It. commander. Pop. 5000.

**Ay**, a tn. of Marne, France, on R. Marne, 14 m. S. of Rheims. The chief industry is vine-growing, the tn. being especially famous for its champagne. Pop. 6000.

**Ayacucheo**: 1. Dept. of S. Peru. It is watered by the Apurimac. There was formerly much gold-mining in the dist. Area 18,185 sq. m.; pop. 359,000. 2. Cap. tn. of dept. of same name. 220 m. S.E. of Lima. Pop. 20,000. It was founded by Pizarro in 1539, and the name, originally Guamanga, was changed to A. in commemoration of the victory gained at a small place of that name over the Spaniards in 1824.

**Ayala**, Adelardo López de (1828-70). Sp. dramatist and politician. He was president of the chamber under Alfonso XII., but his political life was marked by confusing changes of opinions. Chief

dramas, *El tanto por ciento*, 1860; *El nuevo Don Juan*, 1863; *Consuelo*, 1878.

**Ayala, Balthazar** (1548-84), jurist, son of Don Diego de A., of Burgos in Spain, and of his wife, daughter of an alderman of Antwerp, where Balthazar was b. He was made 'auditor' or judge-advocate of the troops of Philip II. in the United Provs., in May 1580. In 1583 he became also member of the great council and master of requests in ordinary. The only work he pub. was *De Jure et Officiis et Disciplina Militari*, libri iii., 8vo., Douai, 1582. An Eng. translation has fairly recently appeared in America. He d. at Alost, Aug. 1584.

**Ayala, Pedro López de** (1332-1407), Sp. poet and historian, b. at Murcia. Fought for Henry of Trastámara at Nájera, 1367, and was captured by Eng.; later member of council of Henry II. of Castile and high chancellor to John I. His best work is the *History of Castile*, 1350-96, and he also trans. Livy into Sp.

**Ayala, Ramón Pérez de**, Sp. author; b. 1881, at Oviedo, Asturias. He wrote 4 prose vols. of disguised autobiography: *Tinieblas en las Cumbres* (1907); *A.M.D.G.* (1910); *La Pala de la Raposa* (1912); and *Troteras y Danzadoras* (1913). The theme of the first is the same as that of Bernard Shaw's *Mrs. Warren's Profession*; the second is an indictment of schooling in a Jesuit college; the third, a study of psychological paralysis. In 1921 he pub. a very popular and humorous novel called *Belarmino y Apolonio*, about 2 cobblers, one with an artistic and the other with a philosophic ideal.

**Ayamonte**, a fortified tn. in the Sp. prov. of Huelva, on the l.b. of the Gadiana; there is a good harbour, and cod, sardine, and tunny fisheries. Pop. 10,000.

**Aydin**, a vilayet of Turkey, 80 m. S.E. of Smyrna. The most important centre of the country for production of olive oil. Pop. 201,000.

**Aye-aye** (*Chiromys madagascariensis*), is a rare and remarkable animal found in the woods of Madagascar. Formerly

regarded as a rodent, the memoir of Owen made it clear that it is really an aberrant lemur with many rodent affinities. It is the size of a cat, has rodent-like teeth, and a hairy hand with an exceedingly slender third finger, which is used to pick out the wood grubs on which it feeds. It is exclusively nocturnal and arboreal in its habits, and is regarded with superstitious reverence by the natives of Madagascar.

**Ayeen Akbery**, properly **Ayīn-i-Akbarī**, the title of a geographical and statistical account of the Mogul empire in India during the reign of Jelal-ed-din Mohammed Akbar, written by his vizier, Abul Fazl. It constitutes properly the third or concluding part of the *Akbar Nameh* of the same author, which gives an account of Akbar's ancestors and his reign down to the forty-seventh year. The *Ayīn-i-Akbarī* is divided into 4 parts; the first 3 are chiefly political and legislative; the fourth part is chiefly statistical and geographical, with an account of the anct. institutions, religion, and literature of the Hindus. Francis Gladwin made a free and abridged translation into Eng. of the *Akbarnameh* (Calcutta, 1783).

**Ayenbite of Inwyt**, *The*, meaning *The Remorse of Conscience*, is a famous translation, made in 1340 by the Augustinian monk, Dan Michel, of *La Somme des Vices et des Vertus*, by Frère Lorens. Chaucer is supposed to have made use of it for *The Persones Tale*; it is the best example of Kentish S. Eng.

**Ayesha** (610-77), the favourite, but childless, wife of Mohammed, was b. at Medina. On Mohammed's death in 632, she prevented the prophet's son-in-law, Ali, from becoming caliph, and secured the succession for her father, Abu-Bekr. She again tried to prevent Ali on the death of the Caliph Othman, but in 656 was taken prisoner. She d. at Medina.

**Aylesbury**, a mkt. tn. in Buckinghamshire, 38 m. N.W. of London, and an important railway centre. It is built on high ground, and overlooks the fruitful valley of A. It has many interesting public buildings. The cruciform par. church was restored between 1849 and 1867; the corn exchange and markets in 1865, and the co. infirmary in 1862. In anct. times it was captured from the Brit. by the Saxons in 571, and in the Civil war a battle was fought near here in 1642. Until 1885 it was a parl. bor., and with its 'hundred' returned 2 members. There are printing works, and manufs. of straw plait and condensed milk. The locality is noted for rearing ducks for the London market. A. is the assize tn. for the co. as well as the co. tn., having supplanted Buckingham. Pop. 13,400.

**Aylesbury, William** (1615-56), educated at Christ Church, Oxford. His main work was a translation of Davila's *History of the French Civil Wars* from the It.

**Aylesford**, a: Eng. vil. in Kent, 3½ m. N.W. of Maidstone, on the r. b. of the Medway. The anct. church of St. Peter, which was restored in 1878, has fifteenth-century brasses, and an early embattled

tower. In the dist. are many monuments of anct. times, including the ruins of a Carmelite friary, cromlechs, and the 'countless stones.' The supposed tomb of Horsa is also to be seen, and here Alfred the Great conquered the Danes. Pop. 3700.

**Aylesham**, a vil. of Kent, England, some 4 m. from Dover. It is a garden city for colliers. Pop. 3000.

**Ayliffe**, John (1676-1732), was b. at Pembr in Hampshire, and educated at Winchester and at New College, Oxford. He was an advanced and zealous Whig, and was expelled from the univ. and deprived of his degrees for stating in one of his works that the funds of the Clarendon printing house had been misappropriated. His treatise on canon law appeared in 1726, and is still a high authority, whilst his unfinished treatise on civil law is the most elaborate one written in Eng. on Rom. law.

**Ayllon**, Lucas Vázquez de (c. 1476-1525 or 1530), Sp. soldier and explorer; b. probably in Toledo. Was a captain and a rich and learned man. Made *auditor de guerra* or legal adviser to the viceroy of Hispaniola, No Nicolás de Ovando, whom he accompanied in Feb. 1502 in the largest expedition yet dispatched to the new Amer. lands. Formed a company with some other inhab. of Hispaniola and sailed out with 2 vessels to capture Indian Caribs as slaves for the mines. Storm-driven on E. coast of Florida, A. entered the prov. of Chicora and by treachery captured 130 natives, most of whom died of homesickness. In 1524 he prepared another expedition to conquer Chicora and landed on another part of the coast. The Spaniards were received with feigned hospitality and most of them murdered. Some say A. was amongst those slain; others that he d. of fever. See Gabriel de Cardenas y Cano, *Ensayo Cronologico de la Florida* (Madrid), 1723; Arthur Hays, *The Spanish Conquest in America*, 1855.

**Aylmer**, a tn. in Quebec, Canada, on Lake Deschenes, 8 m. from Ottawa. Has saw-mills and nickel-refining industries. Pop. 3000.

**Aylmer**, John (1521-94), was b. at A. Hall, Tivetshall St. Mary, in Norfolk. He was educated at Cambridge, and in 1541 became chaplain to the duke of Suffolk. Afterwards, when archdeacon of Stow, he was obliged to leave the country on account of his opposition to the doctrine of transubstantiation, but returned to England and resumed his office on the accession of Elizabeth. In 1562 he was made archdeacon of Lincoln, and in 1576 bishop of London. He was avaricious, and notorious for his severe treatment of any who differed from him.

**Aylmer**, Matthew Whitworth, Baron (1775-1850). Twenty-ninth governor-general of Canada (1831-35). B. May 24, 1775, a general in the army and colonel of the 18th Foot. His tenure of office followed the conciliatory policy of Sir James Kempt on the question of the constitution of the Executive and Legis-

lative Councils. A. had had a distinguished military career, but no administrative experience. Hence he approached this question with at least an open mind, as indeed all constitutional problems in Canada. His administration was characterised by a series of measures which profoundly altered the aspect of the outlook of the Fr.-Canadian party, driving it to a clear-cut policy which led to open violence. In 1834 the Assembly voiced its grievances in the '92 Resolutions,' which document was sent to the Brit. Gov. in London. A royal commission then investigated the affairs of Quebec, and recommended that its revenue should be handed over to the Assembly in return for a 'civil list,' but that there should be no legislative council. This negative recommendation completely alienated the Assembly, and A. was recalled. It was during his tenure, too, that the *Royal William*, the first steamship to cross the Atlantic, was launched from its Canadian shipyard. Again, it was A. who caused a memorial to Montreal to be placed in the Ursuline convent chapel of Quebec city. Sov. tns., lakes, etc., in Canada are named in memory of him.

**Ayliffe**, Sir Joseph (c. 1708-81), an Eng. antiquarian. He was one of the first members of the council of the Society of Antiquaries, and was later made a commissioner for the preservation of state papers. He was author or editor of a considerable number of books, among them *Calendars of the Ancient Charters . . . and of the Welch and Scottish Rolls now remaining in the Tower*.

**Aylsham**, a par. and mrkt. tn. in Norfolk, England, 10 m. S.W. of Cromer; has 2 railway stations. Pop. 2600.

**Aymaras** is the name of a tribe of S. Amer. Indians. They were in former times the inhab. of the dist. round Lake Titicaca and the adjacent valleys, but now they form the chief element in Bolivia, though the race is now of very mixed blood. In anct. days the Incas attributed the origin of all Quichua civilisation to the home of the A., which was therefore 'sacred land' to them. The A. undoubtedly appear to have possessed a considerable culture before they were conquered by the Incas in the thirteenth and fourteenth centuries. Evidence exists of their having important cities and palaces, and the ruins of Tiahuanaco show that these were of colossal size. At the time of the Sp. invasion the A. had been under the dominion of the Incas for a considerable time and were to some extent degenerate. They retained, however, the privilege of using their own language, and on the whole their treatment by the Incas suggested that the conquerors believed themselves to be of Aymara blood. The physical characteristics of the 2 races also are similar. The A. are short and thick-set, with reddish complexion, black hair and eyes, and a rounded forehead. They are of an apathetic and gloomy disposition. They now number about half a million in Bolivia; a few are also found in S. Peru.

**Aymard**, or **Aymar**, **Jacques** (b. 1662), a Fr. peasant of Dauphiné, was b. at St. Veran. He was bred a mason, but soon renounced his trade in favour of the profession of a diviner. He used his so-called powers in the finding of wells, hidden treasures, etc., but in 1692 he thrilled all France with his successful tracing of the murderer of a man and his wife at Lyons. A. discovered the criminals, a hunchback, who was broken on the wheel, and 2 others, who escaped by sea. As a result of this supposed success of his divining powers, A. was taken up by the prince of Condé, but failed miserably on being practically tested. He then confessed that his powers of divination were non-existent; but the true hist. of the Lyons affair was never discovered.

**Aymer de Valence**, **Earl of Pembroke** (d. 1324), son of William of Valence, nephew of Bishop A. (q.v.). He was appointed guardian of Scotland in 1306; defeated the Scots in that year at Methven, but was defeated by Bruce at Loudon Hill in 1307. He joined the Lancastrian party, and was a fierce opponent of Gaveston, whom he captured in 1312. He left the earl of Lancaster owing to the treacherous murder of Gaveston, to whom A. had promised his life, and was reconciled to the king. In 1314 he was made Lieutenant of Scotland, and fought at Bannockburn. In 1322 he joined in the judgment and condemnation of Lancaster.

**Aymer de Valence**, bishop of Winchester, was a half-brother of Henry III., who obtained for him the see of Winchester by putting pressure on the electors. The appointment was in every respect a bad one, for A. was ignorant of Eng., illiterate, and by no means priestly in his mode of life. He repudiated the barons' constitution at the Parliament of Oxford in 1258, and was forced to leave the country. He obtained the support of the pope, however, and was returning when he d. at Paris in 1260.

**Aymestry Limestone** belongs to the Ludlow group of the Silurian system. It is a dark grey concretionary rock, consisting of thin beds. It is named after the vil. of A., in Herefordshire, where it has long been quarried.

**Aymon** was the surname borne by 4 brothers, Alard, Richard, Guiscard, and Renaud. They occupied a prominent place as heroes of the cycle of romance in the time of Charlemagne. Their exploits were described in a romance written by Huon de Villeneuve in the thirteenth century, entitled *Les Quatre Fils Aymon*. Renaud also appears as a leading figure in Ariosto's *Orlando Furioso*.

**Ayr**, a royal, municipal, and police burgh, and the co. tn. of Ayrshire, Scotland, is a seaport 41½ m. S.S.W. of Glasgow. It is the site of a Rom. station, and here in 1197 William the Lion built a castle. Picturesquely situated on the S. bank of the riv., it has a fine bay and beautiful sands, while there are some handsome public buildings.

Its manufs. are numerous, and include leather, woollens, carpets, lace, boots and shoes, etc.; there are foundries, engineering establishments, and saw-mills. The prin. import is timber from Canada and Norway, whilst among the exports are coal, iron, and manufactured goods, and agric. produce. Ship-building is also carried on, and the harbour has both wet and dry docks. In 1873 the municipal boundary was extended to include Newtown-upon-A. and Wallace Town. At Alloway, a pleasant suburb 2½ m. S. of A., Robert Burns was born Jan. 25, 1759. Pop. 40,100.

**Ayrer**, **Jacob**, a Ger. dramatist who fl. in the sixteenth century, rivalled Hans Sachs in the copiousness of his output. He was a citizen and legal officer of Nuremberg. His works comprise 36 humorous pieces and 30 dramas. His works, both humorous and serious in character, are marked by a vigour of diction and purity of style, but the line of demarcation between the grave and the gay is often not sufficiently clearly defined. He d. at Nuremberg in 1605.

**Ayrer**, **John** (fl. c. 1680, d. 1700), was a noted calligraphist; date of birth unknown. Chiefly known as the introducer into Britain of the 'Italian' style of penmanship.

**Ayrshire**, a S.W. co. of Scotland, is bordered on the N. by Renfrewshire, on the E. by Lanarkshire and Dumfriesshire, on the S.E. by Kirkcudbrightshire, on the S. by Wigtownshire, and on the W. by the frith of Clyde. Off its coast are Ailsa Craig, Lady Is., and Rhone Is. The surface of the co. is, on the whole, undulating; there is a mountainous region of small extent in the N., and one of larger extent in the S. and S.E. Though none of the rivs. are navigable, they are famed for their varied and calm loveliness. The Ayr is the longest, 38 m. in length; among the others may be mentioned the Stinchar, the Girvan, the Irvine, the Garnock, and the Doon, whilst the Afton, the Cennock, and the Lugar are known from the poems of Burns. Agriculture flourishes in the co., having made great strides of late years, owing to green-crop husbandry and a more extensive use of manures. The co. is also noted for its dairy products, its cattle, and its horses. It is the prin. mining co. of Scotland, and iron ore and fire-clay are found in addition to coal. Its manufs. are important, and include cotton and woollen goods, lace, curtains at Galston and Darvel, cabinet-making at Beith, ship-building at Troon, Ayr, Irvine, and Ardrossan (which is also a seaport), and extensive engineering at Ayr and Kilmarnock. The area of the co. is 1142 sq. m., and its pop. 285,000.

**Ayrshire Breed**, see under CATTLE.  
**Ayrton**, **Edmund** (1731-1808), the most distinguished member of a race of musicians, was b. at Ripon. He was originally destined for the Church, but as he showed considerable musical talent he was made a pupil of Dr. Nares, the organist of York Minster. He took the degree of Mus.Doc. at Cambridge in 1784,

the Oxford degree being conferred upon him in 1788. He d. in Westminster.

**Ayrton, William Edward** (1847-1908), an Eng. man of science, entered the Indian gov. telegraphic service in 1867, and, after becoming superintendent, was made an associate of the Royal Society of London in 1881. He made many improvements in telegraphy and in the dynamometer. Mrs. A., his wife, the only woman member of the Institute of Electrical Engineers, carried out a series of experiments on the electric arc, and was awarded the Hughes medal by the society in 1908.

**Ayscough, Samuel** (1745-1804), b. of well-to-do parents, and received his education at Nottingham. Owing to family misfortunes he was compelled to labour in a mill, afterwards coming to London as an overlooker of street pavements. He afterwards became an assistant cataloguer to the chief librarian in the Brit. Museum. He is famous chiefly for his index making. He afterwards became an assistant librarian, and took holy orders. Among his numerous works are an index to the *Annual Register*, 1758-80, and an index to the *Gentleman's Magazine*, 1731-86. He also brought out the first Shakespearian concordance. He was appointed to rev. benefices, the last of which was at Cudham in Kent.

**Ayscough, William**. Very little is known of his early life. He became bishop of Salisbury in 1384, and had great influence at the court of Henry VI. He was the king's confessor in an age when it was most unusual for a bishop to occupy that position. He celebrated the marriage of Henry VI. and Margaret of Anjou in 1445. As a councillor of the king he was held to be responsible for the evil deeds of the court, and in his own diocese was disliked because of his continual absence. In 1450, after celebrating mass at Edington, he was seized by the congregation, taken to the top of a neighbouring hill, and beaten violently to death.

**Ayscue, Sir George** (d. 1671), an admiral of the Commonwealth period. He had been knighted by Charles I., but became a parliamentarian and commanded the fleet in the Irish Sea in 1649, being then appointed admiral. At the beginning of the Commonwealth he defeated the Dutch off the Downs. In 1651 he was sent by Cromwell to Barbados to reduce the Royalists to subjection. In 1652 he fought an indecisive engagement off Plymouth. He was superseded in that year, but became commander of the Swedish fleet in 1658, and a navy commissioner on the Restoration. He fought in the second Dutch war, was imprisoned in Holland in 1666-67, and on his return to England did not again take an active part in naval matters.

**Aysen**, a prov. of Chile. Area, 38,350 sq. m. Pop. 17,000.

**Aytoun, or Aytun, Sir Robert** (1570-1638), poet, b. at Kinaldie, Fife. He went to the univ. at St. Andrews in 1584, and took his master's degree 4 years later. He then went upon the usual course of travel which was considered part of a noble youth's education, and finally, in the

early part of the reign of James I. he settled at the Eng. court, where he was well received. He had previously dedicated a Lat. poem to James I. He received many appointments at the Eng. court, and in 1612 was knighted. He numbered amongst his acquaintances most of the wits of the day, and was an especial friend of Ben Jonson and Hobbes. He was one of the first of the Scottish poets to write with any degree of success in the Eng. tongue, but the poem on which his claim to fame has been chiefly based, *I do confess thou'rt smooth and fair*, has been practically proved not to be of his composition. Most of his poems were extravagant praises of contemporaries. He was buried in Westminster Abbey. Among his works may be mentioned *Diaphantus and Charidora* and *Inconstancy Unbraided* (the best of his short poems).

**Aytoun, William Edmonstone** (1813-1865), Scottish poet, b. in Edinburgh. He was descended on both sides from good families, and on his father's side was related to Sir Robert A. (or Aytun) (q.v.), who had been a poet himself. He was imbued with his love for Scottish folklore by his mother, whose knowledge of Scottish ballads was great. He was educated in Edinburgh at the academy and the univ., and at the age of 17 he pub. a vol. of poems called *Poland, Homer, and other Poems*. In 1840 he was called to the Scottish bar, and had a fair practice during the period that he remained there. He pub. a number of poems in *Blackwood's Magazine*, and in 1855, in collaboration with (Sir) Theodore Martin, he pub. the *Bon Gauthier Ballads*, which almost immediately became very popular. In 1845 he became prof. of rhetoric and belles-lettres at the univ. of Edinburgh. In 1849 he had married the daughter of Prof. Wilson (Christopher North), but she d. in 1859, and 4 years later he married again. His chief works are *Poland, Homer, and other Poems*, 1832; *The Life and Times of Richard I.*, 1840; *Lays of the Cavaliers*, 1848, a book which ran into 28 eds.; *Firmilian; or, the Student of Badajoz: a Spasmodic Tragedy* (under the nom de plume of T. Percy Jones), 1854; *Bon Gauthier Ballads*, 1855; *Bothwell*, 1856; *Poems and Ballads of Goethe*, 1858; *Ballads of Scotland*, 1870; *Norman Sinclair*, 1861; *Poems of William Edmonstone Aytun*, 1921.

**Ayub Khan** (1855-1914), Afghan prince, son of Shere Ali, formerly Ameer of Afghanistan. Took possession of Herat in 1879 after his father's expulsion from Kabul by the Brit. In 1881 he invaded Afghanistan in order to win Kandahar and the sovereignty. Defeated Gen. Burrows at the battle of Maiwand, but while hesitating to attack Kandahar, his force was assailed by Sir Frederick (afterwards Lord) Roberts and routed. He renewed his invasion soon afterwards, but after a short-lived success was utterly defeated by Abd-ur-Rahman. Ultimately gave himself up to the Brit., by whom he was sent to India as a state prisoner. He d. at Lahore.

**Ayuntamiento**, the name given in Spain

to what is practically the equivalent of the municipal councils in this country. The establishment of these councils can be traced as far back as Rom. times. They acquired great power during the struggles with the Moors, but this power fell into abeyance during the height of the Bourbon rule. See further under CARILDO.

**Ayuthia**, the anct. cap. of Siam, sacked by the Burmese in 1782, and now called Krung Krao (the old cap.). It was founded in 1351, and during the sixteenth century was a great port, being divided into special divs. for the Chinese, Jap., Malays, and Portuguese who traded there. It still remains a fairly important tn., the greater part of it being now built on the water. Chief amongst its remaining notable buildings is the Buddhist temple, 'the Golden Mount,' about 400 ft. high. Most of its great buildings are now in a state of ruin.

**Azaïs, Pierre Hyacinthe** (1766-1845), son of the musician of the same name, a Fr. philosopher, was b. at Sorèze. He entered a monastery, but soon renounced the monastic life. He was at first a warm partisan of the Revolution, but changed his views and was thereupon sentenced to deportation. He took refuge in the hospital of the Sisters of Charity at Tarbes, where he had leisure for his philosophical studies. After the fall of Napoleon, the Gov. granted him a pension of 6000 francs. He d. at Paris.

AZALEA

**Azalea** is a plant now included in the genus *Rhododendron* of the order Ericaceæ, which is a native of the mts. of Asia and N. America. *A. glauca* occurs in clayey swamps of America; *A. pontica* grows in the Crimea; *A. periclymenia*, the so called upright honeysuckle, is a native of N. Amer. woods; *A. indica* is a beautiful Chinese plant. The trailing *A.* is the sole species of the genus *Loiseleuria*, and is named *L.* (or *A.*) *procumbens*. The various kinds of *A.* are hardy and half-hardy shrubs of attractive appearance.

They do well in a mixture of loam peat and leaf-mould, to which has been added some sand. They may be increased by cuttings planted in a sandy soil in slight heat in spring. These shrubs grow to a height which varies between 10 and 15 ft.

**Azamgarh**, see AZIMGURH.

**Azan**, the call to prayer which is proclaimed by the muezzin from the mosque twice daily in Mohammedan communities. It consists of 7 or 8 phrases, most of them repeated, to each of which there is a set response to be used by the hearer. The muezzin proclaims the *A.* standing at the door or in the minaret of the mosque with his face towards Mecca and his ears stopped by his fingers, and during the proclamation passers in the street must stand still, all work must cease, and even the sick must sit up in bed.

**Azana, Manuel** (1851-1941), president of the Sp. Republic, b. at Alcalá de Henares. Entered the civil service and made a reputation as one of the leading Sp. men of letters. Towards the close of Primo de Rivera's (q.v.) dictatorship, A. came to the fore as a democratic leader, and, after de Rivera's fall, he was elected president of the Madrid Academy, member of the revolutionary committee which in 1931 signed the pact of San Sebastian, and in 1932 he became war minister to the provisional Republican Gov. Largely responsible for the grant of autonomy to Catalonia and for those articles of the Constitution which curtailed the freedom of the religious orders and legalised the suppression of the Jesuits. Succeeded Alcalá Zamora as head of the Gov. in 1931. Much criticised for the suppression of the risings of 1932, his Catalanism and his anti-Clericalism. When President Zamora was deposed by the Cortes in 1936 A. was elected in his place and left active politics. During the Civil war he was little more than a figure-head, and when the Nationalist forces were marching on Barcelona he went into exile in France. He d. at Montauban.

**Azandeh**, see Niam-Niam.

**Azara, Don Felix de** (1746-1811), a Sp. naturalist of the eighteenth century. Entered the Sp. Army and served for some considerable time in S. America, being appointed to 'the Council of Fortifications and Defence of the Two Indias.' His most famous book, pub. in 1809, was *Travels in South America from 1781 to 1801*.

**Azariah**, or **Uzziah**, king of Judah, 792-740 B.C., succeeding his father, Amaziah. The name is also given as that of sev. minor O.T. characters.

**Azay-le-Rideau**, tn. in W. France, dept. Indre-et-Loire, 16 m. S.W. of Tours. It has a fine Renaissance château. Pop. 2000.

**Azazel**, a name found in Lev. xvi. 8, 10, and 26, where it is trans. as scapegoat. Reference is made to 1 goat for Jehovah and 1 for A., and the antithesis is best conveyed by regarding the translation of A. as Satan, or an evil spirit. By many authorities, however, the word is regarded as being purely impersonal and simply conveying the idea of a 'going far away.' The word

was used by Milton as a name given to one of the of the followers of Satan, his standard-bearer.

**Azeglio**, Massimo Taparelli, Marchese d' (1798-1866), an It. author, painter, soldier, and statesman. He was b. at Turin. He was descended from a noble Piedmont family, and at the age of 15 he went to Rome with his father who had recently been appointed ambas. there, and became well known as a landscape artist. In 1830 he made the acquaintance of Alessandro Manzoni, the poet, whose daughter he subsequently married. The revolution in France in 1830 had given impetus to the liberal movement in Italy, and into this movement A. threw himself enthusiastically. He was, however, opposed to the doctrines of Mazzini, who was just beginning his career as an agitator, and advocating republican views. A., however, was imbued with the ideas of constitutional monarchy, and did his best to propagate his doctrines. In 1833 and in 1841 he pub. novels with a political tendency, *Ettore Fieramosca*, and *Niccolò di Lapi* respectively. He took part in the battle of Vicenza when the papal troops supported the rebels against Austria. After the defeat at Novara he was appointed president of the Cabinet by Victor Emmanuel, a position which he occupied until 1852, when he was succeeded by Cavour. At the close of the war of 1859 he was appointed commissioner of the Rom. states, a position which he carried out tactfully and successfully.

**Azerbaijan**, called variously Azerbijan and Aderbaizan; anciently called *Atropatene*. The name A. originates from that of Alexander the Great's satrap, *Atropathen*. In anc. Iranian *athro* means fire, for which there is also another name, *azar*. *Jan* or *djan* means 'province', and the name A. is a play on the word fire. There are 2 As., one a Soviet republic forming part of the U.S.S.R., and the other a prov. in N.W. Persia. The prov. is separated from the republic by the R. Aras (*Araxes*). The republic of A. is situated on the S.W. shore of the Caspian Sea, it extends from the Caucasus in the N. to Persia in the S., and from the Caspian in the E. to Armenia and Georgia. After the First World War, the Nationalist party of the constituent assembly of the Tatars of A., having in 1918 acquired the effective voice in affairs, declared the independence of A. on May 28, 1918. Two years later, however, the Bolshevik caucus in the pay of Moscow turned the Nationalist gov. out and voluntarily handed the cap., Baku, to Lenin's troops. The outcome of these events was a treaty between A. and the Russian Soviet republic. In 1922 the republic entered the Soviet Union as a member of the Transcaucasian Federation.

The Soviet republic's main source of wealth is in the oil-fields of Baku, the ann. average output of which is about 500 million poods. Other minerals such as naphtha, manganese, copper, and salt abound and production of them is increasing. The other prin. products are

grain and cotton; a little tobacco and silk are also produced as well as vine and garden produce. The pop., which is chiefly Moslem, is now about 3,210,000 (1939) (mainly Turko-Tatar), that of Baku being 710,000.

It is very mountainous, one of its mts., Salvan-Dagh, rises to the height of Mt. Ararat. It is very fertile in parts, and produces maize, barley, wheat, cotton, and tobacco.

After the war the continued presence of Russian troops in Persian A. in 1945 raised acutely among the Allies the question of Persian sovereignty in that prov. The original occupation was justified on grounds of expediency. For, Persia lying athwart the single route along which supplies could be sent into the Soviet Union as an alternative to the difficult Murmansk route, Brit. and Russian forces entered the country, supported by Amer. technicians, to improve and use the communications. But by the Anglo-Russian-Iranian treaty of Jan. 1942 the 2 powers restated their respect for the political independence and territorial integrity of the Iranian State (or Persia), and both countries agreed to withdraw within 6 months of the end of the war. Soon after the occupation began the Russians launched an Iranian Democratic party and endeavoured to win over local party groups by promises of extended social services. The Azerbaijanian people were assured that there was no separatist tendency implied by this move, but the other Allies saw in it a policy designed to separate Iranian A. and join it to the A. S.S.R. on the hypothesis of a common language and other interests in common. But though there is, in fact, a common spoken language that in Russia is written in Cyrillic (Russian) characters while that of Persian A. is not written at all save in Iranian script. Moreover, there is a fundamental difference of religion: those who live in Iranian A. are Muslims of the Shi'ite persuasion, and those of the U.S.S.R. of the Sunni. To the orientalist the deduction that Iranian A. ought therefore to be united with the A. S.S.R. did not follow, and in any case, even if union were desirable, it should be the other way round. The name A. was only given to the ter. of the present S.S.R. of that name under the rule of the late Enver Pasha, whose aim was to sow the seeds of a future Irredentism within Russian Trans-Caucasia which might lead those parts to eventual union with Turkey. The Brit. forces began to evacuate the country before the end of 1945, but, as the Russians showed no signs of reducing their forces there, the other Allies proposed that the question should be referred to the United Nations (q.v.). Subsequently it appeared that the Soviet Union and Persia had arrived at an agreement and it was reported that the Russian troops were clear of Iranian A. by May 6 (1946); but, later, the Persian representative informed the United Nations Organisation security council in New York that the Persian

Gov., owing to the existence of a hostile army created under the auspices of the Russian forces, was unable to discover the real situation in A. Subsequent investigations, however, enabled the Persian Prime Minister to announce that the evacuation of Persian soil by Soviet troops had been completed by May 9.

**Azides**, salts of azoimide or hydrozoic acid. Azoimide (formula  $N_2H$ ) has similar properties to those of hydrochloric acid.

**Azimghurh**, **Azimghur**, or **Azamgarh**, a tn. and dist. of India in the United Provs. of Agra and Oudh. The tn. is situated on the R. Tons, a trib. of the Ganges, N.E. of Benares, 475 m. from Calcutta. Produces sugar, rice, indigo, and opium. Inhab. Hindus and Muslims. Pop. of dist. about 1,600,000; tn. about 20,000.

**Azimuth**. The A. of a celestial object is that point in the arc of a horizontal circle intersected by a vertical circle passing through the centre of that heavenly body. Thus, if a star is due S. it is said to be of A.  $0^\circ$ , but if it is S.W. it is  $45^\circ$  A., or S.E.  $345^\circ$  A. Taken in conjunction with its altitude (q.v.), the A. of a star as ascertained by the altazimuth (q.v.) fixes its position on the celestial concave.

**Azineourt**, see AGINCOURT.

**Azo**, see Azzo.

**Azo-Compounds**, organic substances containing the group  $R_1-N=N-R_2$ ,  $R_1$  being an aryl radical and  $R_2$  either an aryl radical or a substituted alkyl. Many A.-C. are important dyes, such as chrysoidine, Congo-red, and methyl-orange, and other members of the group are azo-benzene, the amino-A.-C., the oxyazo-compounds, the diazoamines, diazoaminobenzene, the azoxy-compounds, etc.

**Azogues**, quicksilver.

**Azougues**, or **Canar**, a prov. of Ecuador. Area, 1520 sq. m. Pop. 112,000.

**Azole** (Gk.  $\alpha$ , without,  $\omega$ , life), a geological term applied to such rocks as are found to contain no fossils. The constant tendency, however, is for geologists to discover traces of fossils in rocks hitherto considered A. Archaean crystalline schists are held by some to form the A. system.

**Azore**, a stuff like beaver cloth, manufactured in Styria, Austria.

**Azores**, a group of is. in the Atlantic belonging to the Portuguese. They are called also the W. Is., and are situated between lat.  $36^\circ 55'$  and  $39^\circ 55'$  N. and long.  $25^\circ$  and  $31^\circ 18'$  W. They were discovered and colonised by the Portuguese between the years 1430 and 1480, but they had been known to W. Europe previously, since they are recorded on some of the earlier medieval maps. On the is. of Corvo, in the A. group, Punic coins have been discovered, which show that the Carthaginians must at some earlier period have visited them. When the Portuguese rediscovered them in the fifteenth century they were uninhabited, and their present pop. is chiefly of European descent. They were presented by Alfonso V. to his aunt, Isabella of Burgundy, under whose rule a great immigration of Flemings took place. The A. consist of 9 is., which fall into 3 groups; the central group is composed of the is. of Terceira, São Jorge, Pico, Fayal, and Graciosa; the N.-westerly group of Flores and Corvo; the S.-easterly group of São Miguel and Santa Maria. The is. are of volcanic origin, and present a very picturesque though somewhat rugged appearance. A number of them still suffer from periodical volcanic eruptions, and the surface of the is. consists to a very great extent of lavas and basalts. The highest peak in the is. is Pico Alto, which reaches the height of 7613 ft. São Miguel is the largest of the is., and is also the most populous and the richest; it has an area of 299 sq. m. Ponta Delgada, situated in this is., is the largest port of the whole group. The cap. of the A. is Angra in the is. of Terceira, which tn. is also a port. Horta, in the is. of Fayal, is also a port; but unfortunately there are no good harbours. Sugar-cane, coffee, and tobacco are grown and tropical fruits of all kinds, including bananas and olives. The chief exports of the is. are oranges, wine, brandy, lemons, and corn, most of which are exported to Great Britain or Germany. They export also pork, salt beef, and coarse linen. The climate is mild and healthy, and the A. are rapidly becoming a winter resort; the average temp. is about  $60^\circ$ . Most of the flora of the is. is European, only about 40 plants out of a known 500 species being indigenous. The name A. was given by the Portuguese to the is. because of the numbers of hawks found there (Portuguese *apar*, hawk). On Aug. 31, 1926, the city of Horta was much damaged by an earthquake. At the height of the battle of the Atlantic (q.v.) in 1943 the Portuguese Gov., at the request of Britain, agreed to grant temporary facilities in the shape of naval and air bases in the A. and other Portuguese is., which would enable better protection to be given to merchant shipping in the Atlantic against Ger. submarines or other hostile craft. The agreement included provision for Brit. assistance in furnishing essential material and supplies to the Portuguese armed forces.

These arrangements owed their validity to the treaty between Britain and Portugal made in 1373 and reinforced by 7 later treaties between 1386 and 1815, to a secret declaration of 1899, and, in more modern times, to treaties of arbitration made with Portugal in 1904 and 1914 which recognised the validity of all the antecedent treaties. Thus was vindicated an engagement which had lasted for nearly 6 centuries, and which was without parallel in world hist. Area of the group, 920 sq. m. Pop. 254,000.

See W. F. Walker, *The Azores*, 1886; J. Mees, *Histoire de la découverte des îles Azores* (Ghent), 1901; A. S. Brown, *Madeira, Canary Islands and Azores*, 1922.

**Azote** (Gk. α-, without, ζωή, life), the name given at one time almost universally to nitrogen, from the fact that uncombined with oxygen it is unable to support animal life.

**Azotised Bodies** are substances which contain nitrogen and form part of the structure of plants and animals; such are albumen, casein, gelatine, etc.

**Azotus**, see AZHDON.

**Azov**, a Russian tn. on the S. bank of the Don, about 20 m. from the mouth of that riv., it is also about 25 m. E. of the tn. of Taganrog, its trade rival. It is a great fishing centre, and to a certain extent the outlet for the produce of S.E. Russia. It is identified with the anct. tn. of Tanais, near which site A. was built, and the medieval tn. of Tana. Captured first by the Russians in the tenth century, it did not become a part of Russia until 1774, although it had previously been captured by Peter the Great from the Turks (1696). It was bombarded by the allied army during the Crimean war. Taken by the Gers. in 1941; retaken Feb. 7, 1943. Pop. 17,500.

**Azov, Sea of**, a N. arm of the Black Sea with which it is connected by the strait of Yenikale, or Kertch, about 28 m. long and very narrow, not exceeding 4 m. in breadth at its widest part. The anct. name of this strait is Bosphorus Cimmerius. To the W. of the S. of A., and separated from it only by a long narrow sandy peninsula called Arabat, is the Sivash, or Putrid Sea, a series of lagoons and marshes. To the Romans the S. of A. was known as the Palus Mæotis, the name being given to it from the people who dwelt on its banks, and who, in their own tongue, called it the Mother of Waters. By the Turks it is known as the Baluk Deniz, or Fish Sea, owing to the number of fish which are found there. There is supposed to have been prehistorically a connection between the Caspian Sea and the S. of A. It lies between lat. 45° 20' and 47° 18' N., and long. 35°-39° E. Its greatest length is a little over 220 m., and its average breadth is about 80 m.; its total area just exceeding 14,000 sq. m. It is remarkably fresh, although this freshness differs in various parts of the sea owing to the various currents. It is frozen across in mid-winter. The depth varies

from 3 ft. in some places to 50 ft. Its greatest trib. is the R. Don, and in fact the deepest part of the lake forms a continuation of the Don basin. Winter wheat, winter rye, and sunflower are the main crops of the surrounding ter. It has a number of important tns. on its banks, but its lack of commodious harbours prevents it from obtaining all the trade which it might have. Amongst important tns. on the S. of A. may be mentioned Taganrog, Berdiansk, Mariopol, Yenikale, and Kertch, all of which figured in the Russo-Ger. campaigns of 1943 (see EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.)

**Azpetitia**, a Sp. tn. in the prov. of Guipuzcoa. About 16 m. S.W. of San Sebastian. Just outside this tn. was b. in 1491 the founder of the Society of Jesus, Ignatius Loyola. The house is still preserved within the walls of the Loyola convent. Pop. 2800.

**Azrael**, also called Raphael, and identified with Gabriel, Michael, and Uriel as the 4 archangels 'who go in and out before the glory of the Holy One.' In Moslem mythology he is the angel of Death, regarded in a very similar manner to Fate. Jewish tradition has made him almost an evil genius.

**Azrek**, see BAHR-EL-AZREK.

**Aztecs**, The, are the best known of the numerous tribes which inhabited Mexico. Their early hist. has been elucidated by Humboldt, and the story of their wanderings is told in their picture-writing. They appear to have been of the same origin as certain Asiatic tribes; according to their hist., they came from a pleasant land, Aztlan, somewhere to the N.E., leaving it probably about the seventh century A.D. They wandered towards the S.E., led by their priests, leaving settlements which are distinguishable now. Finally, about 1200, they settled at Chapultepec, at the foot of the volcano Popocatepetl. However, their savage customs were resented by the tribe of the Chichimecs, and they were driven to the lagoons, but a hundred years afterwards they gained their liberty. Led by their priests, they chose a site for and built their cap., Tenochtitlan, also called Mexico, from the name of their god Mexitli. From this god also the A. were called Mexicans, which name was afterwards applied generally to all the inhab. of the country. In this place they built up a magnificent civilisation, and by means of alliances and wars extended their empire over the greater part of what is now modern Mexico. Their later emperors, the Montezumas, were said to possess such wonderful treasures that they have been considered types of magnificence, though it is probable that the greater part of this is due to tradition. Their religion included the sacrifice of human beings taken from prisoners of war. They were an agric. people, had an elaborate system of irrigation, and studied astronomy. According to their belief, time was divided into cycles of 52 years, the close of each cycle being supposed to portend

some grave national disaster. During the last 5 days of each period, they observed various religious ceremonies, intended to avert this catastrophe; immediately afterwards they gave themselves up to rejoicing. The last time that this ceremony of 'tying up the years' was observed was in 1506. The last of the Montezumas succeeded in 1502. The A. were now at their greatest height, but they were feared and hated by all the surrounding nations, and this king, by carrying out a policy of wanton aggression and by the use of human sacrifices, increased this enmity. Rumours of the

as a sun-dial and calendar, such as the Egyptians and Chaldeans used. The inscribed procession of cyclical animals has given rise to the belief that the chronological system which produced the stone had some connection with the Tatar zodiac, and even with the Chinese and Indian astronomical system. Its age is about A.D. 1479, but it is said to have been a copy of some anterior stone evolved through the ages. Also in the museum is a sacrificial stone, 9 ft. in diameter, sculptured from trachyte and upon which human victims in the terrible sacrifices of the A. were butchered, their breasts cut open with obsidian knives and the still-beating heart torn out and flung before the statue of the war-gods in the temple on the *teocalli*.

Consult W. H. Prescott, *History of the Conquest of Mexico*, 1843; also E. J. Payne, *History of the New World*, 1892; T. S. Joyce, *Mexican Archaeology*, 1922; J. E. Thompson, *Mexico before Cortes*, 1933; H. P. Parkes, *A History of Mexico*, 1939.

**Azuza**, a prov. and tn. in the Dominican republic. Petroleum is found in the vicinity.

**Azuaga**, a tn. of Badajoz, Spain, 20 m. E. of Llerena in the centre of the silver and lead mining dist. It has valuable Rom. remains. Pop. 17,500.

**Azuay**, a S. prov. of Ecuador lying to the N. of Loja, and extending to the R. Amazon. It takes its name from the mt. knot lying to the W. called A. It is fertile and well watered. The cap. tn. is Cuenca. Area about 4000 sq. m.; pop. 237,000.

**Azul**, the name of a tn. and dist. in the prov. of Buenos Aires in the Argentine republic. The tn. is the centre of a colony of Its. and Basques. The dist. has a pop. of about 51,000, the tn. 38,000.

**Azulejos**, the name given to a peculiar blue tile which was made by the Mohammedans of Persia, Egypt, and Spain. The manuf. was learnt by the Spaniards from the Moors, and kept up after the conquest of Granada had driven the Moors from Spain. So skilful did the Spaniards become in the manuf. of these tiles that it is not easy to distinguish the Sp.-made from the Moorish-made tile.

**Azun**, sometimes called the 'Eden of the Pyrenees,' in the S.W. of dept. Hautes-Pyrénées. Watered by a trib. of the Gave de Pau.

**Azuni**, Domenico Alberto (1749-1827), a distinguished writer on international law, and jurist. He was b. at Sassari in Sardinia. He studied law at Sassari and Turin, and at the age of 32 was made a judge of the consulate at Nice. He pub. his general dictionary of mercantile jurisprudence in 1788, and in 1795 a book on the growth and progress of maritime law in Europe. He was appointed by Napoleon to be one of the commissioners engaged in drawing up a new commercial code, and in 1807 he became president of the Court of Appeal at Geneva. After the fall of Napoleon he went into retirement until he was recalled and made a judge at Cagliari by Victor Emmanuel I.

Mexican Embassy

#### SCULPTURE OF THE AZTEC TEMPLE OF QUITZALCOATL

approach of the Spaniards had already reached Mexico. In 1517, emissaries of Velázquez, governor of Cuba, penetrated far enough to see some of the glories. Hence, in 1519, Hernando Cortés began his famous expedition, which ended in the conquest of Mexico. He destroyed the greater part of the ships of Montezuma and advanced inland. Montezuma sent him gifts, and ordered him to return. Cortés replied insolently, and then proceeded to take advantage of the isolation of the A. He conquered and christianised Tlaxcala, a small republic at enmity with Montezuma, and then advanced. Montezuma was forced to submit, and d. in 1530. Cortés was driven back for a time, but returned and besieged the cap., Mexico, for 80 days. With its fall comes the end of the native hist. of Mexico.

In the national museum of Mexico city is the famous Calendar stone of the A., or sun-stone, a beautiful and massive monolith of carved basalt, circular in form and 12 ft. in diameter, which was used both

**Azure**, the word used technically to denote blue in heraldry. This term is always used in describing the escutcheons of those beneath the rank of a baron. It is represented by horizontal lines in engraving arms.

**Azurine**, or **Blue Roach**, a variety of the rudd, or red-eye, distinguished by its slate-blue back, silvery-white abdomen, white fins, and straw-coloured iris to the eye. It belongs to the Cyprinidæ or Carp family. It is found all over the Continent, and has been introduced into England, not with very great success, although it is sometimes found in Lancashire. The fish is small and hardy, affords good sport, and has firm, well-flavoured flesh.

**Azurite**, a name given to the stone which is also known as lazulite. This stone, together with lapis lazuli, and mineral turquoise, is given the generic

name of azure spar. It is a brittle, transparent mineral, with monoclinic crystals. It occurs in England in Derbyshire, Devonshire, and Cornwall, and in many parts of the Continent, such as France and Austria.

**Azym**, **Azyme** (Gk. ἄζυμος, not, ζύμη, leaven) unleavened bread eaten by the Jews at the Passover.

**Azymites**, the name given by the orthodox Gk. Church to the adherents of the W. Church who used unleavened bread in the observance of the Lord's Supper. The patriarch of Constantinople attacked the W. Church on this point during the eleventh century.

**Azzo**, sometimes called **Azo** and **Azzolenus**. A prof. of civil law in the univ. of Bologna during the thirteenth century. He has left us his *Readings on the Code*, which is considered by Savigny to be the most important contribution of his school.

## B

**B** is the second letter of nearly all the anct. and modern alphabets. It is the exact counterpart of the Semitic *beth* (including N. Semitic and Heb.), the Arabic *bē*, and the Gk. *bēta*. The sound the letter represents is the sonant labial mute or lip-voice stop consonant, i.e. the sound produced by closing the lips and vibrating the vocal chords. In some languages, however, *b* tends to exchange value with *p*, *v*, *f*, or *m*. So, for instance, in the fourth century A.D., *b* in Gk. came to assume the phonetic value of *v*, and hence in the Cyrillic alphabet and its descendants (Russian, Bulgarian, and so forth) the letter *b* has the phonetic value of *v*, but out of it a new letter was created to express the phonetic value of *b*. The symbol *b* passed through various forms. The capital *B* roughly corresponds with the anct. Rom. and Gk. classical *B*; the minuscule *b* is derived from the same form by eliminating a pair of the letter (the upper loop), while the cursive form *ℳ* evolved from *B* by imperfect junctions of the loops. In the Aramaic alphabet, the opening of the top of the letter *beth* was a prominent feature, and in its descendant, the square Heb. alphabet (the prototype of modern Heb.), the upper loop completely disappeared. The evolution of the form of the Arabic *bē* (as of all the Arabic letters) was the most rapid amongst all the branches of alphabetic scripts. The numerical value of *b* is 2 in most alphabetic scripts.

**B**, in music. In Eng. music *B* represents the seventh degree of the diatonic scale of *C*, but in Ger. music *H* represents the Eng. *B*, while *B* represents the Eng. *B* flat. The musical signs denoting flat and natural are modifications of the letter *b*, i.e. the sign *b*, denoting flat, is a *b* with a slightly pointed loop, and the sign *n*, denoting a natural, is a *b* with a square loop. These signs are used because *B* was the first note of the scale to be modified by a semitone.

**Baader**, Benedict Franz Xavier (1765-1841), a Ger. Rom. Catholic speculative theologian and philosopher, *b.* at Munich, studied medicine at Ingolstadt and Vienna, graduating in 1784. During his stay in England (1791-96) he became acquainted with the work of Hume, Boehme, Eckhart, and Saint Martin. He became an engineer by profession, and was superintendent of the Bavarian mines (1817-20). He was appointed prof. of philosophy and theology at Munich (1826). The rationalism of Hume repelled as much as the mysticism of Boehme attracted him. His philosophy is based on the doctrine of the Catholic Church and is religious rather than ethical. His writings are metaphysical and obscure in tone, but he is considered

by many to be the greatest Rom. Catholic thinker of modern times. His opposition to the interference of the Rom. Catholic Church led to an interdict forbidding all laymen from lecturing on the philosophy of religion (1838). His collected works were pub. at Leipzig (1851-60) in 16 vols., vol. xv. containing his life by F. Hoffmann. A selected ed., ed. by Claassen, was issued in 2 vols. (1886-87).

**Baal**, the chief male deity of the Phœnician and Canaanitish nations. Worship of *B*. began as a god of the sun, but later he was regarded as having a certain sway over morals. The first peoples to worship him adopted a form of nature worship on mt. tops. Those mts. included Horeb and Sinai, where the Midianites and Amalekites congregated respectively; Mt. Peor, used by the Moabites; Carmel, chiefly used by the Phœnicians; and Hermon, where the Canaanites of the interior met. *B*. stood for the life-giving power of the sun, while Moloch represented the sun's destructive influence. Later both were united under the name Melkart, who became the supreme Phœnician deity. The word *B*. is found in many names of persons and places in Heb., Chaldee, and Phœnician, e.g. Jezebel, Hasdrubal, Hannibal, Baalbek. *B*. is not to be confounded with *Beal*, a Celtic deity.

**Baalbek**, an anct. city of Syria. The ruins stand 35 m. N.N.W. of Damascus and 38 m. S.S.E. of Tripoli. The name means *Baal's City*. During its occupation by the Gks. its name was changed to Heliopolis. It lies at the opening of a small valley in the plain of Coele-Syria (El Bukā'a), a dist. of pleasing appearance, and occupies a position 4500 ft. above sea level. Of all Syrian cities *B*. was foremost for the beauty of its buildings and the splendour of its streets. It is remarkable now for the magnificent ruins of Rom. temples it possesses, among which one specially noteworthy is the Great Temple, the finest building in the city. The columns of the entrance measure 88 ft. in height and 22 ft. in circumference. Originally there were 54 columns, of which 6 are now standing, while the ground is strewn with the ruins of the remainder of the structure. A smaller temple stands to the S. of this, and is larger than the Parthenon at Athens. Both are built of limestone. The actual hist. of *B*. is in its beginning difficult to trace. Without doubt it was used, as its name indicates, as a temple of *Baal*. Under Julius Cæsar it was made a Rom. colony. In the second century it was renowned for an oracle, and Trajan is said to have been sufficiently impressed with its powers to consult it before embarking upon his second Parthian war. The Great Temple was built by Antoninus Pius (A.D. 138-

161), though the inhab. to-day attribute its erection to Solomon. Theodosius the Great converted it into a Christian church on the establishment of that religion. During the wars which followed, it was used as a fortress by the Arabs, traces of which are yet visible. In 1400 the city was completely sacked by Timūr Beg. Near by is the largest cut stone in the world—60 ft. by 17 ft. by 14 ft.—weighing 1500 tons. To-day the inhab. live in a state as wretched as the anc. city was once opulent, and its pop. is only about 5000.

**Baan, Jan van** (1633–1702), a Dutch portrait painter, b. at Haarlem. By invitation of Charles II. he came to England and painted portraits of the king and queen and many of the nobility. On his return to The Hague, he executed a portrait of the duke of Tell, which brought him 1000 Hungarian ducats. He also worked for the duke of Tuscany, who placed a portrait of the artist in the gallery at Florence; and Louis XIV. consulted him frequently on the purchase of pictures. B.'s best piece of work is, probably, the portrait of Prince Maurice of Nassau. He d. at Amsterdam.

**Baanfu** (also **Batang** or **Patang**), cap. of the prov. of Sikang, China. At B. the bed of the Yangtse R. is nearly 10,000 ft. above sea level.

**Baasha**, an Issacharite who slew Nadab, son of Jeroboam I., at the Philistine tn. Gibbethon, afterwards killing all the rest of Jeroboam's family. B. thereupon became king of Israel (c. 914 B.C.), and prosecuted an energetic policy against Asa, king of Judah. By bullding Rama, he hoped to cut off Jerusalem from the outer world, but Asa procured the help of Syria. B. was buried at Tirzah, the royal residence. See 1 Kings xv. 27 to xvi. 7.

**Baba**: 1. A corruption of *papa*, father, applied as a title of distinction in Persia and Turkey to dignitaries, especially of the ascetic life. 2. B. (the old woman), the name of a favourite character in Slavonic mythology, represented as an old witch or hag with a hooked nose, prominent teeth, and grey dishevelled hair.

**Baba** (A. c. 1240), a Turkish impostor, or prophet, who devastated Asia Minor and was killed by the combined forces of the Turks and Christians.

**Baba, Cape**, a frowning prominence near the W. point of Anatolia. The Gks. called the cape Lectum, and it was important in classical times as separating Troas from Æolia. On the promontory stands the tn. of B., which has a pop. of about 4000.

**Babahan**, or **Behbehan**, a Persian tn., 130 m. N.W. of Shiraz in the prov. of Khuzistan. Ruins of Arrajan are in the vicinity. Pop. 2000.

**Babahoyo**, or **Bodegas**, cap. of prov. Los Rios, Ecuador, S. America, on the R. Guayas. It is about 45 m. N.E. of Guayaquil, and is the busy trading centre for this city and Quito; pop. 20,000.

**Babar**, see **BABER**.

**Babadagh**, or **Babadagh**, a tn. situated in Rumania, cap. of the Dobrudja; has

a considerable Black Sea trade; pop. 5000.

**Babbage, Charles** (1791–1871), Eng. mathematician, b. at Totnes, Devonshire, and promoter of an important Eng. mathematical revival. He observed that mathematical calculations were greatly impeded by the use of imperfect logarithm tables, and he devoted his attention to the construction of a correct table of logarithms (pub. 1827). The ruling passion of his life, however, was the idea of construction of a great calculating machine. The Gov. contributed £17,000 in aid of its construction, and B. himself expended £6000, but the machine was never completed, owing to disagreements between the constructor and the Gov. The imperfect machine is now preserved in the S. Kensington Museum.

**Babbacombe**, a vil. in Devonshire, 2 m. N. of Torquay. It is a favourite resort of summer visitors. Gained much notoriety from the fact that the criminal Lee, who committed a murder at B., was thrice placed on the scaffold, the trap-door of which refused to work. Lee's execution was postponed, and subsequently commuted to penal servitude. Near by is Kent's Cavern, in which were found remains of prehistoric man. Pop. 3100.

**Babbitt's Metal**, an alloy of copper, antimony, and tin named after its inventor, Isaac Babbitt (1799–1862). It is an anti-friction metal used for shaft bearings.

**Babel, Tower of**, according to the legend of the book of Genesis (xi.), a tower built by the inhab. of B., with the intention of scaling heaven. The Almighty in the narrative miraculously intervenes, and the builders are punished for their presumption by having their speech confounded. The legend thus endeavours to account for the diversity of speech among the different nations of the world, and probably arose from a misunderstanding of the etymology of the word B. B. (Assyrian *Bab-il*) is the native name for what appears as Babylon in the Gk., and signifies Gate of God. It has no connection with the Heb. word *bālal*, signifying to confound. The student of comparative mythology will readily see an analogy between this legend and the Gk. myth of the Titans who attempted to scale heaven by piling Pelion on Ossa. Various sites of the tower have been suggested, e.g. Birs Nimrud near Babylon and Amran within the city. Later interpretation contends that the words 'its top shall be in the heavens' means no more than 'very high' and that the purpose of the tower was to serve as a rallying point for the inhab. of the plain in the land of Shinar. (Consult T. G. Pinches, *The Old Testament in the Light of the Records of Assyria and Babylonia*, 1902, and the *Internal Standard Bible Encyclopedia*.) The remains of 'the temple of the foundation of heaven and earth' called by Nebuchadnezzar the Ziggurat Babil, or Tower of Babylon, towered high above the surrounding plain. The burnt bricks of which it was composed

were all, it is said, cleared out in order to use them for the repair of the Hindiyeh canal. We cannot, however, be certain that this Tower of B. included or stood on the site of the *migdol* or watch-tower in question, although it was built of similar materials.

**Bab-el-Mandeb**, or The Gate of Tears, from its dangerous currents, is a strait separating Arabia and Africa. The Red Sea is joined to the gulf of Aden by it. On the E. side it is called the little, and on the W. the great strait.

**Babelthuap**, the chief is. in the Pelew group, or W. Carolines, in the Pacific Ocean, being about 30 m. in length. It has a fertile soil, and is subject to volcanic eruptions. It was administered by the Jap. under mandate before the Second World War. Pop. (of the group) 6300.

**Babenberg**, the name of a princely Ger. family which came from Franconia, near Bamberg, and flourished from c. 980 to c. 1246. The most noteworthy member of the family was Leopold I., surnamed the illustrious, who became margrave of Austria, 960.

**Baber (Fehir-ed-din Mohammed)** 1483-1530, the first great mogul of India. He was a descendant of Timur. At 12 he succeeded Omar Sheikh Mirza to the rule of the dominions lying between Samarkand and the Indus. Strife ensued owing to the usurpation of an uncle and the revolt of some of the nobles. With surprising courage and determination, however, the young ruler seized and held the provs. of Kashgar, Kunduz, Kandahar, and Kabul. Delhi and Agra speedily fell before the impetuosity of his attack. But his reign as mogul was short, for he d. after having reigned 5 years. Not only were his talents remarkable in civil and military gov., but he possessed also a passion and genius for science and art, and to his many achievements of administration in the improvement of roads, the measuring of land, the levying of taxation, and postal organisation is to be added a hist. of his life and conquests written in the Tatar language. The eldest of his 4 sons succeeded him to the throne at Delhi.

**Baber**, or **Babber Islands**, in the Dutch E. Indies, belonging to the residency of Amboyna. See **SUNDA ISLANDS**. LEESER.

**Baber**, **Edward Colborne** (1843-90), Eng. author and traveller. He was b. at Dulwich, educated at Christ's Hospital, and graduated from Magdalene College, Cambridge, in 1867. He went out to Peking as a student interpreter, and became a first-class assistant in 1872. In 1879 he became Chinese secretary of the legation at Peking. He made 3 journeys into the interior of China, in 1876, 1877, and 1878, which he described in *Travels and Researches in Western China*, 1886; *Chinese Tea Trade with Tibet*, 1886, which appeared in the Royal Geographical Society's *Supplementary Papers*, was awarded the medal of the society. He was consul-general in Korea (1885-86) and political resident

at Bhamo on the Upper Irrawadi from 1886 till his death. See the *Proceedings of Royal Geographical Society*, 1883, 1886, and 1890.

**Babeuf**, **François Noël** (1760-97), a Communist and journalist of the Fr. Revolution. He adopted the title of Gracchus B. as editor of a paper called the *L. Tribun du peuple*, uncompromisingly communistic in principle. He was guillotined for an attempt to overthrow the Directory and establish Communism.

**Babi Islands**, or **Baby Pulo**, form a group of the Malay Archipelago.

**Bablu**, see **BABYLONIA**.

**Babington**, **Anthony** (1561-86), Eng. Catholic conspirator, son of Henry B. and Mary, daughter of Lord Darcy. He acted as a page to Mary Queen of Scots when a prisoner at Sheffield, to whom he soon became strongly attached. In 1580 he became an attendant at the court of Queen Elizabeth, and in 1586 one of the chief promoters of a far-reaching conspiracy. The plot had for its object the assassination of Elizabeth, the liberation of Mary, and the reorganisation of the constitution in Catholic interests. B., in order to have lasting testimony of his own importance in the conspiracy, entered into correspondence with Queen Mary regarding the progress of the plot. The letters were discovered and the conspiracy was betrayed. B. tried to escape, but was arrested, tried, and condemned to death. He wrote a letter to Queen Elizabeth begging redress, but to no avail. The discovery of this plot was the chief cause of Mary's own execution.

**Babington**, **Churchill** (1821-89), classical scholar, scientist, and archaeologist, b. at Roeliffe, Leicestershire. He held the Disney professorship of archaeology at Cambridge, 1865-80, and lectured chiefly on Gk. and Rom. pottery and numismatics, illustrating these lectures from his own valuable collection of coins and vases. He was, moreover, an authority on botany, ornithology, and conchology. He catalogued the classical MSS. in the univ. library and the Gk. and Eng. coins in the Fitzwilliam Museum. His fame as a classical scholar is based on his ed. of Hyperides' speeches (*Against Demosthenes*), 1850; *On behalf of Lysiphron* and *Euxenippus*, 1853; and *Funeral Oration*, 1858, from the papyrus discovered at Thebes in 1847. His other works include *Roman Antiquities found at Rouham*, 1872, and an ed. of Higden's *Polychronicon*, 1858.

**Babington**, **Francis**, Eng. divine. Graduated at Cambridge; went to Oxford, 1555. By this date he had changed his religion, his name being appended to the Rom. Catholic articles of belief. When Elizabeth came to the throne the Rom. Catholic master of Balliol was removed and B. appointed, for with him conscience never stood in the way of preferment. Leicester chose him to preach Amy Robsart's funeral sermon at St. Mary's in 1560, but later he appears to have lost his patron's favour. He was suspected of being a secret papist, was obliged to resign from the rectorship of Lincoln College, 1563, and in 1565 fled

to the Continent, where he d. about 1569.

**Babington, Gervase** (1550-1610) successively bishop of Llandaff, Exeter, and Worcester; fellow of Trinity College, Cambridge; incorporated M.A. of the Oxford Univ., 1578. He became tutor to the Pembroke family, where he made a friend of Sidney's sister. Through the patronage of this influential family he obtained many Church preferments. In 1599, Queen Elizabeth was said to have called him to account for a sermon preached before her in which he made hints on behalf of the earl of Essex, her quondam favourite. He wrote many little treatises which are very dear to the heart of collectors of Elizabethan quartos. They include his *Very Fruitful Exposition of the Commandments by way of Questions and Answers*, 1590 and 1600; and *Comfortable Notes upon the Bookes of Exodus and Leviticus*, 1604. A folio ed. of his works was ed. by Miles Smith, 1637.

**Babinski's Sign**, a medical term which indicates a curious physical phenomenon pointing to disease of the nervous system. If the sole of the foot of a person in normal health be tickled the toes bend inwards, but if there is organic disease of the lateral columns of the spinal cord the toes will bend upwards; the former is known as *flexor response*, the latter *extensor response*, or **Babinski's sign**.

**Babirusa, Babiroussa, or Babyroussa**, an interesting animal of the pig genus, and found only in the E. Indies, in Celebes and Buru. The B. is much more agile than the ordinary pig, having a less cumbersome body and longer and thinner legs. The peculiarity of this species lies in the fact that the upper canine teeth of the male are persistent, like those of rodents, and pierce through the skin of the snout and curve back over the forehead. The teeth have even been known to penetrate the skull. The teeth thus correspond to the tusks and horns characteristic of the male sex of so many animals. This abnormal condition of the teeth undoubtedly originated from adaptation to a particular environment, though the exact reason of the phenomenon is not apparent. The teeth probably served as a means to facilitate the capture of the females.

**Babirush**, see **BABYLONIA**.

**Baboon, or Cynocephalus**, meaning 'dog-headed,' a genus of monkey. Numerous branches of the family include the mandrill, drill, sphinx, chacma, and hamadryas. Africa was their original home, though they have spread into the nearer portions of Asia. The most characteristic features of the animal are, prominent snout, large canine teeth, cheek pouches, strange ugly cushions on which it sits, and shortness of tail. It was sacred in Egypt, and figures frequently upon Egyptian tablet inscriptions and statues. They usually live in herds and form dangerous opponents. They are intelligent animals and possess well-developed brains; besides extraordinary ferocity of temper.

**Babou, Jean, baron of Saggone**, a Fr. soldier, grand master of artillery, 1529. He commanded the artillery at the battle of Saint Denis, 1567, and took part in the battle of Jarnac in 1569, and d. in the same year.

BABOON

**Babrius**, a Gk. collector and versifier of fables. The period of his existence is probably in the time of Augustus. Some say that he was by birth an It. and that he lived at the court of Alexander Severus (A.D. 222-35). He collected many of Aesop's fables and turned them into choliambic verse. The first traces in so-called Aesopian fables of B.'s versification were discovered by Bentley. It was not until 1842 that a definite conclusion could be drawn, and then Minoldes Minas, a Gk. in the service of the Fr. Gov., while exploring the convents of the E., unearthed at Mt. Athos a MS. containing no less than 122 then unknown fables of B. (A second MS. containing 21 more fables was found in the Vatican.) He made a copy of them, and in 1844 they were pub. Later, in 1857, he produced 95 more, though their authenticity has been disproved by eminent scholars, among whom are Conington and Cobet. The best ed. is Rutherford's, 1883.

**Babu, or Baboo**, originally an Indian term of address applied to a proper name and corresponding to the Eng. 'Mr.' The word has come to signify a native with a smattering of Eng. culture, and is used as a term of disrespect. B.-Eng. consists of polysyllabic words for the most part misapplied.

**Babul Tree**, the *Acacia arabica*, also known as the gum-arabic tree, is a native of the E. Indies, Arabia, and Abyssinia. It is a tall tree and yields large quantities of gum-arabic, which is produced by wounding the bark and allowing the fluid to run out.

**Babuyanes**, a Malay word meaning pig islands. They are a group of is. to the N. of Luzon, one of the Philippine Is. The most prominent isles are Babuyan, Calayan, and Camiguen. They are of a mountainous character.

**Baby, see BIRTH, CONCEALMENT OF; CHILD.**

**Babylon**, anct. cap. of Babylonia, first mentioned in a tablet of 3800 B.C. From 2250 B.C. it became the cap. of Babylonia and the holy city of W. Asia. B. is the Gk. form of Babel, meaning the gate of the God. Under Nebuchadnezzar it became one of the wonders of the anct. world. Herodotus has a description of the city, and from the style of it one would imagine that he speaks as an eye-witness. It was in the form of a square with 120 stadia given as the length of one side. This would

ceeding siege of 2 years' duration. For 2 months Alexander the Great employed 100,000 men to clear away the refuse that encumbered the streets, so sadly had the once magnificent tn. fallen from its high estate. But he was unable even to finish his work of removing the debris. The difficulty in the way of conveyance of heavy stones from Armenia, the need for building material in the foundation of a new cap. on the Tigris, namely Seleucia, caused a hastening of the already rapid ruin of the city. Even in the early times of Pausanias little was standing save the walls. The Arabian

THE RUINS OF BABYLON

mean 15 m. The walls were furnished with 100 brazen gates, though the number according to Diodorus is 250. The 2 parts of the city were joined by a huge roofed bridge made of hewn stones fastened by iron clamps. Nothing as yet has been discovered of its remains. The earlier part of the city and that more truly Babylonian is the W. The famous temple of Baal, Birs Nimrud, is supposed to have stood in this portion of the city. An important pile of ruins in the W. portion is probably the remains of a royal citadel. The ruins go by the name of Mujellibe. The hanging gardens of Semiramis, situated in the E. div. and counted as one of the wonders of the world, stand among the buildings of the Neo-Babylonian period. Diodorus has written a detailed description of them. (See HANGING GARDENS OF BABYLON.) It is evident wherever one goes in B. that great damage was done by Persian conquests. The outer walls were demolished during the revolt under Darius I. and the suc-

authorities speak of a vil. Bâbl, but generally make mention more of the great masses of ruins. Naturally it has been a source of rich discovery by the antiquarian, and among the many explorers associated with this research the name of Rich stands out. The tn. of Hillah, with a pop. of 7000, is said by most authorities most accurately to represent the old city of Babylon.

**Babylon**, a fortress on the Nile in Lower Egypt. It became important first under Rom. occupation, though its origin has been stated to be Babylonian.

**Babylonia** (Assyrian Babilu, Persian Babilush), an alluvial plain watered by the Tigris and Euphrates. It now forms part of the independent Arabian state of Irak. References to it in the O.T. are made under the names Shinar, Babel, and 'the land of the Chaldees.' The varying fortunes of its successive rulers make the task of fixing its boundaries very difficult. Approximately the N. boundary from Naharaim (Mesopotamia)

was formed by a line of fortifications estab. by mutual agreement between the Assyrian and Babylonian monarchs and separating their respective kingdoms. Allusions to 'the Median Wall' by classical writers probably refer to this boundary. The Tigris forms a natural E. boundary, though portions of ter. beyond it were at times included in the Chaldean empire. Those dists. were Namri or Kurdistan, The desert beyond the Euphrates provided the W. boundary, for a margin of fertile land on its further bank was a part of the Babylonian empire. The Persian Gulf formed the S. limit, for at that time its water extended further inland. The fertility of the plain has made it at various times the most prolific corn producer in the whole of W. Asia. A network of canals constructed throughout the country acted as a fine irrigation factor. Many of these canals are navigable to-day. The chief is Nar Malka, which until the seventh century A.D. was still in use. It has now been abandoned as a result of Mohammedan neglect. It joined the Tigris and Euphrates in N. B., connecting the cities of Sippara (Sephparvaim) and Akkad, then entering the Tigris 30 m. below Bagdad.

Ant. records say that B. was divided into sev. provs. whose number and dimensions experienced many variations in different periods of the empire's hist. Primarily the most important div. was the forming of 2 large provs., Sumir or Sumer (Shinar, S.B.), i.e. the dist. stretching from the Persian Gulf to Babylon, and Akkad or N. B. The cap. of Akkad resembled Babylon in being situated on both banks of the Euphrates. The larger portion of the tn. was Sippara of Samus (the sun god) and the lesser part Akkad or Agade. It was also called 'Sippara of the Moon Goddess.' Hence the union of the 2 portions in the biblical name Sepharvaim, which means 'the two Sipparas.' Smaller provs. within these 2 main divs. were Gan-Duniyas (N. Akkad), Edina (or Eden or Zeru or Dura, the S. part of Akkad); Gambula, now Afadj; and Matkaidu, the land of the Chaldeans.

The exceptional fertility of the country resulted in the almost unbounded produce of corn and numerous other cereals, grapes and fruit of many varieties, sesame, sev. kinds of vegetables, cucumbers, melons, onions, and garlic. The only building material available was clay, which existed in large quantities, while stone had to be conveyed from the mts. of Elam or Upper Mesopotamia.

The inhab. of B. have invariably consisted of many races, as far as can be ascertained from the classical writers. The oldest inscriptions show that the earliest known inhab. belonged to the Ugro-Finnic branch of the Turanian family, who were related ethnically to the Elamites of Susiana and the Turanian Proto-Medes, in whose tongue traces are found of a connection with the Ugro-Finnic branch. This race, the Sumer-Akkadians, were not originally natives of Chaldea, but, so say their traditions, came from the mts. in the N.W., bringing

with them some idea of the advanced civilisation which they presently estab. From various sculptures indications have been found of a Semitic element in the pop. during the very early portions of the hist. of the empire. Assisted by war and commercial intercourse, other races drifted into the plain, until we find the various peoples alluded to as the 'mixed crowd of nations.' Less advanced than the Sumer-Akkadians, the Semites quickly adopted their superior methods, and rising in numbers and power with equal celerity, they had so far estab. themselves in B. that we find in 2425 B.C. a Semitic dynasty under Sargon of Agade ruling in N. B.

So many valuable tablets have been recovered from the ant. libraries that more information concerning the social life of B. is available than is the case with any other contemporary kingdom, with the exception of Egypt. A child directly after birth, if a male, was invested in the presence of witnesses with the titles and recognition due to sonship. At the end of 8 or 10 days circumcision took place, and on reaching puberty the young man was acknowledged a free-born citizen. Marriage was regarded with a very strict eye. Every woman's dowry was secured to her and on divorce was returned, and the marriage ceremony was characterised by a reverence and solemnity excelling the present-day observance. An interesting fact, too, is the regard which women, especially married women, were held in the eyes of the citizens. An offence against a mother was rigorously punished, and the right to trade and own property in her own right was freely acknowledged. Education was compulsory to freemen, tablet writing forming one of the prin. subjects. Admirable regulations existed for the welfare of the slave. He was protected from cruelty at the hands of his master, who, in the event of disablement following an injury, was compelled by law to support him.

Regularly chosen judges sat in the temple gates, sometimes in the great gate of the city, to administer the law. Those who were the prin. officials were called 'judges of the king.' Fines, forfeiture of civil status, and death were the punishments, while leave to appeal was granted. Taxes were based upon a fixed standard. The 'king's tax' was levied on all property. A revenue supported the army, to which all contributed, while those dists. most concerned paid a ship tax. Among local taxes were first-fruit tax, temple tithes (tenths), corn, date, and sheep taxes, and rates levied for the upkeep of canals and roads. The standard currency consisted of the silver coins, talent, maneh, shekel, and paras, which was first introduced in the time of Darius.

Discoveries on the site of the ant. city of Lagash yielded valuable examples of Babylonian art. Previously its only evidence was contained in a few gems and cylinders engraved with drawings. But added to these are statues of some acknowledged artistic merit. They bear

a distinct value and style from other Babylonish art, and eclipse even that of later Assyria. Of these statues the most remarkable is one representing Gudea, the prince-priest, the viceroys of the city. The statue is nearly life-size, and is executed from the hardest diorite. On it is an inscription which testifies to his restoration of the temple in 2500 B.C. Even more valuable, both from an antique and artistic point of view, is a carved head in red porphyry. Its faithful delineation of the true characteristics that mark the Babylonish physiognomy is remarkable. An inevitable conclusion is that the art of B. represented by these statues was of an order and perfection attained only after hundreds of years of development, and scarcely less interesting is the fact that only perfectly made tools could have been used. The art of casting metals, too, is proved by the discovery of many bronze figures. At Tell el 'Obeld have been found striking examples of another form of art—bitumen models plated with sheets of copper. Delicate work in gold and silver, in shell, alabaster, and lapis lazuli have been found at Ur, in tombs dating from about 3500 B.C. The same high standard of execution marks the seal-engraving. Representations of the harp, pipe, and cymbals show that music was practised in the earliest times, while mention of the trades of weaver, dyer, potter, smith, and builder testifies equally to the fine level of achievements which the Babylonish peoples reached.

The hist. of B. has been traced back to 4000 B.C., aided by the discovery in 1888 of a temple at Nippur, and the antiquity of Babylonish civilisation is rivalled only by that of Egypt. A specimen of line writing (as contrasted with the wedge method) on a stone in the Brit. Museum refers to the reigning monarch Sargon I., king of Agade, who lived about 425 B.C. Proofs of the empire as a collection of independent cities are found in early records of the Sumero-Akkadian inhab., whose date is assigned to 4000 years B.C. Babylon was not always the anct. cap. References are found to the tn. of Uru-ki, or Erech, meaning 'the capital,' and around which a host of legends existed. Kish was cap. for a time, and Ur, the city of the moon goddess, was the seat of 3 dynasties. From the latter city Abraham came. Eridu was the 'holy city' of S. B.

About 2300 B.C. occurred the union of the independent cities into one empire. This took place under Ur-Bahu or Ur-Engur, builder of the great ziggurat at Ur, his cap. During his reign he restored many temples, and in the cities under his sway appointed priest-viceroy. Dungi, his son, succeeded him, and many inscriptions have been unearthed the work of his subjects. By this time the standard of civilisation in Chaldea had assumed a high level. Among the studies, astronomy, mathematics, and science were prominent, while the Persian Gulf was freely navigated by Chaldean ships. At this time the Babylonians were at war with the Elamites. In 2280 B.C. S.

Chaldea was successfully invaded by Elam tribes under Kudur Nakhundi. Until 2120 B.C. this line possessed great power. Two out of the kings of this period are worth mention: Kudur-Mabug, king of the W. (Syria), and Eri-aku, king of Larsa. Students of Assyria claim that this latter monarch is identical with Arioch, king of Ellasar,

BABYLONIAN OFFICIAL OR HIGH PRIEST

British Museum

BULL FROM UR

mentioned in Gen. xiv. Hammurabi (Khammuragas), overthrew Eri-aku. He was the sixth and most powerful ruler of the first Babylonian dynasty, and it is during this important period of Babylonian hist. that many political changes took place. At this time Babylon made her beginning in rising to the rank of the most powerful city in the empire. Many of the temples, specially those of Bel at Babylon, and of Nabo in Borsippa, had suffered demolition at the hands of the Elamite invaders. Hammurabi restored these, but a more important work was the construction of a canal, associated

with the Nar Malka, which crossed N. B. and Sippara. It is navigable to-day, and bears the name of Yusifien. This line lasted little more than 150 years, of which Hammurabi ruled 43 (c. 1792-49). B. then fell into the hands of the Kassites, an Indo-European people who founded a dynasty that lasted 500 years. It is chronicled more fully than any other period by contemporary historians, but few Babylonian tablets dealing with this time have been discovered. Among them, however, is a very important one, that of a memorial stone of Nebuchadnezzar I., dated 1150 B.C. It is chronicled that he usurped the throne and warred against the Assyrians, who were rising to a powerful position. A detailed and descriptive account is given of a battle against the Elamites, at whose hands the Babylonians, but for help given by an adjacent city, would assuredly have been destroyed. As a reward, immunity from taxes and the usual duty of supplying soldiers was bestowed upon the helping city. From this time until the reign of Nabunazir (Nabonassar) the hist. of B. is to be found in Assyrian sources, and any detailed or connected account is so far undiscovered. Nabonassar ruled for 14 years and ascended the throne in 747 B.C. Two Assyrian invasions occurred, though the king, said by the Assyrian chroniclers to have been defeated, still maintained his position. He was succeeded by his son in 734 B.C., but his reign lasted only 2 years, for in a popular revolt he was dethroned, giving place to Ukinziru. Under Tiglath-pileser III., king of Assyria, the Babylonian king was driven from the throne and killed in the marshy region of S. B. Tiglath ascended the throne under the title of Pulu of B. in 729 B.C. More than ordinary significance is attached to this conquest, as it brought more closely together than before the N. and S. portions of B. The Babylonians once more gained their independence during the usurpation of the Assyrian throne by Sargon III. in 722 B.C. This regaining of Babylonian independence was conducted under the leadership of one of the most successful and popular of Babylonian princes, Merodach-Baladan II. The attention of the Assyrians was occupied too fully by wars in Syria and other parts of their empire to allow them sufficiently to concentrate upon the powerful Merodach. An attempt was diverted by the action of Merodach in stirring up Hezekiah and other Syrian princes in revolt. But later the inevitable attack came, and in 710 B.C. the Babylonian ruler was completely defeated by Sargon II. in 722 B.C. This regaining of Babylonian independence was Merodach restored. Only a few months, however, elapsed before he was again deposed, this time by Sennacherib. He fled to the Elamites. Following his downfall the rule of B. was administered by various princes and viceroys appointed by Assyrian rulers. Interruptions occurred here and there in the revolts which took place on behalf of, and directed by,

native princes, but none were successful. Sennacherib, after a period of severe and strenuous fighting, defeated both the Elamites and Babylonians, who had allied themselves against him. He was succeeded by his son, Essar-haddon, who, less martially inclined, attempted the more friendly policy of dividing his time equally between his 2 courts. His power, however, was considerably weakened by the ceaseless and determined opposition he met from Egypt in Syria, and incessant harassing by the Elamites and Babylonians. In 669 Essar-haddon fell ill and associated his son, Assur-bani-pal, with him in the kingship and, on his death in 668, the son was left sole king and made his brother, Saviul-sum-yucin (Sammughes) governor of B. Assur-bani-pal was the 'grande monarque' of anct. Assyria and the empire on his accession was at the zenith of its glory, while its buildings were unequalled for size and grandeur; but constant wars left a diminished inheritance to his successor. War with Elam led to the conquest and division of that country, but soon after this the first blow was struck which eventually led to the downfall of the empire. A general insurrection suddenly took place, headed by the king's brother. The cities of Babylon, Borsippa, and Sippara were besieged, and Assur-bani-pal burned himself to death in his palace in 626 B.C. The dissolution of the Assyrian empire now took place, and the throne of B. was seized by Nabopolassar, a general of the garrison, whose wife was a princess of Media. In 625 B.C. a general invasion of Aryan and other E. tribes gave B. a chance of ridding herself of the Assyrian yoke, and in the same year Nabopolassar was proclaimed king of B. His son, Nebuchadnezzar, succeeded him in 605 B.C. This monarch speedily made Babylon raise her head, and without doubt he can be said to be the greatest of all the sovereigns who ever ruled over the anct. empire. He reigned for 43 years, and during that long time B., all her lost possessions once more regained, was able to take her place as the foremost nation and empire in the world. With few exceptions every building of any significance at all was rebuilt, and every mound in B., so far explored, has revealed bricks bearing his name. He captured Jerusalem in 599 B.C., and later, owing to its continued unrest, he destroyed the city and put into prison Jehoiakim. His son, Evil-Merodach, succeeded him, and promptly released Jerusalem's former ruler in 561 B.C. Evil-Merodach was murdered by his brother-in-law, Nergal-Shorezer, a 'chief seer' of one of the temples. In 556 B.C. the throne was usurped by Nbu-naid (Nabonidus), a powerful prince, whose reign ranks next to that of Nebuchadnezzar in importance. In almost every temple, the inscriptions speak of Nbu-naid, and record important historical information. We learn from a cylinder discovered at Sippara that he rebuilt the temple at Karran, which had suffered destruction from the Scythians, and further, it records that Cyrus defeated

Astyages, king of the Medes, in 550 B.C. Cyrus took Ecbatana from him in the same year. He left Babylon and went to Tema, the modern Teima, in Arabia; in his absence Belshazzar was appointed by him as governor. Finally Cyrus attacked and took Babylon 539 B.C.; apparently some Babylonian sympathies were on the Persian side against Nabonid. The kingdom now suffered invasion at the hands of Cyrus, who advanced as far as Sippara, where the garrison surrendered to him. Babylon was taken with almost equal ease, and Cyrus appointed Gobryas as ruler. In 538 B.C. B. became a Persian prov., and a period of peace under Cyrus and Cambyses appears to have followed. But the dominant spirit of revolt rose again on the accession of Darius, son of Hystaspes, and for 3 years the rebellion lasted. But it was put down finally by Nidintabhel, who claimed to be Nabuchadnezzar II. However, the irrepressible Babylon again rebelled in 513 B.C., under Arakha, a native of Armenia. Presently the Persian rule was destroyed, and for a short time Alexander the Great ruled over the city. He gave orders that the great temple of Bel (the tower of Babel) at Babylon should be restored, and archaeologists have found proof that the site was actually cleared. The actual rebuilding did not take place, for, in 323 B.C., Alexander d. Meanwhile a conference had been held at Triparadisus, and Seleucus had been promised the succession. Antigonus contested his claim, but it was finally won by Seleucus I. in 312 B.C. It was taken from the Syrians in 140 B.C. by the Parthians. For a brief period the empire came under Rom. rule, under Trajan in A.D. 114, Septimius Severus in A.D. 193, and again in A.D. 363 under Julian. In 650, under Mohammed's successors, the prov. of B. became a seat of the caliphs, and the tn. of Bagdad was built in it (762-66). This lasted till 1258. Four centuries later the Turks, for the second time, wrested it from the Persians, and from that time it was divided into Bagdad and Basra, under the dominion of Turkey. Both provs. were occupied by the Brit. in the First World War, Basra in 1914, Bagdad in 1917. By the treaty of Sévres, 1920, the land of Iraq (Mesopotamia) became an independent state under Brit. mandate, and in 1921 the Arab state of Iraq came into being, the Emir Feisal (q.v.), son of the king of the Hejaz, being crowned king.

The excellence of the administration and the high level of civilisation which have been mentioned elsewhere, and the commerce, carried on by means of caravans, with Bactria, Persia, and Media, and by shipping with Arabia, speak for the general prosperity that the kingdom enjoyed. The true Babylonians, or the Sumero-Akkadians, possessed literary inclinations in a most marked degree. The large number of inscriptions executed by private persons, and the numbers of people of highest rank who also belonged to the 'writing class,' form sufficient evidence to testify more than ordinarily to the

excellence of their attainments. In the inscriptions on some of the tablets have been discovered directions to intending students as to the method of getting a 'book' from the library, while the arrangement of the works was in thorough order, and maintained with scrupulous care. Naturally the literature of B. was affected by native schools of thought. This meant that the various depts. of literature reflected to some degree the teachings of the various temples. Of the specimens of Babylonian literature one of the most perfect is a tablet containing a description of a war in heaven between the god Merodach, or Marduk, and the evil spirit Tiamot. This valuable tablet was discovered in the library at the temple of Nebo, in the town of Borsippa. There is a Babylonian version, as well as one in Assyrian. Described in language exceptionally beautiful is the story of Merodach's task, given by the gods, of battling against all the forces of evil. Concluding the last victory of Merodach is a hymn of praise of extraordinarily perfect language and expression. Every subject known at the time is represented in the various libraries. Hist., mythology, theology, astronomy, astrology, magic, arts of divination, geography, myths, fables, poems, and proverbs, all are included. In the proverbs is a very curious one relating to Zu, the god of the birds. We are told how he stole the secrets of the gods and the tablets of destiny, and brought them to earth. For this sin he was driven to the mts., where he was confined. A noteworthy distinction existing between Assyrian and Babylonian literature is the curious fact that in Assyrian all credit is taken by the king for its literature, while in Babylonian the names of the various authors are borne on the tablets.

The varying occupations and successes of the Babylonian races necessarily point to equally changing religions. The earliest known indications of worship belong to the Sumero-Akkadian people, who practised a kind of fetishism or Shamanism. This acknowledged the existence of an inner spirit within every object in nature. This doctrine created a body of medicine men, whose powers were only sought and used against those forces of nature which were regarded as hostile to man, e.g. sicknesses, etc. Many of the hymns of these 'priests' have been discovered in the libraries of Nineveh and Babylon. As their knowledge grew, so did their army of gods, and hence we find the gradual formation of a hierarchy of gods called the spirits of heaven and earth. This gave place in time to a conception of the spirit of heaven and the spirit of earth as creators, or Dingiri. From these arose a number of lesser gods, each city differing from the other in its choice of that which was held most sacred. Girdlu seems to have been one of the oldest seats of religion. Here Ea, the god of the sea, was supreme. He is embodied in a symbol half fish-like, and Berosus says he taught the first elements of learning to the Chaldean people. His

female companion was Dav-Kina, the 'lady of the earth.' Thus it will be seen that the Chaldeans regarded water and earth as the 2 fundamental elements of matter, and also the only 2 materials from which the earth was made. The son of this pair was Tammuz, who was replaced by Merodach. Tammuz had a wife named Ishtar, and the worship of this couple extended over a large portion of the Babylonian empire. The next god, according to rank, was Mul-lil, or Enlil, whose sacred city was at Nippur. This god it was who caused the destruction of wicked men. His wife was the 'lady of the great land,' or Hades. She was the queen who ruled over the land from which there was no return. They had a child named Naptar, the demon of fever. His work was the spreading of disease. The moon-god was another descendant of Mul-lil, and presently he rose to be greater than his father. He was estab. most firmly in the city of Ur, and soon became an influence upon the countries of Syria and Arabia, and on the city of Haran (see CARRAN). There is much sacred poetry in Chaldean, but none is so beautiful as the hymns to the moon-god. In Sippara and Akkad particularly, and more or less throughout the whole empire, the Semites influenced the religion so much that their god, the sun god, soon became pre-eminent. Its highest development existed at Sippara, and a tablet in the Brit. Museum has portrayed upon it a representation of the sun god with priests and kings in the act of worshipping the sacred sun-disk. This god later became the Baal that absorbed the entire army of lesser deities. In the religious hist. of the later empire Merodach assumes a high place, and abstention from his worship was punished. His temple was one of the architectural wonders of the world. Next in importance was Nebo, with his consort Tasmit. They were worshipped at the Eridu temple, the largest seat of learning of Chaldæa.

**Recent Discoveries.**—Scientific excavations are continually being made on the sites of B.'s anct. cities, and at 3 of the oldest tns., Kish, Ur, and Eridu, great discoveries have been made. The Sumerian king-lists state that after the Flood there were dynasties first at Kish, then at Erech and thirdly at Ur. The first 2 are probably mainly legendary, for the kings are said to have ruled from 160 to 1200 years each, but confirmation has been found of the early dynasty at Ur. from a tablet unearthed from the site of Tell el 'Obeld, which states that the temple there was built by A-an-ni-pad-da of Ur, who was the second ruler of Ur's first dynasty, c. 3300 B.C. Excavations at Ur itself have revealed direct evidence of the Flood in a bed of water-laid clay, 8 ft. thick, below which are found the painted pots and flint implements of a non-Sumerian race bearing no affinity to the civilised metal-using people whose remains are found above. Some distance above the flood-clay, a tomb has been discovered, containing 4-wheeled chariots

(the earliest known), the remains of sacrificed slaves, and much delicate metal-work. This tomb dates from about 3500 B.C., and demonstrates the advanced state of B.'s civilisation even at that early date, and also the extent to which she traded, for neither metal nor wood was to be found within her borders. Of Ur's second dynasty little has been found; the third was that founded by Ur-Engur about 2300 B.C. The excavations of Ur were undertaken by the Brit. Museum in 1918, and by the Brit. Museum and the Univ. of Pennsylvania from 1922 onwards. Work was done under the direction of Mr. Leonard Woolley, to whom, and to the late Dr. H. R. Hall, is due also the discovery at Tell el 'Obeld, 4 m. away, of the oldest building known. In 1918 the site of Eridu was excavated by Mr. R. Campbell-Thompson. Very old inscriptions were discovered, and it was found that Eridu, now far from the coast, must in her days of power have been a seaport, and in all probability an importer of building stone. Kish was excavated, 1922-24, by Mr. Ernest Mackay for the Herbert Weld and Field Museum expedition, which worked on behalf of Oxford Univ. and Chicago. Here also evidences of the Flood were found. At Babylon itself a Ger. expedition, although unable, owing to the presence of water, to explore the deeper strata, revealed enough to give a clear impression of the construction of Nebuchadnezzar's palace there. The great Ishtar Gate, as excavated 40 ft. high, is especially remarkable. Like the rest of the city it is constructed entirely of brick; it is adorned with 9 rows of dragons and bulls in relief; and used to be covered, in Nebuchadnezzar's time, with a glaze of brightly coloured enamel. Babylon's ziggurat, the true Tower of Babel, has also been investigated. This work is continuing and massive walls and fortifications are coming to light. There is still much work for the archaeologist in B., for none of the cities has as yet been completely excavated, and many have been barely begun. Nor is it in B. alone that discoveries may be found to throw light on her hist., for the famous Code of Hammurabi and the stele of Naram Sin were found, spoils of conquest probably, in Susiana. See also under ASSYRIA.

**Babylonish Captivity**, the name given to the deportation of Jews from Judea to Babylon, after the capture of Jerusalem by Nebuchadnezzar. The migration went on for 70 years, till the Jews were allowed to return to their own land by Cyrus, who had conquered Babylon; those who returned were exclusively of the tribes of Judah, Benjamin, and Levi.

**Baby Pulo**, see BABI ISLANDS.

**Babyroussa**, see BABIRUSA.

**Baca**, Valley of (Heb., valley of balsam trees), is a place mentioned in the O.T. (Ps. lxxxiv. 6), and is probably El-Bake'a, which lies between Jerusalem and Bethlehem.

**Bacacay**, a tn. of Luzon, Philippine Is., on the gulf of Tabaco. It is in a fertile dist., but is frequently disturbed by the volcano Mayon. Pop. 20,000.

**Bacarra**, a tn. of Luzon in the Philippine Is., 4 m. N.E. of Loag. It is situated in a fertile dist. in the prov. of Ilocos Norte. Pop. 14,500.

**Bacca**, the technical name for the fruit commonly called by the name of berry. It is used to designate those fruits which have a thin skin, are pulpy internally, and have sev. seeds lying loose in the pulpy mass, e.g. the gooseberry, currant, and vine.

**Baccarat**, vulgarly called 'bac,' a card game of chance, said to have been introduced into France during the reign of Charles VIII., since when it has had widespread popularity. There are 2 types of the game—*baccarat à banque* (or *baccarat à deux tableaux*) and *baccarat chemin de fer* (q.v.). The rules of the game are intricate. In this country B. played for stakes is illegal, being a card game not involving skill, but on the Continent it is one of the most vicious and persistent gambling games.

**Baccarat** is a tn. situated in the dept. of Meurthe-et-Moselle, France, 15 m. S.E. of Lunéville. It has most extensive crystal works. Pop. 6000.

**Baccha**, a genus of dipterous insects of the family of Syrphidae. It is remarkable in that the species have the 2 basal joints of the abdomen very long and slender, but the remaining joints depressed and suddenly increased in breadth. It is generally of a black or bronze colour, with yellow spots or markings, and is found in Britain.

**Bacchæ**, the women who took part in the wild orgies of the Bacchanalia, a festival of Bacchus, the Rom. god of wine. They were variously known as B., Bacchantes, and Menades.

**Bacchanalia** (from Bacchus, Gk. Βάκχος, the god of wine) were feasts in honour of Bacchus. Men and women, intoxicated with wine, clothed in deer-skins and Asiatic robes and carrying *thyrsi* (i.e. staves wrapped round with ivy and vine leaves) in their hands, ran about beating drums and cymbals, and crying to Bacchus. They were first introduced at Rome 187 B.C. (Liv., xxxix. 8-10). These feasts were celebrated every third year, and were hence called Trieterica.

**Bacchante**, a priestess or female votary of Bacchus. The representation of B. was popular among classical sculptors.

**Bacchiglione**, a riv. in Venetia, N. Italy. It rises in the Alps, and after passing Vienza and Padua flows into the Adriatic Sea opposite Chioggia. Its total length is 90 m., and it is navigable to Vicensa.

**Bacchius**, a Gk. writer, sometimes incorrectly called Vacceus. He was the author of *An Introduction to the Art of Music*, in questions and answers, a work contained in the collection of Meibomius. It is not certain when he lived.

**Bacchus**, a name used by the Gk. and Rom. writers for Dionysus, the god of wine. Traces of its use in Gk. are found in the period succeeding Herodotus. It commenced more particularly as an ordinary surname, later developing into a term of opprobrium. Though it finally was adopted to signify the wine god, it only applied, so far as the Gks. used it, to the spirit that pervaded an abuse of wine, being therefore more truly the god of the carouse. Here and there its name Dionysus is used in Lat., though the Augustan poets used the alternative invariably. The worship of B. was originally introduced into Rome from Greece, when B. was identified with the It. deity Liber, a god of some antiquity, who was the spirit pervading and controlling the destinies of planting and the cultivation of fruit. The worship of Dionysus was no part of the original religion of Greece, and in Homer he is described simply as the god who teaches man the preparation of wine. On every 17th day of Mar. the Liberalia festival was held, at which youths were invested with the toga virilis, thereby proclaiming their manhood; but this feast is quite separate from the Bacchic festivals (Dionysia) which were of a wild and dissolute character, and were, at length, abolished in 168 B.C., by order of the senate. See Louis Dyer, *The Gods of Greece*, chaps. iii. and iv.; Lewis Campbell, *Religion in Gk. Literature*; and Sandys, *Introduction to the Bacchæ of Euripides*.

**Bacchylides**, a Gk. lyric poet, a native of the is. of Ceos. His period is said by Eusebius to be about 500 B.C. The earliest of his odes is dated roughly at 479 B.C. He lived at the court of Hiero I. of Syracuse (478-467). There are evidences that Hiero showed a preference for B.'s odes to those of Pindar, and a rivalry is supposed to have developed between the 2 poets, which, however, did not result in bitter feeling on the part of B. His writings are characterised by simplicity and picturesque detail. B.'s poems are of 2 kinds, odes to victory and dithyrambs, or passionate hymns. Among recent discoveries in anct. literature must be included his *Odes*, which were found inscribed on an Egyptian papyrus, ed. by Kenyon, 1897. Best ed. Jebb's, 1905.

**Bacciocchi**, Felice Pasquale (1762-1841), b. at Ajaccio, Corsica. He was a captain of infantry, and married Elisa

Bonaparte, the sister of Napoleon I. He became a senator in 1804, and was made a general and prince of Lucca and Piombino in 1805. He d. at Bologna.

**Bacciocchi, Marianne Elisa** (1777-1820), the eldest of Napoleon Bonaparte's sisters, b. at Ajaccio in Corsica. Married (1797) Capt. B. (q.v.) of the Royal Corsican Regiment. On Napoleon's assumption of the imperial crown, she became princess of Piombino and soon after of Lucca. In 1809 she became, by decree, grand duchess of Tuscany. On the downfall of her brother she went to Bologna, where she passed under the name of Countess of Campaniano.

**Baccio d'Agnolo**, see AGNOLO, BACCIO D'.  
**Baccio della Porta**, see BARTOLOMMEO, DI PAGHALO DEL FATTORINO, FRA.

E.N.A.

JOHANN SEBASTIAN BACH

**Bach, Johann Christian** (1735-82), eleventh and youngest son of Johann Sebastian, was b. at Leipzig. After his father's death he studied under his brother Emanuel at Berlin. He became a pupil of Padre Martini in Italy in 1754, and in 1760 he was appointed organist at Milan Cathedral, for which he composed some masses. In 1762 he accepted an invitation to England. His success was rapid, and his operas and concerts were enthusiastically received. He soon became music master to the queen. Of his operas *Orione*, 1763, and *La Clemenza de Scipione* were the best, but his work was not destined to endure, and to-day his compositions are all but forgotten.

**Bach, Johann Sebastian** (1685-1750), in the front rank of the great musicians of the world. He was b. at Eisenach. He came of a family of noted musical

talent. Two of his father's cousins, Johann Christoph B. and Johann Michael B., are worthy of mention, as their influence upon their relative was in some degree responsible for the great result. Before B. was 10 his father, Ambrosius, d. The boy was cared for by his brother Christoph, an organist at Ohrdruf. The extraordinary talent shown by Sebastian excited his brother's jealousy, and a M.S. of organ compositions by great masters was sedulously withheld from the prodigy. However, Sebastian obtained access to the book, and copied its contents by moonlight in order to escape detection. The disagreeable result was the confiscation of his copy immediately following its discovery. The work had taken the boy 6 months to accomplish. His beautiful soprano voice led him to a place in the choir at St. Michael's school at Lüneburg, where he practised as an accompanist on the harpsichord and as a violinist at the breaking of his voice. This was in 1700, and 3 years later he obtained a royal appointment at the court of Weimar, where he became acquainted with much It. music. In the succeeding year he became organist at the new church of Arnstadt, and here he began to compose. His brother's alliance with the Swedish Guard led to the composition in 1704 of the *Capriccio on the Departure of a Brother*, which work was followed and also preceded by sev. of his church cantatas. At this time B. obtained permission to go to Lubeck in order to hear the great Dan. organist, Buxtehude, then 70 years old. His enthusiasm led him to exceed his time of leave, and this, with other reasons, led to a fresh appointment at Mülhausen. He only stayed here a year, during which he married a cousin, Maria Barbara B. At the age of 18 his executive skill on the organ and pianoforte obtained him various appointments, the most important being that of court organist at Weimar. Here he spent 9 years, and composed the best of his cantatas, while a close study of It. masters gave him a thorough mastery of their style, the foundations being thus formed for the later instrumental work he produced. On one journey from Weimar in 1717 rivalry sprang up between the supporters of B. and those of a Fr. harpsichord-player, Marchand. The 2 men concerned became involved, and a challenge was exchanged. On the day fixed for the trial the Fr. musician was nowhere to be found, his better feelings and genuine acknowledgement of B.'s superiority being the causes of his flight. In 1720 his wife d., and in the following year he married Anna Magdalena Wülken, who assisted him by copying his musical scores for him. From this time B. commenced the composition of his suites, while the first half of the *Forty-eight Preludes and Fugues* was also written, though many years separated the first from the complementary portion. In 1722, after some difficulty, B. was appointed to the vacant position of cantor of the Thomasschule at Leipzig. Here all his finest choral work was written, in which

is contained the 2 settings of the story of the Passion and the Mass in B minor. In 1736 he presented 2 movements from the latter composition to Augustus III., and received the appointment of Hofcomponist. In 1747 he visited Frederick the Great at Potsdam. The king, himself a musical amateur, received him with distinguished marks of regard. A few years later his eyes became painfully troublesome, and total blindness resulted from an operation. Apoplexy caused his death, aggravated by the remedies used during the unhappy operation. Besides his musical compositions, B. wrote many clavier and harpsichord pieces, and introduced improvements in fingering, though modern fingering came only with Clementi (1752-1832). B. tuned his instruments in accordance with 'equal temperament,' exemplifying its possibilities in the 'Fortyeight.' As an organist he was supreme in his day and his organ compositions include the so-called *Chromatic Fantasia*. There are early biographies and critical works by Philipp Emmanuel Bach, C. H. Bitter, P. Spitta (trans. 1899), and E. Heinrich. Later works on B. are: A. Pirro, *L'Esthétique de J. S. Bach*, 1907; C. H. H. Parry, *Johann Sebastian Bach*, 1909 (rev. ed. 1934); H. Grac, *The Organ Works of Bach*, 1922; C. S. Terry, *Bach: a Biography*, 1927, *Bach's Orchestra*, 1932, and *Music of Bach*, 1933; Albert Schweitzer, *J. S. Bach* (trans. by E. Newman), 1935; E. M. and S. Grell, *Bach*, 1947.

**Bach, Karl Philipp Emanuel** (1714-88), the third son of Johann Sebastian, was born at Weimar. In his youth, though he studied under his father he intended to adopt the legal profession. In 1738 he graduated, but soon abandoned the idea of a legal calling and decided to devote his life to music. In 1738 he went to Berlin, where he became private pianist to the king. His favourite instrument was the clavier, for which he composed about 200 pieces, while his *Versuch über die wahre Art das Clavier zu Spielen* was recognised as an epoch-making book in the hist. of music. In 1768 he went as musical director to Hamburg. At Hamburg he composed his famous oratorio, *The Israelites in the Wilderness*, and his *Sonaten für Kenner und Liebhaber*, which is his greatest work. He d. at Hamburg. The works of Karl Philipp have suffered an undeserved eclipse in recent years.

**Bach, Wilhelm Friedemann** (1710-84), the eldest son of Johann Sebastian, was naturally the most talented in the family, but his career was ruined by idleness and vicious habits. In 1747 he was appointed musical director of the Liebfrauenkirche at Halle, but lost this position owing to his dissolute habits. He lived a vagabond life thenceforward, and d. in extreme want at Berlin. Some of his fugues, polonaises, and occasional pieces are extremely fine.

**Bachan**, see **BATCHIAN**.

**Bacharach**, a tn. in the Rhineland of Germany, beautifully situated on the l. b. of the Rhine. There are some very interesting medieval remains, including a

Gothic church of the thirteenth century. The tn. has been an important centre in the wine trade. Pop. 2000.

**Bachaumont, Louis Petit de** (1690-1771), a Fr. man of letters, and a prominent member of the set which frequented Mme Doublet's *salon* for 40 years. His minor publications are: *Essai sur la Peinture, la Sculpture et l'Architecture*, 1751; *Mémoires sur le Louvre*, 1750; but he is chiefly remembered in connection with the *Mémoires secrets pour servir à l'histoire de la république des lettres*, which was pub. in Paris, 1771, in 6 vols., and was afterwards extended to 36 vols. by Pidansat de Mairobert and Mouffle d'Angerville.

**Bachelier, Jean Jacques** (1724-1806), a Fr. painter, b. in Paris. He was a director of the porcelain factory at Sèvres and also of the Academy of Painting, Sculpture, and Naval Architecture at Marseilles. In 1765 he founded an industrial school of art at Paris. He was received into the Fr. Academy as a flower painter in 1751 and as a historical painter in 1763, and exhibited at the Salon regularly between 1751 and 1767. His best-known works are 'The Death of Abel' and 'Cimon in Prison.' He is the author of *L'Histoire et le secret de la peinture à la cire*, 1755.

**Bachelin, Auguste** (1830-90), a historical, genre, and landscape painter, b. at Neuchâtel and d. at Berne. He was a pupil of Moritz at Neuchâtel, and then went to Paris (1850), where he studied under Gleyre and Couture. He exhibited at the Paris Salon from 1857 to 1874, at first confining himself to genre and landscape. In 1859 he accompanied Garibaldi's volunteers, after which he painted many military and historical scenes. The following are among his best works: 'March of a Swiss Battalion,' 1860; 'Bourbaki's Army entering Swiss Territory'; 'Death of Ensign Montmollin,' 1866; 'Haymakers of the Alps,' 1863; 'Wrestlers of Hasli,' 1867.

**Bachelor**, a word of uncertain etymology, probably derived, through the Fr., from Low Lat. *baccalarius*, a word used in the eighth century of a servant, male or female, who assisted on a farm; cf. *baca*, Low Lat. for *vacca*, a cow. (1) The word B. was early applied to a young knight or novice in arms who had no following of his own but fought under the banner of another. (2) It was also used of monks in the early stages of their order who performed menial duties. (3) It was adopted in univ. life. See **BACHELOR OF ARTS**. (4) In the popular sense of the word, it is used of an unmarried man, or candidate for matrimony. In Rome legislation placed unmarried men (*cælibes*) under certain disabilities, the chief of which were contained in the Lex Julia et Papia Poppæa in A.D. 9. The object of such legislation was to encourage citizens to bring up children for the State. Penalties on Bs. were also inflicted in Sparta and at Athens. In England, too, higher taxes have, from time to time, been imposed upon Bs., but chiefly with a view to raising money for

some additional State expenditure. In 1695 an Act was passed by which Bs. and childless widowers had to pay a yearly tax of 1s. up to £12 10s. according to rank. In 1785 a higher tax was imposed for the servants of Bs., and in recent years deductions in income tax have been allowed to married persons with children. See CELIBACY.

**Bachelor of Arts**, for derivation, see BACHELOR. The word was first adopted into univ. life in the thirteenth century. Pope Gregory IX. introduced the word *baccalarius* to indicate one who had undergone the first academical examination, but was not yet a 'master' or 'doctor.' The word was altered by a pun to *baccalaureus*, as if it were connected with *bacca lauri*, laurel berry. See DEGREES.

**Bachmann, Charles Louis** (1716-1800), a Berlin violin-maker and distinguished musician. His violins and viols are much sought after; he invented the screw-pin. In 1770 he founded with Benda the concert of Berlin amateur players, which lasted for 30 years.

**Baciccio, Giovanni Battista Gaulli** (1639-1709), an It. painter. He was b. at Genoa, where he received instruction in design and colouring. Later he was a pupil of Bernini at Rome, where he painted portraits of the 7 popes and the cardinals of his time. He is also famous for historical compositions, and he painted frescoes and ceilings in churches. His best known works are those in the angles of the dome of St. Agnes in the Palazzo Navona; the 'Assumption of St. Francis Xavier' in the vault of the church del Gesù; the picture of St. Anne kneeling before the Virgin and Child; and the altar-piece of the 'Death of St. Saverio' in the church of Sant' Andrea.

**Bacillus** (dimin. of Lat. *baculus*, a rod), a genus of Schizomycetæ, but popularly confused with bacteria. The B. has like bacterium a rod-like formation, but is distinct as being larger, non-motile, and has a different method of reproduction. The Dan. scientist Müller first named this type about 1840. This species is present in phthisis and other tubercular diseases. Dr. Yeo describes bacilli as ranging from a quarter to half a blood corpuscle in length.

**Back**, see SPINE.

**Back, Sir George** (1796-1878), a Brit. Arctic explorer, was b. at Stockport. In 1808 he entered the Navy, but was made captive by the Fr. in Spain. He was associated with Franklin in 3 polar expeditions in N. America. In 1833 he commanded in the expedition organised in search of Sir John Ross. During the expedition he suffered great hardships, but discovered Arctillery Lake and the Great Fish R. On his return he was made captain. In 1836 and 1837 he continued his Arctic expeditions. In recognition of his valuable discoveries the Geographical Society awarded both its medals to him. In 1839 he was knighted, and in 1857 he was made admiral. During the years of his retirement he suffered from ill-health. His works are a *Narrative of an Expedition*

in *H.M.S. Terror*, 1838; and a *Narrative of the Arctic Land Expedition*, 1830.

**Bacillus pestis**, see under PLAGUE.

**Backbond**, a term used in Scottish law for a document which shows that the holder of a title receives it only in trust, and is accountable for its use to its real owner.

**Backboned Animals**, see VERTEBRATES.

**Backer, Adrien** (1636-86), a Dutch painter, nephew of Jakob B. (q.v.). He was b. in Amsterdam, and in early youth studied in Italy. He executed chiefly portraits and historical pieces. There is a fine picture of the 'Judgment of Solomon' in the town hall of his native city.

**Backer (or Bakker), Jakob de** (1609-1651), a Dutch painter, b. at Harlingen; studied under Lambert Jakobz at Leeward and afterwards under Rembrandt at Amsterdam. He is chiefly known for his portraits, which he executed with remarkable facility and speed. He also painted historical subjects. There is an excellent head of Brouwer by this artist in the collection of the former elector palatine, and a picture of the 'Last Judgment' is in the cathedral church at Antwerp.

**Backergunge**, see BAKARGANJ.

**Backgammon**, a very old game in England which until the seventeenth century was called 'the tables.' The obvious derivation of the word is 'back game,' as it is necessary in order to win, to bring one's 'men' back from the opponent's tables into their own, and also from the penalty attached to the pieces of going back to its starting point. A similar game, 'the twelve-line game,' was in vogue among the Romans, which consisted of a board, pieces, and the throwing of a dice which controlled the movements of the respective pieces. The game is played in France, where it is called tric-trac, from its noise occasioned by the throwing of the dice. The game is one more of chance than of skill on account of the large part played by the dice-throwing. The board or table consists of 2 parts or 'tables.' At each end of the table are 6 points, alternately coloured white and black. Two persons take part in the game, owning each 15 pieces. The 2 sets of 15 are one black and the other white. At the commencement of the game the pieces are placed at particular places on the table. Two dice are used, and each person has his own dice box, though the dice themselves are used by both parties. The throws are alternate. In the event of a 'doublet,' i.e. the throwing that results in 2 similar numbers, the number signified by the dots may be doubled. Those numbers indicated accidentally by the dice when thrown bear a certain relation to the points of the table, and it is necessary to observe the position of the men on the points in order to understand the connection and the regulations that control movements. The persons sit at the tables so that the points of their opponents face them. Suppose one player be called Black and the other White. The question of 'starter' is decided by

a throw of the dice, the higher score being the determining factor. The men are moved from point to point. The direction of White's moving is from Black's right-hand table to Black's left-hand table, then to White's outer table, and thence to White's inner table, completing the journey. Black's path is, of course, vice versa. The number signified by the dice, when thrown, indicates the number of points the thrower is allowed to travel unless the point at the end of the number is blocked by having 2 or more of his adversary's men upon it. The number indicated by the dice may be taken wholly with 1 man or shared between 2, so that each takes the number separately indicated. It is compulsory for a player to move the whole number signified if able. A 'point' is made by a player on placing 2 of his men on the same point. A 'blot' is that point occupied by 1 man; and it is cancelled by the arrival of an opponent who thus compels the previous occupant to go back to the bar. The numbers of the points count from the ace-point as 1, 2, 3, 4, 5, 6, and the man sent back to the bar is only allowed out again when the throw of the dice corresponds to the number of an unblocked point. While he has a man to enter, a player may not move any other man. When all his men are in his inner table, or 'home,' the game is continued by that player for the purpose of removing his men from the board by throwing a number that corresponds with the point he wishes to empty. He may make a move with any number instead of bearing a man away. When 6 is empty, the same number being thrown is able to empty the other points, though, of course, singly. It is possible for a player to be hit on a blot while bearing his men off the board. In this case he must enter on his opponent's inner table and must move the man into his own inner table before he may continue taking his men off. The winner is he that succeeds first in removing all his men from the table. The degrees of winning are as follows: 1. A 'single' win if his opponent has begun bearing. (This is called a 'hit'.) 2. A 'double' game if the adversary has not borne a man. (This is a 'gammon'.) 3. A 'triple' win if the opponent has a man in the opponent's inner table. In the event of a series of games being played the beginner of the next is determined by the degree of victory. If a 'hit' is won the victor begins; if a 'gammon,' a single die must be thrown. The winner of 2 games of 3 wins the 'rub.'

There is a Russian game called Russian B., which is in bulk similar to the Eng. game, as it varies in only a very few rules from the latter.

**Backhaus, Wilhelm** (b. 1884), eminent Ger. pianist, b. in Leipzig. He studied music at the conservatoire, Leipzig, under Alois Reckendorf until 1899, and Eugen d'Albert at Frankfurt-on-Main. From 1900 he made many concert tours throughout Europe and America, and his brilliant technique won for him a reputa-

tion as one of the foremost pianists of the day. In 1905 he won the Rubinstein prize in Paris, and in the same year was appointed prof. of the piano at the Royal College of Music in Manchester.

**Backhuysen, Ludolph** (1631-1708), Dutch painter, b. at Emden, Hanover. His masters were Evertdingen and Dubbels. He is famous as a painter of seascapes, which are marked by their vivid realism.

**Backnang**, a tn. of Württemberg, Germany, on a trib. of the Neckar. It has tanneries, and manufs. boots and cloth. Pop. 10,000.

**Backwardation**, a term used on the stock exchange for a sum of money paid by a seller of stock to the buyer in order that he may delay its delivery until the following account.

**Backwell, Edward** (d. 1683), a London goldsmith and banker at Unicorn, Lombard Street, one of the founders of the system of bank-notes. He had financial dealings with Oliver Cromwell, Charles II., and the queen mother, most of the nobility of the day, and with the E. India Company and sev. leading city firms. In 1662 he was sent to Paris on the matter of the sale of Dunkirk, and was employed on many secret services between Charles II. and Louis of France. He was alderman for Bishopsgate, 1657, and M.P. for Wendover, 1679 and 1680.

**Bacninh**, or **Bakninh**, cap. of the prov. of B., is in Tongking, about 16 m. N.E. of Hanoi. It was captured by the Chinese in 1884; pop. of prov. 396,000.

**Bacool**, or **Bacolat**, former cap. of Negros, Philippine Is., now of the prov. of W. Negros. It is noted for its fishing; pop. 20,000.

**Bacoler**, a tn. of the prov. of Pampanga in the Is. of Luzon, Philippine Is., situated 40 m. N.W. of Manila. The Is. grows spice, and has a pop. of about 10,000.

**Bacon**, a smoked meat product prepared from the sides, back, and stomach of hogs. In the Brit. trade B. generally consists of the whole side or half the side of the hog, or the half with only the shoulder end taken away; in America, of the smaller end from the back or stomach. Salt for preservation was used long before the preservation of food had reached its present stage of development. Pigs were cut up, put in brine tubs, and then smoked in an open chimney. The principle of B. curing is much the same to-day, but with the exception that it is now done in factories. Hams are often cured separately and sugar or molasses superadded to the salt. In Great Britain the B. industry has been reorganized in accordance with the recommendations of the commission on pigs and pig products, and after 1936 there was in operation a quota scheme regulating imports in order to secure price stabilisation. See Pig.

**Bacon**, a tn. on the W. coast of the Camarines Isthmus, Luzon, Philippine Is., in a fertile dist.; pop. 13,000.

**Bacon, Anthony** (1558-1601), a diplomatist, elder son of Sir Nicholas B., and brother of the great Francis B. In 1573

he went into residence at Trinity College, Cambridge, his tutor being John Whitgift, afterwards archbishop of Canterbury; in 1576 he was admitted with his brother a member of Gray's Inn. In 1579 he undertook a long continental tour, when he made the acquaintance of Montaigne, the essayist, Danæus, an eminent Protestant theologian, and many of the leaders of the court of Henry of Navarre. He returned to England in very bad health in 1591. In 1592-93 he was returned to Parliament as member for Wallingford. In 1593 he entered the service of the earl of Essex, and undertook to keep him posted in foreign information, and as his private 'under-secretary of state for foreign affairs,' was in constant communication with numerous foreign ambas. Many of Bacon's letters remain in MS., much of which is preserved in Lambeth Palace library. In 1597 he was returned to Parliament as member for Oxford. See Dr. Abbot's *Bacon and Essex*, 1877; Todd's *Cat. Lambeth MSS.*

Bacon, Delia (1811-59), an Amer. authoress, sister of Leonard B. (q.v.), b. at Tallmadge, Ohio; a schoolmistress, and a lecturer in hist. and literature at classes for women. Wrote sev. stories: *Tales of the Puritans*, 1831; *Bride of Fort Edward*, 1839. Though the idea did not originate with her, she was one of the earliest and most enthusiastic supporters of the theory that Shakespeare was not the writer of the plays called by his name. She came to England to study the question, and became a friend of Thomas Carlyle and Nathaniel Hawthorne. In 1857 she pub. *Philosophy of the Plays of Shakespeare Unfolded*, in which she expounded her theory that the so-called Shakespeare plays were written by Francis Bacon, Edmund Spenser, Walter Raleigh, and others in order to set forth a philosophy which they did not care to own publicly. Her mind became unhinged, and she returned to America, and d. at Hartford (Connecticut). Hawthorne recounted his friendship with her in a chapter of *Our Old Home* (1863), 'Recollections of a Gifted Woman.'

Bacon, Francis, Baron Verulam and Viscount St. Albans, commonly but inaccurately called Lord Bacon (1561-1628), lord chancellor and philosopher, was b. at York House in the Strand, London, Jan. 22. His father was Lord Keeper Nicholas B., who ranks high among Elizabethan statesmen, and who held the seals of office for 20 years. His mother was Ann, second daughter of Sir Anthony Cooke, a well-educated woman and a zealous Calvinist. In 1573 Francis entered Trinity College, Cambridge, and in 1576 Gray's Inn.

It is said that while he was still at college he determined upon pursuing that course which should bring about the new philosophy. It is said that he himself regarded his profession as a means to this end. However, the death of his father in 1580 left him with comparatively little influence, and so he was dependent upon patronage. Henceforth his life

must be considered in 2 aspects: the political career and the literary, both so distinct and contradictory that, to a casual observer, it seems that Pope's saying is suitable to him, 'The wisest, brightest, meanest of mankind.'

After failing to obtain help from his uncle, Lord Burleigh, he was aided very considerably by the earl of Essex, whose unfortunate career in Ireland terminated too quickly to allow of his giving B. much further help.

Now occurs the period of which the most capital has been made by B.'s enemies. He had to manage the queen and Essex; he evidently did attempt to mediate honestly between them. But this having failed, what is certain is that he offered himself as counsel for the prosecution against Essex. He himself said in his *Apology* that he did so in the hope of helping his unfortunate patron. What was more generally believed was that he saw that he had gone too far, that he had offended the queen, that the fall of Essex meant his own ruin, and so he altered his plans accordingly. He made little attempt to save his friend. Moreover, when the queen wished to vindicate her action, it was B. who wrote *A Declaration of the Practices and Treasons attempted and committed by Robert, Earl of Essex*, and later apologised by saying that the maintenance of the State was more important than the ties of friendship. In the last years of Elizabeth's reign B. tried to act the part of mediator between queen and people. With the accession of James he found his chances of promotion increased. He was knighted on coronation day, and in the same year married Alice, daughter of Alderman Barnham. In 1604 he was made a king's counsel, and given a pension of £60 a year. In 1607 he became solicitor-general, and in 1612 attorney-general. He exerted himself to bring about the union of England and Scotland, and at the same time busied himself in writing. His servility during this period is usually illustrated from the cases of St. John and Peachment. (See PEACHAM'S CASE.) In 1616 B. was the prosecuting counsel in the Overbury murder case, and next year secured the dismissal of Coke, his rival, from the King's Bench. He next attached himself to the new favourite, Buckingham, who at first did his best by using his influence on behalf of B. In 1616 B. became a Privy Councillor, and in 1617 was appointed keeper of the Great Seal, and was raised to the peerage as Lord Verulam. The years in which he held office Macaulay declares among the darkest and most shameful in our hist. He allowed Buckingham to interfere in his decisions in the court of chancery, and at one time actually cancelled his judgment of a case and ordered it to be tried again in response to a peremptory letter from Buckingham. He acquiesced in the execution of Raleigh, and in the project of a Sp. marriage. A great deal of the maladministration of the time must be ascribed to the weakness of the king and the power of the favourites.

But it is impossible to exonerate the lord keeper. At this time the practice of granting monopolies as rewards was at its height. Patentees were armed with such great powers that they could override all law and order. But B., when he was asked to interfere, practically decided in favour of extending these powers. However, his fall was close at hand. The period of the Addled Parliament of 1614 had been succeeded by 7 years in which the nation was governed absolutely by the Crown. In 1621 want of money forced the king to convoke another parliament. If he and his ministers had understood the temper of the people it is possible that they would not have done so. Immediately Parliament assembled, the Commons proceeded in the most reasonable manner to discuss the granting of monopolies, under cover of which Buckingham and his friends had so oppressed and robbed the people. Buckingham began to fear for himself, and so proposed a plan by which certain people were to be sacrificed to the House to save others. Sir Giles Mompesson and Sir Francis Mitchell were first given over to impeachment. It was not long before B. understood that he, too, was to be abandoned. The Commons, led by B.'s enemy, Coke, appointed a committee to inquire into the state of the courts of justice. On Mar. 15, 1621, the chairman reported that great abuses had been discovered. 'The person,' said he, 'against whom these things are alleged is no less than the lord chancellor, a man so endued with all parts, both of nature and of art, that I will say no more of him, being not able to say enough.' There were 23 specific charges which were put before the Lords temperately enough. The evidence was so clear and irrefutable that the lord keeper's friends could only ask for suspension of judgment. B. himself seems to have realised the hopelessness of his position. He became ill, and from a letter written at the time he seems to have had no wish to recover. The inquiry was proceeding when the adjournment of Parliament gave him a short respite. On the reassembly of the Houses B. admitted practically everything, and renounced all defence. He was condemned to pay a fine of £40,000, and to be imprisoned during the king's pleasure. He was removed from his offices, declared incapable of holding any other, and banished from court. The sentence was undoubtedly severe, but probably none of the judges thought it would be carried out in its entirety. B. was indeed imprisoned in the Tower for 2 days as soon as his health improved, but at the beginning of 1624 he received a full pardon. The argument that such bribes and fees were the customary emoluments of the law officers of the day, and that therefore B. was simply used as a scapegoat, cannot be admitted for a moment if we consider B.'s own view of the matter. True, at first he denied all the allegations with great indignation. But later, when he found himself deserted by

his powerful friends, the king and the favourite, his attitude shows clearly his own condemnation of himself. Not once does he hint that presents are the same thing as fees. He never attempted to defend himself now, as he had done in the prosecution of Kissex. In his final 'confession and submission' he goes over all the charges, and, with the exception of a few unimportant denials, declares himself guilty: 'I do plainly and ingenuously confess that I am guilty of corruption, and do renounce all defence and put myself upon the grace and mercy of your lordships'; and again, at the end, when he had stated all he could in favour of himself, 'I do now again confess that, in the points charged upon me, though they should be taken as I have declared them, there is a great deal of corruption and neglect, for which I am heartily sorry, and submit myself to the judgment, grace, and mercy of this court. For extenuation I will use none concerning the matters themselves.' The most remarkable comment on his case and on the state of the courts in England is his own statement, made some years later: 'I was the justest judge that was in England these fifty years; but it was the justest judgment that hath been pronounced these two hundred years.' No judges could have been more favourable to him than those who tried him. He was spared all public humiliation as far as possible. After 1624 he was at full liberty to return to court, and even to take his seat in the Lords, had he desired to do so. He received a pension of £1200 from the Gov., and his magnificence was as great as ever. This carelessness in money matters may explain some of the passages in his confession; it is certain that it brought him into difficulties during the last years of his life. He was forced to sell York House, and to live at Gray's Inn while in London. Yet, during these years he rendered such services to letters that the world must regret the years that had been wasted, as Sir Thomas Bodley said, 'on such study as was not worthy of such a student.' In 1622 he completed his *History of King Henry VII.*, and in 1623 his *De Augmentis*, and in 1625 the best collection of jests in the world, *Apophthegms New and Old*. Sev. political tracts and valuable additions to what he had already written were the product of this part of his life. In 1626, while travelling in his coach near Highgate, he caught a chill while performing an experiment. He considered that excessive cold might serve to prevent animal tissues from putrefaction. On this particular day he alighted from his coach to stuff a fowl with snow in order to test his theory. Almost immediately he became ill and was taken to the earl of Arundel's house. Here he *d.* on Easter Day.

It is by the *Essays* that B. is best known to the general reader. First pub. in 1598, they appeared as 10 in number; later, as successive eds. were issued, they became more; in 1619 they were nearly 4 times as many, and in 1625, the last

ed. pub. during his lifetime, nearly 6 times as many. These *Essays* differ greatly from his later works. They are simply observations he had made, and rules he had found to be true, in his way through life, and are set down uncereemoniously. There is hardly any attempt after 'style'; in few is there any deliberate seeking after order. In 1598 they read almost like notes, and although they are recast later, the same ruggedness of outline remains. For what is considered his greater work he had a different manner of writing. As far as subject-matter, truth, and beauty are concerned he rarely surpassed the *Essays*, but his style was becoming constantly richer, softer, and more melodious. In 1605 he dedicated to the king *Two Books of the Proficiency and Advancement of Learning, Divine and Human*. In 1623 he expounded this into the Lat. treatise, in 9 books, entitled *De Augmentis Scientiarum*. In 1610 he gave to the world his *Wisdom of the Ancients (De Sapientia Veterum)*, a fanciful interpretation of old classical mythology, but none the less a brilliant piece of work. In 1620, just before his fall, appeared what is undoubtedly the greatest of his works, the 2 books of his *Novum Organum Scientiarum*, or new method of scientific discovery, in which he announced what he thought to be a previously unthought-of method of questioning nature, and extorting her secrets from her. This work was to be the second part of a great scheme, *Instauratio Magna*, or the Great Restoration, *De Augmentis* being the first, the whole to be completed in 6 books. In 1622 he pub. the *History of the Reign of King Henry VII.*, and as stated before, his marvellous industry continued to the end. Of these books, the *Advancement* must be considered as a call to a great cause. It is evidently a hurried production, and is not well arranged. Yet it is a work whose purpose was immense, whose influence is even now at work. It was the first of a long line of books, the purpose of which was to teach people the use of knowledge—how, why, and what to know. B. considered it merely a beginning; the *De Augmentis* was a development of it, and in his later Lat. works he sought to go farther in the road he pointed out first of all. In the *Novum Organum* he reverted to the form of aphorisms. He worked 12 years on this book, and carefully weighed every word. It developed into a war on the world of science as it was then; and declared that all knowledge must be begun again, by a new and, as he thought, infallible method. The first book simply prepares; in the second book, with the eleventh aphorism, he declares his own method. It is usually said, mistakenly, that he rediscovered the method of induction as opposed to that of deduction. The method of reasoning then in vogue had been to accumulate instances without following any rule of selection; that is, a theory was formed, and then was supposed to be proved if instances could be accumulated which agreed with the theory. H., on the other hand, pointed

out the advantages of the experimental method. Given an effect, work backwards to the cause or causes; experiment then to discover if the cause produces the effect. B. elaborated this method of exclusions, but, as Macaulay points out, it is ridiculous to say that he discovered the method of induction. Intrinsically, his method was valuable. He saw the force of causation and that the real object of science should be to find out causes. He has received much credit for this. The amazing discoveries of modern science are, not without reason perhaps, assigned to his awakening. But when we come to examine details we find that the most surprising divergence of opinion exists among competent judges. Some of his most ardent admirers have come to the conclusion that as an instrument and real method of work B.'s plan was a failure. B. claimed that his method was infallible and mechanical, and that it would reduce all minds to the same level in the task of obtaining knowledge. To have made such an assertion shows that he could never have understood the possibilities of the human mind. Again, his explanation of the science of induction is not clear enough to be satisfactory. His own conclusions are either unverified or merely negative. His conception of the meaning of philosophy was altogether too narrow, embracing as it did merely the natural sciences. Finally, his method was altogether too mechanical.

Yet with all this he has a pre-eminent place in the hist. of science. The principles on which he worked were the only true ones, and he propounded them systematically and earnestly. He showed that intelligent, patient examination of things was the only way to knowledge. He wished to make a new world, happier than the old in the possession and pursuit of knowing. He was keenly alive to the needs and pains of human life, and thought it no shame to use knowledge to alleviate them, in 'charity to man, and anxiety to relieve his sorrows and necessities . . . for this should men study to be perfect in.' Certain it is that his conclusions were often vague and untrue; that he himself did not know the immensity of what he aimed at; equally certain is it that he expressed in such terse, beautiful language what had broken in on other minds before that men were bound to answer the call and follow the gleam. Unfinished though his great scheme of the Restoration was, yet the *Novum Organum* was a worthy crown. He had intended much more, and there remains a vast amount of unused or neglected material which shows how it was thought out, arranged, and recast. It was written and rewritten 12 times over before its publication. Mr. Ellis says that the scheme for the *Instauratio Magna* was as follows: 'The first book contains a general survey of the present state of knowledge; in the second men are to be taught how to use their understanding; in the third all the phenomena of the universe are to be stored up . . .; in the fourth examples are to be

given of its operation . . . ; the fifth is to contain what B. had accomplished in natural philosophy *without* the aid of his method . . . ; the sixth will set forth . . . the results of the application of the new method to all the phenomena of the universe."

Doubtless, to the ordinary reader, the most interesting claim in regard to B. is that which assigns to him the authorship of Shakespeare's plays, together with that of many other works of the period. The war of Shakespearians v. Baconians has produced much writing and not a little acrimony. For years researches have been carried on in order to clear up the so-called mystery of Shakespeare. The arguments of the Baconians may be summed up briefly as follows: Francis B. was undoubtedly, if we exclude the author of Shakespeare's plays, the greatest mind of the Elizabethan epoch. To him alone, still assuming that William Shakespeare was not the true author, can be credited the production of those marvellous plays. Countless passages in them may be paralleled in his own writings. Moreover, the sonnets, the 'key with which Shakespeare unlocked his heart,' and which open to such a shadowy portal, are peculiarly applicable to B. But it is upon negative evidence that most stress is laid. We have only 5 specimens of the handwriting of Shakespeare, and taking the signature, which occurs in all, we see that it is by no means clear, and certainly not what we would call an educated hand. The evidence is far from being conclusive. Certain enthusiastic supporters of the Baconian theory pin their faith to ciphers obtained by poring over the first folio of Shakespeare's plays, pub. in 1623. Perhaps the most important of these believers are Sir Edward Durning Lawrence and Dr. Orville Owen. The latter, after 30 years' research, claimed to have discovered a cipher which would lead him to the discovery of MSS. which B. buried in the bed of the Wye. According to the cipher, he said that B. originally buried his treasure near Chepstow Castle; then later, fearing its discovery, removed it and placed it in an excavation in the mud of the Wye which he formed by diverting the course of the riv. by means of timbers. No measurements were given, but the place was indicated by means of a Rom. ford and a reference to a cleft in the cliff. During Easter week, 1911, Dr. Owen, assisted by the duke of Beaufort's workmen, discovered timbers which seemed to be between 200 and 350 years old, and which had not been part of a bridge. Later a type of cache was discovered, but then the work was discontinued. Dr. Owen's theory was that B. and Essex were the children of Elizabeth and Leicester, being the offspring of a marriage which took place in the Tower during Elizabeth's imprisonment there. At the age of 16 B. discovered this, and in a fit of anger the queen admitted it. Not daring publicly to resent his position, B. confided it to cipher writings,

and, inspired perhaps by the story of Philip of Macedon, who buried all his treasure near a ford in the R. Oxus, B. determined to do likewise. It is conjectured that the literary secrets revealed will be even more interesting. Not only will Shakespeare's plays be proved his, but much of the work now attributed to Robert Greene, Peele, Marlowe, Spenser, etc., will be also made known as his. The stupendous nature of this claim is dismissed by the Baconians with the assertion that even then it will not be equal in bulk to the work of Sir Walter Scott. *See also under SHAKESPEARE.*

Setting aside all these claims, even if B. is never proved to be Shakespeare, or Shakespeare B., it is enough that his already acknowledged work be accurately judged to place him in the front rank of the geniuses of the world. In one sphere alone, if it is granted that Macaulay's words are true, he 'moved the intellects that moved the world.' B. has a prominent place in the evolution of our law. But, apart from his strong tendency to permit politics to interfere with legal administration through the office of the chancellor, his academic conception of law was so wide that it touched, on the one hand, on the philosophy of things, and, on the other, the comparative institutions of nations. In important cases, to use his own words, he 'always used extraordinary diligence,' as may be gathered from his arguments as solicitor-general in the famous case of the *Post-Nati* of Scotland (1607) (the case which decided that those Scotchmen who were born after the union of England with Scotland under one king (*postnati*) were not aliens); and also in the case of the *de non procedendo Rege inconsulto*, 1616 (the case in which the king's right of appointment to office was involved). It may be said that B. foresaw in his decisions as chancellor the necessary evolution of the whole body of equitable jurisdiction. In his own words, it was the province of equity to 'supply the defects of the common law'—though to-day we should limit that function to proper cases only. As chancellor, B. aspired to the part of an overseer over the judges, but in his conflict with Coke he failed to obtain from the judges any recognition of the position which he so claimed for the court of chancery.

*Consult Reports of Cases decided by Francis Bacon, Baron Verulam, Viscount St. Albans, Lord Chancellor of England in the High Court of Chancery (1617-21), prepared from the records of that court by J. Ritchie, 1932.*

**Bacon, Henry** (1866-1924), Amer. architect, was born at Watseka, Illinois, and studied architecture at Illinois Univ. From 1888 to 1891 he gained experience working with sev. firms, but from then until his death in 1924 he practised independently. Among the notable buildings he designed were the Union Square Savings Bank, New York, Public Library, Patterson, New Jersey, and the Whittemore Memorial Bridge, Naugatuck, Connecticut. He also designed

monuments such as the Civil War and World War monuments, Yale Univ., and the Farnell monument in Dublin. The Lincoln Memorial, erected at Washington 1920, was also his work.

**Bacon, John** (1740-99), Eng. sculptor. Trained as a modeller and painter on porcelain. In 1769 a bas-relief representing the flight of Aeneas from Troy won for him the first gold medal ever awarded by the Royal Academy for sculpture. In 1770 he exhibited a figure of Mars, and in consequence received the gold medal of the Society of Arts and was elected an associate of the Royal Academy. His rivals accused him of ignorance of classic style, and to repudiate the charge he executed a head of Jupiter Tonans. The best known of his works are the monuments of Pitt in Westminster Abbey and the Guildhall, of Dr. Johnson and Howard in St. Paul's Cathedral, and of Blackstone in All Souls', Oxford. He was buried in Whitefield's Tabernacle.

**Bacon, Leonard** (1802-81), Amer. Congregational minister, editor and author, called 'the Congregational Pope of New England'; b. at Detroit, Michigan. Graduated at Yale Univ., 1820, and Andover Theological Seminary, 1823. In 1825 became pastor of the First Church, New Haven, with which he was connected till his death. Ed. the *Christian Spectator*, 1828-38. He was prof. of didactic theology at Yale Univ.

**Bacon, Nathaniel** (1593-1660), Puritan lawyer. Member of the Long Parliament, 1645-60. Wrote *A Historical Discourse of the Uniformity of the Government of England* (1647-51).

**Bacon, Nathaniel** (1642-76), b. in England, but emigrated to Virginia, where he became a member of the governor's council. Headed an expedition against the Indians, in defiance of Governor Berkeley's policy. Was proclaimed a rebel, captured, tried, and acquitted. B. and his supporters demanded a reduction of taxes and an extension of the suffrage. Being for a second time proclaimed rebels, they marched on Jamestown, which they captured and destroyed, but B. d. before he could carry out any of his reforms.

**Bacon, Sir Nicholas** (1509-79), Eng. statesman, father of Francis B. by his second wife Anne, daughter of Sir Anthony Cooke. He graduated at Corpus Christi College, Cambridge, in 1527, after which he entered Gray's Inn and was called to the Bar, 1533. In 1537 he became solicitor of the court of augmentations; 1546 attorney of the court of wards and liveries; 1550 he became a bench, and in 1552 treasurer of Gray's Inn. After the dissolution of the monasteries, 1539, he received a large share of the forfeited estates from Henry VIII. During Mary's reign, his Protestantism cost him many of his emoluments, though he retained his office in the court of wards. On the accession of Elizabeth, 1558, he became a Privy Councillor and keeper of the great seal. In 1559 he was knighted and was allowed to exercise full jurisdiction of lord chancellor.

He and his brother-in-law, Cecil (afterwards Lord Burleigh), had the ordering of eccles. matters. He had a keen political hatred for Mary Queen of Scots. Founded a free grammar school at Redgrave. Buried in St. Paul's Cathedral.

**Bacon, Sir Reginald Hugh Spencer** (b. 1863), Brit. admiral; educated, H.M.S. *Britannia*. In 1897 appointed commander of H.M.S. *Theseus*. Started the submarine boat service in the Royal Navy, and was naval assistant to the first sea lord of the admiralty in 1905. Captain of H.M.S. *Dreadnought* during her first commission: director of naval ordnances and torpedoes, 1907-9. Retired 1909 and became managing director of the Coventry Ordnance Works. When the First World War broke out he commanded the Heavy Howitzer Brigade, Royal Marine Artillery, with the B.E.F. (q.v.) in France. Rendered great service in command of the Dover Patrol (q.v.) from 1915 to 1918. In 1918-19 he was controller of the munitions inventions dept. at the Admiralty. Pub.: *Benin, the City of Blood* (he was chief of intelligence service in the Benin expedition of 1897); *The Dover Patrol*, 1919; *The Jutland Scandal*, 1925; *A Naval Scrap Book*, 1925; *The Life of Lord Fisher of Kilverstone*, 1929; *The Concise Story of the Dover Patrol*, 1932; *The Life of John Rushworth, Earl Jellicoe*, 1936; *Modern Naval Strategy* (with F. E. McMurtrie), 1940.

**Bacon, Robert** (d. 1248), the first Dominican writer in England, the brother, or, according to some authorities, uncle of Roger B. He was educated at Oxford and Paris, joined the order of the Dominicans, and (possibly) succeeded Edmund Rich as treasurer of Salisbury Cathedral in 1233. He rebuked Henry III. for his fondness of foreign advisers, notably Peter des Roches. He wrote a life of Edmund Rich, *Liber in sententias Petri Lombardi, Sectiones Ordinariae*, and other works.

**Bacon, Roger** (c. 1214-94), an early Eng. philosopher and scientist, author of numerous treatises; b. near Ilchester, Somerset. Educated at Oxford, where he took orders in 1233. Went to Paris for study and returned about 1250, when possibly he joined the Franciscan order. His learning won for him the title of Doctor Admirabilis. His brother friars were jealous of his ability, and his research in physics and chem. caused him to be suspected of dealings in the black arts and gave rise to doubts as to his orthodoxy.

In 1257 his lectures at Oxford were interdicted, and he was imprisoned in Paris. During his confinement he was requested to send to Rome a copy of his work, which the Pope, Clement IV., had been forbidden to read at the time when he was Guy de Foulques, papal legate in England. B. accordingly wrote his *Opus Majus*, which he followed up in 1266 with *Opus Minus* and *Opus Tertium*. It is not known what Clement thought of them, but at any rate B.'s release was

effected, and in 1268 he was back in England. Ten years later his works were again condemned as heretical, and his second imprisonment, which lasted 14 years, was sanctioned by Pope Nicholas III. During this term of imprisonment he wrote many treatises, including *De Retardandis Senectutis Accidentibus*. He was released in 1292.

B.'s fame has increased of late years. The *Opus Majus* is a storehouse of information. In it he showed up the vices of the theology of his time, expounded the necessity of reformation in the sciences by a careful study of nature, and descanted generally on alchemy and other sciences. B. discovered errors in the existing calendar, and his rectified calendar may be seen at Oxford. He had a practical knowledge of chemicals in advance of his age, but he shared in certain popular beliefs with regard to alchemy, the philosopher's stone, and the doctrine of signatures.

**Bacon Beetle** (*Dermestes lardarius*), a destructive species of beetle, which attacks bacon, dried foods, and stuffed collections. The insect is small and black, with the exception of the root end of the wing, which is golden-brown and dotted with 3 dark spots.

**Bacon-Shakespeare Controversy**, see BACON, FRANCIS.

**Baconthorpe**, Bacon, or Baco, John (d. 1346), an Eng. schoolman and philosopher, called the Resolute Doctor; the grandnephew of Roger B. He entered a Carmelite monastery near Walsingham, graduated at the univ. of Paris; became the head of his order in England, 1329-33. In 1333 he went to Rome, and returned to England in 1346. He preached the doctrines of the Arabian philosopher Averroes (q.v.) and wrote commentaries on the Bible and numerous treatises, including *Commentaria super Quatuor Libros Sententiarum*, Paris, 1484. Consult Aymers (Turin, 1687-69), and Zagalia (Ferrara and Parma, 1696-1706).

**Bács**, or **Bács-Bodrog**, formerly a co. of S. Hungary, being a plain lying between the Danube and Theiss, which rivs. are joined by the Bács or Franzens canal, constructed between the years 1796 and 1802. In 1920 the greater part was allotted to Yugoslavia; the remainder has a pop. of 115,220 of whom 28 per cent are Gers. Wheat, maize, and fruit are produced and horses bred. The cap. is Baja (q.v.).

**Bacsanyi, János** (1763-1845), Hungarian poet. His first pub. work was *The Valour of the Magyars*, a poem. He ed. the *Magyar Museum*, which was suppressed by the Gov. as advocating dangerous liberalism. He was implicated in the conspiracy of Bishop Martinovitch, and underwent imprisonment. During the remainder of his life he suffered persecution.

**Bacteria** are microscopic organisms which have no chlorophyll and consequently most of them are unable to synthesise their body substance (protoplasm) from simple inorganic materials. A few, however, such as the iron and

sulphur and nitrifying B. mentioned below, are able to build up protoplasm from carbon dioxide and salts by the process of chemosynthesis, allied to photosynthesis of green plants but taking place in the absence of light. In many respects B. closely resemble the fungi, and so are sometimes grouped as Schizomycetes, on account of their reproduction by fission (Gk. *σχίζειν*, to cleave; *μύκης*, fungus). It is, however, preferable to regard B. as a distinctive group of very simple living organisms which have not yet evolved into either plants or animals, and which may resemble the primitive forms of life first produced on the earth. The names bacilli, microbes, micrococci, microorganisms, and germs are also popularly applied to the group as a whole. Their multiplication is so rapid that they may produce more than 16,000,000 in a day, and they are so minute that about 2500 of some of the larger forms, placed end to end, would measure about one-tenth of an in. Others cannot be seen even under the highest magnification of the microscope, and their presence is detected, or rather deduced, only from their effect on other organisms in which they cause some of the most virulent diseases. Such ultra-microscopic forms are known as the filterable viruses, because they pass through the pores of a porcelain filter. If the pores be fine enough, the virus may be separated from the microscopic B.

**Classification.**—The classification of B. is unsatisfactory, because the main diagnostic feature on which it was originally based was that of the shape of the cell. This method has been in use so long, and has consequently collected so much nomenclature founded on this feature, that there are obvious disadvantages to the medical profession in replacing it by a newer system of terminology. Moreover, the ready recognition of external form is of great importance in clinical work. Such a system of classification is, however, not really scientific, and the Society of Amer. Bacteriologists has suggested a system comparable to that of the higher plants.

The classification at present still in use in Great Britain divides B. into higher and lower forms. The latter, or Eubacteriales are far more numerous, and include motile and non-motile unicellular organisms, consisting of a mass of protoplasm within an investment. Spores may be formed within the cells, and such spores are called endospores. Eubacteria are of 4 main types, and are classified according to their shape as:

(1) **Cocci**. These are spherical organisms reproducing by fission, but various members of the group divide in different ways, and so sub-divs., dependent on the mode of fission, have been formed.

(a) In *Sarcinococci* (Gk. *σπέρμα*, twisted) occur in only 1 plane, and the cells are held together in a row by their gelatinous investments.

(b) In *Staphylococci* (Gk. *σταφυλή*, a bunch of grapes) divs. may occur in any

plane, and so will result in the formation of an irregular mass of cells.

(c) *Micrococci* in fission form groups of 4 or multiples of 4 by div. in 2 planes at right angles. Two of these cells, remaining in contact after the separation of the groups, are described as a diplococcus, e.g. the *Gonococcus* and *Pneumococcus*.

(d) *Sarcinae* divide in 3 planes, 2 longitudinal and 1 meridional, at right angles to one another, and so form groups of 8.

(2) *Bacilli* are rod-like B. which are really cylindrical. The main axis of the cylinder may be relatively long or short, and the ends may be flat or convex, so that under the microscope the bacillus

with a narrow fixing base. They are mainly aquatic, and their envelope frequently contains iron oxide. Such forms are popularly described as 'iron B.'

2. *Streptothrices* are branched aseptate filaments which may produce special reproductive branches from which chains of rounded conidia are formed, or the filament may reproduce by dividing transversely into a number of rods.

3. *Thiobacteria* or 'sulphur B.' contain sulphur and sometimes bacterio-purpurin. A sheath is not always present, and the organisms may be free or attached. The free forms move by protoplasmic contraction.

The Amer. classification divides the B. into the six orders: 1. Eubacteriales;

BACTERIA

A, cocci; B, diplococci; C, streptococci; D, staphylococci; E, monotrichous flagella; F, amphitrichous flagella; G, peritrichous flagella; H, bacilli; I, vibrios; K, spirilla; L, spirochaetes; M, anthrax spores; N, tetanus spores; O, division of a bacterium.

looks like a rod with square or rounded ends. It may have flagella at one or both ends, or all round the body, or flagella may be absent.

(3) *Spirilla* are curved, rod-like forms. The curves may be undulatory or spiral; at each end of the motile forms are from 1 to 20 flagella.

(4) *Spirochaetes* are non-flagellate, motile, spiral, or undulatory cells, usually comparatively long and thin. Various types of movement are effected by the contraction of the cell, and in some forms one end tapers so considerably that it is comparable to a flagellum.

The higher B. consist of branched or unbranched septate or aseptate filaments often invested with a gelatinous sheath. The units of these filaments resemble separate B., but the filament must be regarded as a simple colonial aggregate, for the units are interdependent and have sometimes a very special function. The unit at one end often fixes the organism, while that at the free end divides, abstracting spores called conidia, which can reproduce the bacterium immediately if conditions be favourable. The 3 chief orders of this group are:

1. *Chlamydo- or Tricho-bacteria*. These are unbranched, filamentous forms, often

2. *Spirochaetales*; 3. *Chlamydobacteriales*; 4. *Thiobacteriales*; 5. *Actinomycetales*; and 6. *Myxobacteriales* (see *General Systematic Bacteriology*, Buchanan). In this classification, B. producing diseases in human beings belong to orders 1, 2, and 5.

*Structure*.—Examined under the microscope, B. are seen as minute and transparent cells, usually colourless, and consisting of a mass of protoplasm surrounded by a definite wall which is different in character from the cellulose wall of higher plants. Around this wall many B. have a gelatinous covering, which enables them to cohere and form a slimy mass such as may be found on the surface of stagnant water and round flower-stalks which have begun to rot. This cohesive mass is the zoogloea (i.e. 'animal glue'). Some B. are coloured, but since the majority are not, their structure can be determined only with the aid of appropriate stains, usually aniline dyes. The presence of a differentiated nucleus has not been satisfactorily demonstrated, even in the larger forms, and from results so far obtained it seems unlikely that the cell contains an organised nucleus. The cells may contain food reserves of fat, carbohydrate such as glycogen, and of other materials.

**Growth and Reproduction.**—Under favourable conditions a bacterium grows very rapidly, and divides either transversely or longitudinally or in both directions. The new cells grow and divide almost immediately. When conditions become adverse, thick-walled resting spores, endospores, are formed inside the cell, and may rest and remain viable for months, or even years, awaiting the return of favourable conditions. Most B. are not killed unless they are subjected to extreme conditions.

**Food and Feeding.**—On account of the inability of all except the chemosynthetic species to synthesise food from carbon dioxide, water, and mineral salts, B. have to live on food manufactured by green plants. In a few cases they do this directly by living within or on parts of the plant. For example, some species live on seeds, and in feeding help to rot the testa and so help the seedling to grow out more easily. Most, however, do it indirectly by living in or on animals and on decaying plant or animal matter. In fact, the B. themselves effect the decay by the chemical decomposition due to their methods of feeding. These B. are either saprophytes (i.e. *sapros*, decay), or parasites, but many of the parasites cause the death of their 'host' or are expelled, and then go on living as saprophytes. To effect decomposition the B. secrete enzymes or ferments capable of decomposing such substances as cellulose, lignin, protein, and other compounds, and on this account are very useful to man (*see below*). On the other hand, some parasitic B., by decomposing blood and tissues, may cause great harm and even death. Some parasites are useful; those found in the intestine probably aid digestion.

The elements of food substances required by B. are practically the same as those needed by all plants—carbon, hydrogen, oxygen, phosphorus, sulphur, nitrogen associated with the metals calcium, potassium and magnesium. Some species need iron, and sodium compounds are present in many. It is difficult to discover in exactly what form B. require these compounds, because any one species of bacterium is rarely found alone. Usually there are associations of several species, and each may modify the substratum, while the others may be feeding on materials produced by the modification. Most B. prefer an alkaline medium; even a small amount of free acid will inhibit the growth of the cholera bacillus, and many B. are killed by the hydrochloric acid in the gastric juice of the stomach. By the method of culture it is possible to discover the foods which some B. can use.

**Methods and Uses of Culturing B.**—In any medium where B. flourish freely there is a confusion of different forms, spherical, cylindrical, and spiral. Some species use up all the available nourishment and die or dwindle into spores. Other species enter and multiply, and are in their turn destroyed through the exhaustion of the food supply or by the poisons created in the medium by other

species. The microbe pop. is thus always changing, and it is difficult to study their structure and actions unless each species can be separately collected. This may be done by sterilising a solution of agar-agar (obtained from a Jap. seaweed) to which has been added a food solution of materials similar to those on which the B. grow naturally. The sterilisation is carried out at a temp. which will not decompose the medium, and if it has to be as low as 57° C., sterilisation will take some days. If, however, it can be performed under pressure due to super-heated steam, from 20 to 30 min. will be long enough to kill any spores which have found their way into the medium. This is poured into sterilised flat dishes, Petri dishes, or into test-tubes sloped to expose a long slant surface of the agar. In the latter case the medium is usually sterilised in the tubes, which are plugged with cotton wool. If sufficient agar be used, the medium sets like a jelly, and is most convenient, because pieces on which B. are growing can easily be removed. Many other media are used for specific B.; the diphtheria bacillus grows on coagulated blood serum and the meningococcus on egg albumen. B. are scattered on the surface by adding a drop of water or liquid gelatine or by dipping a platinum needle into a mass of B. and quickly stroking it across the medium. If conditions be favourable, they divide, and the different types form separate colonies, which may be removed and sub-cultured separately on fresh media. In this way pure cultures may be obtained and subjected to experiments to determine the effect of changes in temp., light, food materials, poisons, and other factors. Such researches may be invaluable in determining the most favourable conditions of life for disease-producing B., the means of ending their activities, and also the best conditions for the activities of B. of economic value.

**Identification of B.**—Contrary to popular belief, it is not usually possible to identify B. by the use of the microscope alone, though examination of stained preparations is, of course, employed; living B. can be viewed by dark ground illumination, and this method is particularly useful for recognising Spirochaetes.

A most important aid to identification is the manner of growth of B. in the pure cultures prepared as described above, and observed with the naked eye. The size, colour, shape, type of surface, and other similar features are all used. Further important methods of identification are: (1) whether gelatine, used instead of agar-agar in the culture medium, is liquefied by the bacterium; (2) whether indole, a substance which can easily be tested for by chemical means, is formed; (3) whether various sugars are fermented by the bacterium, with production of acids, as shown by the colour change of an indicator incorporated in the medium; (4) whether in (3) a gas is formed as a result of the fermentation.

**Effect of Temperature.**—Every organism

has a temp. which is most favourable to its growth. Above or below this optimum temp. growth decreases until the limits beyond which it cannot take place are reached. These vary considerably, so that while for most B. the lower limit is about 12° C. and the upper about 40° C., a few will grow at 5° C., while those which decompose hay and dung grow well at about 60° C. Beyond the temp. limits endospores are frequently formed, so that though meat may be preserved in a refrigerator and milk by boiling, in neither case is it safe to assume that the B. are killed. Their activities, ended for a time, may be resumed if the endospores have survived and are given suitable conditions. Some B. have been found to survive temps. required to liquefy hydrogen, while the sulphur B. flourish in hot springs at a temp. of 77° C.

**Effect of Light.**—As a rule, B. are destroyed in a short time by bright sunlight, and in any case develop more rapidly in the total absence of light. It has been found that the ultra-violet rays are most efficient in bactericidal action, and the electric arc, which is particularly rich in blue-violet and ultra-violet rays, has been used with some success in the treatment of lupus (tuberculosis of the skin) by the Finsen lamp.

The action of the rays is limited, however, to the superficial tissues of the body; B. which are more than a centimetre from the surface remain unaffected. Increasing use of ultra-violet rays is being made in bacterial infections of skin, nose, and throat, and investigations on their effect on other glandular structures are proceeding.

**Phosphorescence.**—On a dark night luminous gleams may be seen on the surface of the sea. These are usually caused by protozoa, such as *Noctiluca*, but may also be due to B. living on organisms on the surface of the water or on fish. Other forms of phosphorescent B. are found on dead fish, putrefying meat, decaying wood and vegetables. The exact cause of phosphorescence is unknown, but oxygen is essential for its appearance. If phosphorescent material be put in an atmosphere devoid of oxygen, the light vanishes. Phosphorescence seems therefore to be the direct or indirect result of an oxidation process.

**B. and Oxygen.**—Whereas most living organisms can exist for a very limited time without free oxygen some B. can live only in the absence of this gas. The bacilli causing tetanus (lockjaw), botulism (*g.v.*) ('meat-poisoning'), and gas gangrene, a disease prevalent among the troops in the First World War, all flourish in the absence of oxygen, and are consequently termed anaerobes. They are found in the active state only in situations where free oxygen is absent, *e.g.* deep wounds (lockjaw and gas gangrene) or tinned food (botulism), and are destroyed by hydrogen peroxide, which readily liberates oxygen. Other B., aerobes, are unable to live unless oxygen be present, and to this type belongs the bacillus (*B. subtilis*) which is found in an infusion of

hay. Many of the disease-producing B. are able to live equally well with or without oxygen.

**B. and Nitrogen.**—Among the most important phenomena associated with bacterial action is the way in which the nitrogen of the atmosphere is rendered available for the use of animals and plants. The higher plants are unable to use atmospheric nitrogen until it has first been converted into nitrates by the agency of bacteria. Leguminous plants, such as clover, peas, beans, etc., are so well served in this respect by particular B. that they actually leave the soil richer in nitrogen than when they were sown. The bacterium lives in the root of the plant, and its presence is indicated by the appearance of nodules or tubercles upon the roots. Plants which are affected by this bacterium grow more vigorously than plants grown in sterilised soil and free from nodules. Leguminous plants are therefore an important item in the rotation of crops, and artificial cultures of the B. concerned are prepared so that the plants may be as fully infected as possible and so be able to gain the greatest amount of nitrogen compounds. The bacterium is able to effect the conversion of the nitrogen into ammonium compounds, and then into nitrites and nitrates, which the plant may build into proteins. When the leguminous crops are cut, the roots decay and the nitrate and protein pass into the soil. Here another group of B. decompose the proteins, breaking them down into ammonium compounds and sometimes liberating free nitrogen. Some nitrifying B. live in the soil and can carry on the rebuilding process of ammonium compounds into nitrates available for the higher plants. Other nitrifying B. in the soil can build up the free nitrogen into the ammonium compounds. By the activities of these nitrifying and denitrifying B. the amount of nitrogen in the atmosphere is kept approximately constant, and depletion of nitrogen in any one form is prevented. The circulation is known as the nitrogen cycle.

**B. in Industry.**—Owing to their power of secreting ferments, B. are of great economic importance. The separation of the fibres of flax is effected by the decomposing action of the B. on the tissues connecting the fibres. Those of jute and hemp are separated in a similar way. B. also play a part in the curing of tobacco, the manuf. of vinegar from wine, the decomposition of dung for use as manure, leather tanning, and in the preparation of cream for butter. A bacterium known as *Clostridium* is now employed in the commercial production of acetone and butyl alcohol. Citric acid (for fruit drinks) is formed by a mould, alcohol and glycerine by yeast; both these organisms are closely related to B. Ginger beer is obtained by fermenting sugar with a yeast and a bacterium living in symbiosis. Sour milk may be produced by the action of many different bacilli; one of the best known of these is the lactic acid bacillus which during the

fermentation produces the acid from which it is named.

**B. and Disease.**—It had long been suspected that suppuration was due to the presence of organisms in wounds. For instance, Semmelweis of Vienna had shown the value of washing the hands in chloride of lime as a means of preventing the spread of puerperal fever. Joseph (afterwards Lord) Lister realised the importance of Pasteur's work on microbes as agents of fermentation, and showed (1867) that suppuration was likewise due to micro-organisms (in this case *B.*) and could be avoided by killing the germs with antiseptics such as carbolic acid. Finally, Robert Koch isolated and cultured the bacterium which causes anthrax; similar work on other diseases quickly followed. The more superficial diseases due to *B.* entering wounds are caused by small spherical *B.*, *Streptococcus pyogenes* and *Staphylococcus aureus*. They are constantly present where people are gathered together, especially in sick wards of hospitals and other places where there are persons affected with suppurative inflammation. Child-bed fever is caused by the same organisms, and undoubtedly many cases were occasioned by doctors and nurses carrying infection before the origin of the disease was known. The danger has been considerably lessened by the precautions taken to sterilise the hands and instruments used in child-birth and by the gradual improvement in the standard of efficiency and general intelligence of midwives.

*Streptococcus pyogenes* may produce degrees of irritation varying from local redness to erysipelas, while *Staphylococcus aureus* is associated chiefly with supuration. The *B.* infecting the deeper tissues of the wound are even more dangerous, and are those causing tetanus and gangrene. Their activities precede those of the pyogenic forms, and are stopped by the latter, which live partly on the products of decay of their predecessors.

The formation of pus when wounds are infected by these *B.* is due to the action of the *leucocytes*, or white corpuscles of the blood. They are single cells which in ordinary circumstances circulate with the blood-stream, but are capable of penetrating the walls of the blood-vessels into spaces in the tissues. The work they do is the engulfing and digesting of small particles of waste or foreign substances, and they thus serve as scavengers to the blood. When *B.* enter a wound the corpuscles make their way to the part affected. Here they proceed to ingest the *B.*, but if these multiply more rapidly than the leucocytes can ingest them, they may penetrate to other parts of the body and cause abscesses. If, however, the leucocytes can cope with the bacterial invasions, they help in forming new tissue to heal the wound, from which the dead corpuscles and *B.* are discharged as a yellowish-white mass known as pus.

Many of the pathogenic or disease-producing *B.* produce substances called

toxins in the tissues or in the blood, but in other cases, e.g. anthrax, a toxin is not formed, and the disease is caused merely by the presence of *B.* in large numbers. If these toxins circulate in the blood-stream a general effect known as toxæmia is caused. The *B.* themselves in this case are incapable of invading other tissues, and remain localised as in tetanus. In other cases the *B.* themselves, as well as their toxins, circulate and multiply in the blood so spreading infection throughout the body and producing the conditions of septicæmia (blood poisoning).

**Bacterial Diseases of Economic Importance.** **Cholera.**—For many years cholera has caused considerable mortality in tropical and sub-tropical countries where sanitation is bad, but the bacterium (*Vibrio cholerae*) was first isolated by Koch in 1883. It is often called the comma bacillus on account of its curved shape. It is usually taken into the body in contaminated water, and is able to move rapidly by vibrating a terminal flagellum. Although it may spread to other organs, it lives chiefly in the intestine. The onset of the disease is very rapid, and recovery, when it occurs, is equally rapid. While investigating the habits of the cholera bacillus a number of research workers have discovered contracting the disease. Its cure is still very uncertain, but cholera may be prevented, and even modified in intensity, by inoculation. This treatment was discovered and first used in India by Haffkine (1895), and it has subsequently been used during wars to protect troops from the disease.

**Influenza** is a term loosely applied to similar conditions of feverishness and catarrh due to very different causes. From time to time, however, there have been widespread and devastating epidemics of such conditions, and the epidemic disease is described as epidemic influenza, to distinguish it from isolated non-epidemic cases. Epidemic influenza spreads rapidly and dies out rapidly, but often spreads so widely that it is best described as pandemic. After the pandemic outbreak of 1889-92, 2 independent investigators, Pfeiffer and Kitasato, discovered what they believed to be the influenza bacillus in bronchial sputum, while a third observer, Canon, recorded it in the blood.

Further investigations carried on after the pandemic outbreak of 1918 revealed the presence of a filterable virus associated with the disease. This virus, discovered by Obitsky and Gates, 1921, has been confirmed by more recent workers. There is no satisfactory evidence that Pfeiffer's influenza bacillus is the cause of the disease, though frequently associated with it, and particularly with the catarrh which often accompanies influenza. Inoculation with vaccines of different germs has in many cases helped to prevent influenza or to reduce its intensity.

**Leprosy** is caused by a bacterium, *Bacillus lepræ*, the disease exists in 2 different forms, one attacking the skin and the other the nervous system. It is treated with chaulmoogra oil, though

not very successfully. Better results have recently been obtained with extracts containing the essential principle of the oil and also with sulphur drugs. Transmission is by actual contact with an infected individual, e.g. during sexual intercourse.

**Plague.**—Both bubonic and pneumonic forms are due to bacilli. The devastating Manchurian epidemic of 1911 was caused by direct infection through inhalation of the pneumonic bacilli. The bubonic bacillus is usually carried by rat fleas, which are also parasitic on man. Bubonic plague was the epidemic which decimated London in 1665.

**Relapsing fever** is very common in the Mediterranean basin, and is produced by *Spirochaeta obermeieri*, which is introduced into the body by lice or ticks. The disease also occurs in Asia and America, and receives its name because the fever reaches a maximum, after which the temperature becomes normal; a few days or a week later another rapid rise in temperature occurs, lasting a shorter time than the first attack, and disappearing rapidly. A third relapse may occur in a similar way. In Asia the death-rate from this disease is very high. The *Spirochaeta* is a slender, fine, spiral organism with tapering ends. It can move quickly and multiplies rapidly in the blood and in the organs for a few days. Then, owing to the action of the leucocytes, it disappears gradually. The few remaining organisms multiply, and so produce a second feverish attack. Inoculation with serum containing anti-toxin has proved beneficial.

**Syphilis.**—As far back as the fifteenth century there are records of a disease which, from the descriptions, doctors recognise as syphilis, and Paracelsus says that he treated it with mercury, with some success. The organism causing it was discovered in 1903 by Schaudinn and Hoffmann, and is regarded by some authorities as a Protozoan rather than a bacterium. Recent classifications, however, include it with the *Spirochaetae* and though its discoverers named it *S. pallida*, it is now called *Treponema pallidum*. It is able to remain quiescent for a time and then multiply more actively. Wassermann has devised a test that will show the presence of the disease even during the inactive period. Syphilis is highly infectious, and may eventually cause general paralysis and disintegration of the nervous system. It is now treated by organic arsenic preparations, salvarsan and neo-salvarsan; penicillin is also proving of great value.

**Tuberculosis** was shown by Koch in 1882 to be due to a non-motile bacillus which can survive for some weeks in drought, and in distilled water. Ejected in sputum, the bacilli may remain alive for 2 months or more. As the sputum dries up, particles bearing the organisms are blown about by the air, and may be inhaled or taken into the mouth on food. Fortunately the human body, when in good health, offers considerable resistance to the bacillus, but should this gain successful access to the tissues, the cells

will divide actively and form little swellings, or tubercles, round the infection. Sunlight destroys the B. in the superficial tissues, but cannot effect a cure of more deeply seated infections. A method of treatment which has met with some success is to deflate one lung if it be more badly infected than the other and so force it to rest for some time. Prolonged rest of an infected part enables the tissues in time to enclose the bacillus. Tuberculosis has decreased considerably since sanitation and conditions of housing and nutrition have improved, and better methods of treatment have been devised.

**Typhoid fever** is caused by motile bacilli which are considerably larger than those associated with tuberculosis. They enter the body with food or drink and multiply in the intestines, giving rise to toxins which, when carried to other parts of the body, produce the characteristic symptoms of the disease. The bacilli also invade other organs, and may be found in the spleen, liver, and even the lungs. The bacillus does not infect the lower animals, and the disease is communicated by the excreta of infected persons, so that the elimination of typhoid fever is intimately connected with the methods of sewage disposal. An important feature is that the bacilli sometimes become domesticated in the person who has recovered from the disease, and although no longer injurious to their host, are still capable of infecting other persons. In this way local epidemics of typhoid may be caused. Flies, too, may act as carriers, especially in countries where sanitation is bad. They may carry the bacilli on their bodies or in their digestive system. During feeding, the bacillus may be ejected on food when the fly secretes saliva.

During the South African war and the 2 World Wars, an anti-typhoid vaccine was injected to prevent the disease. Two other types of fever, paratyphoid fevers A and B, required separate specific injections, so that a triple vaccine (T.A.B.) is now used.

**Yellow Fever**, which causes considerable mortality in W. Africa, the W. Indies, and America, is caused by a filterable virus, which is transmitted through the agency of a certain mosquito, *Aedes aegypti*. Control of this mosquito has greatly reduced the incidence of the disease, and rendered possible the construction of the Panama canal.

**Other Bacterial Diseases.**—Diphtheria, tetanus, and pneumonia are well-known bacterial diseases. Others under investigation are meningitis, which occasionally becomes pandemic and which accompanies or follows pneumonia and may sometimes apparently be caused by the same bacterium. Of the 4 types of *Meningococcus* known, only 1 at present can be combated by an antitoxin serum. Encephalitis lethargica, sleepy sickness, is attributed to a filterable virus, and increasing numbers of cases are being recorded. The disease is nearly always fatal, and further research in its nature and cure is being made.

Filterable viruses are the cause of many other diseases, such as foot and mouth disease, distemper, psittacosis, infantile paralysis, smallpox, chicken-pox, typhus, and measles, as well as sev. diseases of plants.

**Immunity.**—Individuals and races vary in their susceptibility to bacterial disease, owing probably to some inherited constituents in the blood which render it favourable or otherwise to the development of B. Where individuals are found to be unaffected by injurious germs, they are said to enjoy natural or hereditary immunity. It is also possible to *acquire* immunity from a second attack of a disease by the changes induced in the body as a consequence of the first attack. When bacterial poisons are produced in the blood, the body-cells elaborate certain substances which unite with these toxins and render them harmless. A habit of forming such anti-toxins may be estab., with the result that on subsequent infection the body may already be in a condition to neutralise the effects of bacterial invasion. Thus people who recover from small-pox, measles, scarlet fever, and, to a certain extent, typhoid fever, are protected from further attacks for a considerable time. The anti-toxin is usually specific—that is, it is only effective against one particular disease—and considerable progress has been made in the artificial preparation of anti-toxins to aid the natural resisting power of the body in fighting certain diseases. For example, when a horse is inoculated with the poison produced by diphtheria bacilli, his cells are stimulated to bring forth the appropriate antitoxin. The treatment is continued with larger doses of the toxin as the horse increases his resisting power by production of antitoxin. He is then bled and the serum or clear fluid removed from the blood and used to inoculate diphtheria patients, thus enabling them to combat the disease with greater prospects of success. Similar treatment is applied in cases of tetanus and botulism. Since a serum already contains the antitoxins, the immunity given by it is described as passive. Active immunity is given by vaccines which stimulate the body to produce its own antitoxins. Vaccines are emulsions of living or dead germs, or toxoids, that is toxins which have been rendered innocuous by treatment with chemicals such as formaldehyde. The dead ones are usually obtained by heating the culture sufficiently; living ones are grown under such conditions that their vitality is impaired, so that when injected into the body they may readily be overcome by the leucocytes. The antitoxins formed usually remain in the body for some considerable time.

Both serums and vaccines may be used in prophylactic as well as in curative treatment. When the antitoxins disappear from the blood re-injection is necessary to preserve immunity. In vaccinations against smallpox (Jenner, 1798) the antitoxins probably persist throughout life, though not in sufficient

quantity to prevent an attack, but they probably never lose their power to modify it. For prevention, revaccination is necessary from time to time. The original anthrax vaccine (Pasteur 1880) was efficacious for only 1 year. Immunity for a longer period is given by the anti-anthrax sera now used. Jenner and Pasteur were the pioneers in vaccine treatment; epidemics and war conditions have stimulated research, with the result that various vaccines have been discovered and are prophylactic against influenza, typhoid and paratyphoid fevers, plague, dysentery, and cholera, while endeavours to use others as curatives are being made in the treatment of boils and of tuberculosis.

B. also stimulate the cells of the body to produce substances called *opsonins*, which render the B. more susceptible to attack by the leucocytes. Vaccines thus help in securing immunity by inducing the formation of opsonins.

**Bacteroids**, a name applied to the bacteria which form tubercles on the roots of leguminous plants, e.g. beans living in symbiotic relationship with the plant.

**Bactria**, part of anc. Persia, corresponding to modern Balkh in Afghanistan, bounded on the N. by Sogdiana, on the S. by Ariana. Its early hist. is mythological. Conquered by Cyrus c. 540 B.C., when it was made one of the satrapies of the Persian empire. It was conquered by Alexander, and became a prov. of the Macedonian empire under the rule of Seleucus. About 255 B.C. Diodotus, a satrap, asserted his independence and founded a Græco-Bactrian kingdom which extended as far as the Kabul and the Indus. During the sixth century A.D. it was subjugated by the Turks, and came under the rule of Islam. The cap., Bactra, or Zariaspa (modern Balkh), was the cradle of the Zoroastrian religion.

**Bactrian Coins** have been found in the 'topes' or burial-places to the N.E. of Kabul. The inscriptions are written in the B. alphabet, an offshoot of the Iranian alphabet. The same characters are found on rocks near Peshawar and Kathiawar, which had been inscribed in the third century by Asoka, a great Buddhist emperor, with sermons on his faith. Dr. Isaac Taylor discovered that the numerals in ordinary use are the actual symbols of Indo-B. letters found on the above-mentioned coins, e.g. 4 is the Indo-B. letter *ch*, *chatur* (cp. Lat. *quatuor*), 5 is *p*, *panchan* (cp. Gk. *πεντε*). This alphabet was probably introduced into India after the conquest of Darius, then brought to Spain by the Arabs in the twelfth century, whence it spread throughout Europe, and was adopted in place of the more clumsy Rom. figures.

**Bactris** (Gk. *βακτρον*, staff), a genus of Amer. palms of small size, with slender stems which are much used in making light but solid walking-sticks. *B. maraja* produces a small fruit of pleasant taste; *B. acanthocarpa*, a fibre used in making nets.

**Bactrites**, a genus of fossil Ammonitidae with a straight instead of a spiral shell. The genus is found in Silurian and Devonian strata.

**Baculites**, a genus of polythalamous cephalopods belonging to the family of fossil Ammonites. The shell is elongated, straight, and conical. The chambers are pierced by a marginal siphon. B. are found in Neocomian and Cretaceous formations. The best specimens are to be found in the baculite limestone of Normandy.

**Baeup**, a modern municipal bor. and mrkt. tn. of the Rossendale div. of E. Lancashire, England. Cotton-spinning and power-loom weaving are the chief industries. There are also dye-works, brass and iron foundries, coal-mines, and stone quarries in the dist. Pop. 20,600.

**Badagry**, a small state and tn. in Nigeria, Africa. It does a considerable trade in palm-oil.

**Badajoz**: 1. a frontier prov. of W. Spain, formed in 1833 from dists. taken from the prov. of Extremadura. Pop. 703,000; area 8451 sq. m. The country is watered by the R. Guadiana, and there are low ranges of hills. The climate varies between extremes of heat and cold. The rainfall is scanty. The prov. suffers through lack of water and means of communication. The Madrid-Lisbon railway passes through Villanueva de la Serena, Mérida, and Badajoz. Agriculture is neglected, but live-stock—acorn-fed swine, sheep, and goats—is reared. Lead and copper are found in small quantities. The important tns. are: B., the cap., 46,000; Almendralejo, 15,500; Don Benito, 23,000; Azuaga, 16,500; Villanueva de la Serena, 14,300; Mérida, 13,000. 2. The cap. of the Sp. prov. of the same name, situated on the l.b. of the Guadiana. The tn. is a natural fortress, built on a slight hill, which is crowned with the ruins of a Moorish castle. It is the Pax Augusta of the Romans. Later captured by the Moors, and in 1031 made the cap. of a small Moorish kingdom, when it was named Bax Augos, or Bathaljus. In 1168 held by the Portuguese, but retained its independence till 1229, when it was captured by Alfonso IX. As a key to Portugal it has been an important stronghold in times of war; 1660, besieged by the Portuguese; 1705, besieged by the allies in the war of the Sp. Succession. During the Peninsular war it was unsuccessfully attacked by the Fr. in 1808 and 1809, and finally surrendered to Marshal Soult, 1811. It was a scene of terrible slaughter when Wellington pillaged the city, 1812. The prin. industries are woollens, cotton, leather, pottery, soap, and there is a large trade in cattle. In the Sp. Civil war, 1936-39, the tn. was taken by storm, in Aug. 1936 by Franco's forces, after fierce hand-to-hand fighting. Pop. 46,000.

**Badakhshan**, a Moslem ter. N.E. of Afghanistan, part in the Tadzhikistan S.S.R., part in Afghanistan. It is 200 m. from E. to W. and 150 m. from N. to S. It is bounded on the S. by the

Hindu Kush Mts., and by the Amu Darya on the N. There are beautiful woods, fertile valleys, and much pasture land. Travellers speak with the highest praise of its orchards and flower gardens, its fruit and nightingales. It was visited by Marco Polo, 1272-73, and by Gen. Wood, 1837-38. The inhab. are Tajiks, an Aryan race, speaking Persian. They are Muslims. Cap. Farkabad. Iron, lapis-lazuli, and rubies are found. Many kinds of animals are to be found there, of which may be mentioned the yak, cattle, camels, wild sheep, wolves, foxes, jackals, bears, boars, and leopards. Originally belonged to the Gk. Bactria. From the thirteenth century onwards governed by the so-called descendants of Alexander the Great. In the eighteenth century it belonged to the empire of Nadir Shah. In the nineteenth century it was captured by the chiefs of the Kataghan Usbeqs of Kunduz, but in 1859, Mir-Jahanded Shah was reinstated, and agreed to pay tribute to Afghanistan. In 1873 England and Russia agreed upon a frontier between B. and Afghanistan. Pop. about 100,000.

**Badalocchio**, Sisto (c. 1581-c. 1650), surnamed Rosa, b. at Parma. An It. painter and engraver, pupil of Annibale Carracci, whom he and a co-disciple, Lanfranco, accompanied to Rome in 1606. His prin. engravings are the series known as Raphael's Bible, which were executed by him in conjunction with Lanfranco. On the death of Carracci, 1609, he went to Bologna, where he d. about 1650.

**Badalona**, a seaport in the prov. of Barcelona, Spain, 5 m. N. of Barcelona tn. The surrounding dist. is rich in fruit. The tn. has pop. 45,200, and ship-building, sugar-refineries, and glass-works.

**Bad Ems**, see Ems.

**Baden**, a state of the Ger. Reich (1945), lies between Alsace-Lorraine and Württemberg, and is separated from Switzerland by the Rhine. It is divided into 4 dists., Constance, Freiburg, Karlsruhe, and Mannheim. The country is mountainous. The Schwarzwald, or Black Forest, has a maximum altitude of 4903 ft. The Neckar highlands are lower; to the N. of them begins the Odenwald. To the S. are the wide plateaux of the Ger. Jura, drained by the Rhine and the Danube. The tribs. of the Rhine on the B. side are the Neckar, Murz, and Elz. The N.E. ters. are bounded by the Maine. There is one lake, Constance. The Rhine valley is very warm, and the soil rich and fertile. Fruit and vegetables of all kinds, grain, hemp, tobacco, and wines are produced. Cattle are reared, and the production of honey is important. Before the Second World War clocks and straw-plaiting were the chief industries, and the jewellery of Pforzheim was well known. Other manufs. were ribbons, cottons, brushes, paper, cigars, leather, rubber goods, machinery, mirrors, and chemicals. Limestone quarries are worked, and there are important clay and gravel pits. Coal, zinc, gypsum, salt, and soda are found. There are as many as 60 mineral springs. There is a Protestant univ. at Heidelberg and a Rom. Catholic

one at Freiburg. The early inhab. were Alemanni, who fell under the dominion of the Franks; 496, conquered by Clovis and christianised; 748, Pepin the Little abolished the dukedom of Alemanni. In the eleventh century Duke Berthold built the castle of Löhningen in Breisgau and started the house of Löhningen. His second son Hermann took the title of margrave, and became the ancestor of the still famous house of B. In 1715 Margrave Charles William built Karlsruhe. His grandson, Charles Frederick, succeeded in 1746; he favoured the policy of Napoleon, joined the confederation of the Rhine, and in consequence doubled his estates, and gained the title of elector and grand duke. In 1811 he was succeeded by his grandson, Louis Frederick, who seceded from the confederation of the Rhine and in 1815 joined the Ger. confederation. In 1830 Leopold succeeded his half-brother Ludwig, and his rule began with a contest between Liberals and reactionists, and unfortunately the influence of the Fr. revolution of 1830 led the democratic party to excesses. Matters were beginning to readjust themselves in 1846 through the dominance of Liberalism when the revolution of 1848 again aroused the opposing forces; and Hecker and Struve drove out the grand duke and estab. a republic. The latter was reinstated by the Prussians, July 1849. In 1866 B. joined Austria against Prussia, and, when peace was made in the following year, joined the N. Ger. confederation. 1870-71, fought in the Franco-Ger. war and became part of the restored Ger. empire. Although he was very popular, the grand duke was obliged to abdicate after the collapse of the Ger. empire. His successors in power thanked him publicly in the name of the people. The National Assembly of B. voted the new constitution on Mar. 21, 1919. Pop. 2,300,000. The chief tns. (with 1939 pop.) are Karlsruhe (cap.) 160,000; Mannheim, 278,000; Heidelberg, 82,000; but the first two were largely destroyed by bombing in the Second World War.

Baden, or Oberbaden, a watering-place in the Swiss canton of Aargau, on the l. b. of the Limmat. Famous for its sulphur baths (the Aque Helvetiae of the Romans), which reach a temp. of 117° F. From the fifteenth to the eighteenth century it was the seat of the Swiss diet. Pop. 9220, but visited yearly by 20,000 persons.

Baden-Baden, in the valley of the Oos, at the edge of the Black Forest, 8 m. from the Rhine. Before 1939 it was a famous resort of society people of all nationalities. The season lasted from May to Sept., and there was a brief winter season. The gaming tables were once famous, but were abolished in 1872. There are medicinal springs containing iron, magnesia, lime, and sulphur, and varying in temp. from 115° to 150° F. On the summit of the Schlossberg are the ruins of an old castle, destroyed by the Fr. in 1689. The 'new castle,' built 1479 and likewise destroyed in

1889, has been restored. There were some 50,000 to 70,000 visitors annually.

In the great devastation wrought in S.W. Germany by the Second World War B.-B. was 1 of the only 2 tns. (the other was Heidelberg) that survived, and both are nearly intact. During the war 42 of the many hotels of B.-B. were used as hospitals. At the end of the war the inhab. were still living comfortable and even prosperous lives, untouched by war.

The city was founded in the second century A.D. by Hadrian (Civitas Aurelia Aquensis). Rom. antiquities and the remains of a vapour bath and dungeons have been found. Pop. 30,000.

Baden-bei-Wien (B. near Vienna), a fashionable resort (pre-war) of Lower Austria, in the valley of the Wienerwald, 16½ m. by rail from Vienna. Known to the Romans as Aquæ Pannonicæ. Famous for sulphur springs, which were visited annually by over 50,000 persons. These springs vary in temp. from 79° to 104° F., and are recommended for gout, rheumatism, and all kinds of skin diseases. Pop. 22,200.

Badenoch, a dist. in the S.E. of Inverness-shire, Scotland, 45 m. in length and 19 m. in breadth. It is traversed by the Spey. Gneiss rock and granite are found.

Baden-Powell, Robert Stephenson Smyth, Baron Baden-Powell of Gilwell (1857-1941), Eng. soldier, b. in London, Feb. 22, 1857, son of the Rev. Prof. Baden-Powell of Oxford. He had for godfather Robert Stephenson, son of the 'father of railways'; and his mother was descended from Capt. John Smith (1579-1631) of Virginian fame. Until he was nearly 12, he lived an outdoor life; then he went to a preparatory school, and in 1871 (with his younger brother) to the Charterhouse. He joined the 13th Hussars in 1876, with which he served in India, Afghanistan, and S. Africa. Assistant military secretary in S. Africa, 1887-89, in Malta, 1890-3; commander of the native levies in Ashanti, 1893; served with distinction in the Matabele campaign, 1896-97; raised to the command of the 5th Dragoon Guards, 1895. In the Boer war he won great popularity by his brilliant defence of Mafeking; in spite of famine and sickness, with a force of 1200 men he held the tn. for 215 days, till its relief on May 18, 1900. In recognition of his ability he was raised to the rank of major-general; inspector-general of the S. African constabulary, 1900; inspector-general of the cavalry, 1903-7. Always interested in boys and their welfare, he had written some years prior to his retirement from the Army in 1910 his *Aids to Scouting*, which was eagerly read by large numbers of boys. The first experimental camp of Boy Scouts on Brownsea Is., Poole Harbour, in 1907, was so successful that B.-P. decided on more extensive operations, which spread rapidly in Britain and other countries and eventually formed the world-wide Boy Scout organisation which has played a great part in the physical and moral development of youth in all countries. A

parallel organisation among girls—the Girl Guides—was founded in 1910. In the Boy Scout movement he was Chief Scout. He was knighted in 1909 and raised to the peerage in 1929. Exhibited sculpture in the Royal Academy, 1907. Lt.-Gen. commanding Northumbrian Territorial Div., 1908; retired, 1910; O.M., 1937. Died on Jan. 8, at his home in Kenya. Among his publications are: *Pig-sticking or Hog-hunting*, 1889 (revised ed., 1924); *Vedette*, 1890; *Cavalry Instruction*, 1895; *The Matabele Campaign*, 1896; *Sport in War*, 1900; *Scouting for Boys*, 1908; *Quick Training for War*, 1914; *My Adventures as a Spy*, 1915; *Indian Memories*, 1915; *The Wolf-Cubs' Handbook*, 1916; *Girl Guiding*, 1917; *Aids to Scoutmastership*, 1920; *Old Wolf's Favourites*, 1921; *What Scouts can do*, 1921; *Rovering to Success*, 1922; *Life's Songs*, 1927; *Scouting and Youth Movements*, 1929; *Lessons from the Varsity of Life*, 1933; *Adventuring to Manhood*, 1937. See E. E. Reynolds, *Baden-Powell*, 1942.

**Badenweiler**, a vil. of Baden, Germany, noted for its alkaline thermal springs. It is near the Black Forest, and 3 m. from Mülheim. It contains remains of Rom. springs. There were 10,200 visitors in 1926. Pop. 1100.

**Badge**, a device used as a distinctive emblem of families, countries, etc. It is a simpler and more primitive cognisance than the crest or coat-of-arms, and is not subject to the laws of heraldry. Bs., like crests and coats-of-arms, are usually symbolic in character, but on the one hand are distinct from the coat-of-arms as not being supported on a shield, and on the other hand are distinct from the crest as not surmounting a wreath. Famous Bs. are the *steur-de-lis* of the Fr. kings, which can be traced back to the reign of Louis VII. (1137–80), the Tudor rose, the thistle of Scotland, the harp and trefoil of Ireland, and the cross of Christianity. Bs. are also worn as signs of office, or as a token of membership of some society, e.g. Solomon's seal and the mason's tools used as an emblem by Freemasons, and the primrose used as a badge by members of the Primrose League. Bs. are used by savage peoples to identify their arms and mark their belongings. From the B. the more elaborate devices of heraldry were evolved.

**Badger** (*Meles*), a genus of burrowing carnivores, constituting with the skunks the sub-family Mephitidae in the Mustelidae, or weasel and otter family. Its chief characteristics are short, strong legs, long and more or less plantigrade feet, and a pointed muzzle. It has perineal glands, containing a substance emitting a fetid odour, which is thought to be of use in sex-attraction. The common B. (*M. taxus* or *M. vulgaris*) is found in the hilly and woody dists. of Europe and Asia, but is now comparatively rare in Great Britain. Its colour is greyish-brown, with a white head marked with black lines running from the nose to the back of the ears. It is about 2 ft. 6 in. long, and stands 1 ft. high. It is an inoffensive, solitary animal, sleeping by day in subterranean burrows

which it digs for itself, and wandering by night in search of its food, which consists of roots, insects, frogs, and the larvae of wasps and bees. The Amer. B. (*Taxidea americana*) is more carnivorous, and eats small animals such as marmots. Bs. are conspicuous for their shrewdness, perseverance, and courage. The cruel practice of B.-baiting, or drawing the B., was prohibited in England in 1850. A B. was kept in a barrel and attacked by dogs until it at last gave way and was dragged out. Then its owner released it from the dogs and put it back into the barrel to recover itself. This performance was continued during the day, and formed an attraction at public-houses of a low order. The verb 'to badger,' meaning to assail repeatedly, to worry, is derived from this practice.

**Badger, George Percy** (1815–88), an Arabic scholar, born at Chelmsford, Essex. His early life was spent at Malta and Beirut. He worked in the editorial dept. of the Church Missionary Society at Malta, and in 1841 entered that society's institution at Islington and became a priest. On account of his knowledge of the E. languages, he was sent out as delegate to the E. churches (1842–44 and 1850); gov. chaplain at Bombay, 1845; chaplain at Aden, 1846. He joined a Persian expedition under Sir James Outram, 1854–57. He was created D.C.L. by the archbishop of Canterbury in 1873. Author of *The Nestorians and their Rituals*, 2 vols., 1852; *An English-Arabic Lexicon*, 1881.

**Badger-baiting**, see BADGER.

**Badger State**, see WISCONSIN.

**Badghiz** (home of the winds), dist. in the N.W. of Afghanistan, bounded by the Murghab and Harirud Rs.

**Badia-y-Lablick, Domingo** (1766–1818), Sp. traveller, b. at Barcelona. He studied Arabic language and life, and he disguised himself as a Mussulman, calling himself Ali-Bel. His disguise was perfect, and he was invited to the court of the sultan of Morocco, where he was held in high esteem. Two years later he went on a pilgrimage to Mecca, and there performed all the rites. At Paris he pub. an account of his adventures under the title of *Voyage d'Ali-Bel en Afrique et en Asie*.

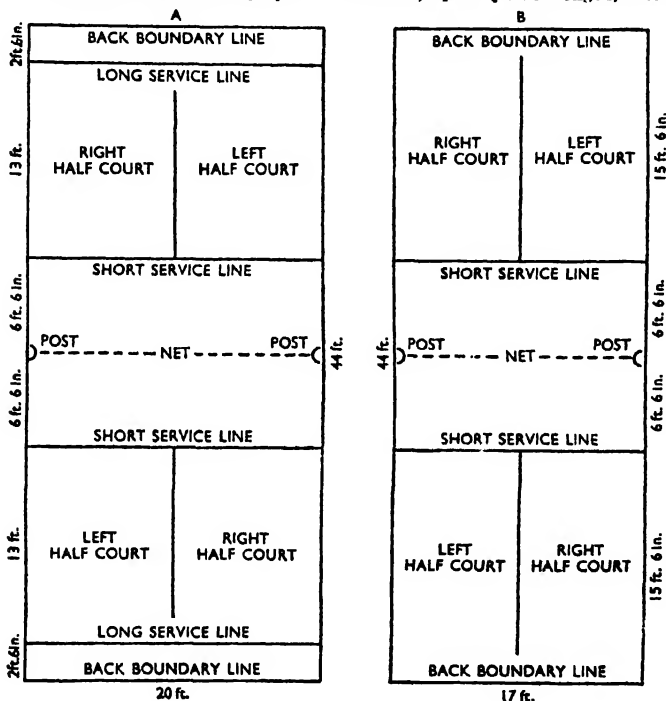

**Badistes** (Gk. *βαδιστῆς*, walker), genus of coleopterous insects of the family Carabidae. They inhabit marshy dists. of India and Madagascar; they are of small size and of a reddish, yellow, or black colour.

**Badius, Jodocus, or Jose** (1462–1535), Fr. printer, b. at Assche, near Brussels, and therefore sometimes called Ascensius. He studied at Ghent, Brussels, and Ferrara, and taught Gk. at Lyons and Paris. Treschel, a printer, engaged him as corrector of his press, and afterwards secured his services as a partner. In 1500 he settled in Paris and estab. a printing office that went by the name of Prelumi Ascensianum. He also wrote books, which include a life of Thomas à Kempis; *Sylva moralis contra vitia*; *Navicula stultarum mulierum*, a satire on the follies of women.

**Bad Lands**, great stretches of waste and rugged country in the W. of the U.S.A. Such regions are found in S. Dakota and Nebraska, on the White R., the Yellowstone, and the Little Missouri. Their chief interest is zoological, as they contain valuable fossil specimens.

**Badminton** is a game said to have been invented at B. House, the seat of the duke of Beaufort, in Gloucestershire. It is believed to have been much played in

The courts are laid out as shown in the diagrams and defined by white or black lines  $\frac{1}{4}$  in. in width. The net should be 5 ft. high in the centre, and 5 ft. 1 in. high at the posts. The court should be 44 ft. long; and 20 ft. wide for a double court and at least 17 ft. wide for a single court. The shuttles weigh from 75 to 85 grains, the average being about 79 or 80 grains. They consist of 16 goose feathers,  $2\frac{1}{2}$  to 2½ in. in length, inserted in

**BADMINTON COURTS**  
A, Doubles: B, Singles

India prior to its introduction into England in 1870. It is now very popular as an indoor game all over the Brit. Empire, and interest in it in the U.S.A. and on the continent of Europe has developed to such an extent that an International B. Federation was formed in 1934.

B. may be played both indoors and outdoors, but to-day it is played almost exclusively indoors on account of the effect of wind on the shuttlecocks which are used instead of balls. The game is really a development of the nursery game of battledore and shuttlecock, and is not unlike lawn tennis in character, except that all strokes must be taken on the volley, and the action is very much faster.

a cork base 1 to 1½ in. in diameter; the diameter of the circle formed by the feathers should be 2½ to 2¾ in. at the end of the feathers. The racket, though of no specified size or shape, usually weighs from 4 to 5½ oz., is 26 to 26½ in. in length, and similar to a tennis racket in shape.

The four-handed or double game is played with 2 players on each side. Choice of courts or service is decided by toss. The side winning a game shall always serv. first in the next game, but either of the winners may serve and either of the losers may receive the service first. The game consists of 15 aces. At 'thirteen all' the side reaching 13 first has the option of

'setting five,' and at 'fourteen all' of 'setting three,' or may elect to play only to 15. A match is the best of 3 games. The players change sides at the end of each game. If a third game is necessary the players also change when the leading side reaches 8.

It having been decided which side is to have the first service, the player in the right-hand half court on that side commences the game by serving to the player in the opposite right-hand half court (diagonally opposite). If the latter player returns the shuttle before it touches the floor, it is to be returned by one of the 'in' (or serving) side, and then returned by one of the 'out' (or receiving) side, and so on, until a fault is made or the shuttle ceases to be 'in play.' If a fault is made by the 'in' side, the server's hand is out, and as the side beginning a game has only one hand in its first innings, the player in the right-hand opposite half court now becomes the server; but if the service is not returned or the fault is made by the 'out' side, the 'in' side secures the ace. The 'in' side players then change from one half court to the other, the server now being in the left-hand half court and serving to the player in the opposite left-hand half court. So long as a side remains 'in,' service is delivered alternately from each half court into the half court diagonally opposite, the change being made by the 'in' side when, and only when, an ace is added to its score. The first service of a side in each innings shall be made from the right-hand half court. After the service is delivered the server and the player served to may take up any positions they choose on their own sides of the net, irrespective of boundary lines. A fault made by either player of the side which is 'in' puts the server out; if made by a player whose side is out it counts an ace to the 'in' side.

A fault consists in breaking one of the following rules: (a) If the service is overhand (i.e. above the level of the wrist). (b) If in serving the shuttle falls into the wrong half court. (c) If the server's feet are not in the half court from which service is at the time being in order, or if the feet of the receiver are not in the half court into which service is at the time being in order. (d) If either in service or play the shuttle falls outside the boundaries, or passes through or under the net. (e) If the shuttle while in play be struck before it crosses to the striker's side of the net. (f) If while the shuttle is in play a player touch the net or its supports with racket, person, or dress. (g) If the shuttle be hit twice in succession by the same player or by a player and his partner. (h) If a player wilfully obstructs his opponents.

Note 1.—A service is delivered as soon as the shuttle is struck by the server's racket. Note 2.—A foot on the line is out of court. Note 3.—A shuttle falling on any line is held to have fallen in the court. Note 4.—A shuttle is 'in play' from the time it is hit by the server's racket until it touches the ground at the end of the rally.

The two-handed or single game consists of one player on each side. The above rules hold good, except that (a) the players shall serve from and receive service in the right-hand courts only when the server's score is 0, or when he has scored an even number of aces in the game, the service being delivered from and received in the left-hand half court when the server has scored an odd number of aces; (b) both players shall change half courts after each ace has been scored, and consecutive services shall be received by the same player; (c) in ladies' singles the game shall consist of 11 aces, setting at 9 and 10 being permitted as at 13 and 14 in a game of 15 aces. Note. The courts for the single game are laid out as provided in Diagram B.

The 4 kinds of strokes used in the game are: (1) clears, (2) drop shots (both of a defensive character), (3) smashes, and (4) drives (both of an offensive character). A clear is a high deep stroke to the back of the court. A drop is a stroke that falls just over the net. A smash is a hard-hit overhead stroke. A drive is a hard flat stroke just clearing the net.

B. is one of the fastest of games, but owing to the light weight of the racket and shuttle players of all ages and both sexes meet on greater equality than in any other active game. The moderate cost is another item in its favour and accounts for thousands of devotees. The greatest living authority on the game is Sir G. A. Thomas, author of *The Art of Badminton*, 1923. See also J. H. C. Prior, *How to play Badminton*, 1922, and G. S. B. Mack, *Badminton*, 1925.

Badminton, or Great Badminton, vil. of Gloucestershire, England. (Pop. 383.) Here is the seat of the duke of Beaufort, B. House. It is an imposing mansion in the Palladian style of architecture, surrounded by fine grounds. B. House has given a name to the game described in the preceding article, to a kind of claret cup, and to the B. Library.

Badminton Club, London sporting club founded in 1876 and named after the estate of the duke of Beaufort. It is located in 55 Park Lane, London, W.; the entrance fee is 20 guineas, and the ann. subscription is 8 guineas.

Badminton Library, set of books on sport and pastimes embracing 26 subjects in 29 vols., projected by a member of Longmans' firm and ed. by the eighth duke of Beaufort and A. E. T. Watson between the years 1885 and 1902.

Badnara, tn. of Berar, in the dist. of Amrat, India. It contains a spinning and weaving mill, and is situated on the Great Indian Peninsula railway. Pop. 11,000.

Bados, tn. of Luzon, Philippine Is., in the prov. of Ilocos Norte and about 20 m. S.W. of Laong. Pop. 11,000.

Bad Nauheim, see NAUHEIM.

Badoglio, Pietro (b. 1871). It. general and duke of Addis Ababa, b. in Sicily. Served in Tripoli in the Italo-Turkish war. In the First World War he commanded a corps at Caporetto (q.v.) and was instrumental in reducing the

stronghold of Gorizia (q.v.). Signed the armistice on behalf of Italy. Chief of staff to Mussolini. Succeeded Gen. de Bono as commander-in-chief of the It. Army invading Abyssinia late in 1935, and brought the war to a successful conclusion in the spring of 1936. Created marshal in 1936. Was never an enthusiastic collaborator with the Fascists in the war against the W. Allies, and in Dec. 1940 he resigned the post of supreme commander of the It. armed forces, no details being given. On the fall of Mussolini, he became Prime Minister and announced his intention to summon the Senate and Chamber in order to set up a constitutional democratic form of gov., but it was not long before he resigned, it being evident to the Allies that his political views and past were incompatible with the kind of peace terms the Allies would impose on a nation which still retained Fascist elements.

**Badrinath**, peak in the Himalayas 23,210 ft. above sea-level. On one of its slopes stands the temple of Srinagar, whose thermal springs, supposed to be endowed with the power of cleansing away sin, are frequented by thousands of pilgrims.

**Baduria**, tn. of W. Bengal, India, on the Jamuna R., a branch of the delta of the Ganges. It has a considerable trade in molasses and sugar. Pop. 13,000.

**Bæda**, see **BEDE**.

**Baedeker, Friedrich** (1844-1925), Ger. publisher, son of Karl B. Became head of his father's business in 1878. Largely responsible for the accuracy in style of the famous B. guides, the scope of which he extended by embracing in them descriptions and information about countries outside Europe.

**Baedeker, Karl** (1801-59), Ger. publisher and writer, b. at Essen, where his father carried on business as a bookseller. He started a book shop at Coblenz in 1827, where he d. His fame chiefly remains on account of his excellent guides. The first guide he pub. was a handbook on the Rhine. B. guides came to be considered the most reliable series in the market. They have been trans. into many languages, the Eng. eds. appearing in 1861. The business was removed to Leipzig in 1872.

**Baekeland, Leo Hendrik** (b. 1863), Amer. chemist, b. Ghent, Belgium. Associate prof. of chem., univ. of Ghent, 1882-89, and later prof. of chem. and physics, Bruges. Went to U.S.A. 1889, and has since been engaged in chem. research. Collaborated in developing Townsend electrolytic cell for big power company, Niagara Falls. Member of Naval Consulting Board, 1915. Awarded Nichols medal of Amer. Chemical Society, 1909; John Scott medal, by Franklin Institute, 1910; Perkin medal for industrial chemical research, 1916; grand prize, Panama Pacific Exposition, 1915, and many others, in recognition of his work in organic chem., electrical insulation, and electrolysis. He was the inventor of the substance bakelite (q.v.), and holds many patents in the U.S.A. and in other countries on the

subjects of organic chem., electric insulation, synthetic resins, plastics, etc. He has contributed to numerous publications on photo-chem., electro-chem., patent reform, and also on social and philosophic subjects.

**Bael**, or **Bhel** (*Ægle marmelos*), Indian tree prized for its fruit, which is of the orange order. The ripe fruit is agreeable, and the unripe fruit may be dried and used as an astringent. Yellow dye is derived from the rind.

**Baena**, tn. in the prov. of Cordova, Spain, about 30 m. S.E. of Cordova. Near B. is the castle which belonged to Gonzalvo di Cordova, the famous captain. Pop. 18,000.

**Baer, Karl Ernst von** (1792-1876), Ger. zoologist, b. at Plep in Estonia. His studies and researches in embryology resulted in his discovery of the human ovum on which he wrote a treatise *Epistola de Ovi Mammalium et Hominis Genesi*. His next great work was his *History of the Evolution of Animals* (*Über die Entwicklungsgeschichte der Thiere*). This book explodes the animalculist theory and proves that the Graafian follicles in the ovary are not eggs, but the real ovum is the spherical vesicle contained by them. He then traced the development of the fertilised egg and the order of the appearance of the organs of the body. B. was appointed librarian of the Academy of Sciences at St. Petersburg in 1834. He made studies of the fish of the Baltic and Caspian seas. Towards the end of his life he pub. his autobiography. The work of B. influenced Huxley and Spencer, and he is regarded as the founder of comparative embryology.

**Baerle, Caspar van**, see **BARLEUS**.

**Bætica**, one of the three provs. into which Augustus divided Hispania, the Sp. peninsula. The other two were Tarraconensis and Lusitania. B., called after the R. Bætis (= Guadalquivir), was separated from Lusitania by the R. Anas (= Guadiana), and from Tarraconensis by an imaginary line drawn from the Anas to the promontory Charidemus in the Mediterranean. B. was made into a Rom. colony, with Corduba as its seat of gov. The Romans praised the climate and the fruit. The early trade of the country was chiefly in horses, asses, sheep, and wool.

**Bætis**, Rom. name of the modern Guadalquivir, riv. in Spain.

**Baeyer, Johann Friedrich Wilhelm Adolph von** (1835-1917), Ger. chemist, b. at Berlin, d. at Munich. Studied chem. and physics under Bunsen and Kekulé; prof. of chem. at Strasburg (1872). From 1875 he lectured at the univ. of Munich. He was awarded the Davy medal by the Royal Society in 1881, and the Nobel prize in 1905. He was a leading authority on the chem. of indigo and made valuable contributions to the knowledge of theoretical chem. He was the inventor of aspirin (q.v.).

**Baeza**, a tn. in the prov. of Jaen, Spain, 9 m. from a station of its own name which is 160 m. S. of Madrid. It is the *Beaia* of the Romans, and was once a flourishing

Moorish city. There is a cathedral and the remains of the univ. (1533). The city was sacked by the Castilians, 1228. Pop. 15,000.

**Ba-Fan**, see FANS.

**Baffa**, see BAFFO.

**Baffin**, William (1584-1622), Eng. explorer and navigator. Accompanied James Hall on a voyage in search of the N.W. passage, when for the first recorded time long, at sea was determined by astronomical observation. In 1613 he commanded a whaling fleet to Greenland, and in 1615 he was the pilot of the *Discovery* under the leadership of Robert Bylot, when the bay now called by his name was discovered. He was killed at Kismis, near Ormuz, in 1622, whilst engaged in an Eng. expedition acting in conjunction with the Persians to drive the Portuguese out of the Persian Gulf.

**Baffin Bay**, sea passage extending between N. America and Greenland. It communicates with the Atlantic Ocean by Davis Strait and with the Arctic Ocean by Smith Sound and Lancaster Sound. It is about 800 m. long, with a mean breadth of 280 m. It was called after William B. (q.v.). The whale and seal fisheries are important. Other animals are the walrus, ducks, sea-birds, and on the coast-land bears and foxes.

**Baffin Land**, is. lying W. of Greenland, called after B. (q.v.). The coast is mountainous and inhabited by Eskimos. Area 231,000 sq. m.

**Baffo**, or **Baffa** (a Venetian corruption of Paphos), seaport in the W. of Cyprus, an important tn. in Rom. times (Acts xiii). See PAPHOS.

**Bafulabe**, Fr. military station in the Sudan, on the R. Senegal, W. Africa. It has a large fort, and is of commercial importance. Pop. 1700.

**Bagagem**, tn. in the prov. of Minas Geraes, Brazil, on the R. B. Diamonds are to be found in the surrounding dist. Pop. 10,000.

**Bagalkot**, tn. in the Bijapur dist. of Bombay, India, on the R. Ghatprabha, trib. of the Kistna. Its manufs. are silk and cotton. Pop. 19,000.

**Bagamoyo**, a seaport and trading settlement in Tanganyika Ter., lying in lat. 6° 26' S. and long. 38° 55' E., 36 m. to the N.W. of Dar-es-Salaam. Prior to the construction of the railways B. was the chief starting point for the interior, whence Lake Tanganyika could be reached in two months by caravan. It was once the centre of the Arab slave trade, since the suppression of which and the construction of railways it has been eclipsed by Dar-es-Salaam. Burton, Speke, Stanley, and other explorers took it as their starting point for the interior. It is the seat of a Rom. Catholic bishopric and there is a Fr. mission. The Rom. Catholic father of the Holy Ghost landed at B. in 1867 and built a hospital and school N. of the present tn. These buildings were destroyed by a cyclone, but rebuilt, and it was at the door of the old church, which still exists, that a party of footsore native carriers in 1873 deposited the remains of Livingstone at the feet of

the father-in-charge. The surrounding dist., also called B., has a mixed pop., both Africans and Asiatics, who are mainly engaged in growing tropical fruit. There is a considerable trade in copra; other products are rice, gum copal, maize, mahogany, sweet potatoes, cotton, and ground nuts. Until 1914 B. was in Ger. E. Africa. It was occupied by the Brit. on Aug. 15, 1916. Pop. 5200.

**Bagaria**, see BAGHERIA.

**Bagasse** (Fr.), sugar trash; crushed stalks of the cane after the juice has been expressed. Used as fuel.

**Bagatelle** (Fr., from It. *bagatella*, a trifle): 1. Thing of no importance. 2. Game, possibly derived from billiards. It is played with balls on a board or table varying in size from 6 ft. by 1½ ft. to 10 ft. by 3 ft. The bed, either slate or wood, is covered with green cloth, and has at its upper end nine numbered cups to receive the balls. Round the sides there is an india-rubber cushion. The balls used are 9 in number, generally 1 black, 4 red, and 4 white; the black ball is placed on a spot about 9 in. in front of the first hole, and at the player's end, about 18 in. up, there is a balk line, with another spot behind it from which to start play. These measurements vary with the size of the table. The balls are struck with a cue, as in billiards, and the object is to drive them into the holes, the black ball counting double. There are sev. forms of B., the most usual being: (a) Ordinary B. In this game each player sends all the balls up; no score is allowed until the black ball has been touched. (b) Fr. game. Two players, or 4 in partnerships, take part, playing alternately. The rules as to scoring vary slightly in different forms of this game. (c) Cannon game. This more resembles billiards, and may be played with either cups or pockets, or both. (d) Mississippi. Played with a bridge having 9 or more numbered arches (according to the size of the table), through which the balls must be played off the cushion.

**Bagdad**, or **Baghdad**, vilayet of Iraq. Area 42,643 sq. m. The vilayet includes the divs. B., Diyala, Kut, Diwaniyah, Hillah, Kerbala, and Dulmal. The country is watered by the Euphrates and the Tigris, but the soil is, in general, poor and unproductive. There is a mixed pop. of Turks, Arabs, Jews, Armenians, and Kurds, the number of which is estimated at 1,736,000. Cap. Bagdad.

**Bagdad**, or **Baghdad**, Moslem city in Iraq, once renowned for its learning and culture, for its flourishing trade, for its minarets and gardens, and for the E. splendour of the life within its palaces. The modern tn. is situated on the E. bank of the Tigris, and is connected with the old tn. on the opposite bank by 2 pontoon bridges, 650 ft. and 715 ft. long respectively. It is enclosed by an old brick wall, half in ruins, and a dry moat. The tn. is a place of pilgrimage. Many nationalities congregate within its walls, Arabs, Turks, Jews, Persians, Armenians, Hindus, Syrians, and Kurds. The religious bodies that predominate are Muslims, Shi'ites, and Sunnites. Trade

from Persia passes through B. to Iraq, and is carried by boat and caravan. Leather, silk, cotton, and woollen goods are manufactured in the tn.; the prin. exports are leather articles, woollens, oriental fabrics, fruits, dates, skins, feathers, and horses.

During 762-66 the tn. was built by Abu Jaffar 'al-Mansur, the Victorious, second caliph of the Abbasid dynasty, who founded it on the ruins of Seleucia and Ctesiphon. It was enlarged by Harun-al-Rashid, and for 500 years remained the cap. of the Abbasids, during which time it reached the height of its prosperity and harboured a million and a half people within its walls. It was called Dar-es-Salam, the dwelling of peace. In 1258 Hulaqu subjugated the Abbasids; in 1393 the city was captured by Timur. During the sixteenth century Shah Ismail, the founder of the Persian Saffi dynasty, took possession for a time, but the Turks and Persians repeatedly struggled for the city. In 1638 it was annexed to the Ottoman empire by Amurath. In 1755 a Brit. trade agency was estab. there as a branch of the E. India Company's Basra office. Another W. innovation was the opening of a telegraph at B. in 1861. B. became the centre of European politics towards the end of the nineteenth century in connection with the proposed railway, by which it was intended to link up the Persian Gulf with Turkey. The railway had been started in 1871 from Stamboul. It reached Angora in 1887 and Konia in 1896. See BAGDAD RAILWAY. In 1910 a Ger. wireless station was opened. Col. (later F.M.) von der Goltz, and later, Gen. Liman von Sanders Pasha arrived to reorganise the army on Ger. lines. The effect of these innovations was to introduce anti-Brit. influence into the city's life.

On the outbreak of the First World War B. became the base of operations against the Brit. forces at Basra and Shaiba. To improve the communications with various parts of the city a main street was made in 1915. In the summer of 1916 F.M. von der Goltz, who was in command of the Turkish-Ger. forces in this area, d. of typhus in B. in the house in which the Brit. Gen. Maude d. later. On Mar. 4, 1917, Maude advanced against the Turks and on the 10th the Brit. occupied B.

The little that survives of the anct. city of the Abbasids is in the shape of a few mosques and shrines. These include the arch and gateway of the Mirjanīyeh mosque and medreseh (fourteenth-century) which stands near Exchange Square; the very worn minaret el Ghazi in the poor quarter of the *suk* (bazaar) el Ghazi and conjectured by L'Estrange and others to have adjoined the great palace of the Abbasids: the medreseh el Mustansiriyeh, situated on the Tigris, which was once a flourishing school but is now used as a customs house, and the Aquliyah mosque (thirteenth century); the tomb of Zobeide (q.r.) in the 'city of the dead' or the anct. burial ground, where also are various other shrines such as that of the mystic Sheikh Jonayd (tenth century)—

a shrine visited by childless women; the tomb of the Jewish rabbi Joshua, and the much-venerated tomb of the mystic Mansur al Hallaj. A very notable Sunni shrine is that of Abd-el-Kader, the so-called Moslem St. Francis, which stands near the Sporting Club, and contains the tomb of el-Kader in a silver grille. Europeans do not usually enter this shrine or mosque. The shrine of Abu Hanifa, the jurist, is also a noted Sunni relic. The medieval walls of B. on the S. and E. can be traced, though very little has survived the destruction by Midhat Pasha, governor of B. in 1860, who replaced the walls with fortifications but left the gates Bab el Wastani and Bab el Tilism (Talisman). The latter was blown up by the Turks in the First World War. The citadel, which rises up from the N. quarter of B., is encircled by a high wall. A fine view is to be had from its watch tower. Here, too, is the ruined palace of the Caliph Mamun, son of Harun-al-Rashid, with Cufic inscriptions on its arches, doorways, and lintels. It is considered one of the best examples of Abbasid architecture in the city. Another fine relic is the Khan el Ortman which stands at the entrance to the *suks*. These *suks* or bazaars are large and comparatively modern. In the narrow streets may be seen silversmiths, vendors of slippers, beggars in sackcloth; Kurdish porters, and walling minstrels; and crouching scribes who send messages for the illiterate—all vividly recalling the B. of fairy tales, notwithstanding the offends in European dress, cinemas, electric light, telephones, and motor cars. A well-known bazaar is the so-called 'Thieves' Bazaar,' a shabby place where many a fine bargain has been picked up. Mention should be made of the museum, which is located in the gov. Press Buildings in Bridge Street. It contains many recent finds from the excavations of Ur (q.r.), Kish (q.r.), and other anct. sites of Mesopotamia (see also BELI, GERTRUDE). Pop. 170,000. Consult E. S. Stevens, *By Tigris and Euphrates*, 1923; Sir Mark Sykes, *The Caliphs' Last Heritage*, 1915; R. Coke, *Bagdad*, 1927; Freya Stark, *Bagdad Sketches*, 1932.

By 1918 B. had become a modern city, with railways, postal service, telephones, electric light, riv. bridges, new thoroughfares, and a proper currency. A univ. was opened in 1926. B. is a stage in the air routes to India and Australia. B.'s modern airport is used by Brit. Overseas Airways, K.L.M., Air France, and the Iranian State air-lines, and is busy with transcontinental traffic. Pop. (estimated) 340,000.

**Bagdad Railway.** The B. R. or Euphrates Valley railway scheme to construct a line from Konia, in Asia Minor, to B. and Basra, and thence on to the Persian Gulf, was brought forward for discussion in 1899. The Russian and Brit. proposals were rejected, and by a provisional convention preference was given to a Ger. company in 1903. England had a particular interest in the scheme, as the line would provide a short route to

India; accordingly in 1903 the Brit. Gov. objected to the railway being placed under Ger. control, and discussion followed with a view to putting the line under international control. By the agreement of 1903 it was decided the Ger. group should control 40 per cent of the capital, the Fr., through the Imperial Ottoman Bank, 30 per cent, the Austrian, It., Swiss, and Turkish 20 per cent, and the Anatolian railway 10 per cent. In 1904, 124 m. of the line were completed, from Konia, through Ereğli, to Bugurlu. In 1908 sanction was given to extend the line eastwards from Bugurlu across the Taurus to Adana. One of the causes of the First World War was Germany's ambitious policy in the S.E. of Europe, and Prince von Bülow before 1914 openly advocated the exploitation of the B. R. as opening 'to Ger. influence and enterprise a field of activity between the Mediterranean Sea and the Persian Gulf, on the Rs. Euphrates and Tigris' (consult his *Imperial Germany*). In the early years of the twentieth century England, with the view of conciliating Germany, began negotiations for the settlement of matters of common interest, and among these was the question of the B. R., in the exploitation of which considerable concessions were made to Germany. But Germany's plan was to project the route between Vienna and Salonika into a grand Pan-Ger. route from Berlin to B., and thereby not only destroy the value of the Suez canal, but lead up gradually to the domination of Egypt, Syria, Persia, and India. But with the conquest of Mesopotamia by the troops of Gen. Maude in the First World War, Ger. ambitions in B. were shattered. The line crosses the Euphrates at Jerablus and is open to goods and passenger traffic as far as Tell-Kochak on the Syro-Iraq border. Railheads at Tell-Kochak and Kirkuk are connected by motor service. In 1936 the Iraq Gov. decided to connect B. with Mosul and Tell-Kochak by a line prolonging the existing B.-Baiji line and this work was completed in 1939, thereby making it possible to reach B. by through train from Europe. The total length of the line now open is 966 m. (standard gauge). Consult E. M. Farie, *Turkey, the Great Powers and the Baghdad Railway*, 1923.

**Bagé**, tn. in the state of Rio Grande do Sul, Brazil, on the R. Negro, a trib. of the Paraguay. Pop. 22,000.

**Bagshot, Walter** (1826-77), Eng. journalist, economist, and political writer. He was the son of a banker at Langport, Somerset, took his degree at London Univ., and was called to the Bar in 1852, but gave up law for literature, while retaining for many years a close connection with banking, which gave practical value to his economic studies. In 1858 he married Miss Wilson, daughter of the first editor of the *Economist*. Being in touch with many leaders in political and commercial life, including Gladstone, Sir George Cornewall Lewis, Robert Lowe, and prominent city bankers and merchants, he was able to write on

politics and finance as one acquainted with their innermost working. His books, *The English Constitution* and *Lombard Street*, show not only observation, but deep research into the principles of gov. and finance. The theory of a practical banking reserve is developed by him with great clearness. His *Physics and Politics*, pub. in 1869, was successful abroad as well as at home. He was for many years editor of the *Economist*, and also helped to edit the *National Review*. His *Literary Studies* and *Economic Studies* were pub. after his death. Life by Mrs. Russell Barrington, 1914, and by Wm. Irvine, 1939.

Paul Popper

BAGGARA

**Bagelen**, prov. of Jiva, bound by the Indian Ocean on the S.; pop. 1,500,000.

**Bagenalstown**, see BAGNALSTOWN.

**Bagford, John** (1650-1716), collector of rare books, both on his own account and on commission for booksellers and amateurs. He was b. in St. Anne's par., Blackfriars, and began life as a shoemaker. He formed 2 collections, known as the Bagford Ballads, in which many old Eng. ditties have been rescued from oblivion, and the Bagford Fragments, an 'enormous collection of title-pages and other fragments in 64 vols. folio,' which earned him the description of 'shoemaker and biblioclast.' Apparently they were intended as materials for a hist. of printing. They came to the Brit. Museum among the Harleian MSS. The Bagford Ballads were pub. in 1878 (ed. by Ebbsworth). He was one of the revivers of the Society of Antiquaries. See Arundell Esdaile, *The British Museum Library*, 1946.

**Baggaras**, a Moslem race of Bedouins who dwell in the valley of the Nile. Their chief occupation is cattle-rearing.

**Baggesen, Jens Immanuel** (1764-1826), Dan. poet, b. at Korsør, d. at Hamburg. While a student at Copenhagen, he pub. *Comic Tales*, 1785. In 1811 he was appointed prof. of the Dan. language and

literature at Kiel, but after 3 years returned to Copenhagen. He quarrelled with Öhlenschläger, and in 1820 left Denmark and never returned. He wrote much in Ger. as well as in Dan. His works include *Labyrinth*, 1792, and *Parthenais oder die Alpenreise*, an epic idyll, 1804. B. excelled in serio-comic satire.

**Baghal**, or **Baghul**, native state in the Punjab, not far from Simla. Area 124 sq. m.; pop. 25,000.

**Baghdad**, see BAGDAD.

**Baghelkhand**, or **Bagelkhand**, dist. in Central India, including sev. native states, of which the chief is Rewa; others are Nagode, Maihar, Sohawal, and Kothli. Until 1871 they were included in the Bundelkhand Agency. Area 14,000 sq. m.; pop. 1,550,000.

**Bagheria**, or **Bagaria**, tn. at the E. end of the bay of Palermo, Sicily, once the residence of the chief Palermitan families. Pop. 20,300.

**Bagimond's Roll**, originally named from Bolamund or Bagimund of Vicci, or Vitia, who was sent by Pope Gregory X. to assess the church revenues of Scotland for the purpose of raising a crusading fund, A.D. 1274. The Scottish clergy wished to retain the old assessment as a basis, but Bagimund, under Pope Gregory's instructions, insisted on a new return, founded on the real value at the time of inquiry, 1275. Part of this return has been preserved, and is known as B. R.

**Bagirmi**, or **Baghermi**, Moslem kingdom of W. Africa, lying S.E. of Lake Chad. It is a Fr. possession. The people are of negroid race and number about 150,000. The cap. is Massenia.

**Bagnacavallo**, tn. in Emilia, Italy, 11 m. W. of Ravenna. Formerly called Tiberiacum. Pop. 16,000.

**Bagnacavallo**, **Bartolommeo**, see RAMENGHI.

**Baginastown**, or **Bagenastown**, tn. in co. Clare, Ire, 10 m. due S. of Carlow on the Great S. railway. Pop. 2000.

**Baginara**, tn. in the prov. of Reggio di Calabria, Italy, nearly opposite Messina. Founded by Robert Guiscard, duke of Apulia and Calabria, in the eleventh century; suffered from earthquake in 1783; and again in Dec. 1908 when almost every house was laid in ruins. Pop. 11,000.

**Bagneres-de-Bigorre**, watering-place in the dept. of Hautes-Pyrénées, France, situated on the Adour. The Romans called it Aque Bigerrionum or Vicus Aquensis. There are springs of sulphate of lime, and the tn. is visited by invalids and tourists. Pop. 9000.

**Bagneres-de-Luchon**, watering-place in the dept. of Haute-Garonne, France, near the Sp. frontier. There are 48 mineral springs. The Romans knew it as Balnearia Lixovienses. Pop. 600.

**Bagnes**, name given to the Fr. convict prisons which were substituted for the galleys in 1748. As the latter had naturally been stationed at the naval ports and arsenals, the B. were estab. in the same localities, and remained until the middle of the nineteenth century. About

1852, the last 3, at Brest, Rochefort, and Toulon, were closed, and convicts were deported to Cayenne. The miseries of prisoners in the B., like those of galley-slaves, were extreme, and have often been described by writers of fiction. Jean Valjean, in Hugo's *Les Misérables*, was a sufferer there. The word *bagnes* is derived from the It. *bagno* (q.v.).

**Bagnes**, **Val de**, valley in the W. of Switzerland, canton Valais. Its lower end opens into the valley of the Rhône, near Martigny. A catastrophe occurred here in 1818; the R. Dranse was for two months blocked by falls from the Getroz glacier; when the ice-dam burst the valley was devastated by a flood 90 ft. deep.

**Bagni di Lucca**, commune of Lucca, Italy, noted for its warm springs, temp. 98° to 130°, which give off CO<sub>2</sub> and contain lime, magnesium and sodium. These springs are in the Val di Lima, and are mentioned as far back as 1284, but were first made widely known by the physician Fallopius in 1569. Chief resorts, Ponte Seraglio (pop. 1300) and Bagno Caldo (pop. 12,000).

**Bagni di San Giuliano**, tn. of Tuscany, 5 m. from Pisa, Italy. It has mineral springs and manufs. soap and candles. Pop. 21,000.

**Bagno**, It. word signifying a bath, also used in other senses. The B. at Galata (Constantinople) was a place of detention for slaves; in London (seventeenth and eighteenth centuries) a B. was a house of ill fame.

**Bagno a Ripoli**, tn. 5 m. from Florence, Italy, with warm baths. Pop. 17,870.

**Bagno in Romagno**, watering-place 35 m. E. by N. of Florence, Italy, on the R. Savio, near its source; has hot springs (about 110°) containing natron. Pop. 10,645.

**Bagnoles**, vil. in Orne, France, 13 m. S.E. of Domfront. It has hot and cold mineral springs. Pop. 370.

**Bagnolet**, suburb of Paris. It has gypsum quarries and fisheries. Pop. 27,000.

**Bagnols-les-Bains**, vil. in the dept. of Lozère, France, 8 m. from Mende. It has mineral springs. Pop. 400.

**Bagnols-sur-Cèze**, tn. in the dept. of Gard, France, on the R. Cèze, a trib. of the Rhône, 13 m. N.E. of Uzès. The silk-mills, built on the banks of the Cèze, are the chief industrial features of the tn. Fine wines are also produced. It is supposed that the Romans had baths here, as some ant. monuments have been found from time to time. Pop. 4000.

**Bagnone**, tn. in the prov. of Massa e Carrara, Italy, at the foot of Mt. Orsajo. Pop. 1000.

**Bagos** (Persian *Bagoi*), a name often given to eunuchs. The best known of these (called by Josephus *Bagoses*) was vizier of Artaxerxes III., and practically master of the Persian kingdom. He murdered 2 kings in succession, and tried to poison Darius III., but the king was warned, and made *Bagoses* drink the poison himself. See Josephus, *Ant.* xi. 7; Diodorus, xvi. 50, 51, xvii. 5.

**Bagot**, Sir Charles (1781-1843), Eng.

diplomatist and 34th governor-general of Canada, b. Sept. 23. He negotiated the Rush-B. treaty (1817), which is still in force, between Great Britain and the U.S.A., limiting the armaments of each country on the Great Lakes. Was ambas. at St. Petersburg in 1825 when the agreement with Russia was signed defining the N.W. boundary of Brit. N. America. Though his tenure as governor-general of Canada (1842-43) was brief, his administration prepared Canada for the self-gov. which she received not long afterwards from Lord Elgin (1847-1854). This B. achieved by forming a dual administration of both sections of the country, Upper and Lower Canada, a div. which was retained until the Confederation (1867) and which, in his time, corresponded to the Reformers (Liberals) of both sections. It was on B.'s initiative that the geographical survey of Canada was begun in 1843. He d. at Kingston, Ontario, May 19, 1843.

**Bagpipe**, musical instrument, being a development from the primitive reed-pipe. Its characteristics are the bag for the wind-supply and the peculiar 'drone' which furnishes the ground bass. The former may be inflated either by a blow-pipe, as in the Highland B., or by a bellows worked by the arm, as in the musette (Fr.) and the Northumbrian pipes. Every instrument has these prin. parts: (1) the wind-bag; (2) the chanter, or melody-pipe, which always has a double reed, and lateral holes for fingering; (3) the drones, each of which has one invariable sound, but can be tuned by means of sliding joints. The compass of the chanter ranges from 9 notes in the Highland pipes to 12 in the Irish and 15 in the Northumbrian. The musette, as improved by Hotteterre in the seventeenth century, had a wider range, and was popular in France, being played at court and in the opera; Lully wrote music for it. In a Highland pipe the notes of the chanter do not correspond with those of the diatonic scale, and are not strictly in tune. The same note cannot easily be repeated without the interpolation of grace notes, known as warblers; these, introduced to overcome a difficulty, form one of the chief beauties in pipe-music, 'brilliance in his warblers' being one of the distinguishing marks of a skillful player. 'The key of the Highland pipe is that of A major with a natural G and with the C and the F something between the sharp and the natural—a unique scale, but one with some similarities to certain scales of the Near E.' (Scholes). (The normal key of the Northumbrian pipe is G and it has usually 4 drones tuned to G and D.) The B. is suitable both for solemn funeral marches and laments and for the liveliest dances. As for its antiquity, a drone-pipe with reed complete has been found in an Egyptian mummy-case. The Romans had pipes and introduced them into S. Britain, whence they spread into Caledonia and Ireland, and survived there after they d. out in England. They are mentioned in Ireland as early as (possibly) the fifth century. The modern Irish

'union-pipe,' like the musette, is blown by bellows worked by the arm. The old Ger. *Dudelsack* was made in sev. forms varying in their range: one is said to have had separate chanters, on which a two-part melody could be played.

BAGPIPES

Above, Scottish; Below, Northumbrian

**Bagradas**, anct. name of the Medjerdah or Mejirda, African riv., which rises in the Great Atlas and flows in a N.E. direction into the gulf of Tunis. Its length is nearly 300 m.

**Bagratidæ**, dynasty of monarchs in Armenian hist., founded in A.D. 885 by Aschod I., who claimed to be descended from King David of Israel. Armenia was then a trib. kingdom under the caliphate. (See ARMENIA.) The rule of the B. was for 2 centuries prosperous. On the dissolution of the kingdom as a result of civil war in the eleventh century, the B. retired to Georgia (conquered by them c. A.D. 1000), and ruled there until 1800, when Georgia was annexed by Russia.

**Bagration**, Peter Ivanovitch, Prince (1765-1812), Russian general, descended from the Georgian branch of the Bagratidæ. In 1805, covering the retreat of Kutusov's army before superior numbers under Murat, he showed skill and courage, losing half his men, but saving the main army. He served in sev. lost battles, Austerlitz, 1805, Eylau, and Friedland, 1807, but always won personal distinction. When Napoleon invaded Russia in 1812 B. commanded the 2nd Russian Army. As before he was unsuccessful, being beaten by Davout at Moghilev, July 23, but succeeded in rejoining the main force under Barclay. On Sept. 7 he was mortally wounded at Borodino.

**Bagshaw**, Edward (d. 1662), Eng-royalist and author. Graduated at

Brasenose College, Oxford, 1608, and entered the Middle Temple. In 1639 he was elected Lent reader, and delivered lectures in favour of Puritan principles. He was elected M.P. for Southwark, 1640, and sat in the Parliament convened by Charles I. at Oxford, 1644. He was imprisoned by the parliamentarians, 1644-46, during which time he wrote *De Monarchia Absoluta*.

**Bagshot Sand, or Beds**, part of the Upper Eocene strata found round London, especially in Surrey, and stretching as far S. as the Isle of Wight. The heaths of Surrey and Hampshire belong to this formation.

**Bagster, Samuel** (1772-1851), Eng. publisher. He began as a bookseller in the Strand in 1794, and in 1816 removed to Paternoster Row. The firm which he founded is famous for its eds. of polygot Bibles, including the *Biblia Sacra Polyglotta Bagsteriana*, 1817-28, for an octoglot ed. of the Church of England liturgy, 1821, and for *The English Hexapla*, 1827.

**Baguette, or Baguet** (Fr. a small wand), architectural term for a small convex moulding of semicircular section of the same type as the astragal. When ornamented it is called a chaplet.

**Baguio**, summer cap. of the Philippine Is., and cap. of Benguet prov. It is picturesquely situated in the mt. dist., Luzon, a dist. which includes what were formerly known as the B. and Suyoc mineral dists. The tn. is built at a high elevation and in the vicinity of splendid pine-woods. It became a chartered city over 20 years ago, and has been much modernised. Pop. 8400.

**Bagul**, see BAGHAL.

**Bahai', or Babi**, the believers of a modern Persian sect founded by Mirza Ali Mohammed, who was b. at Shiraz in 1819, and who adopted the title Babi-Din, Gate (or Intermediary) of the Faithful, and shortened into Báb. The religion of the B. is eclectic, containing germs of what is best in Mohammedanism, Judaism, Christianity, and Parseism. The Báb made several pilgrimages to Mecca and other sacred places, and was believed by many to be the Mahdi promised by Mohammed to save the nations. Both orthodox Muslims and State conspired to overthrow him, and as a result he spent the greater portion of his teaching life in prison, his followers zealously carrying on his work of proselytisation. The Báb was finally shot before the eyes of the people in front of the citadel at Tabriz (c. 1850). The body was recovered by his followers and enshrined at Jehram, and subsequently conveyed to Acre in Syria, where it now rests. After the death of the Báb his adherents were deported to Constantinople and Cyprus, but in spite of oppression Bábism still prevails in many parts of Asia and America. The number of martyrs to this creed is more than 20,000. Two-thirds of the Bahais are drawn from the Mohammedan world and the remainder from the other great world faiths. The leadership of this sect was assumed in the sixties by Baha'u'llah, a

Persian nobleman, who in prison at Acre wrote many books. Chief among these are *Hidden Words* and the *Kitáb-i-Aqdas*. He d. in 1892, and was succeeded in the leadership by Abdul Baha, who settled in Syria, on the side of Mt. Carmel above Haifa; and who, on charges of disaffection to the Gov., was imprisoned in 1907. He obtained his liberty at the revolution of 1908. During the First World War, he and his following were under strict supervision by the Turks at Haifa, where he was energetic in averting famine. Haifa was taken by the Brit., Sept. 23, 1918; and Abdul Baha was knighted Apr. 27, 1920. He d. Nov. 28, 1921, aged 77. His will appointed, as guardian of the cause, his grandson Shogi Effendi, then studying at Balliol College, Oxford. The religion of the Bs. is based on a belief in successive revelations of the Deity. These revelations are progressive and not final. Thus Mohammed was a great prophet and his doctrines were a revelation of God, but Mohammed is not the final prophet, and the Koran is not infallible. The morality of Bábism is high. Man is regarded as an emanation from God, and as such is immortal in spirit, but the tenets of Bábism vary on the subject of individual immortality. Sometimes the individual soul co-exists with the Deity for all time; sometimes the soul is re-absorbed into the divine essence whence it emanated. At death the body and soul are reunited. Polygamy and concubinage are forbidden, and woman is held in high esteem as being the spiritual equal of man. While the religious value of a life of consistent self-abasement and asceticism is denied, a life of licence is not advocated. It is attempted rather to realise the Gk. ideal of keeping the 'golden mean' in regard to earthly pleasures. Bábism is thus founded on the intellect rather than on the emotions, and is a philosophy of life rather than a religion of the soul. The modern Bahais are said to number about 700,000 in Persia, with small groups in European countries and, especially, the U.S.A.

**Bahamas**, formerly called *Lucayos*, group of is. forming a div. of the Brit. W. Indies. They are situated in the Atlantic Ocean, lying to the S.E. of Florida, and N. of Cuba and Haiti. There are about 3000 is. in all, including coral reefs, but only 20 are inhabited. The prin. is. are New Providence, Great Bahama, Abaco, Cat Is., Harbour Is., Andros Is., Acklin Is., Watling Is., Eleuthera, and Mangana. The total area is 4375½ sq. m. The is. are long and narrow in shape, and of a low surface, the highest altitude being not more than 230 ft. The climate is so temperate that the is. have come to be a popular winter resort for Amers. The colony is sub-tropical, and both N. and tropical plants exist, the pine-tree and the palm growing side by side. There are large areas of pine-lands on sev. of the is., the land of which being unsuitable for agriculture is commonly known as 'pine-barren'. The pine makes good timber, however, the forests being let on licence to

private firms on a royalty basis. Among other woods of commercial value, there is a small export trade in gualacum (*Ilignum vite*) and cascarrilla bark. Agriculture is not extensive as it suffers from the rocky state of the land and the poverty of the soil. Certain products thrive, with the aid of fertilisers, and chief among these are sisal hemp and tomatoes. Export of sisal has diminished, but the trade in tomatoes increased. Other products are citrus fruits, maize, cotton, sugar-cane, and such fruits as tamarind, grapes, olives, and oranges. The sponge industry was one of the main activities of the is., but declined greatly during and after the Second World War. The shallow waters around Andros, Abaco, Exuma, Acklin, and Eleuthera are the chief areas for sponging. Salt is raked from the ponds in Rum Cay, Rugged Is., and Inagua, mostly for local consumption. Pineapple canning is being developed. Fishing round the is. is excellent, and a factory has been started in Bimini for the canning of crayfish, which find a market in Florida. Turtle-shell is also exported, and there is a trade in conch-shells, from the lip of which cameos are made. The constitution consists of a governor, assisted by executive and legislative councils of 9 members each, and a representative assembly of 29. All white men over 21 who have resided 12 months in the is. have a vote. Among the religious sects of the community Methodists and Baptists predominate. The Church of England was disestablished in 1869. The cap. of the B. is Nassau, New Providence. The pop. of the is. was estimated in 1942 at 73,000, of which 85 per cent are coloured races.

**History.** The B. were visited by Columbus in 1492, and he stated that the group of is. was called Lucayos, implying that the name was Indian or Arawak. While it has never been finally settled whether Watling Is. was his first landfall in Amer. waters, most authorities are agreed that it was on this is.—which Columbus named San Salvador and the Indians Guanahani—that he landed. Others think the honour belongs to Cat Is., and yet others say Great Turk Is. But Watling Is. won the official sanction of the Bahamian Legislature in 1926. A few years after Columbus landed, all the Carib inhab. were transported to work in the mines of Cuba. It does not appear that the Spaniards had any settlements on any of the is. at any time. Early in the seventeenth century the is. were well known to the settlers in Bermuda. They were included in the royal grant to Sir Robert Heath, the attorney-general of England, of Oct. 30, 1629. The Company of Eleutherian Adventurers was formed in London under the aegis of William Sayle, a former governor of Bermuda, for the purpose of making a systematic colonisation of the is., but Charles II., ignoring previous titles, granted the land, in 1670, to 6 of the lords proprietors of Carolina. Before this grant, however, the inhab. had organised a settlement and instituted a form of gov. which included an elective

House of Assembly, and had selected Capt. John Wentworth as their governor (1671). He was confirmed in office by the lords proprietors. Thirteen proprietary governors were appointed between 1671 and 1715. The settlement on New Providence was sacked by the Spaniards on sev. occasions between 1680 and 1684. In 1684 most of the inhab. were driven away, and it was not until 1688 that the settlement was re-formed under Thomas Bridges with settlers from Jamaica. Bridges became governor, and the settlement developed promisingly until, in 1703, it was practically annihilated by the Fr. and Spaniards. A year or two later, however, the dispersed inhab. returned to New Providence, and another proprietary governor was appointed in 1707. But the is. then became a regular resort of pirates, and this determined the Crown to place it under a civil and military gov. Since 1717 there has been a regular succession of royal governors. The is. were surrendered to a fleet of the Amer. rebels in 1776, and again to the Spaniards in 1781, but they had been retaken by the Brit. before the end of the war, and the peace of Versailles (1783) confirmed the Brit. in possession. In 1787 the lords proprietors surrendered all their proprietary rights to the king for £12,000, which was provided by Parliament. During the Amer. Civil war Nassau became the headquarters of the blockade runners and enjoyed a rapid prosperity, the total value of trade, which was under £500,000 in value in 1860, rising to £10,000,000 in the 4 years 1860-64. A rather similar state of affairs prevailed 60 years later when the B. carried on a roaring trade during the period of prohibition in U.S.A. That the revenue of the B. was converted in 1920 from a threatened deficit to a surplus was entirely due to wine and spirit duties. A wireless service was installed in 1923. The B. have been visited by severe hurricanes, notably in 1866, 1883, and 1929, when it was recorded that the hurricane reached a velocity of 90 m.p.h.

See Mary Moseley, *The Bahamas Handbook*, 1926; Stephen McKenna, *By Intervention of Providence*, 1923; MacLachlan Bell, *Bahamas: Isles of June*, 1934.

**Bahar** (dist. and tn.), see BIHAR.

**Bahawalpur**, a Moslem state in the Punjab State Agency, India, which acceded to Pakistan in Oct. 1947. The dist. round the Ghara and the Indus is fertile in grain and fruit, but most of the state is desert. Big game, such as tigers and boars, abounds. Area 17,285 sq. m.; pop. 985,000. The Camel Corps of the state afforded valuable help during the First World War. The cap. has the same name as the state. The manuf. of turbans, silk girdles, scarves, chintzes, flowered cottons, etc., is the chief industry. Pop. 18,500.

**Bahia**, E. prov. of Brazil, bounded on the N. by the states of Pernambuco and Piauh, on the S. by Minas Geraes, on the W. by Goyaz, and on the E. by the Atlantic Ocean. The land by the coast is fertile and woody, the climate being hot and moist. The interior is rocky, with

plateaux rising in terraces, and the climate is dry. The country is watered by the R. São Francisco and its tribs. The prin. products of the soil are sugar, tobacco, coffee, cotton, Indian corn, rice, and cocoa. Area 184,649 sq. m.; pop. 3,900,000.

**Bahia**, or **São Salvador da Bahia**, cap. of the state of B.; see of an archbishop, and a univ. tn. It is a hot, unhealthy port lying 800 m. to the N. of Rio, and is the oldest tn. in Brazil. As well as the univ., there is a medical college, a normal school, a museum, and a public library. Seaport, with a flourishing shipping trade. There is a fine harbour, protected by the natural breakwater formed between the is. Itaparica and the mainland. Industries are boots and shoes, hats, and cotton materials, which are exported with agric. produce, hides, and lute-wares. The city was visited by Amerigo Vespucci, 1603, and again by Correa, a Portuguese, in 1610. It was colonised in 1536, but abandoned, and refounded, 1549. Until 1763 it was the seat of the viceroys of Brazil, and is one of the intellectual and economic centres of the country. Pop. 376,000.

**Bahia Blanca**, a city 3 m. up the R. Naposta, prov. of Buenos Aires, Argentina. Its port on B. Bay has been handicapped by a shallow channel, but dredging operations are expected to maintain a minimum draught of 30 ft. B. B. was founded in 1823; its prosperity dates from 1885, when the first railway was opened. It exports wheat, wool, and hides. The naval station of Puerto Militar lies below the city. Pop. 80,000.

**Bahia de Todos los Santos**, see ALL SAINTS' BAY.

**Bahia Honda**, a seaport in the N.W. of Cuba, about 60 m. from Havana; trades in sugar and mining products. Its harbour is one of the deepest and most spacious in Cuba. Pop. 1400.

**Bahinda Steppe**, see BAYIDA.

**Bahlingen**, a tn. and dist. in the S.W. of Württemberg, in the region of the Black Forest. The dist. is noted for its sulphur baths. Pop. 4000.

**Bahr**, an Arabic term meaning sea, or large riv., as B.-el-Ablad and B.-el-Azrek, the White and Blue Nile. A dry riv.-bed is sometimes called B.

**Bahr, Hermann** (1862-1934), Austrian author and dramatist, b. at Linz. His plays include *The Concert* (1911), *The Fool and the Wise Man* (1912), and *Fashions in Love* (1929). During the First World War he wrote some admirable notes and critical essays on current literature, art, and music, in which he sought to justify the new movement in art by assuming the historical continuity of all artistic movements. In 1925 he wrote on expressionism (q.v.). Was also for a short time manager of Reinhardt's Deutsches Theater and then of the Vienna Burg Theater.

**Bahraich**, tn. of Oudh, India, on the R. Sarju; has a sacred shrine much visited by pilgrims. Pop. 27,500. The dist. of B. has an area of 2600 sq. m. Pop. 1,100,000.

**Bahram**, or **Varahran**, the name of 5 Persian monarchs of the Sassanid dynasty.

They were B. I. (A.D. 273-77), who is chiefly recorded as having ordered the execution of Mani, founder of the Manichæans (q.v.); B. II. (276-93), son of the foregoing, and B. III. (293), son of B. II., who reigned for only a few months. Nothing is recorded of their reigns beyond the partition of Armenia with Rome; B. IV. (389-420), son of Sapor III., and B. V. (420-39), son of Yazdegerd I. B. V. was a notorious persecutor of the Christians, a policy which involved him in war with Rome, at the end of which mutual toleration was extended to both Christians and Zoroastrians.

**Bahramabad**, tn. in the prov. of Kerman, Persia, noted for its fields of poppies; pop. 13,000.

**Bahramghat**, vil. in the United Provs., India, on the R. Gogra, which is here crossed by a bridge of boats. It trades in timber and furniture. Pop. 3000.

**Bahr-bela-Ma** (the waterless sea), valley in the Libyan desert, 50 m. W. of Cairo. It is 9 m. long, very deep, and dry and barren, but has been a watercourse. Some assert, on the strength of a passage in Herodotus, that a branch of the Nile once flowed here.

**Bahrain**, independent Arab state under Brit. protection. It was in treaty relations with the Gov. of India for over a century. It is a group of is. half-way up the Persian Gulf near the Arab coast (Al Hasa) and having a combined area of 213 sq. m. and a Moslem pop. of about 150,000. Manama, or B., is the largest is. of the group, lies at the mouth of B. Bay; it is 27 m. long by 10 m. wide, flat on the whole, but having in its centre a rocky hill, Jebel Dukhan. The chief tn. of B. is Manama (pop. 25,000). The next largest are Muharraq or Moharek, situated on a neighbouring smaller is., and Sirah. The whole group is fertile, producing rice, herbs, and fruit; fish are abundant, and the pearl fisheries of B. have been famous for centuries. The Bahrain (Brit.) Petroleum Co. have held a concession from the Gov. since 1930 and have an oil refinery at Manama. The yield is over 1,000,000 tons (metric) a year. The ruler is a sheikh, to whom is attached a Brit. adviser and a Brit. political agent. On B. itself there is an immense collection of huge sepulchral tumuli, enclosing tombs of limestone; some of these have been examined, and in them were found Phœnician relics. Religion, Muslim. The pop. of the is., numbering altogether 120,000, are a mixed race, mainly Persian and Arab.

**Bahrain Bay**, on the E. coast of Arabia, noted for its pearl fisheries.

**Bahr-el-Ablad**, or **White Nile**, riv. in Africa, rises from Lake Victoria, and is one of the chief branches of the main Nile. It is the Upper Nile, joined at Khartoum by the Bahr-el-Azrek. It flows through about 2300 m. of flat marshy country, and is fed by the trib. riv. Sobat on the E. and Bahr-el-Ghazal on the W.

**Bahr-el-Azrek**, or **Blue Nile**, rises near Lake Dembea, or Tsana, in Abyssinia, at an elevation of 7000 ft. It unites with the White Nile, Bahr-el-Ablad, at Khartoum. Its length is about

900 m., 500 of which are navigable at high water. In Abyssinia it is called Abai.

**Bahr-el-Ghazal:** 1. Trib. of the White Nile (or Bahr-el-Abiad), which it joins at Sobat. This riv. is responsible for the floating vegetation, called the *sudd* of the Nile. It gives its name to the dist. of Sudan through which it flows, formerly leased to the Congo Free State, but, since 1906, under the Brit. sphere of influence. 2. Riv. of the Sudan, which rises in the E. end of Lake Chad, and flows in a N.E. direction, until it spreads into the lagoon of the Bodele.

**Bai, Bais, or Baj, Tommaso** (1650-1714), It. tenor singer and composer, b. at Crevalcuore, near Bologna. He became master of the chapel of the Vatican. He is celebrated on account of his beautiful *Miserere*.

**Baise**, modern **Baja**, tn. in Campania, Italy, with grand ruins, 10 m. W. of Naples. In Rom. times it was a watering-place, with warm sulphur springs; it had baths and palatial residences, and was a favourite resort of the Cæsars. Nero built a villa here, and Hadrian d. in one that had belonged to Julius Cæsar. B. had from early times a reputation for immorality; Cicero once apologised for defending a man who had lived there. The most notable relics of antiquity are the temples of Venus, Mercury, and Diana.

**Baiburt**, tn. of Turkish Armenia, on the Tchoruk-See, about 65 m. W.N.W. of Erzerum. It has an imposing castle, and there are manufs. of carpets and cutlery. Pop. 10,000.

**Baidyabati**, tn. of Bengal, India, on the Hugli, opposite Barrackpur, and 15 m. N. of Calcutta. There are manufs. of jute and hemp rope. Pop. 30,500.

**Baie de Chaleurs**, see CHALEURS BAY.

**Baisersbronn**, tn. of Württemberg, Germany, in the region of the Black Forest, dist. Freudenstadt; pop. 6700.

**Bail (or Bayl), Jean Antoine de** (1532-1592), Fr. poet, b. at Venice. He studied with Ronsard under Daurat. He was a member of the Pleiade, and attempted to write Fr. verses with cadence and accent of Gk. and Lat. poetry. These verses he set to music, and in 1561 pub. *Twelve Hymns or Spiritual Songs*, and in 1578 sev. books of songs. He founded an 'Académie de poésie et de musique,' 1567-84, in Paris, which was the first of its kind. His poems were pub. in 2 vols., *Œuvres en rime* and *Les Jeux*, in 1573 at Paris, and consist of serious, comic, and sacred pieces. His *Poésies choisies* have been ed. by Beq de Fouquières, 1874, and his *Mimes, enseignements et proverbes* by Blanchemain, 1880. See M. Augé-Chibquet, *La Vie, les idées et l'œuvre de Jean Antoine de Bail* (Paris), 1909.

**Baikal**, fresh-water lake in Asia, situated in S. Siberia on the border of Irkutsk and Transbaikalia, called *Dai-lai-nor*, the holy sea, by the Mongols, and said to be the deepest lake in the world. It is 390 m. in length, and 20-50 m. in breadth, the area being 12,500 sq. m. The greatest depth is 4500 ft., the lake being 1513 ft. above sea-level. Its chief tribs. are the Selenga and Barguzin, and its outlet the

Lower Angara, a trib. of the Yenisei. There are many is., the largest of which is Olkhon. The lake is surrounded by the Baikalean Mts., a spur of the Altai. The fishing industry is important, the prin. fish caught being sturgeon and salmon. A fish called the golomyinka (q.r.) was once found in great quantities, but is now rare. Seals, too, are caught.

**Baikalean Mountains**, name sometimes applied to all the ranges which enclose Lake Baikal, Siberia, but properly belonging only to those on the W. side. They are about 500 m. in length, and average 3000 ft. in height. Granite and marble abound, and there is much iron ore; lapis lazuli is also found. The people of this region are the Buriats.

**Baikie, William Balfour** (1824-64), Scottish explorer and naturalist, was b. at Kirkwall, Orkney. Obtaining his M.D. degree at Edinburgh in 1848, he became a surgeon in the R.N., and in 1854 was appointed surgeon and naturalist to the *Pleiad* expedition, sent to explore the Niger. The chief officer dying, B. took command, and succeeded in going 250 m. further than any previous explorer, without losing another man. In 1857 he again went out in the *Pleiad*; the ship was wrecked on the Niger, and his party returned home, but he remained in the country, and single-handed laid the foundation of our present colony of Nigeria. He d. at Sierra Leone.

**Bail**. In law, when a person is charged with an offence he may be released on security given by one or more persons, usually householders, that he will appear at the trial. He is then on B., or in the B., i.e. custody, of the person giving B. or security. If he fails to appear, the B. is forfeited. If the sureties think the bailed person will not appear, they may surrender him, and be relieved of liability. A justice may now dispense with sureties and release the accused on his own recognisances if he be of opinion that justice will not be defeated. In felonies other than treason and in certain misdemeanours, the magistrate may in his discretion admit to B., but is not obliged to do so. In all other misdemeanours and in all summary cases the magistrate is bound to admit to B. In practice, however, B. is never allowed in a charge of murder, or in misdemeanours where the costs of prosecution may be allowed out of the co. rate. In treason it can only be granted by a judge of the king's bench div. or a secretary of state. The police may grant B. if, on arrest without warrant, the prisoner cannot be tried within 24 hours. In Scotland (Bail Act, 1888), murder and treason are the only non-bailable offences. The high court and the lord advocate can admit to B. In U.S. law B. is used to indicate either the bond which is furnished or the persons who bind themselves under penalty to see that the accused appears. Some state constitutions contain specific provisions as to the cases in which B. may be allowed; in other cases, the courts have a general discretion, subject to statutory regulations. Release on B. is the rule,

except in cases of murder or other capital charges. The amount of B. or penalty in the bond is fixed by the judge or court. The prohibition in the U.S. constitution of excessive B. is interpreted as a direction that B. shall not be refused in a proper case.

**Baildon**, tn. in the W. Riding of Yorkshire, England, 4 m. N. of Bradford, in the Otley div. There are sev. industries, including worsted mills and chemical works. Pop. 6500.

**Bailén**, or **Baylen**, tn. in the S. of Spain, 21 m. N. of Jaen. Here Dupont with 17,000 Fr. soldiers had to surrender to the Spaniards in 1808. B. is a mining centre. Pop. 8800.

**Bailey**, a prison or any modern structure situated where courts existed, as the Old B. in London. It formerly meant the courts of a castle formed by the spaces between the outward wall and the keep. In olden times it also meant the work, fenced with palisades or masonry, covering the outskirts of a tn. by way of defence.

**Bailey Bridge**, see under BRIDGING, MILITARY.

**Bailey**, **Liberty Hyde** (b. 1858), Amer. botanist and lecturer, b. at S. Haven, Michigan; educated at Michigan Agric. College and Wiscotau Univ.; dean of the College of Agriculture at Cornell Univ. Prof. of agriculture at Michigan Agric. College 1885-88; later, fellow of the American Academy of Arts and Sciences and the Botanic Society of America, and president of both in 1926. Among his works are *The Survival of the Unlike* (1896); *The Cyclopædia of Amer. Horticulture* (1900-2); *Botany* (1901); *Lessons with Plants* (1904); *The State and the Farmer* (1908); *The Apple Tree* (1922).

**Bailey**, **Nathan**, or **Nathaniel** (d. 1742), Eng. lexicographer and philologist. His *Dictionary Britannicum*, pub. in 1721, an improvement on previous lexicons, went through many eds., and was taken by Dr. Johnson as the basis of his dictionary 20 years later.

**Bailey**, **Old**, see OLD BAILEY.

**Bailey**, **Philip James** (1816-1902), was b. and educated at Nottingham. In 1835 he went to London, and entered Lincoln's Inn, but did not take up the legal profession in earnest. In 1839 he pub. his poem *Festus*, a version of the Faust legend. He continued to revise and enlarge it in successive eds. for the next 50 years. It has fallen into unmerited neglect, being a work of great imaginative power and lofty moral tone, but has faults in execution. B.'s later poems, *The Angel World* (1850), *The Mystic* (1855), *The Universal Hymn* (1867) were, comparatively, failures.

**Bailey**, **Samuel** (1791-1870), was the son of a Sheffield merchant, and for some years took an active share in business. A Liberal in politics, he twice contested Sheffield as a 'philosophic Radical,' but without success. His first book, *Essays on the Formation and Publication of Opinions*, appeared in 1821, and a sequel, *On the Pursuit of Truth*, in 1829. Other works were *Theory of Reasoning*, 1851, and

*Letters on the Philosophy of the Human Mind*, 1856-63. He also wrote sev. books on economics, the chief one being a *Critical Dissertation on Value*, 1825—an attack on Ricardo's theories.

**Baille**, or **Baillie**, superior officer or magistrate of a municipal corporation in Scotland. Bs. are invested with certain judicial and administrative authority within the city or burgh for which Bs. are appointed. They are assisted by a paid legal adviser called an assessor. The office is in some respects analogous to that of alderman in England, but unlike an Eng. alderman he retains his seat for the ward to which he has been appointed after selection as a B. The term of office is 3 years.

**Bailiff**, Eng. legal term signifying a superior steward or agent. The keeper of Dover Castle is called the king's B. The name now generally applies to the sheriff's officers. Such are either Bs. of hundreds or special Bs. The former are appointed by the sheriff to collect fines, summon juries, execute writs and processes, and attend at assizes and quarter sessions. The latter are men selected for their skill in hunting and apprehending persons liable to arrest. Being compelled to enter into an obligation for the due performance of their duties, they are sometimes called bound-bailiffs, or vulgarly bum-bailiffs. Special Bs. are appointed at the request of a suitor, and the sheriff is not responsible for what is done by them. A B. cannot lawfully act until he has received a warrant under the hand and seal of the sheriff. Bs. of a franchise or liberty are appointed by the lord of a liberty. They exercise jurisdiction in certain parts of the country, e.g. the liberty of Gower in Gloucestershire. The high B. of a co. court appoints sub-bailiffs who execute process of the court. His office is for life.

**Bailiwick**, legal term used with regard to the co. or dist. with which the sheriff, as bailiff of the king, has jurisdiction.

**Baillet**, **Adrien** (1649-1708), Fr. critic, b. at Neuville-au-Hez, near Beauvais in Picardy. He studied in a neighbouring convent, where he was introduced to the bishop of Beauvais, who assisted him in obtaining a good education. In 1676 he received holy orders and was given the vicarage of Lardières; in 1680 he became librarian to M. de Lamignon, the advocate-general. His *Les Enfants devenus célèbres par leurs études et par leurs écrits* (Paris, 2 vols., 1688) won popularity. His prin. work is *Jugements des savants sur les principaux ouvrages des auteurs* (1685-86). He also wrote a life of Descartes (1691) and various historical works.

**Bailleul**, tn. in arron. of Hazebrouck, dept. of Le Nord, France. It is an old Flemish tn. and has a museum of paintings and antiquities. The church of St. Vaast and the *hôtel de ville* date from the fourteenth and fifteenth centuries respectively. The chief industry is hand-made lace, and it has manufs. of woollens, lincens, cheese, earthenware, and soap. B. was in Ger. occupation and devastated during the First World War.

Retaken by the Brit. Aug. 30, 1818. Pop. 8000.

**Bailliage**, Fr. term, equivalent to bailiwick. The word was used in Switzerland of portions of ter. over which a bailiff was appointed. This officer was in charge of the police and had jurisdiction in certain civil and criminal cases. In case of maladministration, appeal lay to the cantons to which the B. belonged.

**Baillie, Lady Grizel (née Hume)** (1665-1746), Scottish poet, *b.* at Rebraes Castle, Berwickshire, daughter of the patriot, Sir Patrick Hume, first earl of Marchmont. In 1684 she supplied her father with food during his concealment in the vault of Polwarth church, and accompanied him when he fled abroad (1680-88). In 1692 she married the son of Robert B. of Jerviswood. Some of her ballads may be found in Allan Ramsay's *Tea-table Miscellany* (1724-27). The best known of her songs is *And werena my Heart licht I wad dee*. Memoirs of her and her husband were written by her daughter, Lady Grizel Murray of Stanhope (1693-1759).

**Baillie, Joanna** (1762-1851), Scottish poet and dramatist, *b.* at Bothwell, Lanarkshire, but went to live at Hampstead, where she *d.* The *Plays on the Passions* (1798-1836) are artificial in conception and lacking in dramatic incident, but they are written with vigour. *De Montfort* had a vogue through the acting of John Kemble and Mrs. Siddons. She is at her best in her songs and ballads written in the Scottish dialect.

**Baillie, Matthew** (1761-1823), Scottish lecturer on anatomy. Educated at Glasgow and Oxford Univs.; 1787, appointed physician to St. George's Hospital; 1789, fellow of the College of Physicians. After 1810 he acted as physician to the royal family. *The Morbid Anatomy of some of the most important Parts of the Human Body* (1795) influenced the study of medicine.

**Baillie, Robert** (1599-1662), Scottish Presbyterian divine. One of the commissioners appointed to prepare charges against Archbishop Laud, 1640. The first prof. of divinity at Glasgow Univ., 1642. Sat in the Westminster Assembly of Divines. Prin. of Glasgow Univ., 1661. His *Letters and Journals, 1637-62*, give an interesting picture of the times.

**Baillie, Robert**, of Jerviswood, Scottish patriot and martyr, who has been called the Scottish Algernon Sidney. He opposed the tyranny of Charles II.'s favourite, the duke of Lauderdale, in 1678, and was arrested on a charge of complicity in the Rye House plot and was unjustly condemned to death. Hanged at Edinburgh, Dec. 24, 1684.

**Baillon, Ernest Henri** (1827-95), Fr. botanist, *b.* at Calais, and *d.* in Paris. In 1864 he was appointed prof. of natural hist., and later prof. of hygiene, at the Industrial School of Art. Author of *Histoire des plantes*, 1866-85; *Traité de botanique médicale phanérogamique*, 1884, etc., and a botanical dictionary.

**Baillon, Guillaume**, see BAILLOU, GUILLAUME.

**Baillot, Pierre Marie François de Sales** (1771-1842), Fr. violinist. Studied music in Paris and Rome. He made his début in Paris in 1791, and was prof. of the violin in the Paris Conservatoire from 1795 till his death. He studied the theory of music under Catel, Reicha, and Cherubini. He entered Napoleon's private orchestra in 1802, and afterwards travelled in Russia with Lamare, 1805-8. In 1814 he organised concerts for chamber music in Paris with great success; toured in Holland, Belgium, and England, 1815-1816, and became a member of the London Philharmonic Society; director of the Paris Opera, 1821-31; and of the Royal Orchestra, 1825. B. belonged to the classical school of violin players, and won fame as a teacher. His compositions are difficult, and have been almost forgotten, but his *Art du Violon*, 1834, is still regarded as a standard work.

**Baillou, or Bailion, Guillaume** (otherwise Ballonius) (1538-1616), Fr. physician *b.* in Paris. Began by teaching the classics and philosophy in the univ. of Paris, and then studied medicine, taking his doctor's degree in 1570. His great merit lies in the fact that he rejected the 'specious and seductive' theories current in the doctrines of his day, preferring to follow on sound principles and to study the old physicians. B. was essentially the resuscitator of anct. medical studies, and particularly of the work of Hippocrates; and even if he did nothing on the speculative side at least he abstained from following the false route which depicts rather than explains, and realised the talent of the anct. scholars for observation. His outstanding work was his study in epidemiology, *Epidemiorum et ephemeridum libro quarto* (Paris) (1640), which revived the doctrine of Hippocrates in 'epidemic constitutions.' He thus gave the impulse to Sydenham who went still further in the doctrine. Another notable work was *Consiliorum medicinarum* ('synonymic' of the terms of Hippocrates). He is further remembered for being the first to differentiate between rheumatism and gout, and to describe arthritis, whooping cough, and many women's diseases. His works were collected and ed. by J. Thévat in Paris and, later, by Tronchin (1762).

**Bailly (or Bailly), David** (1584-1657), Dutch artist, *b.* at Leyden. He studied first under his father, Peter B., and was afterwards a pupil of Jacob de Gheyn. He travelled in Germany and Italy, returning to his native tn. in 1613, where he won a reputation as a portrait painter.

**Bailly, Jacques** (1629-82), Fr. painter, *b.* at Gracay (Cher). He settled in Paris and became a member of the Academy of Painting, in 1664. He etched 12 plates, representing bouquets of flowers, but is better known for his portraits in miniature.

**Bailly, Jean Sylvain** (1736-93), Fr. statesman, astronomer, and savant. In 1784 he was elected a member of the Fr. Academy, and in 1785 of the Academy of Inscriptions. In 1789 president of the Third Estate and of the National

**Assembly.** Mayor of Paris, 1789-91. He lost his popularity and went into retirement at Melun, where he was seized, brought to Paris, and executed in 1793 on a charge of conspiracy. 1775-87, *Histoire de l'astronomie*. Pub. posthumously *Essai sur l'origine des fables et des religions anciennes*, 1799; and *Mémoires d'un témoin*, 3 vols., 1821-22.

**Bailment**, term for the delivery of goods by the bailor to the recipient or bailee to be held according to the purpose of the delivery, and to be restored when the purpose is accomplished. B. is of 3 kinds: (1) For the benefit of the bailor or his representative. The bailee receives and keeps his deposit without reward, and is responsible only for gross neglect. (2) For the benefit of the bailee or his representative. The bailee receives a gratuitous loan, which he must return, without payment, at the end of a certain time. He is responsible in this case for the least neglect. (3) For the mutual benefit of the bailor and bailee or their respective representatives. This includes deposit as a security (as when goods are left with a pawnbroker, or when furniture is stored with a warehouseman), and the hiring of the use of a bailed article. The bailee is responsible only for ordinary neglect.

**Baily, Edward Hodges** (1788-1867), Eng. sculptor, b. at Bristol. Went to London in 1807 and entered Flaxman's studio. He was employed by George IV. to execute the sculpture in front of Buckingham Palace and the figures on the Marble Arch. He executed a number of busts and statues of public men, the Nelson monument in Trafalgar Square, Charles James Fox and Lord Mansfield in St. Stephen's Hall, Westminster. Among his finest works are: 'Eve at the Fountain,' 'Eve listening to the Voice,' 'Hercules casting Hylas into the Sea,' 'Psyche,' 'Girl preparing for the Bath,' and 'The Graces Seated.'

**Baily, Francis** (1774-1844), Eng. astronomer. In 1827 he was awarded the gold medal of the Astronomical Society for revising their Star Catalogue. He set on foot the reform of the *Nautical Almanac*, 1829; 1802, *Tables for the Purchasing and Renewing of Leases*; 1810, *The Doctrine of Life-Annuities and Assurances*.

**Baily's Beads**, the name given to a phenomenon which is observed in connection with the total eclipses of the sun, first fully described by Francis B. (q.v.). Owing to the effect of irradiation and the irregularity of the moon's edge, the crescent-shaped portion of the sun that is unobscured by the moon's disk looks like a belt of bright spots in a dark background, compared to a string of beads.

**Bain, Alexander** (1818-1903), Scottish psychologist and philosopher. Educated Marischal College, Aberdeen, 1836-40; became prof. of natural philosophy in the Andersonian Univ., Glasgow, 1845; secretary of the Board of Health, 1848-50. In 1860 he was appointed to the chair of logic in Aberdeen, and on his retirement was made lord rector of his own univ., 1881. He followed in the steps of Hartley, in that his psychology was based

on physiology, and he belonged to the experimental as opposed to the transcendental school. His prin. works are: *The Senses and the Intellect*, 1855; *The Emotions and the Will*, 1859; *Study of Character*, 1861; *Mental and Moral Science*, 1868; *Logic*, 1870; *Relation of Mind and Body*, 1873. In addition he assisted in the editing of Grote's *Aristotle* and ed. Grote's *Minor Works*; he wrote, in 1882, a biography of James Mill, as well as a criticism of J. S. Mill. His autobiography appeared in 1904.

**Bainbergs**, plate armour of the thirteenth century, to protect the legs.

**Bainbridge, Christopher** (c. 1464-1514), Eng. prelate. Bishop of Durham, 1507; archbishop of York, 1508. Henry VIII. sent him on an embassy to Pope Julius I., who appointed him cardinal of St. Praxed in 1611. He was poisoned by Rinaldo de Modena, a priest, who confessed that the bishop of Worcester had instigated him to perform the act.

**Bainbridge, John** (1582-1643), Eng. astronomer, b. at Ashby-de-la-Zouch, d. at Oxford. He was the first Savilian prof. of astronomy at the univ. of Oxford. He pub. *Astronomical Description of the Comet of 1618* (1619).

**Bainbridge, William** (1774-1835), Amer. naval officer, b. at Princeton, New Jersey. He entered the merchant marine service at the age of 15; became a lieutenant in command of schooner *Retaliation* in 1798; was captured off Guadeloupe by the Fr.; in 1800 he was promoted to the rank of captain, and was sent on an embassy to the dey of Algiers, who pressed him into Algerian service, under which flag he was compelled to go to Constantinople. When in command of the *Philadelphia* he captured the Moorish frigate *Mesboha* (1803), but was himself taken prisoner off Tripoli. He was appointed commodore in 1812, in command of the *Constitution*, *Hornet*, and *Essex*, and captured the Brit. frigate *Java*. From 1832 to 1835 he acted on the board of naval commissioners.

**Bainbrigg, Sir Philip** (1786-1862), Brit. general. He entered the Navy as a midshipman in 1799, but retired through ill health. In 1800 the duke of York appointed him to an ensigncy in the 20th Regiment; inspector of fortifications at Curacao, 1807; entered the senior dept. of the Royal Military College at High Wycombe, 1809, where he invented a projecting pocket sextant; deputy assistant quartermaster-general in Portugal, 1811. He took part with distinction in the Peninsular war and also served in France. He commanded the forces in Ceylon, 1852-54, and was promoted to the rank of lieutenant-general.

**Baines, Edward** (1774-1848), Eng. journalist and economist, b. at Walton-le-Dale, Lancashire. He was apprenticed to a printer first at Preston and then at Leeds; bought the *Leds Mercury* in 1801; M.P. for Leeds, 1834-41, as an independent Liberal. He advocated the reform of factory laws, Catholic emancipation, and opposed state interference in educational matters. He wrote a *History, Directory, and Gazetteer of the County of York*, 1823,

which was enlarged as the *History of the County Palatine and Duchy of Lancaster, 1668-70*; and a *History of the Reign of George III.*, 1823. See *Life*, 1859, by his son, Sir Edward B.

**Baines, Sir Edward** (1800-90), Eng. politician. Elected member of Parliament in 1859; he defended disestablishment of the Irish Church, opposed church tests in the univs., and introduced 2 franchise bills, in 1861 and 1864. Author of *History of the Cotton Manufacture in Great Britain*, 1853.

**Baines, Sir Frank** (1897-1933), an Eng. architect. Most of his professional career was passed in the Office of Works. Had much to do with the repair of old buildings of historic value. It was he, also, who set afoot the repair of the crumbling fabric of the Royal Palace of Westminster or Houses of Parliament. Resigned his official position to devote himself to private practice. Designed Chemical House and its companion building on the Thames Embankment. Repaired the historic roof of Westminster Hall. K.C.V.O. 1928.

**Baines, Peter Augustine** (1786-1843), Eng. prelate, b. at Kirkby, Lancashire. He was educated at the Eng. Benedictine abbey of Lambspring, Hanover, and entered the Benedictine order in 1804, and became a priest in 1810. He taught at Ampleforth till 1817, when he undertook the mission at Bath. He won a reputation as an eloquent preacher, and in 1823 he was appointed coadjutor-bishop to Collingridge, and in the same year was consecrated bishop of Siga. In 1829 he became vicar apostolic of the W. dist. of England; in this year he bought Prior Park, where he founded St. Peter's and St. Paul's, a lay and eccles. college respectively.

**Baini, Giuseppe** (1775-1844), It. priest, musical critic, and composer, b. and d. in Rome. He was appointed master of the pontifical chapel, and composed numerous musical works, of which the chief are a *Misereere* and the *Memorie storico-critiche della vita e delle opere di Giovanni Pierluigi da Palestrina*, 1828.

**Bains, vil.** in the dept. of Pyrénées-Orientales, France, 4 m. S.W. of Céret. Louis XIV. caused a fortress to be built here in 1670, at the foot of which are 2 mineral springs. The water is hot, and is collected in a reservoir, the descent to which is by steps. Over the bath and steps is an anct. vault. The building of this bath has been ascribed both to the Romans. and to the Moors.

**Bains, or Bains-les-Bains, vil.** in the dept. of Vosges, France, 16 m. S.S.W. of Epinal; it is frequented for its baths and warm springs (86-123° F.), which are recommended for cases of gout and diseases of the chest. Some anct. bronze medals, mostly Rom., but a few Gk., were discovered in 1752 under a large stone placed over one of the springs. Pop. 1850.

**Balocco, or Bajocco**, coin worth about a halfpenny, coined by the papal states, 1-100th part of the scudo = 4s. 3d.. so called from its brown colour.

**Bairaktar, or Balrak-dar** (1755-1808), title of Mustapha, grand vizier of Mahmud II. He was born of poor parents, and distinguished himself in military service. When pasha of Rustschuk, he fought against the Russians with some success, 1806. On hearing that the janizaries had murdered Selim III. and put Mustapha IV. on the throne, he marched to Constantinople, deposed Mustapha, and elevated his brother Mahmud II. to the throne, 1808. He was then appointed grand vizier. His policy was to strengthen the regular army and crush the power of the janizaries. However, his success was short-lived, for in the same year the janizaries revolted, seized the Seraglio, and demanded the restoration of Mustapha. At first he resisted, but seeing that he would soon be enveloped in flames, he strangled Mustapha and killed himself. The Turkish word B. means standard-bearer.

**Bairam, or Beiram**, name of 2 great Moslem feasts: 1. The Lesser B. is celebrated at the end of the fasting month Ramadan or Ramazan. It lasts from 1 to 3 days, and is marked by great rejoicings and the interchange of presents. 2. The Greater B. is held 70 days after the Lesser, and lasts for 4 days. It was instituted in commemoration of Abraham's sacrifice of Isaac. The faithful of Islam are expected to offer up a sheep, which is divided into three portions, one for the household, one for the relatives, and one for the poor.

**Baird, Sir David** (1757-1829), Scottish general, b. at Newbyth, Haddingtonshire. Entered the service, 1772; served in Brit. India, 1780-89. He was wounded while fighting against Hyder Ali at Pernambucum in 1780, and was taken prisoner and kept in a dungeon at Seringapatam for nearly four years. He took Pondicherry 1793. In 1799 he led the assault at Seringapatam, Col. Wellesley (afterwards duke of Wellington) being in command of the reserve. In 1801 he commanded an expedition to Egypt for the expulsion of the Fr. On his return to India he complained of the preference given to Wellesley, and asked for leave of absence. In 1804 he was knighted and made a K.C.B. Led an army to recapture the Cape of Good Hope from the Dutch settlers, 1806, and served at the siege of Copenhagen, 1807. In 1808 he was sent to the assistance of Sir John Moore with a reinforcement of 10,000 men, and distinguished himself at Corunna, 1809. In 1820 he was appointed commander-in-chief in Ireland, but was not successful as an administrator, and was removed from office in 1821, when Marquess Wellesley became lord-lieutenant.

**Baird, Dorothea** (Mrs. H. B. Irving) (1873-1933), Eng. actress, b. in Northumberland and educated at a high school in Hampstead. Joined Ben Greet's company, filling Shakespearian roles. But it was as the original Trilby in Sir Herbert Tree's production in 1895 that she made her name. Other parts, *Sophia*, in *Olivia*; *Acte*, in *Nero*; Mrs. Darling, in *Peter Pan*, and *Portia*.

**Baird, Henry Martyn** (1832-1906), Amer. historian, b. at Philadelphia, Pennsylvania; educated at Paris and Geneva, and graduated at New York Univ., 1850. Was a tutor at Princeton Univ., and from 1859 to his death prof. of Gk. at New York Univ. His best-known works are: *History of the Rise of the Huguenots of France* (1879); *The Huguenots and Henry of Navarre* (1886); *The Huguenots and the Revocation of the Edict of Nantes* (1895).

**Baird, Sir John Lawrence**, see **STONE-HAVEN, BARON**.

**Baird, John Lodie** (1888-1946), Scottish inventor of television, b. at Helensburgh, Scotland, the son of the minister of West Parish church; educated at Larchfield and the Royal Technical College, Glasgow. He undertook independent research at the early age of 18, when he set up a small laboratory at Hastings and devoted himself to the problem of 'seeing by wireless.' By 1924 he had designed an apparatus by which images could be transmitted in outline either by wire or by wireless. Two years later television was demonstrated by B. at the Royal Institution, showing the successful representation of images in detail with light and shade. In 1928 B. was the first man to demonstrate the possibilities of transatlantic television. In 1929 the Ger. post office was the first organisation to use B.'s system, and in the same year the Brit. Broadcasting Corporation began a television service, using his system. Television was subsequently improved by the development of the cathode-ray tube, and B. adopted this into his system (see **TELEVISION**). Further developments in television were interrupted by the outbreak of war in 1939. In Dec. 1941, however, B. showed for the first time television in relief and full natural colour. In that year he became technical adviser to Cable and Wireless Ltd., in which position he remained until his death at Bexhill on June 14, 1946. In addition to television, an earlier invention was the 'noctovisor,' which was designed by B. as a result of experimentation with infra-red rays. This instrument enabled visual impressions to be regarded in total darkness. At the time of his death B. was conducting experiments with a view to enabling audiences seated in cinemas to watch events, as they occurred, taking place at considerable distances away.

**Baird, Robert** (1798-1863), Amer. clergyman, reformer, and author. He was b. in Fayette co., Pennsylvania, and graduated from Jefferson College, 1818. He was agent and secretary of the Amer. and Foreign Christian Union, and worked in Europe on behalf of temperance and a revival of evangelical Protestantism. He wrote *A History of Temperance Societies in the United States*, 1836.

**Baird, Spencer Fullerton** (1823-87), Amer. naturalist. Graduated from Dickinson College, Carlisle, Pennsylvania, to which he was elected prof. of the natural sciences, 1845. He became assistant secretary of the Smithsonian Institution at Washington in 1850, and secretary in

1878. During this period the National Museum was organised and developed by him. In 1871 he was elected commissioner of fish and fisheries. He wrote numerous books on zoology and Amer. archaeology, the most important being: *Catalogue of North American Reptiles*, 1853; *Mammals of North America*, 1859; *Birds of America* (with John Cassin), 1860; *History of North American Birds* (with Dr. Brewer and Prof. Ridgeway), 1874-1884.

**Baireuth**, or **Bayreuth**, tn. in Bavaria, cap. of the dist. Upper Franconia, on the Red Main, 58 m. N.E. of Nuremberg by rail. It is famous for Wagner's theatre (1876), built especially for the performance of his operas. Among other interesting buildings are the palaces Fantasia and Hermitage. In the latter may be seen the apartments of Frederick the Great, and the room where his sister wrote her memoirs. There are also the houses of Wagner (Villa Wahnfried) and of Jean Paul Richter. The graves of Richter and Franz Liszt may be seen in the cemetery. The tn. was formerly the cap. of a margraviate, ruled by the house of Hohenzollern. The suburb of St. Georgen and the old tn. are industrial quarters, the textile industry before the Second World War having 300,000 spindles and over 4000 workers; there were also porcelain, machine, pianoforte, electrical, etc., manufs. Pop. 35,000. See *A. Bahr-Mildenburg, Bayreuth and the Wagner Theatre*, 1913.

**Bairnsdale**, tn. in Victoria, Australia, on the Mitchell R., 37 m. N.E. of Sale.

**Bairnsfather, Charles Bruce**, Eng. artist and journalist, b. at Murree in the Himalayas, 1887; eldest son of Maj. Thomas H. Bairnsfather; educated at United Services College, Westward Ho!; served in Warwickshire Militia, 1911-14. Engaged in civil engineering when war broke out; rejoined Warwickshire regiment, went to France Nov. 1914. From 1916, attached to War Office for work abroad. His humorous drawings of soldier life, at first a subject of official censure, estab. him the war caricaturist *par excellence*. Publications: *Fragments from France* (6 vols.), 1916, etc.; *The Beller 'Ole* (play); *Bullets and Bilets*, 1917; *From Mud to Mufti*, 1919; *Old Bill*, M.P. (play).

**Bairn's part of Gear**, see **LEGITIM**.

**Bairout**, see **BEIRUT**.

**Bairstow, Sir Edward Cuthbert** (1874-1946), Eng. organist and conductor, b. at Huddersfield. Served his articles to Sir Frederick Bridge at Westminster Abbey. Organist, Leeds par. church, 1906, and York Minster from 1913 till almost the end of his life. His publications are chiefly songs, and organ and church choral music.

**Baise**, or **Bayse**, one of the chief rivs. of the dept. of Gers, France. It is 145 m. in length, and flows from the Hautes-Pyrénées to the Garonne, which it joins at Alguillon.

**Baltul**, see **BERUL**.

**Baize**, coarse woollen cloth with a long nap. It was formerly made of a finer texture.

**Baj, Tommaso, see BAI, TOMMASO.**

**Baja**, cap. of co. of Bács, Hungary, trade in corn, cattle, and wine. Pop. 19,000.

**Bajan, see BEJAN.**

**Bajaur**, dist. on the borders of Pakistan, N.E. of Afghanistan, separated from Chitral on the W. by the Lahori Mts. It is a fertile plain, yielding iron ore.

youngest, Selim, and near Adrianople, on his way to exile, was taken into captivity. He is said to have d. at Aya, near Hassa, and some say he was poisoned by order of his son Selim. He was a generous ruler, but under the influence of the janizaries.

**Bajmond, see BAGIMOND'S ROLL.**

**Bajmok**, tn. in Yugoslavia, not far from Theresienstadt; pop. 9000.

Breitkopf & Härtel

#### THE THEATRE, BAIREUTH

The stage is set for the Grail scene in *Parsifal*.

**Bajazet, or Bayazid I. (1347-1403)**, son of Amurath I., on whose death at the battle of Kossovo he became sultan of the Turks. He was so active in warfare that he won the title Ilderim (lightning). He conquered Bulgaria and parts of Asia Minor, Serbia, Macedonia, and Thessaly. He blockaded Constantinople for 10 years, thinking to subdue it by famine. Sigismund of Hungary with a large army, officered by 2000 Fr. nobles, laid siege to Nikopol, but B. gained a decisive victory over the united forces of Fr., Poles, and Hungarians, 1396. He was, however, defeated in 1402 near Angora by Timur, who kept him prisoner till his death. The literary tradition that he was kept in a cage and fed with bits like a dog (cf. Marlowe's *Tamburlaine* and Rowe's *Tamerlane*) is without historical foundation.

**Bajazet, or Bayazid II. (1447-1512)**, Turkish sultan, son of Mohammed II. He ascended the Ottoman throne in 1481. During his reign he conquered Constantinople, and engaged in continuous warfare with his neighbours, particularly with Hungary, Poland, Persia, Venice, and Egypt. The last years of his reign were disturbed by the quarrels of his 3 sons about the succession to the throne. He finally abdicated in favour of his

**Baius, or De Bay, Michael (1513-89)**, Belgian theologian, b. at Melun; studied theology at Louvain, became prof. of scriptural interpretation at the univ. in 1552, and chancellor, 1575. He was deputy to the Council of Trent, 1563. At Louvain he was the leader of the Augustinian anti-scholastic school of theology. Plus II. condemned him in the bull *Ex omnibus afflictionibus*, 1567, for his teaching on justification by faith, sufficiency of the scriptures and grace, free will and original sin as applied to the immaculate conception. He was again condemned by Gregory XIII., 1579. His school came into conflict with the Jesuits, and later influenced Cornelius Jansen and Jansenism (q.v.). Collected works pub. 1696.

**Bajza, Joseph (1804-53)**, Hungarian poet and writer, born at Szécsi; contributed to *Aurora*, and succeeded Kisfaludy as editor, 1830; pub. a collection of his lyrics, 1835. He became director of the National Theatre at Pest, 1837. His historical writings include *Historical Library*, 1843-45; *Universal History*, 1847; and a translation of Dahlmann's *History of the English Revolution*. In 1848 he was editor of Kossuth's paper, *Kossuth Hirlapja*.

**Bakacs, Thomas (1442-1521)**, Hungarian cardinal and politician. He

became bishop of Győr and Eger, archbishop of Erzsébet, and cardinal and titular patriarch of Constantinople, 1510. He directed foreign policy under Michael Corvinus and Ladislaw II.; he failed in his candidature for the papacy in 1513; he declared an unsuccessful crusade against the Turks.

**Bakar, see BUCCARI.**

**Bakarganj**, dist., Dacca div., Bengal and Assam, India; area 5452 sq. m.; princ. tns. Barisal and Pirojpur; chief product, rice. It is situated on the delta of the Ganges and Brahmaputra; it is intersected by rivs., of which the chief are the Meghna, Arial Khan, and Harnighata. The forest tract of the Sundarbans lies along the coast. Pop. 2,700,000.

**Bakau**, or **Basau**, cap. of the dist. of the same name in Moldavia, Rumania, on the Bistritza, 50 m. W.S.W. of Jassy, and 188 m. N. of Bucharest by rail. It has a gymnasium, paper works, and some trade in agric. products. Pop. 20,000, of whom half were Jews before the Second World War.

**Bakchisarai**, or **Baktehissari** (Persian *bakhtcha*, orchard, garden; and *sarāi*, palace, inn). tn. in the Crimea, Russia, about 20 m. from Simferopol in the valley of Choruk. The anct. palace of the khans was built by Abdul-Sakhal-Geral in 1519, and restored in 1787 by order of Prince Potemkin. The tn. contains one long street of bazaars and booths; there are 36 mosques, 2 synagogues, and a Christian church. In one of the synagogues was found a very anct. parchment roll of the Bible which was subsequently placed in the Imperial Library. Leather articles, fur coats, soap, and candles are manufactured, and there is trade in tobacco and fruits. There is a mixed pop. (16,000) of Tatars, Russians, Gks., Armenians, and Karaites Jews.

**Bake, Jan** (1787-1864), Dutch classical scholar, b. at Leyden. Prof. of Rom. and Gk. literature for over 40 years in his native tn.

**Baked Shale, see PORCELLANITE.**

**Bakel**, fortified port and chief tn. of the B. dist., Senegal, Fr. W. Africa. It is situated on the Senegal R., 85 m. below Kayes, and about 550 m. above St. Louis on the coast. It is an important trading centre from the interior. Pop. 37,000.

**Bakelite**, substitute for celluloid, bone, ivory, etc. It is a carbon compound made from formaldehyde and phenol. B. was invented by the Belgian-Amer. chemist L. H. Baekeland (q.v.).

**Baker, Sir Benjamin** (1840-1907), Eng. civil engineer. He invented the pneumatic shield; designed, in conjunction with Sir John Fowler, the Forth Bridge, and assisted in the construction of the Nile reservoir.

**Baker, David** (1575-1641), Eng. Benedictine monk, b. in Monmouthshire; studied law; was converted to Catholicism, entered a monastery at Padua and joined the renewed Eng. congregation of Benedictines, 1619. He was spiritual director of an Eng. Benedictine convent at Cambrai, and was on a mission in England when he d. His valuable MS. collection

on eccles. hist. is in Jesus College, Oxford.

**Baker, George** (1540-1600), Eng. physician, a member of the Barber Surgeons' Company, and elected master in 1597. He was attached to the household of the earl of Oxford, and he wrote sev. works, which include: *The Neue Jewell of Health*, a translation of Conrad Gesner's *Euonymus*, with a preface, 1576; translations of Guldo's *Questions*, 1579, and Vlgio's *Chirurgical Works*, 1586; and *Antidotarie of Select Medicine*, 1579.

**Baker, Henry** (1698-1774), Eng. scientist and author, b. in London, was at one time a bookseller, but, in 1720, as tutor to a deaf girl, invented a system of teaching the deaf and dumb. He kept his methods secret, and estab. a profitable private school for deaf mutes. He helped Defoe in the *Universal Spectator*, 1728, and married his youngest daughter, Sophia, 1729. His scientific work was concerned with the microscope. He gained the Copley gold medal of the Royal Society for observations on the crystallisation of salts in 1744. He was made a fellow in 1740. He helped in the foundation of the Society of Arts, 1754, and by his will founded the Bakerian lecture of the Royal Society.

**Baker, Sir Herbert** (1862-1946), Eng. architect, educated at Tonbridge School. Trained at the Architectural Association and in the office of Arthur B., to whom he was articled. Later he was assistant to Sir E. George & Peto, among his colleagues being Edwin Lutyens and Guy Dawber. Meanwhile he studied at the architectural school of the Royal Academy where he won the Asplund prize of the R.I.B.A. in 1889. In 1892 he went to S. Africa, and after the Boer war designed many important buildings in that country. He built Groote Schuur for Cecil Rhodes, the administrative buildings for the S. African Gov. at Pretoria, the fine cathedrals of Cape Town, Pretoria, and of Salisbury, in Rhodesia. He designed Rhodes's tomb in the Matoppos, his memorial on Table Mt., and the Rhodes Hall at Oxford. He designed also the Kimberley siege memorial and the S. African Institute for Medical Research, and he may be said to have created the architectural character of S. Africa. This character combines effectively the ideals of the ruling race, as derived from anct. Rome, with different aspects of the local tradition of building, and in his later work, in India, he revealed the same ability to infuse local sentiment into the classical tradition. Through his friendship with Rhodes he had been able to visit Rome, Athens, Thebes, and Pæstum, and his work in S. Africa shows strongly the dominating influence of Mediterranean architecture. He was associated with Sir E. Lutyens in the designing of the new cap. at Delhi, the secretariat and the legislative buildings being his work. After the First World War he designed the memorials at Neuve-Chapelle and Delville Wood and, in England, the Winchester College war memorial and the Haileybury war

memorial hall. His chief work in London was the reconstruction of the Bank of England, a difficult task, which involved adherence to the style of Sir John Soane's original but with it an element of the present. In this work he made free use of painters, sculptors, and mosaic designers. India House, Aldwych, is a conspicuous example of his ability to introduce a special atmosphere into classic design. Other works: S. Africa House, in Trafalgar Square; Glyn, Mills's bank in Lombard Street; the building of the Royal Empire Society in Northumberland Avenue; and Church House, Westminster. He was knighted in 1926; K.C.I.E., 1930; R.A., 1932. His memoirs, under the title *Architecture and Personalities*, were pub. in 1945.

**Baker, John Gilbert** (1834-1920), Eng. botanist, b. Guisborough, Yorkshire; became in 1886 first assistant at the herbarium of the Royal Gardens, Kew, and keeper 1890-99. He was Victoria medalist of the Royal Horticult. Society, 1897, and gold medalist of the Linnean Society, 1899. He was associate editor of the *Journal of Botany*, and pub. botanical works, of which the most important are: *Synopsis Filicum*, 1883 (begun with Sir W. J. Hooker); *Flora of the Mauritius*, 1877; *Flora of the English Lake District*, 1885; *Handbooks of the Fern Allies*, 1887; *Amaryllidaceae*, 1888; *Bromelidaceae*, 1889.

**Baker, Josephine Turek** (1861-1942), Amer. author. Founded the *Correct English Magazine*, 1899; president and founder of the International Society for Universal Eng. Publications: *Correct English*, and other similar works; also *Songs of Triumph*, 1933, and 4 plays, including a drama on Madame de Staël.

**Baker, Newton Diehl** (b. 1871), Amer. politician, b. at Martinsburg, W. Virginia. Educated Johns Hopkins and Washington and Lee Univs. Practised law for a time at Martinsburg, then moved to Cleveland, Ohio, where he became city solicitor. President Wilson in 1916 appointed him secretary for war. A little over a year later, when the U.S.A. entered the First World War, B. and Wilson decided to adopt conscription almost immediately. The measure was bitterly fought in Congress; nevertheless the law was enacted. B., with Gen. Crowder, devised the machinery whereby the entire war man-power of the nation, between the ages of 18 and 45, was enrolled for service if necessary. So successful were the training camps that B. devised with his military aides that when the war closed the U.S.A. had some two million soldiers in France and Flanders, with over two million more in Amer. training camps, waiting to be sent if required. B. left office in 1921, when President Wilson's second term came to an end. He was appointed by President Coolidge in 1928 as an Amer. member of the Court of International Justice at The Hague, and in the same year was elected president of the Woodrow Wilson Foundation.

**Baker, Ray Stannard** (1870-1946), Amer. author. Studied law and literature, Michigan Univ. Became managing

editor of McClure's Syndicate, 1897-1898; appointed to the special commission of the Dept. of State in Great Britain, France, and Italy during the last year of the First World War. Among his numerous publications are: *The Spiritual Unrest*, 1910; *What Wilson did at Paris*, 1919; *Woodrow Wilson and World Settlement—a History of the Peace Conference* (3 vols.), 1922. With Prof. E. W. Dodd, ed. *The Public Papers of Woodrow Wilson* (6 vols.). Under the pseudonym of David Grayson: *Adventures in Contentment*, 1907; *The Friendly Road*, 1913; *Hempfield*, 1916; *Adventures in Understanding*, 1925; *Adventures in Solitude*, 1932; *The Countryman's Year*, 1936.

**Baker, Sir Richard** (1568-1644), author of the once-popular *Chronicle of the Kings of England*, which, we learn from Addison's *Spectator* (269 329) and Fielding's *Joseph Andrews*, was the favourite hist. of the country squires. He was M.P. for Arundel and E. Grinstead, and knighted 1603. He lost all his property, and was confined in the Fleet prison 1635, where he wrote his hist. and d.

**Baker, Sir Samuel White** (1821-93), Brit. explorer, was intended for business by his father, a W. India merchant, and went to Mauritius, and in 1846 to Ceylon, where he founded an agric. settlement. He travelled in Asia Minor and E. Europe, and in 1861 started on his explorations of the Nile basin which made him famous. He first explored the Athara and Ea tribes of the Nile. In 1862 he met Speke and Grant at Gondokoro returning from the discovery of Victoria Nyanza and the main sources of the Nile. With their information B. discovered Albert Nyanza, 1864, through which he proved the Nile passed, and the Murchison Falls of the Victoria and Nile, returned to Khartoum, 1865. He was given the gold medal of the Royal Geographical Society, and was knighted, 1866. In 1870 the Khedive Ismail appointed him governor-general of the Nile equatorial dists. for four years to suppress the slave trade and open up the country for trade. Many difficulties prevented his success, but he laid the foundations for Gen. Gordon, his successor. His second wife (married 1861), a Hungarian, Florence von Sass, accompanied him on all his travels. His publications include *The Albert Nyanza and the Exploration of the Nile*, 1866; *Nile Tributaries of Abyssinia*, 1867; *Ismaïlia*, 1874; *Wild Beasts and their Ways*, 1890.

**Baker, Thomas** (1656-1740), Eng. antiquary, b. at Lanchester, Durham; was educated at St. John's, Cambridge, of which he was a fellow. He refused to read James II.'s Declaration of Indulgence, and lost his living in 1690 as a non-juror, and in 1717 his fellowship. He left his MSS. on the hist. of Cambridge Univ. to the Brit. Museum and the Univ.

**Baker, Sir Thomas DuRand** (1837-93), Brit. officer. He obtained a commission as ensign in the 18th Royal Irish foot regiment in 1854. He served in the Crimean war, 1854-56. In 1857 his regiment was ordered to Central India, where he took part in the pursuit of

**Tantia Topi**, 1858. He was appointed quartermaster-general in the Ashanti expedition, 1873-74; assistant-adjutant-general in London, 1875; aide-de-camp to Queen Victoria, 1877. During the Russo-Turkish war he took part in the operations, being attached to the Russian Army; in 1848, he was sent to India as military secretary to the governor-general, Lord Lytton; he accompanied Sir Frederick (afterwards Earl) Roberts in the advance on Kabul, 1879-80. He was made lieutenant-general in 1891, and *d.* at Pnn.

**Baker, Valentine** (1827-87), also known as **B. Pasha**, Eng. soldier, brother of Sir Samuel White B. Entered the army in 1858; served in the Kaffir war, 1852-53; promoted to colonel of the 10th Hussars, 1860; explored the N.E. frontier of Persia, 1873; entered the service of the sultan, 1877; and became a major-general in the Turkish Army. He took part in the Russo-Turkish war; organised the Egyptian Army for the khedive, 1882-87, and was defeated by Osman Digna at El Teh, near Tokar, in 1884. On his return to England he joined the staff of Gen. Wolseley, 1885, but his application to re-join the Brit. Army was refused. Two years later he returned to Egypt and *d.* at Tel-el-Kehir. Author of *Clouds in the East*, 1876, and *The War in Bulgaria*, 2 vols., 1879.

**Baker City**, co. seat of B. co., Oregon, U.S.A., on the Powder R., on the Oregon railroad and Navigation Company's and Sumter Valley railroads. It is the centre of a gold- and silver-mining dist. The chief industries are agriculture, lumbering, and the manuf. of carriages. There are also breweries, brickyards, and planing mills. Pop. 9,300.

**Baker Mount**, a volcanic mt., 10,827 ft. in height, belonging to the Cascade Range in Whatcom co., Washington, U.S.A.

**Bakersfield**, the co. seat of Kern co., California, on the Kern R., and on the S. Pacific and the Atchison, Topeka, and Santa Fé railroads. It is a stock-raising and fruit-growing dist., and there are machinery works, foundries, oil refineries, planing and flour mills. The chief exports are live-stock, wool, hides, and agric. products. Pop. 29,280.

**Bakewell**, tn. in Derbyshire, England, on the R. Wye, 25 m. from Derby. The scenery of the dist. is beautiful; near by are Haddon Hall and Chatsworth. There are Saxon remains on Castle Hill; the church of St. Anne is mentioned in Domesday; on its S. side stands an eighth-century carved stone cross. Lead-mining was practised from early times, and zinc and marble are still worked. The almshouse dates from 1602, the grammar school from 1637. Pop. 3100.

**Bakewell, Robert** (1725-95), Eng. agriculturist, *b.* at Dishley, Leicestershire, England; he devoted himself to the breeding of live-stock; his new long-wool 'Leicester' sheep and the 'Dishley long-horn' cattle became famous. See **CATTLE**.

**Baking**, method of cooking in which food is cooked in a heated oven; the term is also used in connection with the making

of pottery (*q.v.*) and bricks (*q.v.*). The chem. of the process is explained in the article on cookery (*q.v.*).

**Baking Powder**, substitute for yeast composed of a mixture of tartaric acid and bicarbonate of soda, a quantity of flour usually being added to reduce the strength. When the powder comes in contact with water, carbonic acid gas is set free by the decomposition of the carbonate. The evolution of this gas when the powder is kneaded up with dough produces the porosity which is required to make the bread light.

**Bakninh**, see **BACNINH**.

**Bakony Wald**, mt. range in Hungary, N. of Lake Balaton and S.W. of Budapest. It forms the outlying E. portion of the Alps, and is separated from the Carpathian system by the Danube. The N.E. portion is known as the Vertes Mts. and Pelis Mts. (highest point 2476 ft.). Up the S.W. portion, the B. W. proper, the highest peak is Köröshegy, 2320 ft. The forests were the haunt of the robbers of Hungarian folk-song.

**Bakshish** (Persian, from *bakhshidan*, to give), word meaning a gift, and used in the Moslem E. of petty almsgiving. For European travellers it embraces the large or small gifts necessary in the E. to procure any service, hence equivalent to 'tip.'

**Bakst, Leon** (1866-1924), Russian painter; *b.* probably at St. Petersburg (Leningrad), where he passed his earliest years. One of his grandfathers having been a society Parisian in Napoleon III.'s time, the home in which Leon was brought up was full of decorations of the Second-Empire period—so well reproduced by him later. He attended the Imperial Academy of Arts; but left after displeasing the authorities there by his painting of a 'Madonna Weeping over Christ,' in which all the figures were Jewish. He was employed to teach the children of the grand duke Vladimir—afterwards his patron in theatrical matters. Visited Paris at beginning of Franco-Russian entente; returning to Russia, he became scene-painter, first to the Hermitage Theatre and then to the Imperial Theatres. He helped the movement for reviving native Russian art, as opposed to Germanised fashions. He was also active in restoring the antique beauty of presentment of the drama of ant. Greece. In the autumn of 1906, exhibited in Paris; in 1908 became famous as the scene-painter of Diaghilev's Russian ballets. Returned to Russia in 1922; but afterwards resumed residence at Paris, and *d.* there. Life by A. Levinson, 1923.

**Bakhtissari**, see **BAKHCHISARAI**.

**Baku**, formerly a gov. of Transcaucasia, but, since the First World War, a prov. of Azerbaijan (*q.v.*); bounded E. by the Caspian Sea, N. and W. by Daghestan and Ganja (Elisavetpol), and S. by Persia, area, 15,061 sq. m.; pop. before 1914, about a million. The chief tns. are B. (see below), Geokchai, Kuba, Lenkoran and Shemakha. B. includes the fertile and wooded slopes N. and S. of the E. Caucasus, the Kuba plain N. of that range, and the Kura and Aras steppes to the S.

The railway lines are run from B. to the Beslan-Vladikavkaz junction *via* Derbent along the Caspian Sea (400 m.), and from B. to Batum *via* Tiflis along the Kura valley (560 m.). It is linked with Moscow by rail *via* Rostov. The arid Apsheron peninsula is the seat of the great oil-fields, which lie round the tn. of B.; these include Balakhani, Bibi Eybat, the 'black tn.', and the 'white tn.'. The output, amounting to some 5000 tons only in 1863, yields about 6-10 million tons annually. The outbreak in 1905 of the racial feuds between Tatars and Armenians, and the general civil disorders of the period, reduced B. to anarchy and large areas of the oil-fields were burned. A steady recovery ensued, and the output reached a normal level by 1909. The refined oil, petroleum, is mainly conveyed by pipelines to Batum, on the Black Sea, for export; the heavier crude oil, naphtha, used for fuel and lubricants, is conveyed by tank-cars. The prin. tn., B., cap. of the prov., lies to S. of the Apsheron peninsula, on the Caspian. It is an important harbour for the Transcaspien trade, and was the chief station of the Caspian naval flotilla. Pop. (1939) 809,000. The new tn. lies on the W., the old tn., still retaining its oriental look, is to the E. The tn. is mentioned by Masudi, the Arabian historian, in the tenth century, and the eleventh-century mosque of the Persian shahs still remains. B. belonged to Persia till its capture by the Russians in 1735; it became part of the Russian empire in 1806. The Parsee fire-worshippers had a holy shrine and sacred place at Surakhani, 13 m. E. of the tn. During the First World War the collapse of Russia led to revolutions and counter-revolutions of 'Reds' and 'Whites' in S. Russia, which the beaten army of Turkey exploited to its advantage. A Brit. military mission under Gen. Dunsterville was sent from Bagdad to advise and assist the Armenians in B. in August 1918, but had to withdraw a month later owing to lack of local support. The oil resources of B. were threatened by the Ger. invasion of the Caucasus in the summer of 1942. By the end of July the Gers. were 700 m. away, and were soon rapidly pushing forward along the Rostov-B. railway. But the prospect of their reaching the S. Caucasus for a drive on B. was still remote when the ice and snow of early winter closed down on the high mt. passes. The beginning of Oct. saw the Gers. still 50 m. from Grozny, and the great prize of B. appeared to be more than ever out of reach. The great defence of Stalingrad in that month soon hindered the Gers. from throwing their main weight into a determined advance on B., and by Jan. of the following year Gen. Maslennikov's forces had advanced 200 m. from Ordzhonikidze along the Rostov-B. railway, and thereafter B. was safe.

**Bakunin, Mikhail** (1814-76), Russian anarchist and revolutionary, was *b.* at Tajok, Russia, of a noble family. He resigned his commission in the Imperial Guard, and in 1846 met Proudhon, the founder of anarchism, in Paris. Expelled

from France in 1848, he shared in the Dresden revolution and was sentenced to death. The sentence was commuted, and he was later handed over to the Russian authorities and exiled to Siberia, 1855. He escaped in 1861, and spent the rest of his life chiefly in Switzerland. He joined the International in 1869, becoming the leader of the more violent Lat. section, styling themselves federalists or anarchists as opposed to the political socialists under Marx. His attacks on his opponents at The Hague Congress of the International, 1872, led to the expulsion of B. and the anarchists. He *d.* in Bern. His best-known work is *Dieu et l'État*; his complete works were pub. in 1905. See **THIRD INTERNATIONAL**. See also E. H. Carr, *Michael Bakunin*, 1937.

**Bala**, tn., Merionethshire, N. Wales. The prin. industry is stocking and flannel manuf. B. College is the N. theological college of the Calvinistic Methodists. B. Lake (Llyn Tegid), 4 m. long by  $\frac{1}{2}$  wide, is the largest in Wales. Pop. 1405.

**Balaam**, son of Beor, a prophet of the O.T. (Num. xxii., xxiii.), who is recognised as inspired by God, although not of Heb. race. In other parts of the Bible, e.g. 2 Pet. ii. 15, Rev. ii. 14, he is reprobated as one of those who love the 'wages of unrighteousness.' Balak, king of Moab, alarmed at the defeat of the Amorites and Bashan by Moses and the Israelites, sends twice with promises of reward to summon B. from Pethor on the riv., i.e. Euphrates. Forbidden at first, he is commanded to go, but only to speak the words God shall put into his mouth. On his journey occurs the incident of the angel and the speaking ass. Three times B.'s curses are turned to blessings, at the high places of Baal, on Pisgah, and on Peor. These blessings take the form of 7 poems: (1) Num. xxiii. 7-10, the power of Israel; (2) and (3) xxiii. 18-24, xxiv. 3-9, the coming monarchy; (4) xxiv. 15-19, the rise of the star and sceptre out of Jacob; (5), (6), and (7) xx.-xxiv. the doom of Amalek, conquest of the Kenites by Assyria, the ships from the W., Chittim (Cyprus), to overthrow Assyria. The last 3 poems are considered a later addition by modern critics, who trace 2 distinct versions in the story of Numbers. B. is slain in the punishment inflicted on Moab (Joshua xiii. 22).

**Balachong**, Chinese condiment made of putrid shrimps or small fish pounded with spices and salt and then dried and eaten with rice.

**Balaclava**, see **BALAKLAVA**.

**Balad**, see **BELED**.

**Balaena**, see **RIGHT WHALE**.

**Balaeniceps** (Lat. *balaena*, whale, *caput*, head), shoebill, a genus of the family Ardeidae, which includes herons and bitterns, and it is allied to the storks and flamingos. It lives in the marshes of the Upper Nile and feeds on fish, lizards, and other reptiles. It has a peculiar, large, boat-shaped beak. *B. rex* is the only species known.

**Balaenoptera** (Lat. *balaena*, whale, Gk. *πτερόν*, wing), name given by Lacépède to the fin-whales (*q.v.*).

**Balaghat**, dist. of the Nagpur div. of the Central Provs. of India; area 3132 sq. m.; pop. 511,600. The chief tn. is Burha.

**Balaguer**, Victor (1824-1901), Sp. poet, historian, and politician, was b. at Barcelona, and d. at Madrid. In 1854 he was appointed keeper of the archives at Barcelona, and afterwards prof. of hist. Among his most important works may be mentioned *Trovador de Montserrat*, 1850; *Primavera del último trovador catalán*, 1876; *Don Juan de Serralonga*, 5th ed., 1875; *Historia política y literaria de los trovadores*, 1878.

**Balakhissar**, see **BALIKESIR**.

**Balakhna**, or **Balachna**, one of the circles of the prov. of Nijni-Novgorod (now Gorky), Russia, situated principally on the r. b. of the Volga. The land is cultivated and produces crops of flax, hemp, and corn. The chief tn., of the same name, is about 20 m. N.W. of Nijni-Novgorod, on the r. b. of the Volga, where it is joined by the Ussla. The wooden walls and towers which once surrounded it were destroyed by fire in 1730. There is traffic in grains, linens, and other manufs., and barges are built for the navigation of the Volga. Pop. 6000.

**Balakirev**, Mily. Alexeevitch (1837-1910), Russian musical composer, b. in Nijni-Novgorod. He was the acknowledged leader of the Russian 'Nationalist' school of the fifties, and carried on the tradition of Glinka. It was in 1861 that he began to attract around him promising musicians like Borodin (*q.v.*), Mussorgsky (*q.v.*), and, later, Rimsky-Korsakov (*q.v.*), and on all of them he exercised great influence, and also upon composers who were not his pupils, such as Tchaikovsky. In 1869 he became conductor of the Imperial Russian Musical Society. In 1881, after some years of seclusion he returned to St. Petersburg with his masterpiece *Tamara*. As a composer B. is original, even though he reveals the influence not only of Glinka, but also of Chopin, Liszt, Schumann and, to a lesser degree, of Berlioz. D. in St. Petersburg.

**Balaklava**, or **Balaclava**, tn. in the S.W. of the Crimea, on the Black Sea, about 6 m. from the harbour of Sebastopol. The harbour is excellent, having a narrow entrance, and being sheltered by lofty hills. It is the Portus Cymbolorum of the ancients, a port at which Ulysses is said to have touched. An accurate and graphic description of the bay is given by Homer. It was for long a Gk. colony; in the fourteenth century it fell into the hands of the Genoese, who called it Bella Cala, or Cembala. The Genoese settlers were expelled by the Turks in the fifteenth century. Catherine of Russia made it into a military station. In 1854-56 the tn. was held by the Brit. An engagement was fought between the Eng. and the Russians on the heights between B. and Tchernaya, when the famous charge of the Light Brigade (Six Hundred) was made on the Russian guns. Pop. 2000. See *Kinglake, Invasion of the Crimea*, 1863-1887 (vol. IV.).

**Balalaika**, a form of the guitar common

in Russia, where it is used by the peasants to accompany popular songs. It has a triangular body, and usually 3 strings, and is made in various sizes.

BALALAIKA

**Balance** (Lat. *bi-*, twice, *lanx*, a dish), instrument for determining the weight of a body. The application of the term is extended to any condition of equilibrium, as in B. of power (*q.v.*), and also to the excess of one quantity over another, or the quantity necessary to establish equilibrium, as in B. of trade (*q.v.*), and the credit or debit B. in a book-keeping account.

The common B. consists essentially of a beam resting at its middle point upon a fulcrum and furnished at its extremities with 2 scale pans; the goods to be weighed are placed in one of these, and known weights placed in the other until the beam assumes a horizontal position. The B. thus constitutes a lever of the first class, the condition of equilibrium being established by the force rotating the beam in one direction being counteracted by an exactly equal force tending to rotate the beam in an opposite direction. In order that the B. should give a true result, the following conditions must exist: (1) The two arms of the beam must be precisely equal in length, otherwise a weight depending from the end of the shorter arm will be balanced by a smaller weight on the longer arm, as in the steelyard. A sufficient test is provided by placing weights in the two pans until the beam is horizontal and then interchanging the weights, when the beam should become horizontal again. (2) The B. should be in equilibrium when the scales are empty. This does not necessarily mean that the arms are equal, for unequal arms may be compensated for by pans of unequal

weight; this condition would give an incorrect result, a weight in the lighter pan on the longer arm having more additional turning power than an equal weight in the heavier pan on the shorter arm. (3) The centre of gravity of the beam and pans should be in the same vertical line as the fulcrum when the beam is horizontal, and should be a little below the fulcrum, otherwise the slightest displacement would result in the beam toppling right over.

A B. is said to be delicate, sensible, or sensitive when a small additional weight in one pan causes an appreciable rotatory movement of the beam, that is, when the angle moved through by the beam is large for a small difference in the weights at either end. Delicacy may be obtained by attention to the following points: (1) The arms of the B. should be made as long as is consistent with lightness and rigidity, for the longer the arm is, the greater will be the turning power of a small weight.

THE COMMON BALANCE

(2) The weight of the beam should be as small as is consistent with rigidity, for the amount of rotation should depend as much as possible on the weight in the pan, or, in other words, the weight in the pan should be the greatest possible proportion of the total weight tending to turn the beam about its fulcrum. These two conditions are often met by making the beam of aluminium and constructing it so that it is capable of bearing the greatest strain without bending in a vertical direction. (3) The centre of gravity of the beam should be brought a very little below the point of support, so that the weight of the machine should tend as little as possible to keep the beam in a horizontal position. (4) Friction should be reduced to a minimum. To effect this, the edges from which the beam and pans are supported are made as sharp and as hard as possible, and the surfaces on which they rest as smooth and as hard as possible. The edges are therefore often made of agate and the surfaces of polished steel. Additional delicacy is imparted to the machine by the use of a long vertical pointer attached to the middle of the beam, the slightest deflection of which causes a considerable arc to be described by the end of the pointer.

It is sometimes necessary that a B. should be stable, that is, that the beam should return as quickly as possible to the horizontal position after deflection. To effect this, it is necessary that the centre of gravity of the beam and pans should be some distance below the fulcrum, so that when the beam is deflected, and the centre of gravity therefore no longer vertically beneath the fulcrum, the weight of the machine will operate in bringing the B. to rest again. This condition is the reverse of that required for sensibility, so that the properties of stability and sensibility are in some degree incompatible. In commerce, where quickness of weighing is desirable, stability is aimed at; whilst in physical and chemical research, where accuracy is of prime importance, the centre of gravity of the B. is brought close to the fulcrum. In the delicate Bs. used for chemical analysis, the distance of the centre of gravity from the fulcrum can be regulated within small limits by the use of a screw on the beam vertically above the fulcrum, turning the screw so that it rises, bringing the centre of gravity nearer the fulcrum, and vice versa. Such Bs. are protected from air currents, dust, etc., by being enclosed in glass cases, with sliding fronts. Strong sulphuric acid, caustic potash, or some other dehydrating substance is usually exposed in dishes to absorb moisture from the air. The wearing of the parts in a chemical B. is obviated by allowing the beam and pans to rest on suitable supports when not in use, the knife-edges being brought into contact with their surfaces by moving a screw in front of the instrument. A graduated scale behind the pointer renders it unnecessary to wait for the B. to come to rest at each weighing, as equal deflections either side are quite sufficient to indicate equal weights. A small 'rider,' or movable piece of wire, can be used to bring the B. into equilibrium when the difference in weights is very small; the rider is moved along the beam towards its extremity over small graduations, the motion over one graduation being generally equivalent to an additional weight of one-hundredth of a grain.

Even if a B. be not accurate in itself, a good result may be obtained by double weighing. The body to be weighed is placed in one pan and shot or sand is poured into the other until the beam is horizontal. The body is then taken off and known weights are placed in the pan until the beam is again horizontal. The result will be accurate even if one of the pans is loaded. Another method consists in placing the body to be weighed in the two pans successively and obtaining two results. If the fault of the B. is that it has unequal arms, the true weight will be the geometrical mean of the apparent weights, but if the B. is false through the pans being unjustly loaded, the true weight will be the arithmetical mean of the apparent weights.

*Roberval's B.* consists of four rods hinged smoothly in the form of a parallelogram. In its position at rest the rods form a rectangle, the weight pans being

firmly fixed to the vertical rods, and the horizontal rods free to turn about their middle points, which are supported by fixed vertical uprights. Whatever movement takes place, the four movable rods form a parallelogram, those supporting the weight pans always being vertical. The vertical work done in displacing one of the pans downwards is therefore always equal and opposite to the virtual work done in displacing the other, no matter on what parts of the platforms the weights may be placed. This form of B. is commonly used for weighing letters and parcels.

*Beranger's B.* is at first appearance much more complicated than Roberval's B.; but in reality is not so. The principle of placing the pans above the beam is retained, but all loads on the pans are transferred to subsidiary beams arranged below the main beam, which, in their turn, transmit a pull, always vertical and equal to the load, to the sharp edges of the main beam, and, by this means, the intervention of lateral forces is avoided.

*The common or Rom. steelyard* is a lever of the first class, but equilibrium is obtained by varying the distance of the weight from the fulcrum instead of varying the weight. It consists of a beam movable about a fulcrum near the end, from which is suspended the body to be weighed. A movable weight is slid along the long arm until the beam balances horizontally. Graduations on the long arm indicate the weight.

*The Dan. steelyard* consists of a bar with a heavy knob at one end and a hook at the other from which the body to be weighed is suspended. In this case the fulcrum is movable, and usually consists of a loop of string, its position with respect to graduations on the bar indicating the weight of the body.

*The bent lever B.* consists of a lever of unequal arms, the lighter of which ends in a pan to receive letters or small parcels. The other arm is bent downwards and weighted, and moves in front of a graduated arc. The nearer the weighted arm is to the horizontal position the greater is its turning power, as the weight acts at a greater distance from the fulcrum. Therefore the weight of the body placed in the pan is determined by the extent to which it lifts the weighted arm. The instrument is generally graduated empirically.

*The spring B.* consists of a steel wire wound in the form of a spiral, and usually enclosed in a cylindrical case with a slot through which the spring is attached to a pointer moving along a vertical scale. The body to be weighed is suspended by a hook, or placed in a pan attached to the bottom of the spring, and the weight is indicated by the amount of stretching that the spring undergoes. The elasticity of the spring varies with time and use, and as it is used directly against the force of gravity, the readings of such an instrument vary in different parts of the world.

*The torsion B.* consists of a fine wire clamped at one end and carrying an index swinging in a horizontal plane at the other. The angle through which the index is

twisted is proportional to the force causing the torsion. The index is usually a magnetic needle, and the instrument is used to measure the force of magnetic attraction and repulsion.

**Balance of Power**, in diplomacy, the principle of maintaining an equilibrium between states or groups of states so that no single state or group becomes overwhelmingly powerful, or able to dictate to others. In diplomatic relations the principle of the B. of P. has operated, though not stated in actual words, from the earliest times, e.g. in the leagues of the Gk. city states; the maze of wars and alliance of the It. republics; or the attempt of Wolsey and Henry VIII. to make England the balancing power in Europe. In the seventeenth and eighteenth centuries, the B. of P. was recognised as a definite formula of diplomacy. It was the guiding principle of William III. in his lifelong struggle against Louis XIV. It explains the tangled diplomacy and constant wars of the eighteenth century, culminating in the coalition of all the powers against Napoleon. Canning's famous remark, 'I called the New World into existence to redress the balance of the Old,' in regard to his recognition of the revolted Sp. colonies in S. America, illustrates the vitality of the theory. The years before the First World War confirmed its place as a principle of modern European policy; the Triple Alliance was countered by the Dual Alliance, and by her *entente* with France and the later agreement with Russia, Great Britain left her 'splendid isolation' in order to maintain the equilibrium threatened by the increase of Ger. power and the weakness of Russia. The establishment in 1918 of the League of Nations was an attempt, in the words of Mr. Asquith (later, Lord Oxford and Asquith), to form 'a community of power' to replace the B. of P. The latter term became less prevalent than it once was, although the facts and the principle involved may be said to have remained. European public opinion became more influenced by opinion in the U.S.A., which has always been, in theory at least, against the B. of P. While formerly the principle was confined to European diplomacy, the tendency was to extend it to world politics; China and the Middle E. came into its sphere; the rise of Japan made the B. of P. in the Pacific a vital question for the future of Australia, and, as the event proved, not for Australia alone. The end of the Second World War revived the ideal of substituting an international authority for diplomacy based solely on the B. of P. See UNITED NATIONS. See also Hume, *Essay on the Balance of Power*; F. von Gentz, *Fragments on the Balance of Power*, trans. 1806; A. Tardieu, *France and Alliances*, 1908; L. F. L. Oppenheim, *International Law*, vol. 1, 1912; H. N. Brailsford, *War of Steel and Gold*, 1914; C. J. O'Donnell, *Lordship of the World*, 1925; and the *Cambridge Modern History*.

**Balance of Trade**, The, was a term applied to the balance of the profits of the exports and imports of a country. It was held that the wealth of a country

depended on the difference in gold between its exports and imports; if there was an excess in the value of exports over the value of the imports, the balance was in favour, if not, the balance was against the country. In consequence, legislation tended to protect the exports and place prohibitive taxes on the imports. This theory grew out of the mercantile system of political economy, and is now regarded as fallacious.

In addition to the exports and imports of commodities, settlements in respect of freights, insurances, loans, interest on loans, expenses of gov. abroad, receipt of tribute, etc., have to be made. These are known to economists as *invisible* exports and imports. For many years Britain was able to absorb an excess of imports in actual commodities over exports, an excess which is measured by many millions of pounds. This excess is paid for by the money received for *invisible* exports. In 1932, however, Great Britain abandoned its policy of free imports and instituted a tariff scheme, thereby gradually reducing the gap between imports and exports. But during the Second World War Great Britain was compelled to sell her foreign and, particularly, her Amer. securities in order to find foreign currency, and especially dollars, to finance her war requirements. In consequence imports in the shape of interest or dividends on foreign investments disappeared, whence, after the war, the country bent all its efforts on manufacturing certain goods exclusively for the export trade in the hope of reducing the great adverse balance of trade.

Putting aside *invisible* services, the money value of exports must equal the

money value of imports in theory, and the relative prices of commodities must be adjusted in such a manner as to attain this equality. If this adjustment were not made, the country with an excess of imports must export money for as long as the excess continued. This outflow of money would reduce prices to a point when it paid to export some commodities or not to import others. In other words, exports would be increased and the imports reduced and the B. of T. would be restored. New Zealand attempted to do this in 1933-39 when the Labour Gov. there, having spent large sums on social services, endeavoured to restore the balance by a drastic prohibition of all kinds of imports. Other modes of redressing an adverse balance are by the payment of export bounties or subsidies, and by barter agreements. See also TRADE.

**Balance Spring**, see HOROLOGY.

**Balanga**, cap. of Bataan, on the is. of Luzon, Philippines, on the W. side of Manila Bay, 34 m. from Manila. There is irrigation from the R. Talisay. Pop. 15,000.

**Balaninus**, a genus of coleopterous insect of the family Curculionidæ which includes many species of small size. The members of this genus have a long snout furnished with a pair of horizontal jaws which assist it in placing the eggs in the kernels of fruit. The egg hatches into a larva, when the creature feeds on the host-kernel, bores a hole through it, and assumes the pupa state when it has burrowed into the ground. They are cosmopolitan. *B. nucum*, the nut-weevil, attacks common nuts and filberts; *B. glandium*, the acorn.
